ENEMY AND FRIEND of mankind, the element of fire occupies a dual role. Fire can be the blazing forest, the volcano belching forth sulphurous death, or the dreadful heat of the desert sun. In war it is the crimson terror engulfing cities and nations, but in peace it is the glowing industrial furnace, servant of man, and the friendly hearth, symbol of domesticity and peace. Yet fire remains an elementary force imprisoned within a man-made cage, ready at the least relaxation of vigilance to escape from its prison and reduce homes and cities to ashes.

Fire to the ancients represented the seed of life, to which all life must in time return. As one of the four elements in which the basic matter of creation found physical expression, it symbolized the ray of light, the lightning and gold and, in its material aspects, heat and dryness.

Fire is also the agent of purification and renewal, and therefore of sacrifice and resurrection. It has been used throughout history in the rites of sacrifice, for the burned offering was considered peculiarly appropriate as an atonement for sin. Sometimes the god himself might be ritually consumed in the fires in the person of a human substitute or in effigy, a rite devised for the purpose of liberating the spiritual element from the corruptible mortal bonds. This was the fate of the Cappadocian god Sandan, corresponding to Hercules, burned in effigy at Tarsus.

The idea that fire embodies a form of divinity is a basic theme of the world's religions. In the book of Exodus in the Old Testament we read of the miracle of the burning bush, which Moses saw as he tended his flocks: 'And the angel of the Lord appeared to him in a flame of fire out of the midst of a bush; and he looked, and lo, the bush was burning, yet it was not consumed.' Fire, as a sacred element, was tended with infinite care, often as a religious rite. The divine fires of Vesta, Roman goddess of the hearth, were served by priestesses who were bound to chastity under pain of death. In Ireland a perpetual fire was maintained at Kildare and tended by nuns until the beginning of the 16th century, this being no doubt a relic of pagan fire worship carried forward into the Christian era. Similarly, in ancient Peru sacred fires were maintained by the virgin daughters of the Inca.

Masters of Fire

Every civilization, great and small, has incorporated in its pantheon of deities a god of fire, Apollo, Helios, Hestia, Loki and Lleu (Lugh) being those with whom we in the West are most familiar. There were gods of sun fire, lightning fire, forest fire, prairie fire, altar fire and hearth fire. Every society projected its own conception of fire on to its created gods. To the Mongols the fire deity was Mother Ut, whose father was steel and whose mother was flint. For many North American Indians fire was the sun's representative on earth; tribes of the Great Lakes worshipped 'Grandfather Fire' in a special cult.

The extensive fire mythology of the fire worshippers of ancient India centred upon the fire god Agni, symbol of earth-kindled fire, lightning and the fire of the sun; he was reincarnated daily from the fingers of holy maidens who twirled the fire drill. The Parsees, the modern representatives of Zoroastrianism, are so dedicated to the sanctity of fire that they will not burn their dead, exposing them instead on Towers of Silence.

A consistent theme of mythology has been the belief that the first fire was stolen either from the gods or the sun and handed on to mankind. Prometheus, in Greek legend the giver of the sacred flame to mankind, was

punished for the theft by the angry Zeus. The Finns held fire to be the child of the sun, descended from the heavens where it was rocked in a tub of yellow copper. In European folklore the agent of fire was commonly a bird. The theft theme is widespread among North American Indians, whose tales speak of fire stolen by a trickster culture hero, then passed from animal to animal in a relay, while the angry owners pursue it until finally it is given to humanity. Some tribes, including Indians of Brazil, believe the stolen flame to have been hidden among the trees, no doubt because fire could be found ready-made in the smouldering of a lightning-charred tree. Then too, fire was first produced by rubbing one piece of wood against another. For this reason the oak, a hard wood suitable for fire-making, was considered sacred; the mistletoe, which grows on the oak, became in consequence a protective charm against lightning, while an acorn carried in the pocket gave security to the traveller.

The priesthood of the oak, the Druids (see DRUIDS) were also Masters of Fire, as were lesser mortals who had acquired the supposedly miraculous art of igniting fire and who were considered in consequence to be inspired by the gods. Potters and smiths, who worked with fire, were craftsmen falling into this category, and for thousands of years the latter were credited with magical powers of a high order. This is confirmed by a Yakut proverb which declares that 'the first smith, the first shaman and the first potter were blood brothers'. Smiths, by virtue of their supposed knowledge of the secrets of fire and iron, were assumed to exercise a degree of power over the elements which extended to healing the sick. Although universally respected, they seem to have excited considerable apprehension among the early Christian clergy, and in an ancient hymn Christendom is warned to guard itself against 'the spells of women, smiths and Druids'. In a number of intriguing medieval legends smiths were regarded as agents of the Devil. Vulcan, the Roman fire god, was the patron of workers in metal.

The alchemists, who held that metals were living entities, were likewise Masters of Fire. Their mysterious philosophy involved

The salamander, a mythical lizard-like monster, could even live within fire without injury to itself

the doctrine that all physical substances consisted of a combination of body and spirit which, being submitted to fire, left a residue, the ash representing the body and the smoke the soul. They believed that a spark of the divine life descended from the heavens to be embodied in all matter; this suggests the old myth of the original fire having been stolen from the gods.

An essential function of many practitioners of magic was the public demonstration of man's mastery over the fire element. To this end wizards in their ceremonies walked over burning coals or swallowed fire, or handled red hot iron without apparent injury. The hereditary Holy Men of Fiji had the power to walk uninjured over red hot stones, while at the annual festival of the Feast of Fire in India certain adepts have been known to walk a distance of 40 feet over an area of flame.

A further faculty of the magician was the ability to quench fire by magic. The Norse god Odin in his role of wizard, as described in the *Elder Edda*, was master of this mysterious art. It descended during the course of ages to the magical priesthoods and later still to Christian priests and saints who were immune from injury from fire. St Catherine of Siena, for instance, fell into a blazing hearth and emerged unscorched.

Will o' the Wisp

Many complicated and extremely interesting fire rites have survived into modern times among the less sophisticated of the world's communities. It was believed by primitives, for example, that a forest blaze might be quenched by a ceremonial dance performed around a man-made fire, accompanied by the singing of a rain charm. As a means of halting a heavy rain shower by sympathetic magic Australian aborigines will pour water into a fire.

Magical fire precautions of a most primitive kind have been practised in Europe, particularly in Germany, and also in the Germanic areas of the United States. The most effective form of fire insurance was considered to be a text worn as an amulet upon the body, of which the following is an example: 'Like unto the cup and wine and the Holy Supper which our dear Lord gave unto his dear disciples on Maundy Thursday, may the Lord Jesus grant me in day time, and at night, that no dog may bite me, no firearm hurt me, no weapon, no steel, no iron, cut me, no fiends, no witchcraft and enchantment hurt me and no fire burn me.'

Engendered by Friction

We may note, however, that to produce fire in one's own body is a sign that one has transcended the human condition. According to the myths of certain primitive peoples, the aged women of the tribe 'naturally' possessed fire in their genital organs and made use of it to do their cooking but kept it hidden from men, who were able to get possession of it only by trickery. These myths reflect the ideology of a matriarchal society and remind us, also, of the fact that fire, being produced by the friction of two pieces of wood (that is, by their 'sexual union'), was regarded as existing naturally in the piece which represented the female.

Mircea Eliade *The Forge and the Crucible*

The old legend which declared that the spirit of fire, after descending from the remote heavens, made its home among men is echoed in a number of the intriguing folk beliefs of Europe. In Britain the flame which flickers over marshy places, sometimes luring lost travellers to their doom, was thought to be of supernatural origin and was known as Will o' the Wisp or Jack o' Lantern. The mysterious flame called St Elmo's fire, which sometimes clings to the masts of ships at sea, had ominous significance as described in the lines:

> Last night I saw St Elmo's stars
> With their glittering lanterns all at play
> On the tops of the masts and the tips of the spars
> And I knew we should have foul weather that day.

The human soul has also been conceived in terms of fire, taking shape as either a luminous ball or a flickering flame. Reminiscent of the firedrake, dragon guardian of hidden treasures, are those tales in which the souls of the old sea kings glowed as flame above the tumuli or burial mounds where they lay buried with their hoards. Balls of fire observed dancing at night on the shores were regarded by seafaring folk as the souls of drowned sailors eternally seeking rest. Often the soul would be manifested as a bluish light moving from the chamber of death.

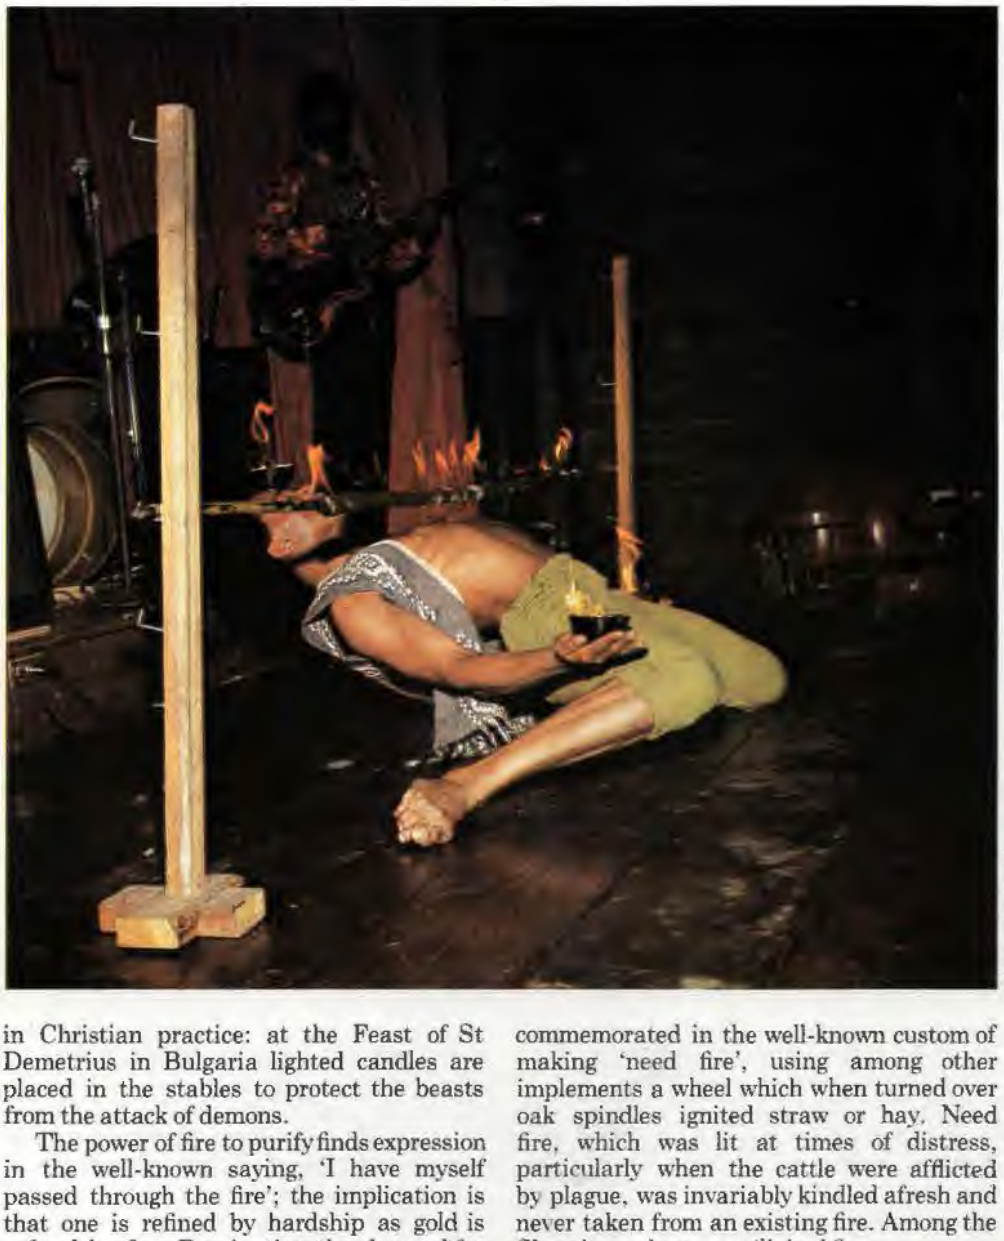
In the past, as a special act of deference to the one newly dead, all the household fires were extinguished to relieve the soul from the obligation of paying homage to the hearth, which was the altar of the god of fire where the family ancestors were worshipped. The concept that the soul left the body in the form of a flame inspired an old custom often employed to discover the missing body of a drowned person: a lighted candle was inserted in a crust of bread, which was then floated upon the water, the place where it stopped being the supposed site of the corpse. In this rite the flame was said to symbolize the soul, the bread the husk.

There are innumerable allusions to fire in the world's folk legends, in tales of fantastic cities, castles, thrones and even human beings and trees entirely composed of living flame. Animals and dragons breathing fire persistently haunted the imaginations of our ancestors. The salamander, a mythical lizard-like monster, could even live within fire without injury to itself, while 'salamander's feathers' was the name given by the pagans to asbestos. In the story of the Phoenix of Arabian legend may be observed the continuous theme of fire-lore, the statement that although the elemental may die it is immediately reborn. It was the Phoenix which, after a period of years, ignited its own nest and burned itself to ashes, emerging from the flames pulsating with new life.

Trial by Fire

Other legends tell of young maidens who are made to pass between raging fires as a test of chastity. This motif was reflected in the old trials by ordeal, in which an accused person submitted himself to the judgement of God, seeking to vindicate his innocence by walking barefoot over red hot coals or by carrying a red hot iron in his hand. Theological disputes were at times submitted to the somewhat arbitrary form of judgement by fire, and it was not unknown for conflicting liturgies to be cast into the flames, the one which emerged unscathed being declared the authentic version.

It seems to have been almost universally assumed that evil spirits, like wild animals, could be intimidated by fire. The Indians of South America carry flaming torches when entering the dark forests, not so much for the illumination they provide as to terrify the spirits lurking there. This theme is echoed



Picturepoint London

Syndication International

Mastery over fire was one of the marks of the priest or the magician, and in the past many such practitioners would give public demonstrations of their powers – a tradition continued both by showmen and in certain Eastern cults *Above left* A limbo dancer in a night club in the Bahamas introduces fire into his act to make it more spectacular. The circus fire-eater *(above)* relies on technique but the ability of the fire-walkers in Hong Kong *(above right)* to pass unharmed through flame must be attributed, in the absence of any other explanation, to the power of faith

in Christian practice: at the Feast of St Demetrius in Bulgaria lighted candles are placed in the stables to protect the beasts from the attack of demons.

The power of fire to purify finds expression in the well-known saying, 'I have myself passed through the fire'; the implication is that one is refined by hardship as gold is refined by fire. Dominating the demand for the ritual burning of witches and heretics at the stake lay the same ancient theme of purification by the element of fire. Witches, it was thought, possessed tainted blood that could only be purged by the flame and it was for this same reason that the heretic was burned alive and his ashes broadcast or thrown into a stream. The identical theme is apparent in beliefs about the after-life, for purgatory, where souls are purged of sin, has been said to be a domain of fires spiritual and physical. Hell, for the damned, was notorious for its invisible flames.

The supervision of hell lay in the hands of a class of beings who in earlier cultures and mythologies had been fire elementals, but who were now degraded to the status of infernal furnace tenders and torturers of the damned.

A typical tool for the original practice of fire-making was a wooden bow, with which a hole was drilled in a piece of wood; the spark produced was then used to ignite a wisp of straw. It has been suggested that the impact upon social life created by this invention must have been equalled perhaps only by the modern discovery of steam. This primitive type of fire-making was commemorated in the well-known custom of making 'need fire', using among other implements a wheel which when turned over oak spindles ignited straw or hay. Need fire, which was lit at times of distress, particularly when the cattle were afflicted by plague, was invariably kindled afresh and never taken from an existing fire. Among the Slavs it was known as 'living' fire.

Bonfire Festivals

The great public fire ceremonies of ancient times were scenes of horrifying cruelty, if the reports of early travellers like the Greek Posidonius are to be believed. Huge wickerwork effigies containing living human beings and animals were set on fire and the ashes afterwards scattered on the soil. The later ceremonies as practised in Europe embodied relics of the original theme of sacrifice, in the burning of effigies or in rites in which pretence was made of hauling a man or woman into the flames.

Fires known in different places as bale fire, wild fire, will fire or neat fire were ignited to signalize the passage of the seasons, for purposes of purification and to revive by sympathetic magic the powers of the declining sun. They were lit to celebrate various points in the year: spring, the beginning of summer, midsummer, the beginning of winter and midwinter. It has been suggested that the Guy Fawkes bonfire ceremony replaced one of these ancient fire ceremonies. The early Church frowned on the pagan implications of these ceremonies but the ban had apparently little effect. The fires were in part at least dedicated to the expulsion of evil in the form of witchcraft, since sorcerers were terrified of fire. It was an old Scandinavian custom, known also in Iceland, to hurl a burning coal after a departing troll wife or witch to neutralize her spells. A relic of the old May Day festival, Beltane, is still celebrated at Peebles, Scotland, and in the early 1920s the custom was instituted in Cornwall of lighting a chain of bonfires on St John's Eve (23 June). A sickle was cast into the flames followed by the chant:

> In one bunch together bound
> Bonfire blossoms here are found
> Both good and ill:
> Thousandfold let good seed spring
> While ill weeds, fast withering
> This fire shall kill.

An even more recent innovation has been the introduction of fire-leaping ceremonies by

Barnaby's Picture Library

the exponents of the modern version of witchcraft, as popularized by the late Dr Gerald Gardner of the Isle of Man. These performances are carried out in secluded places on the old seasonal feast days, usually in strict privacy but occasionally in front of television cameras.

In domestic spheres a remnant of ancient fire magic has persisted in a number of curious hearth superstitions, now disappearing under the impact of artificial forms of heating. Many people believe that a poker placed in an upright position against the fire bars to form a cross helps the fire to burn, while others consider that if the rays of the sun are permitted to shine upon the hearth the fire will go out. Sometimes the future is read from the state of the ashes. This custom was long practised in Yorkshire on the Eve of St Mark (24 April) to determine who in the family was destined to die next.

A General Conflagration

Fire being the seed of all existing things, to which they must in time again return, has suggested to generations of pyromaniacs the alarming idea that if humanity could only be consumed entire then it must, as a matter of course, arise from the flames renewed and purified; this doctrine became popular in 17th century England. One of the most notorious symbols of this revolutionary epoch was Solomon Eccles, a fanatical prophet of doom who walked through the streets of London in the nude, bearing a cauldron of burning brimstone upon his head.

A flaming torch is the symbol of freedom in New York's Statue of Liberty; and the same significance underlies the action of young men of the East and West who in recent times have set light to themselves, committing suicide as living torches, in affirmation of religious or political faith. Firmament

The vault of the heavens: it was generally viewed in the ancient world as a solid crystal sphere, constantly rotating, to which the stars were fixed; it contained windows through which the waters above the firmament fell as rain; later it was thought of as the eighth sphere surrounding the seven spheres of the planets.

A beginning, anything new, a 'first time' of any kind, whether it be joyful or alarming, is specially significant; both these elements are implied in the rituals and precautions surrounding New Year's Day or the first sight of the new moon. The first child of a marriage, like the first fruits of the harvest, is particularly precious and for this reason to sacrifice it to the gods is a mark of the highest devotion

FIRST

THE OFFERING OF THE FIRST-BORN is the theme of one of the most dramatic stories in the book of Genesis (chapter 22.1–19). It concerns Abraham, the great patriarch of the Hebrew people, and in its present form it is clearly intended to demonstrate his unflinching faith in Yahweh, the god of Israel (see YAHWEH). However, the story was obviously based upon a very primitive custom, and in its original form it was doubtless an aetiological myth, that is, a myth designed to explain the cause of something.

The original theme is concisely stated in the opening verses. Yahweh is represented as commanding Abraham: 'Take your son, your only son Isaac, whom you love, and go to the land of Moriah, and offer him there as a burnt offering upon one of the mountains of which I shall tell you.' Abraham is obedient to the terrible command, and the narrative vividly describes the journey and the preparations for the sacrifice. Having built an altar and laid his son, bound, thereon, 'Abraham put forth his hand, and took the knife to slay his son.' At this fatal moment, the angel of Yahweh intervenes and Isaac is saved. Then, instead of his son, Abraham sacrifices a ram, 'caught in a thicket by his horns'. The episode ends with Yahweh again addressing Abraham: 'By myself I have sworn . . . because you have done this, and have not withheld your son, your only son, I will indeed bless you, and I will multiply your descendants as the stars of heaven and as the sand which is on the seashore.' Thus the story achieves its conclusion of showing how Yahweh, having tested the faith of Abraham, promised that his descendants would henceforth become a great nation.

But behind this edifying tale of Abraham's faith there is clearly another purpose, that of explaining how an ancient custom of sacrificing first-born sons to Yahweh was superseded by the offering of an animal victim. There is an abundance of evidence in the Hebrew scriptures that such a custom was once observed by the ancient Israelites. For instance, in the ritual law set forth in the book of Exodus, Yahweh is depicted as commanding Moses: 'Consecrate to me all the first-born; whatever is the first to open the womb among the people of Israel, both of man and of beast, is mine. . . . Every firstling of an ass you shall redeem with a lamb, or if you will not redeem it you shall break its neck. Every first-born of a man among your sons you shall redeem' (chapter 13). The reason assigned for this savage practice is that it commemorates Israel's exodus from Egypt, when Yahweh 'slew all the first-born in the land of Egypt, both the first-born of man and the first-born of cattle'. But this historicized explanation is typical of many others given in the Bible to account for ritual customs of which the origin was unknown in later times.

The ritual killing of the first-born is found elsewhere among primitive peoples. It seems in origin to have been a propitiatory rite addressed to supernatural powers to ensure their benign attitude towards later offspring. There could be some variation of motive: for example, the first-born son could be made a sacrifice for the well-being of a city or offered as a vicarious sacrifice made by a father for his sin. 'Shall I give my first-born for my transgression, the fruit of my body for the sin of my soul?' asks the prophet Micah.

Babies Buried in Jars

The many skeletons of infants buried in jars which have been found on Canaanite sites attest to the practice of infant sacrifice among the ancient inhabitants of Canaan. In a revealing passage, describing the reforms of King Josiah at Jerusalem, it is recorded: 'he defiled Topheth, which is in the valley of the sons of Hinnom, that no one might burn his son or his daughter as an offering to Molech' (2 Kings 23.10). It is now generally accepted that the word 'Molech' was not the name of a god but a technical term for child sacrifice, indicating that the Israelites were once accustomed to burn their children as sacrifices, probably to Yahweh.

The same custom was practised by other Semitic peoples, for instance the Phoenicians and Carthaginians; the calcined bones of children, sacrificed to Tanit and Baal-Hammon, have been found at Carthage. Other forms of the sacrifice of the first-born among non-Semitic peoples are recorded by J. G. Frazer in *The Golden Bough*.

Every departure from the familiar in the life of mankind is in effect a step into the dark, a journey into the dangerous unknown. In primitive societies that are dominated by superstition, each new occurrence is generally regarded as potentially harmful unless its impact can be countered by rites specially devised to placate the gods. The passage of the seasons, the displacement of the old by the new, were once believed to be disturbing processes. The first action undertaken and the first object received, even the emergence of the new crop in the fields or the birth of a child, could be a source of danger to the community unless made safe by magical rites.

From time immemorial it has been the custom among many of the world's people to consume the first fruits of the harvest in a ceremonial feast, or dedicate it wholly or in part to the tribal deity, as a method of offsetting the jealousy of the gods or the envious dead, or the spirit of the crop itself. Fishermen in many countries nail the first fish of the season to the ship's mast and believe that it is possible to determine from its sex the prospects of the forthcoming fishing season. If the fish is female the hauls are expected to be good, but if it is male, poor. Closely allied to this custom is the importance attached to the first coin received by a merchant in his day's takings. Handsel money, as it is called, must be first spat upon and then kept separately in the pocket to ensure a good day's trading. Theatrical people believe it possible to determine the fate of a new production from the age of the purchaser of the first ticket. If he or she is old the production will have a long run; if young the future of the show is bleak.

Painting from a 16th century Italian dish showing Abraham about to sacrifice his son Isaac: the biblical story points to an ancient practice among the Israelites of sacrificing the first-born child to God

Michael Holford

Stepping Into Danger

The belief that the future of a building had to be insured against evil and misfortune on completion, before it was safe to use, lies at the root of many foundation rites, including the sacrifice of young children (see BUILDERS' RITES). The old terror of human sacrifice in turn probably reinforced the superstition that it is dangerous to be the first to enter a new house. Some form of protection is afforded, however, by taking the initial step with the right foot. The new bride is also shielded from baleful influences when she enters her home for the first time by being carried over the threshold. But in America this custom may spring from the old superstition that the first one of the newly-weds to step over the threshold will be the first to die.

Primary actions of any kind have all the force of magic behind them, a very well-known example being the 'crossing the line' ceremony with its mock ordeal and its attendant galaxy of sea gods. The significance of first actions permeates our superstitions. The seamstress who puts the first stitch in a bridal dress will be married within the year. In love magic, if nine peas are found in the first pod opened by an unmarried girl and one of these is placed on the lintel of the outer door, the first single man who crosses the threshold afterwards will be the one she will marry.

The newly-born child was believed to be extremely vulnerable to the influence of witchcraft in its first few days of life, and its first and therefore magically potent gifts often included salt, which was thought to

'Crossing the line': at sea each person crossing the Equator for the first time is ceremonially drenched, while 'King Neptune' directs operations

provide protection against the forces of evil. There was a time when even the first kiss received by a baby from any individual other than its mother was thought to transmit to the child the characteristics of the person who gave it; great care had to be exercised in warding off undesirable people.

Even greater dangers might face the dead, for the soul of the first person to be laid to rest in a new cemetery was assumed to become automatically the property of the Devil. Until very recently it was the custom in parts of eastern England for children to dance seven times round the oldest (or first) gravestone in a churchyard and at the conclusion to place their ears close to the ground and listen for the sound of 'the Devil rattling his chains'.

The New Year

The sense of wonder tinged with alarm at the transition from one phase of time into the next provides the motive force for those magical ceremonies which are still observed by the adult community. At the first sight of the new moon many people continue to turn over their money, reciting at the same time the ritual words 'white rabbits' as a charm to encourage good fortune during the next four weeks. With the emergence of the New Year the church bells acclaim the presence of a renewed first moment in time in which all enter a state of ritual rebirth. In the United States, the custom in most towns and cities of greeting the New Year's arrival with a prolonged torrent of noise, far greater than mere bell-ringing, resembles primitive noise-making to frighten off devils. Perhaps in this way the New Year noise clears the air of the previous year's evil, allowing for a fresh start.

In a practice that extends from East to West, the household prepares to usher in the New Year in symbolic form. In the British Isles the New Year will be represented by the first male person to cross the threshold after midnight, known as either First Foot or Lucky Bird. He must be tall and dark haired, and also bear token gifts representing the basic needs of the household for the year: money, coal and a piece of bread. It is important that there should be nothing ill-omened about his appearance and those with crossed eyes or with eyebrows that meet across the brow are rigorously excluded, since these are signs of the Evil Eye, the first glance of which is doubly lethal. American belief, where the 'first footing' custom still holds, finds other ill omens if the first visitor is a widower, or red-headed.

(See also NEW YEAR.)

Picturepoint London

The story of the garden of Eden has been interpreted in ways as various as the doctrine of original sin and the belief that nudism is virtuous. It has kept its long hold on humanity because it deals with matters of vital human importance – evil, death, love, and the gulf between man and God

FIRST MAN

SOME GROUPS OF HUMAN BEINGS believe that they are closely related to animals and trace their descent from an ancestor who had both human and animal characteristics (see ANIMALS; AUSTRALIA; TOTEM). Others say that men are descended from the sun, whose light and heat preserve all life in the world. According to an Indian myth, for instance, the first man and woman were the twins Yama and Yima, who were children of the sun. There is a Maori story that the first human being was made of earth and given life by the sun: 'it was the sunlight fertilizing the Earth Mother.' The Zuni Indians of New Mexico said that men and all living things were the children of the sun and the earth. Elsewhere the sky and the earth are the original ancestors of humanity (see EARTH).

There is a very widespread tendency to give the earth an important role in the creation of the first human beings, sometimes in association with plants, which suggests a poetic parallel between human life and the life of vegetation, both springing from the earth and returning to it again in death. A striking example is a Pawnee story of how Mother Corn led the first men up to the earth's surface.

> Before the World was we were all within the Earth.
> Mother Corn caused movement. She gave life.
> Life being given we moved towards the surface:
> We shall stand erect as men!
> The being is become human! He is a person!

Another example is Gayomart, who shone like the sun, the Zoroastrian first man. Gayomart was killed by Ahriman, the evil power, but his seed fell into the earth and from it there grew a rhubarb plant which turned into the first human couple. (See AHRIMAN.)

A Greek myth says that the first men, the 'golden race', were born from Earth. 'These men . . . lived without cares or labour, eating only acorns, wild fruit, and honey that dripped from the trees, drinking the milk of sheep and goats, never growing old, dancing, and laughing much; death, to them, was no more terrible than sleep' (Robert Graves, *The Greek Myths*).

Various episodes from the story of Adam and Eve are depicted in this illustration from the 15th century *Bedford Book of Hours*: within the garden of Eden, Adam names the beasts, God takes Eve from Adam's side, the guilty pair eat fruit from the forbidden Tree of Knowledge and are condemned by God; outside the garden Adam and Eve labour as their son Cain kills his brother Abel

Sometimes the human body is said to be made of earth, fashioned of clay. The Shilluk of the White Nile accounted for differences in skin colour by the differently coloured clay from which the various races of men were made. The Sumerian god Enki caused human beings to be made of clay and the Egyptian god Khnum was believed to fashion men on a potter's wheel (see CREATION MYTHS).

Some of these themes also appear in the first man myth which has had far and away the greatest influence on the western world, the story of Adam and Eve.

Adam and Eve

Perhaps no story ever told has been subjected to such a weight of exhaustive analysis and learned criticism as the opening chapters of Genesis. The great 19th century controversy has died away and it is now generally accepted that the world and man were not created in the way that Genesis describes; which is not to deny that Genesis contains truth of a different sort. It is also generally accepted that Genesis was influenced by the myths of other eastern peoples, the neighbours of the Jews. But in the quality of its insight into the human condition Genesis stands alone.

There are two different stories of the creation of man in Genesis. The first, in chapter 1, is the 'official' version, preserved by the Jewish priests. God created man 'in his own image', as an inferior copy of himself (an idea also found in Babylonian mythology). The point is not merely that God is thought of in human form but that man is thought of in divine form, as a miniature replica of God, which has provided a biblical basis for the theory that man is potentially God and can eventually become God.

God created male and female, ordered them to 'be fruitful and multiply' and gave them the lordship of all living things. The Hebrew word used for man is *adam*, which later in Genesis is the name of the first man, though most modern interpreters maintain that *adam* here means 'mankind' in general.

The second story (starting at Genesis 2.4) is longer, more vivid and older. It seems to have been a more popular version than the official, priestly account, with which it conflicts on various points of detail. It is the familiar tale of Adam and Eve, the forbidden fruit and the serpent, and it is clearly concerned with a couple who were the first of the human species.

The Making and Fall of Man

God formed a man out of dust from the ground, an implied play on the words *adam* (man) and *adamah* (earth). God breathed into the man's nose to give him life (another widespread theme – see BREATH), which provided a basis for the later sharp distinction between man's 'spirit' – the pure and godlike part of him – and his earthy material body with its earthy habits and desires, the part of man's being which so many ascetics and puritans have tried to suppress.

When he had given man life, God planted a garden for him 'in Eden, in the east'. Eden means 'pleasure, luxury' and judging from the description of its rivers, it was somewhere to the north of Mesopotamia. In the paradise garden was every tree which is beautiful to look at and whose fruit is good to eat. There were also the Tree of Life, whose fruit brought immortality, and the Tree of Knowledge, whose fruit Adam was forbidden to eat on pain of death.

God decided to give the man a helper. He made the animals and birds, also from earth, and brought them to Adam, who gave them all their names. But none of them qualified as a suitable helper and so God 'built' a woman from one of Adam's ribs. Adam hailed her with delight as 'bone of my bones and flesh of my flesh' and her making from his body is the origin of human love. He named her *Hawwah* (which became Eva in Greek, Eve in English), meaning 'the mother of all living' – a play on words, linking her name with *hayah*, 'to live'.

Next comes the entrance of the serpent, the most subtle of animals. The serpent told Eve that eating the forbidden fruit would not bring death: on the contrary, 'God knows that when you eat of it your eyes will be opened, and you will be like God, knowing good and evil.' So Eve picked the fruit and gave some to Adam and they both ate it. The immediate consequence was that they felt shame at being naked and made themselves aprons of fig leaves. In other words, the story refers the association of guilt and shame with sex to this original disobedience of God's orders (an idea echoed by Milton in *Paradise Lost*).

Adam and the Angels

We created man from dry clay, from black moulded loam, and before him Satan from smokeless fire. Your Lord said to the angels: 'I am creating man from dry clay, from black moulded loam. When I have fashioned him and breathed of my spirit into him, kneel down and prostrate yourselves before him.'

All the angels prostrated themselves, except Satan. He refused to prostrate himself.

'Satan,' said Allah, 'why do you not prostrate yourself?'

He replied: 'I will not bow to a mortal created of dry clay, of black moulded loam.'

'Begone,' said Allah, 'you are accursed. My curse shall be on you till Judgement-day . . .'

'Lord,' said Satan, 'since you have led me astray, I will seduce mankind on earth: I will seduce them all, except those that faithfully serve you.'

The Koran

Adam and Death

The devil is a skilful enemy: how many palms he has won! consider to what he has cast us down! That we are born mortal comes of this, that he in the first place cast down from Paradise our first ancestor!

St Augustine

In this light, actual death becomes a visible demonstration of the fissure between God and man which cleaves man's being to its very essence and which was opened at the very beginning of his spiritual moral history . . . Man's death is the demonstration of the fact that he has fallen away from God.

Karl Rahner *On the Theology of Death*

God discovered what Adam and Eve had done – Adam blamed Eve and Eve blamed the serpent – and punished them with death, with the pain of childbirth, with the subjection of woman to man, and with hard work. To prevent Adam from eating the fruit of the Tree of Life and becoming immortal, God drove Adam and Eve from Eden and set an angel with a flaming sword to guard it.

The Meaning of the Story

It is clear that death was one of the punishments for Adam's crime but not clear in what sense. The story may have meant, originally, that man would have been immortal if Adam and Eve had not disobeyed God. Or it may have meant (a more sophisticated, perhaps too sophisticated, explanation) that man was subject to death in any case but would have seen it not as something frightening and cruel but as his natural end, 'no more terrible than sleep'.

Essentially, the story is about the double nature of man, a creature whose life is made of labour, pain, frustration, defeat and death but who knows himself capable of finer things, who has his moments of joy, beauty, splendour and power: man who is half animal and half God. Genesis says that the evils which afflict man came to him because he disobeyed God. 'By wanting to be like God,' as Gerhard von Rad puts it, 'man stepped out from the simplicity of obedience to God. He thereby forfeited life in the pleasant garden and close to God.'

That the serpent was the Devil is a later belief – Genesis does not say so – but the temptation the serpent offered was the possibility of becoming 'like God', of achieving all-embracing, superhuman power, which is the central aim of black magic. The Genesis story describes how man, who stands midway between the animals and God, tries to become God. In doing so, he overreaches himself and brings evil into the world. From a modern point of view, the story sees the roots of evil in man's refusal to submit tamely to the conditions in which he finds himself, in his attempts to master everything about him and, in this sense, to make himself God.

The Two Trees

The significance of the two trees is very unclear, and there may have been only one tree in the original story. If it was the Tree of Life, Adam was not forbidden to eat its fruit and parallels in other myths suggest that the serpent's role in the original story was to steal the fruit of the Tree of Life and so obtain the immortality intended for man.

Alternatively, S. G. F. Brandon has suggested that the tree in the original story was the Tree of Knowledge, and that by eating its fruit Adam and Eve acquired the knowledge of sex, knowledge of the means of reproducing life: it was this knowledge that made them 'like God', the creator of life. And this brought death upon them because of the myth of the overcrowded earth, the widespread belief that if birth exists but not death, the world will quickly become hopelessly overcrowded: death is the only solution.

The Wickedness of Woman

For hundreds of years, Eve's part in the story has powerfully reinforced the feeling, which spreads far beyond Jewish and Christian tradition, that woman is inherently evil. It was Eve who succumbed to the serpent's temptation and the legend grew up that the serpent had physically seduced Eve, infecting all her descendants with abominable lust. It was Eve who persuaded the weak-willed Adam to eat the fruit and so it was Eve who was responsible for the evils that the crime in Eden unleashed on humanity. 'From a woman sin had its beginning, and because of her we all die' (Ecclesiasticus 25.24).

In the late 2nd century AD the Christian writer Tertullian castigated women with, 'Do you not know that each of you is also an Eve? . . . You are the devil's gateway, you are the unsealer of that forbidden tree, you are the first deserter of that divine law, you are the one who persuaded him whom the devil was too weak to attack. How easily you destroyed man, the image of God! Because of the death which you brought upon us, even the son of God had to die . . .'

Origin of the Two Sexes

Genesis says that Adam was the father of Cain, Abel, Seth and other children, and died at the age of 930. According to other Jewish traditions, he wrote some of the Psalms (numbers 5, 19, 24, 92, 132) and his grave was in the cave of Machpelah at Hebron, to the south of Jerusalem, where Abraham, Isaac and Jacob were also believed to be buried. Christian tradition placed his grave at Golgotha where Jesus was crucified. This is the origin of the custom of showing a skull at the foot of the cross in paintings and sculpture, and is based on the link which Christians saw between Adam, who alienated man from God, and Christ, the second Adam, who reunited man with God.

Jewish stories said that Adam was originally a man on his right side and a woman on his left (the side of evil), and God separated the two halves. Or Adam and Eve were joined at the shoulders, back to back, and God split them in two with an axe. These tales were probably meant to reconcile the making of man in God's image with the belief that God is beyond sex and incorporates both male and female in himself. If Adam was a copy of God he must have been bisexual. The idea is present in the Genesis story, perhaps for the same reason, Eve being made from Adam's body.

Another story was that the angels were jealous of Adam. Some of them advised God against creating him in the first place but were destroyed by God in a rage. When Adam had been created, the Archangel Michael commanded the host of heaven to fall down and worship him. They all obeyed except Satan, who was too proud and was hurled out of heaven in punishment. Some writers explained that this was why Satan tempted Eve in the form of a serpent, to revenge himself on Adam. The story survives in the Koran.

The belief that the angels were jealous of man is part of the tendency of later Jewish writers to drawing glowing pictures of the glory and wisdom of Adam in Eden before the Fall. He was unimaginably beautiful, he looked like one of the angels, his skin was like a shining robe, and the ball of his heel outdid the sun in splendour. His body was so huge that it filled up the space between the earth and the sky, and stretched from one end of the earth to the other.

These notions seem comically exaggerated but there was serious feeling behind them. They stemmed from the belief that man was not condemned for ever to toil, pain and death but would one day recover Adam's greatness and beauty. Adam was the pattern of what God had intended man to be. He had fallen from grace but in days to come, when the Messiah appeared, the righteous would be restored to the splendour meant for man.

To the Christians, Jesus was the Messiah, and St Paul – who was, of course, a Jew and familiar with the teachings of the rabbis – explained that Christ has brought back to man the glory which Adam had lost. One of St Paul's great themes was the contrast between Adam, who had plunged all men into death and the power of the Devil, and Christ who had come to mankind's rescue. At least as far back as the 7th century, Christians called Adam's disobedience 'the fortunate sin' (*felix culpa*) because it had made necessary the coming of Christ. In other contexts, however, Christians did not take so kindly a view of Adam's crime.

Original Sin

Genesis does not say that Adam's rebellion infected all mankind with what was afterwards called 'original sin' – a germ of wickedness endemic in human nature so that babies at birth are already sinners. That death and the other penalties for Adam's sin have been transmitted to all later generations is clearly implied, and the Jews inherited from their nomad ancestors the tradition that the father of a family was its representative. If he committed a crime, the rest of the family were automatically implicated and had to take the consequences. The story of Achan (Joshua, chapter 7) is an example, and there was a popular saying that 'The fathers have eaten sour grapes, and the children's teeth are set on edge', which is quoted with disapproval by Ezekiel (chapter 18). But although Jewish writers accepted that men have inherited the punishment of Adam's disobedience, most of them did not believe that men have inherited his sinfulness.

Whether St Paul invented the Christian doctrine of original sin or not is disputed. John Hick, summarizing the opinions of most commentators, says that St Paul believed that all men die because of Adam's sin; that all men have inherited from Adam a tendency to sin; that all men do in fact sin as a result of this tendency; and that Christ came to abolish sin and death. He concludes that, 'There is thus clearly present in St Paul the root idea of what was later to be called "original sin".'

The early Church had to contend with gnostic theories which saw the world as a thoroughly evil place that must have been made by a thoroughly evil god. Convinced

Eve in Eden

Never had Ransom seen a face so calm and so unearthly, despite the full humanity of every feature. He decided afterwards that the unearthly quality was due to the complete absence of that element of resignation which mixes, in however slight a degree, with all profound stillness in terrestrial faces. This was a calm which no storm had ever preceded . . .

Opposites met in her and were fused in a fashion for which we have no images. One way of putting it would be to say that neither our sacred nor our profane art could make her portrait. Beautiful, naked, shameless, young – she was obviously a goddess: but then the face, the face so calm that it escaped insipidity by the very concentration of its mildness, the face that was like the sudden coldness and stillness of a church when we enter it from a hot street – that made her a Madonna.

C. S. Lewis *Perelandra*

Gayomart, the first man of Zoroastrian legend, reclines on a tiger skin: his seed fell into the earth and became a rhubarb plant which turned into the first human couple; 15th century Persian manuscript

that God is good, Christians needed an explanation of how evil had entered the world and man, which God had created. Whatever St Paul may have intended, one of the explanations adopted was based on Romans 5.12, which in the original Greek says that sin and death entered the world through one man (Adam) and death came to all men, *for* all men sinned. The verse was mistranslated into Latin to read that sin and death entered the world through one man *in whom* all men sinned. St Augustine, who was primarily responsible for fastening the doctrine firmly into the fabric of Roman Catholic orthodoxy – and who was the first to use the term 'original sin' itself, in a work written in 397 – read Romans 5.12 in the Latin translation.

St Augustine thought different things at different times and a brief summary does not do him justice, but he believed that in Eden before the Fall Adam was wise and happy, free of disease, old age and death. He sinned by rebelling against God and his sin was inherited by the entire human race, who were his descendants and who were 'seminally present' in his loins. It follows that babies who die before they are baptized go straight to the Devil's clutches in hell, though St Augustine did suggest that the tortures inflicted on them might be comparatively mild.

Some Gnostics of the early centuries after Christ identified the god of the Old Testament as the evil being who created the evil world. This naturally involved them in standing the Old Testament stories on their heads. The god who made man was now an evil power and the serpent, the tempter, became a virtuous creature, sent by the good supreme God to teach Adam and Eve the knowledge of good and evil so that they could see for themselves the evil nature of the world which the Jewish god had made.

Gnosticism, Mysticism, Nudism

According to the gnostic 'Secret Book of John', for example, man was created by the god of the Jews, an evil supernatural being named Ialdabaoth (probably a corruption of Jehovah Sabaoth). He seduced Eve after the expulsion from Eden and fathered on her the two sons men call Cain and Abel, but whose real names are Jehovah and Elohim. The one has a face like a bear and the other like a cat. (Elohim, like Jehovah, is a name of God in the Old Testament.)

In Manichean theory, Adam was created by an evil power, begotten of the coupling of two great demons as a receptacle for certain particles of heavenly light, which had been captured by the forces of darkness. The Adam the demons produced was blind, deaf, fast asleep and unconscious of the divine light within him but the sowers of light sent a redeemer – called Ohrmazd or the Son of God or brilliant Jesus or Jesus the brilliant light – to rescue him. From his demon ancestors man has inherited his physical body and its desires but he also contains the divine light.

The Manichean Adam was spawned by evil as a copy of the heavenly 'primeval man', who had earlier been created by the powers of light. The two different creation stories in Genesis encouraged some Jewish and Gnostic writers to suggest that the first story describes the making of the ideal 'heavenly man', the image of God, a spiritual, non-material being who combined both sexes in himself; and that the second story describes the making of actual earthly man, a being who is part spirit and part matter (his body, made of earth) and who is divided into two sexes. Here again is the theme of the dual nature of man, material and spiritual, animal and divine.

The idea survived in Jacob Boehme's theory (which powerfully influenced William Blake) that there were two Falls. The original Adam was an angelic spiritual being, immortal, bisexual and virgin. He fell for the first time in acquiring a physical body and dividing into male and female. This was followed by the second Fall when the serpent successfully tempted Eve, bringing death and the necessity for reproduction of the species because man was no longer immortal. As in gnostic theory, everything which is physical, material, earthly is regarded as evil, and in particular sex.

The belief that the original Adam was the perfect pattern of humanity, which man had lost but might regain, inspired various medieval heretics to maintain that men and women should go about naked and refrain entirely from work, which would restore them to the state of perfection of Adam and Eve in Eden before the Fall. In 1925 a group of Adamites were discovered in California. Their leader was Eve recreated, her husband was Adam and their farm was the Garden of Eden. They used to dance naked in the farmyard round a bonfire and a lamb was burnt alive on at least one occasion. It is a far cry from the beauty and far-reaching significance of the Old Testament story but the Adamite heresy may perhaps have contributed to the notion that nudism is physically and psychologically healthy.

FISH

IXΘYC

Jean Arland

On the walls of the catacombs of Rome are scratched representations of a fish, for to the early Christians the fish was the symbol of Christ. Inhabitants of a mysterious and alien world, since ancient times fish have been associated with the sacred and the supernatural

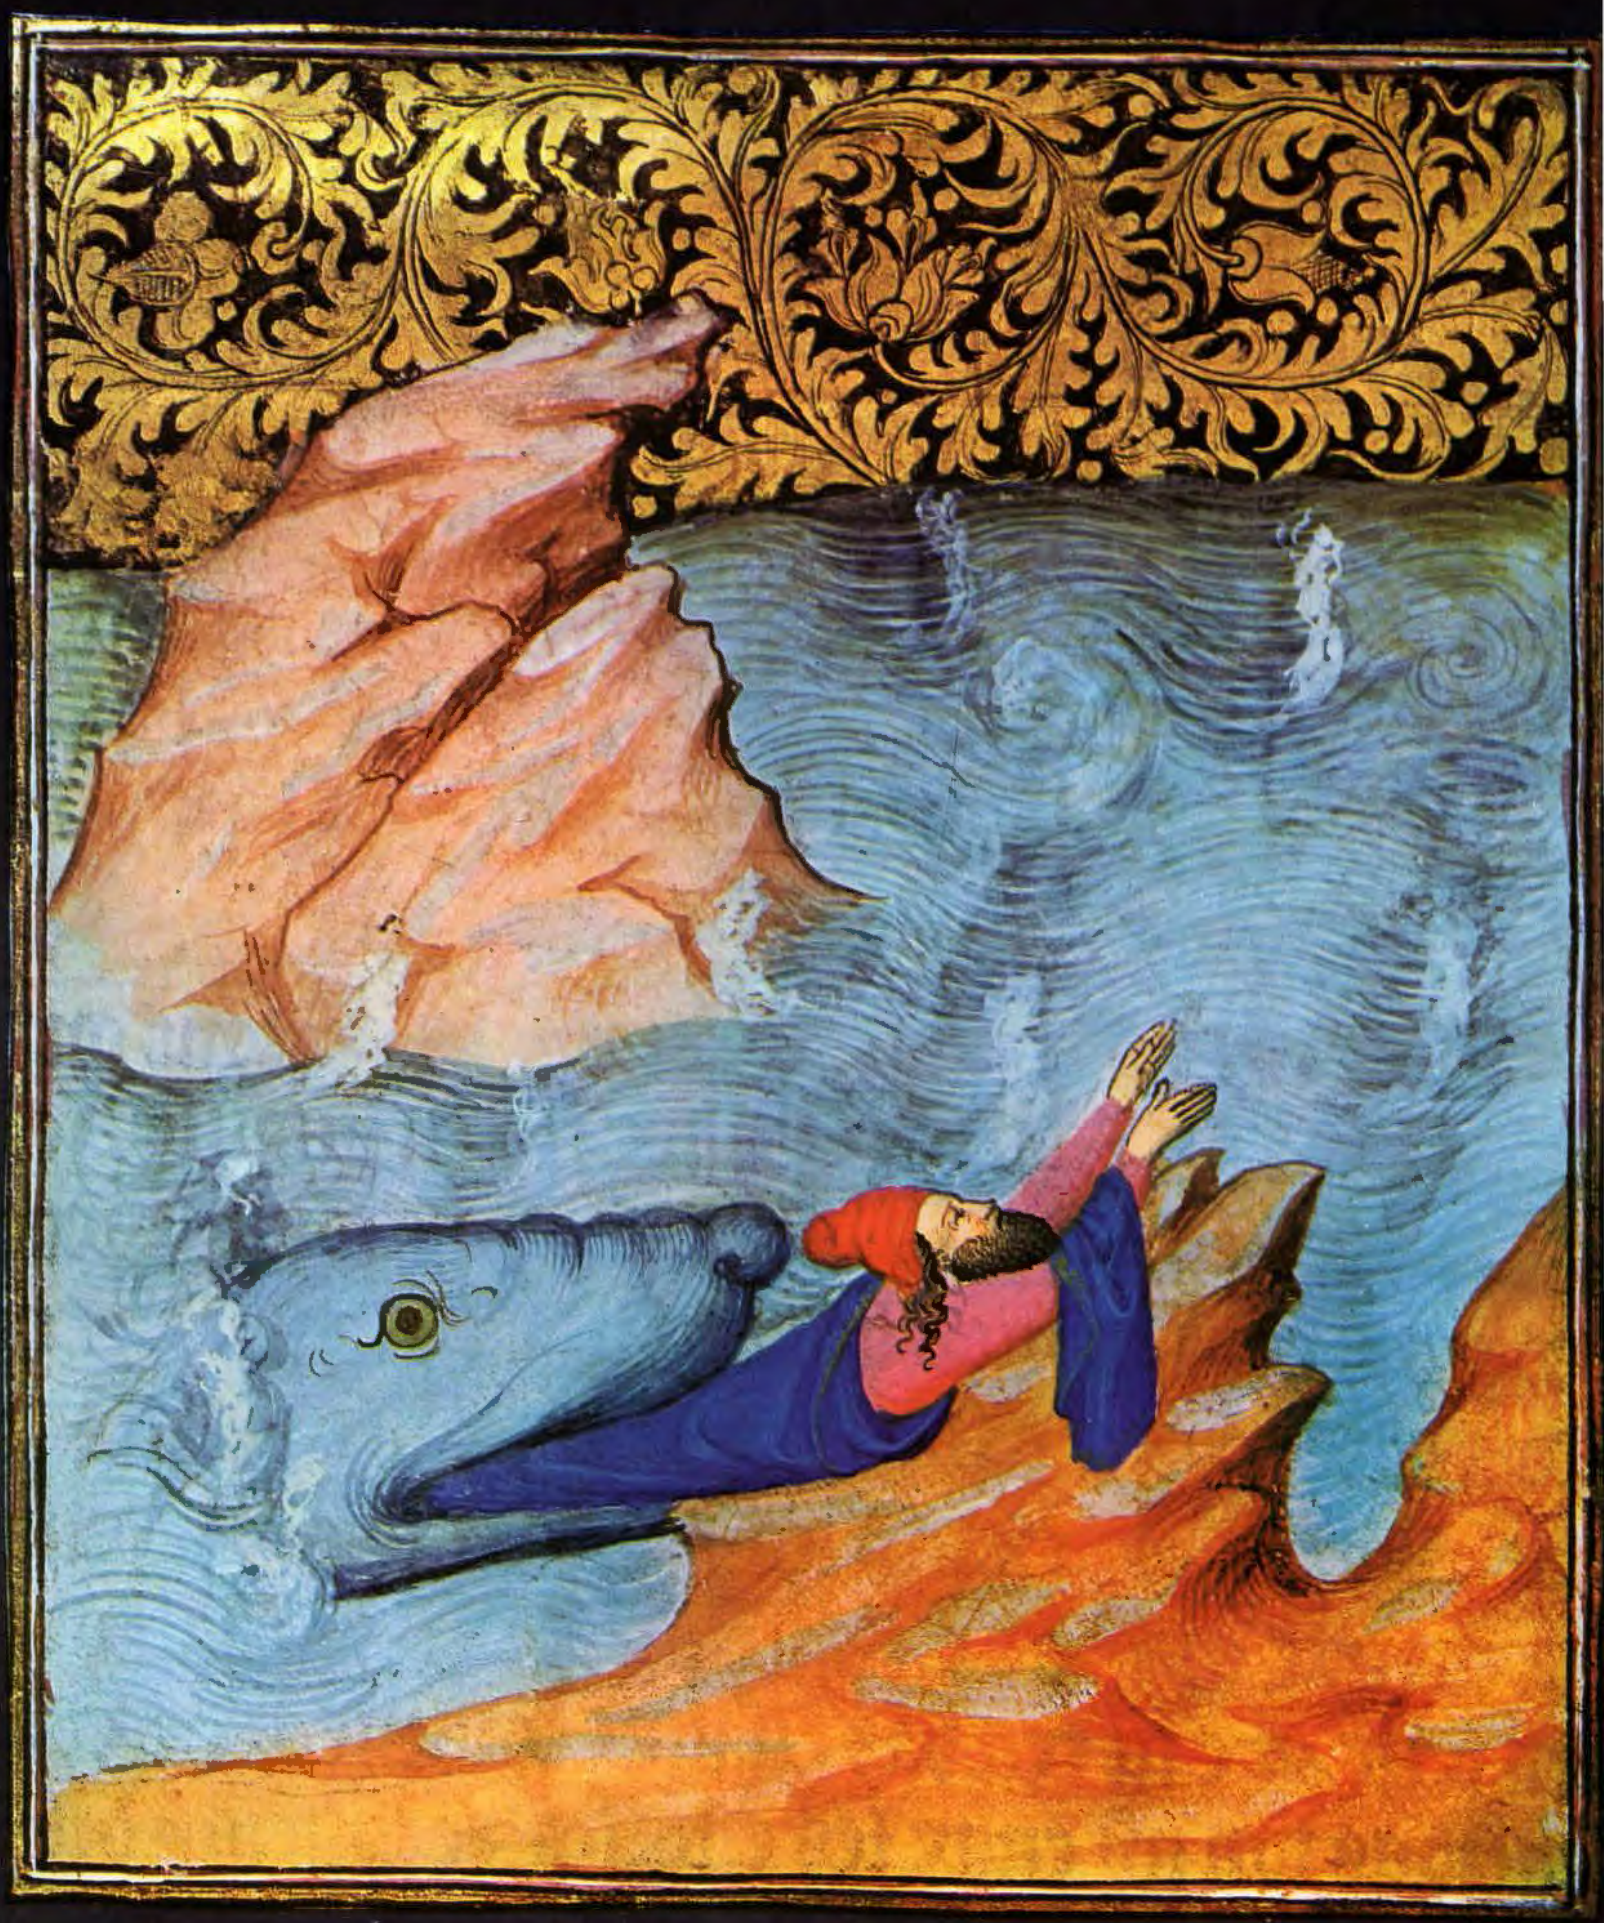
MANY MEANINGS are embodied in the fish, reflecting the various facets of its nature. Because of its affinity to the sea, from which all created life originated, it was widely held to be sacred. Like the Leviathan, the fabulous fish that bore the whole weight of the world upon its back, the cosmic fish is the symbol of the physical universe. The fish is also a symbol of sexual activity, because of its fecundity.

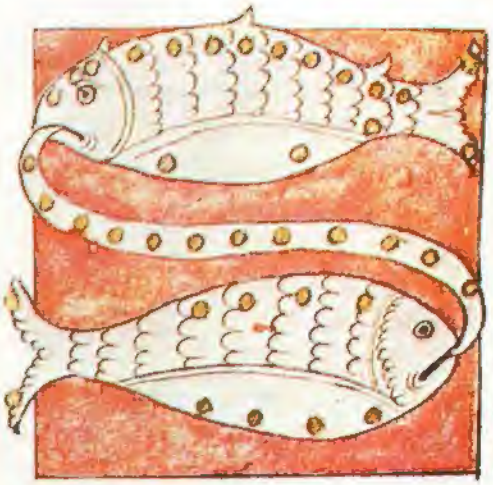
In the lore of the ancient Chaldeans, the swallow-headed fish was the expression of psychic regeneration, as was Pisces, the sign of the fish and the last sign of the zodiac. Pisces is closely bound up with the symbolism of water, while those born under the sign are said to have some of the characteristics of the fish.

In Asia certain cults practised fish worship and to their priesthoods the flesh of fish was taboo. Even at the most primitive level fish worship has persisted until modern times. The Indians of Peru not only revered those fish which came to their nets in the greatest profusion but held the doctrine that the first fish created in the world above bore the name 'Heaven' and was the mother of all the others. The zoologists of the ancient world tended to the belief that fish were the spontaneous creations of the water itself, and in a Sumerian legend the first fish to rise from the primordial waters became the teacher of the arts of civilization to men.

Top **Early Christian sign of the fish** ***Above*** **'The Miraculous Draught of Fishes' by the 15th century Swiss painter Konrad Witz: Christ's first followers were fishermen, later to become 'fishers of men'**

Innumerable are the legends of creatures half-human and half-fish haunting the rivers and coasts of the world (see MERMAIDS AND MERMEN). It is significant in this respect that the Sumerian god Ea, god of the waters, had a body like a fish, the tail of a fish and feet below like a man's.





Bodleian Library Colour Filmstrip

The kraken was about a mile and a half in circumference and so vast as to be frequently mistaken for an island

Above **Pisces, the sign of the fishes, is formed of two constellations joined by ribbons of stars; in Syrian legend it was connected with the sacred fish of the goddess Derceto or Atargatis**

Opposite page **The great fish which swallowed Jonah, thus preserving his life in the midst of the sea, spews out the prophet on dry land; illustration from an early 15th century French Bible**

The existence of a fish cult in the Near East is by no means conclusive, although it is strongly suggested by the fact that the Syrian form of the goddess Derceto was a fish and also that her son Tammuz was probably associated with a fish. Under the name of Atargatis this deity has been identified as a local form of the Semitic Ishtar-Astarte, goddess of fertility and water. There were sacred fish ponds at Endessa and Ascalon and at Hierapolis, where the fish grew to an immense size and would answer to their names. Atargatis is said to have descended into the sacred pond at Hierapolis and to have returned to heaven bearing a fish – the ancestor of the sign of the Zodiac, Pisces.

Dagon, god of the Philistines, has been considered a fish god. This idea probably arose from a confusion between *dag*, meaning fish, and *dagan*, meaning corn, for there is every reason to believe that he was a corn deity. In Assyrian monuments, however, a god named Dakan or Dagan is represented as a man with the tail of a fish. Nina, the divinity of Lagash, who was the patroness of fishermen and goddess of maternity, was in fact a corn spirit who received offerings of fish. Egypt, where the harvest was considered with perfect truth and logic to be the gift of the River Nile, provided a fusion of aquatic and agricultural symbolism in the Egyptian fish deity Rem, who wept fertilizing tears over the land.

In India the creative gods Brahma and Vishnu could take the forms of fishes. The first man, Manu, is told by a fish in the Indian version of the flood story to build a ship to save himself from the coming deluge.

Fish have been consumed as holy food, and at the heart of Jewish fish symbolism is the belief that at the end of the world Messias will catch the great fish Leviathan and divide its flesh among the faithful. It would appear that the Jewish custom of eating fish was later adapted by the Christians, who partook of a sacramental fish meal. The fish in Christian symbolism represents Jesus Christ, and in the old Roman catacombs the fish symbol appears frequently. The Greek word for fish is *ichthus* and the early Christians saw in the letters of this word a monogram summarizing their faith: Iesous CHristos, THeou Uios Soter (Jesus Christ, Son of God, Saviour).

The fish is introduced into the legendary lives of the saints. St Congall received a fish as the gift of an angel, while in the story of St Walter the fish giver is a bird. The great fish which swallowed Jonah is always associated with him pictorially.

Certain fish of a sacred character, possessing the power of foreknowledge and of healing, had considerable influence on the divinatory rites of Celtic peoples. At Ffynnon Beris in Carnavon the appearance of a trout was always considered a favourable omen, and as recently as the 18th century the movements of sacred fish or eel indicated the matrimonial prospects of young girls at Ffynnon Ddwynwen in Anglesey, where an old woman was always present to interpret the oracle.

Many fishing communities judge the weather from the movements of marine animals: thus cuttle-fish swimming at the top of the water are said to forecast a storm.

The Mighty Kraken

Some fish had the power to heal the sick from contact with their divinely 'charged' bodies. To this day, tench applied to the soles of the feet are used for the treatment of yellow jaundice in peasant Ireland; the tench also has the reputation for healing other fish, being known as the 'physician of fishes'.

Even more remarkable were nautical freaks, the monstrous squids, sea serpents, and the mighty kraken of the northern waters, described by Erik Pontoppidan in his *Natural History of Norway* (1752–53) as 'the largest and most surprising of all the animal creation'. The kraken was said to be about a mile and a half in circumference and so vast as to be frequently mistaken for an island, yet fishermen were often kindly disposed towards it, for its presence at the bottom of the sea was thought to drive shoals of fish into their nets. According to one legend, which would appear to link the kraken with the great cosmic fish of antiquity, only two of these fish existed and these were created at the beginning of the world and would die at the world's end.

The sea monk of Norway, described by Guillaume Rondelet in his *Books of Sea Fishes* in 1544, was a grotesque creature which derived its name from its monk-like cowl and tonsured head. The Chinese sea monk raised storms and attacked and capsized junks and was the terror of the Eastern seas. It could be kept at bay, however, by a ritual dance.

The inclusion of the fish in the totemic systems of many peoples from Alaska to Africa has led to corresponding taboos. A Polynesian would not eat eel or shark if it happened to be his own individual totem. The anthropologist Margaret Mead reported how certain brightly coloured fish were taboo until they had water poured over them; then they could be safely presented to the tribal chiefs. In Serbia fish is taboo to a pregnant woman; the Tasmanians rejected fish with scales, and the Bantu reject fish absolutely. On the banks of the Seine the John Dory is taboo and in Co. Sligo in Ireland it is the skate. The monk fish already referred to brought bad luck and if caught was always nailed to the masthead, for its presence upon a ship, like that of priests and clergymen, brought disaster.

Fish have provided the theme of many legends. Innumerable are the tales of fishes that return lost rings, perhaps the best known being that of the ring recovered from the body of a salmon, as recorded in the life of St Kentigern, patron saint of Glasgow. This miraculous fish found further immortality by being incorporated in the arms of this city. In the Chinese versions of the Cinderella story a girl receives help from a fish, and in the legend of the Cathedral of St Pol de Léon in Finistère a fish brought a bell to the Ile de Batz from England in the 6th century. There are other curious legends of human souls imprisoned within the bodies of fish and of fabulous rewards being offered to fishermen for their liberation.

Some of the most amazing beliefs form part of the contemporary lore of fishermen. Even the most prosaic of anglers can be victim of the superstition that a fish returned to the water will convey a warning of danger to its fellows. American anglers

British Museum

Mariners' tales peopled the depths of the sea with terrifying monsters such as the kraken, the sea serpent and the giant squid, which might even attack shipping

share this and other fishermen's superstitions: that an offering should be made, perhaps a coin put into the water; that fishing is best in a south or a west wind; that changing poles is unlucky, as is talking of how many fish you have caught.

Creature with Principles

Generally speaking, the fish has been thought of as on the side of the angels, although there is a solitary incident in the annals of English witchcraft in which a fish played the part of a familiar spirit, in Leicester in 1616. There seems to be a universal belief that fish are endowed with a kind of pre-knowledge, and also that they have an instinctive moral sense. Thus, blood shed by human beings in anger has been known to result in fish deserting a particular fishing ground.

Most fish superstitions contain vestiges of ancient modes of thought. One of the most interesting of these relates to the 'system of correspondences' (see CORRESPONDENCES) and takes shape in the belief that every land creature has its marine counterpart. Well-known examples were the sea horse and the sea cow, while the swordfish, which really exists, was the opposite number of the mythical unicorn. A suggestion of spontaneous generation is contained in the superstition that the eel springs to life from river mud or from a horse's hair in water, and of sun worship in the conviction that it cannot die until sundown.

A considerable body of mythological lore survives in the British Isles in connection with that once staple article of diet, the herring. According to an article in the journal *Folklore*, it was a Yorkshire fisherman's belief that the herring evolved from the sea anemone. Far more common was the belief in the Royal Herring, the monster leader of the shoal on sea journeyings, a creature so sacred that fishermen refused either to catch or harm it. Herrings, incidentally, if eaten raw were reported to bring visions of a future bride to Tyneside bachelors. Optimistic sea fishermen had the custom of wrapping inedible portions of herring in a piece of paper before discarding them, in the hope that the bones would knit together again and that the reconstituted herring would then summon its fellows from out of the sea.

Misinformation marches hand in hand with mythology in the lore of individual fishes: the shark is aware of forthcoming death at sea and follows the ship in anticipation of a meal; the skate loves music and can be caught by playing the fiddle. Crustacea and other forms of marine life possess their own individual mythologies. In Tahiti the sea-hermit crab is a god and if eaten without the proper rites can cause death; the shadows of the gods also take the form of crabs.

Harvest of the Sea

As with agriculture on land, the opening of the fishing season is accompanied by special rites, including blessing the boats and sometimes laying salt in the nets to placate the water spirits. In the Caroline archipelago in the Pacific there is ceremonial chanting followed by an obligatory silence; if this silence is not observed, the season will be a failure. Indeed success in fishing must never be mentioned as this constitutes a form of arrogance that is highly objectionable to spirits. Greediness among fishermen is always unlucky. One must never fish every day, as this might be construed as an expression of dissatisfaction with the bounty of the gods.

Inevitably the fish harvest is an occasion for thanksgiving ceremonies, a curious example being the mimetic dance of the Yuchi Indians of North America suggestive of the movements of a fish. More sophisticated are the various modern festivals like the 'harvest of the sea' services at Brixham in

The Almighty Fin

Fish (fly-replete, in depth of June,
Dawdling away their wat'ry noon)
Ponder deep wisdom, dark or clear,
Each secret fishy hope or fear.
Fish say, they have their Stream and Pond;
But is there anything Beyond?
This life cannot be All, they swear,
For how unpleasant, if it were!
One may not doubt that, somehow, Good
Shall come of Water and of Mud;
And, sure, the reverent eye must see
A Purpose in Liquidity.

We darkly know, by Faith we cry,
The future is not Wholly Dry.
Mud unto mud! – Death eddies near –
Not here the appointed End, not here!
But somewhere, beyoud Space and Time,
In wetter water, slimier slime!
And there (they trust) there swimmeth One
Who swam ere rivers were begun,
Immense, of fishy form and mind,
Squamous, omnipotent, and kind;
And under that Almigbty Fin,
The littlest fish may enter in.

Oh! never fly conceals a hook,
Fish say, in the Eternal Brook,
But more than mundane weeds are there,
And mud, celestially fair;
Fat caterpillars drift around,
And Paradisal grubs are found;
Unfading moths, immortal flies,
And the worm that never dies.
And in that Heaven of all their wish,
There shall be no more land, say fish.

Rupert Brooke *Heaven*

Devon, when the churches are decorated with fishing gear and offerings of the catch. The nets and sea are blessed each year in a number of places.

Aids to Love

Preaching to the fish takes place in certain American Indian tribes, based upon the assumption that fish are more likely to submit to a friendly than an unfriendly group. The preacher must utter his words 'in full voice' to be effective. In Scotland at one time fishermen would make pretence to hurl a fellow fisherman into the loch and then haul him out as if he were a fish, providing a clear hint to the fish of what was expected of them.

Certain fish are luck-bringers, a well-known example being the fiddle fish, which is never eaten but instead towed behind the fishing boat until it falls to pieces. Even the eating of fish has its appropriate ritual. Mackerel, herring and pilchard must always be eaten from tail to head, never the reverse way or the main school of fish in the sea will turn tail and desert the fishing waters for the open sea. American belief says that goldfish are lucky, and that whooping cough can be cured by swallowing a live fish. New Englanders predict weather from how the cod are running. And backwoods superstition insists that a woman will die if she eats fish after childbirth, and that fish and milk consumed at the same meal will poison the consumer.

Fish as prolific breeders could hardly escape becoming sex symbols and as such they were incorporated in the monuments of the ancients. Symbolically the fish represents the male principle in an active state, while the head alone symbolizes the female. (Freud also conceived the fish to be the symbol of the male organ.) Fish have therefore been thought to influence the sexual activities of both men and women. To eat certain fish in Greenland led to pregnancy in either sex, and in Java the husband of a childless woman who ate fish from 'the Children's Sea' was likely to have offspring. It is quite common to prescribe fish for women during pregnancy, and virgins in Brazil, India and Samoa are said to have actually been fertilized by presents of fish.

On this 19th century silver sword guard from Japan, Kwannon, the Buddhist goddess of mercy, is shown standing on the back of a black carp; in Japan the carp was a symbol of strength and virility

Michael Halford Sotheby's

Such aphrodisiacs as oysters and the sepia octopus were favourites in classical times. The book of Tobit, written in the 2nd century BC, describes how the burning of a fish drove away a demon that impeded love. In pagan times a trigle, a kind of fish, was frequently sacrificed to Hecate, goddess of witchcraft and sorcery. It is not surprising therefore to learn that in medieval love rites fish were often burned rather than eaten, since the acrid smell of burning fish could be calculated to drive away the demonic enemies of love.

The presence of phosphorus in fish is said to have been responsible for the choice of this form of food as an aphrodisiac, and it would appear that even lower forms of life could be overwhelmed by too immoderate a dosage. It is on record that a drake which inadvertently drank phosphorus was aroused to such a frenzy of lust for an army of ducks that it died from exhaustion. Even more surprising is the widely held belief that fish as a food is good for the brains, a superstition which possibly arose from the fact that the monks, the educated class of an earlier age, ate large quantities of fish. Or perhaps it arose from the half-understood fact that phosphorus is a prominent constituent of human nerve and brain cells. (See also DOLPHIN; KRAKEN; PISCES; SALMON; SEAL; TROUT; WHALE.)

Fisher King

In legends of the holy Grail, the lord of the Grail castle and keeper of the Grail and the bleeding lance: he was crippled and fishing was his only pastime; his infirmity was bound up with the desolation of his land and people, and he could only be cured by a question asked by the Grail hero; the story combines Christian elements with earlier pagan themes.

See GRAIL.

FIVE

NERVOUS and highly strung, many-sided, fickle, attracted by everything but held by nothing, an opportunist, a gambler, a sensualist: this is the type of person you are supposed to be if your name adds up to 5 (see ALPHABET). A 5 is a versatile and resourceful person, clever and amusing, good company, good at languages and with words, optimistic and fun-loving, someone who makes friends and money easily and quickly. Jumpy, tense and restless, he lives on his nerves and he lives for excitement, sensation, amusement. He loves adventure, change, travel, anything new and untried. He hates to be in a rut or to be tied down, he is impatient of rules and conventions, and he is likely to be erratic, untidy, unpunctual, irritable and quick-tempered.

People whose number is 5 are lively, wide awake, inquiring and outgoing. Alert to seize their opportunities, they tend to be good at many things but supremely good at none of them. They are highly attractive to the opposite sex, they probably have active love-lives and they may be debauched, promiscuous or perverse. Not particularly creative or original, they can be boastful, sarcastic and rebellious. They loathe routine, detail, waiting for anything. Loyalty, patience, endurance and steadfastness of purpose are not among their virtues.

The restless, many-sided, experimentalist qualities of 5 follow from the fact that it is the halfway house in the series of numbers from 1 to 9, so that it 'faces both ways'. This also gives the number its characteristics of being outgoing, unreliable and unable to concentrate.

Liveliness, nervousness and the love of sensual pleasure, of physical excitement and human contact, stem from the association of 5 with the five senses (sight, hearing, taste, touch, smell). This link, which was the principal clue to 5 in medieval numerology, makes it the number of the living flesh. The 12th century author Hugh of St Victor explained that 'because of the five senses, the number 5 naturally represents natural men who, though they are not shamefully dominated by carnal lusts, nevertheless pursue and love things that minister to the delight of their natural senses, since they do not know what spiritual delight means.' Christian numerologists also pointed out that since the flesh is imperfect it is fitting that the imperfect Old Law of Moses is contained in the Pentateuch, the first five books of the Bible. And it has been observed that in his body of flesh Jesus suffered five wounds (in the hands, feet and side).

Sex and Nature

Five is made of the first male number, 3, added to the first female number, 2 (for male and female numbers, see NUMEROLOGY), and so it is the number of marriage from the male point of view, an idea found in Hinduism as well as in the West. In 5 woman is added to man, in 6 she is multiplied by him, so that 6 is the female marriage number (see SIX).

Many of the characteristics attributed to 5 are based on this association with male sexuality – attracted by everything but held by nothing, impatient and impulsive, alert to seize opportunities, loving change and excitement, bold and aggressive. Some of them have a directly phallic reference – 5 is elastic and rebounds easily, hates to be tied down.

The association of 5 with the senses and with man was strengthened by the fact that the human body has 5 extremities and, shown with arms and legs extended, can be fitted into a pentagram, or five-pointed star (see PENTAGRAM).

Besides being made of 2 + 3, 5 is also made of 1 (God) plus 4 (the earth and matter), and so it is the number of living things, the animate world of Nature, divine life infused into the inanimate. This contributes to 5's character-picture the qualities of liveliness and of being good at animating things, getting things moving. In his essay on *The E at Delphi* Plutarch, the Greek philosopher and historian who lived at the turn of the 1st and 2nd centuries AD, notes that 5 is the number of marriage and goes on to say that it is also called Nature 'since by being multiplied into itself it ends in itself again', as wheat seed produces wheat ($5 \times 5 = 25 \times 5 = 125$, and so on). He quotes Aristotle's view that the universe is made of five elements, the four traditional ones plus a fifth which, he says, some call the heavens, others light, others the quintessence. The five elements in the universe correspond to the five senses in man as follows: touch to earth, taste to water, sound to air, smell to fire, sight to light or the quintessence.

As the number of man and of living Nature, 5 is the number of man as microcosm, as a miniature image of the universe. The four elements and the quintessence, the life-infusing element or the soul or spirit of things, can be taken to correspond not only to the five senses but to the head and four limbs of the human body or to the thumb and four fingers of the hand, and these in turn to the centre and the four directions in space (5 being the central number between 1 and 9). In the symbolic decoration of Gothic churches and cathedrals a five-petalled flower is sometimes shown at the centre of a cross, representing the quintessence and the four elements or the centre and the four directions.

In modern cabalistic systems 5 has an alternative and more ominous significance, for it is the number of the sefirah Geburah or Din, associated with violence, destruction and evil, and linked with Mars as the planet of destructive energy (see FORCES).

Michael Holford

The fact that in his physical body Christ on the cross suffered five wounds has reinforced the connection of the number five with the living flesh: painting by Velazquez in the Prado

'Spare the rod and spoil the child,' warned King Solomon, while an 11th century cardinal reckoned that 1000 self-inflicted lashes were the spiritual equivalent of ten penitential psalms. But flagellation is also a means of gratifying sexual and sodistic impulses

FLAGELLATION

HEALTH SEEKERS who have indulged in the popular sauna bath know that the process traditionally ends with a light scourging of the naked skin by means of birch twigs. Devotees of the sauna reject imputations of sexual deviation, claiming that this mild birching is intended to stimulate the circulation, not the libido. And certainly flagellation – ritualized whipping, mostly engaged in voluntarily – has long been considered a healthful and curative practice. The ancient Romans, who were also great bathers, saw whipping as a cure for several diseases: Seneca used it for fevers, others for rheumatism. (Whips were used on the latter disease by many primitive tribes, too, such as the Hopi of Arizona.) The Romans turned to the whip to cure barrenness in women; practically every culture from Greece to Victorian England, and later, used it to cure incontinence in boys.

But then whipping has long been thought to cure boys of almost everything that needed curing, and some 20th century boarding schools have not let the tradition die. Most ailments of character or psychological make-up have been 'treated' at one time or another by flogging: Dr Christian Paullini, the 17th century German author of *Flagellum Salutis*, is only one of a long line who recommend flagellation to cure schoolboys of idleness, women of shrewishness, thieves of criminal behaviour.

In such cases the whip is laid on partly in punishment but mostly to rectify personality

flaws. It sets out to cure by ritual purification, to drive out evil from the recipient's body and mind. We may no longer believe that illness is caused by evil spirits or demonic possession; but some of our therapeutic techniques derive directly from this attitude. In the history of flagellation, this purificatory aspect has far more importance than another main ritual use of the whip, in the ordeal or test of endurance.

Many primitive peoples use whipping as a means of testing fortitude, usually in puberty rites or other initiation ceremonies. Such pain rituals can be found in the initiations of the fierce warrior tribes of American Plains Indians; and the late Gerald Gardner, who revealed much of the pagan background of present-day witch covens, hinted that whipping once formed a part of initiation into that ancient sect. But the ordeal side of flagellation seems very unimportant in the face of the fantastic life span of the purificatory, or penitential, or 'therapeutic' uses of the whip.

Wherever a devout individual or community has perceived evil needing to be driven out, the whip has made its appearance. Many societies cleansed their community by the use of a scapegoat, on to which all the evil afflicting them was laid before it was killed – often by beating it to death. The Bible (apart from Solomon's adjuration in the Proverbs not to spare the rod) clearly pictures the Messiah in this way, in the book of Isaiah: 'he was bruised for our iniquities . . . with his stripes we are healed.' The tradition of exorcism – the driving out of evil spirits from houses or bodies – is full of tales of flagellation (see EXORCISM). And of course the ascetic and ecstatic religions found flagellation a firm ally.

Opposite left **Sado-masochism, more or less overt, clearly underlies flagellation in all its aspects: the element of perversion is explicit in this frontispiece by Aubrey Beardsley** ***Opposite right*** **An initiate to a witch coven receives a ritual scourging from the high priestess; the reason given for such rituals is that they lead to a higher plane of consciousness through pain willingly undergone** ***Below*** **In the late Middle Ages long lines of Flagellants travelled across Europe, beating each other and themselves in penance for their sins and those of society**

Penitential Lashes

The ancient Greek cult of the Spartans had an annual purifying Feast of Flagellation; and early Christian monasteries resounded with the crack of the lash, but far more frequently. An 11th century cardinal reckoned that 1000 self-inflicted lashes were the spiritual equivalent of ten penitential psalms. The early Franciscans turned also to the whip. The object was mortification of the flesh and repression of any unchristian fleshly urges.

Out of this spirit of purification and penance came also that weird phenomenon, the Brotherhood of the Flagellants – never a real religious order, never recognized by the Church, but immensely widespread in 14th century Europe. Perugia, in central Italy, saw the beginning of mass flagellation in public in the 13th century; in the next century the practice took on new strength and spread like the plague that coincided with it. But the Flagellants did not turn to the whip because of the Black Death; they were active, especially in Germany, before the plague had reached that far. Certainly, though, the plague gave them their justification for bloodthirsty penance, and brought thousands of converts after 1349, the year of the plague. The Flagellants massed in public, vast crowds of partly naked men and women, lashing themselves and each other twice daily for 33½ days, with devices ranging from little cords to leather thongs knotted and holding metal points, for the more extensive penitential spilling of blood.

The Flagellant cult went to the New World with the conquistadores, giving rise to the movement called Los Hermanos Penitentes – still thriving, still self-flagellating with whips of cholla cactus in parts of New Mexico and southern Colorado. Their whips fly most during Holy Week, but also during the initiation of new brothers, the only time a brother is lashed by anyone but himself. It is a feast of pain when few initiates retain consciousness throughout the ceremony.

The Flagellants and their fellows used the whip to punish the sins inherent in the flesh and to scourge evil from the spirit. But this ecstatic flagellation has a positive side, too: it becomes a means of achieving a higher plane of consciousness, a more exalted state of being, through pain. The ordeal, too, aims to produce an exalted state: the initiate is not only being tested for endurance and courage, but is being directly infused with some higher power to fit him for his new role in the community or the secret society. The aspiration to a higher plane is also offered as the reason for the orgiastic aspects, including flagellation, of the various cults of evil that have proliferated in past centuries and apparently still thrive today.

Mention of the sexual deviation known as sado-masochism stirs up powerful emotional reactions. Undoubtedly many of the people claiming today to be practising Devil worshippers or black magicians may well be using the traditions of evil as a smokescreen behind which they are performing the usual antics of the sex orgy, deviant or otherwise. They can be said to be involved with orgies for orgies' sake, disguised as satanism.

A Perverted Pleasure

But it may be that, whatever the intention of the flagellant, sado-masochistic sexual pleasure is the root cause of the practice, in all its forms. Sadism and masochism were well documented long before De Sade or Sacher-Masoch, and modern sexology has dwelt upon them extensively. Fascination with the subject has become so widespread that one finds it nearly everywhere, certainly in a great many books, plays and films. One can hardly be blamed, then, for finding this sexual deviation in every manifestation of ritualized flagellation: not just in the overt 'whipping sessions' in brothels, but in a subliminal form in the self-mortification of saintly ascetics, whether Indian fakirs or Christian fathers.

So one considers every proponent of birch and rod – schoolmaster, politician, clergyman, saint – guilty of the perversion of sado-masochism until he or she is proved innocent. Modern horror stories involving flagellation underline the need for such proof. Many will remember the case in 1968 when a young girl, a member of an 'ascetic' religious sect in Switzerland, died following a fearful series of 'purificatory' beatings. Brutality to others performed in the name of spiritual or mystic ecstasy remains brutality; perhaps only the self-flagellants deserve, if not respect, at least a sympathetic hearing.

DOUGLAS HILL

Weidenfeld & Nicolson/Bibliothèque Nationale

Flamel

French alchemist (1330–1417): Nicholas Flamel, a Parisian bookseller and scholar, was wealthy, pious and respected; in 1357 he acquired an alchemical work, *The Book of Abraham the Jew*, which he had seen previously in a dream; with its help he claimed to have produced a white elixir which transmuted lead into silver and, eventually, a red elixir which changed mercury into gold.

Flamen

Sacrificial priest of ancient Rome: there were 15, each serving a particular god; the flamen Dialis, flamen Martialis and flamen Quirinalis were the most important, serving Jupiter, Mars and Quirinus respectively; they were always patricians, the other 12 flamens being chosen from the plebs; the flamen Dialis was a high ranking state official and subject to a great many regulations and taboos designed to guard him from pollution.

The preservation of the chosen few and the destruction by flood of the rest of humanity – often as a punishment for sin – is a theme which occurs in legend in many parts of the world

FLOOD

THE TRADITIONS of many widely separated peoples include legends of a great flood which, at some time in the remote past, overwhelmed vast tracts of land and flourishing cities, and drowned all or nearly all the inhabitants, men and beasts alike. In the more ancient forms of the legend, it is often the whole world that is inundated. One man only, with his family and, usually, a number of animals, manages to escape because, being supernaturally warned of the coming disaster, he is able either to build or acquire a ship that carries him safely through the deluge. Eventually, after a period varying in different traditions from a few days to several months, the anger of the gods is appeased, the floods recede and the dry land reappears. Life is preserved in the midst of universal destruction, and in due course the world is filled again by the decendants of the hero and of the animals that sailed with him.

The most widely known, though not the oldest, of all these ancient tales is that contained in the book of Genesis (chapters 6–9). In it is related how, when ten generations had passed since the time of Adam, Yahweh saw that the world he had created had become corrupt and full of wickedness. He resolved to drown all mankind and everything else that had life in one vast flood, with the exception of Noah, who was a righteous man and worthy to become the ancestor of a new race of human beings in a regenerated world. He commanded Noah to build an ark of gopher wood, giving him directions as to its size and design, and bade him go into it when it was finished, taking with him all his family and male and female creatures of every species known on earth – clean beasts by sevens and unclean beasts by twos.

Noah did as he was told, and Yahweh loosed the deluge. Rain fell without stopping for 40 days and nights, the water rose until even the tops of the mountains were covered, and the ark floated upon it. Every living being perished, except those that were with Noah. After a long time the floods began to subside. The ark came to rest on Mount Ararat in Armenia, and Noah sent out a raven, and then a dove, to discover how far the waters had abated. The raven flew away over the drowned land but the dove, finding no resting place outside, returned to the ark. Again, after seven days, it was sent out and again it came back, but this time it had an olive leaf in its beak. Finally, after a third flight, it did not return and Noah, looking forth, saw that the land was dry. He came out from the ark and built an altar on the mountain, and offered a sacrifice in gratitude for his deliverance. Then Yahweh made a covenant with him, promising that his descendants should multiply and fill the earth, and that never again should the whole world be destroyed by water.

The Original Noah

The Mesopotamian flood legend, from which the Genesis story is clearly derived, is far older. Abraham's people must have known it when they lived in their Chaldean homeland, and probably they carried it with them when they migrated to the land of Canaan. There are several known versions. One was incorporated by a Babylonian named Berosus in a history of his own country written in Greek in the 3rd century BC. According to Berosus's account, the god Cronus appeared to Xisuthros, tenth king of Babylon, in a dream and warned him that there would be a great flood which would destroy the human race. Xisuthros would be saved if he would obey the god's commands which were that, first, he must write a history of the world from its beginnings and bury it in the city of Sippara, and then he must build a ship and fill it with living creatures, men and birds and four-footed beasts.

Xisuthros accordingly buried his history at Sippara and constructed a stout vessel, five furlongs in length and two furlongs broad, on to which he took his family and friends and an unspecified number of animals and birds. The flood came as had been foretold and only those on the ship survived it. When the water began to go down, the vessel was stranded on a hilltop. Like Noah, Xisuthros sent out birds, and when the last of these did not come back, he disembarked with his wife and his daughter and his helmsman to build an altar and offer sacrifice. The other human passengers remained on board, and when their leader did not return they became anxious and went in search of him. They could not find him but presently they heard his voice speaking to them from the air, though he himself was invisible. He told them that he and his three companions had all been taken from this world to dwell with the gods. He went on to say that the mountain on which his hearers stood was in Armenia, and that they must make their way thence to Babylon, and dig up the writings that had been buried at Sippara. This they did, and by them and their descendants many cities were built, ancient sanctuaries restored and all the land repeopled.

An earlier and more interesting variant of the same story forms part of the *Epic of Gilgamesh*, which concerns the doings of Gilgamesh, king of Erech. He was not personally involved in the deluge, which took place long before his time, but he heard about it from his immortal ancestor, Utnapishtim.

Long ago, he said, when he lived in the city of Shuruppak on the banks of the Euphrates, the gods sat in council and decided to send a flood whereby all men would be drowned. Ea, Lord of Waters and of Wisdom, was present at this council and contrived, by a subterfuge, to warn Utnapishtim of what was about to happen. Instead of speaking to him directly, as Yahweh did to Noah, he addressed the wall, saying, 'O reed hut, reed hut, O wall, wall, O reed hut hearken, O wall attend,' and so conveyed his message without actually revealing the secrets of his fellow gods to a lesser being. He bade him build a ship, well-planned and strong, in which he could save himself and his family. He was to tell no one of the threatened deluge, and if anyone asked him why he was building a ship, he was to reply that he had incurred the wrath of the great god, Enlil, and must therefore seek refuge with Ea upon the ocean.

Even the Gods Were Afraid

Utnapishtim made a barge of wood, caulked with pitch within and bitumen without, and set on it a house of six storeys, each storey having nine rooms. Into it he brought his kinsfolk and his handicraftsmen, his cattle and other beasts of the field, and all that he had of living seed and of gold and silver. When the appointed time came, he went in and shut the door. Then the winds blew and the rain fell in torrents, the waters rose and whirlwinds rushed over them, and there was no light anywhere. For six days and nights the tempest raged, and so terrible was it that even the gods were afraid. They drew back, they cowered by the wall, they climbed up into the heaven of Anu for safety; and all but Enlil repented that they had unleashed such destruction.

On the seventh day the storm ceased, the turbulent waters became calm, silence succeeded uproar; but when Utnapishtim looked out he saw nothing but desolation and death. As the flood slowly receded, the

Michael Holford

hilltops reappeared and the ship grounded on Mount Nisir. Utnapishtim opened a window and loosed a dove, and after an interval, a swallow. Both returned because they could find no dry land, but when a raven was released, it found food to eat and ground on which to alight and it did not return. Then Utnapishtim knew that the water was going down and he came out of the ship, with all his companions, and offered a sacrifice on the mountaintop.

The gods smelt the sweet savour of the offering and gathered round it with delight. Only Enlil was angry when he saw that some human beings had survived, for he still desired the end of mankind. Ea was suspected of having betrayed the secret counsels of the gods, which indeed he had, though in such a way that he was able to deny the charge. He reproached Enlil because it was he who had wished for the deluge. Let it be enough, he said, to diminish the tribes of men by sending a lion, or a leopard, or a famine, or a plague, but let them not all perish together in a flood. Then Enlil relented, and taking Utnapishtim and his wife by the hand, he blessed them and promised that henceforth they should be like gods and live for ever.

The oldest known version of this story is that inscribed upon a tablet unearthed during excavations at Nippur, an ancient city of southern Sumer. It was written, apparently about 2100 BC, in the language of the Sumerians, the ancient people who flourished in Mesopotamia before they were conquered by the invading Semites. The hero in this legend was named Ziusudra. He was a king and also a priest of Enki, the god who, in the Sumerian pantheon, corresponded to the Semitic Ea. When Enlil called upon the assembled gods to destroy the world by a rainstorm, Enki warned his faithful servant. Like Ea, he did so by indirect means, bidding his priest to stand outside a wall and listen to a message addressed to that wall. Ziusudra built a ship, though because the tablet is broken at that point in the narrative, exactly how he built it and who sailed with him is not known. Then the winds and the rain raged together for seven days and nights, and the flood waters covered the earth. When they had at last abated, Ziusudra offered sacrifice and prostrated himself before Anu and before Enlil. In this version, Enlil's wrath was more quickly appeased than in the Gilgamesh story, and he bestowed upon Ziusudra both immortality and the title of Preserver of the Seed of Mankind.

The deluge is also mentioned in the

Sumerian king lists wherein are enumerated their rulers from the country's first beginnings. After some early kings have been listed it is stated: 'Then came the Flood. And after the Flood, kingship again descended from heaven.' Archeologists of the 20th century have proved that the historians of those far-off days were right in supposing that their land had once been devastated by a catastrophic flood. In 1929, during his excavations at Ur, Sir Leonard Woolley found clear evidence of a widespread inundation, greater in extent and magnitude than anything subsequently known in the region, which had occurred about 3000 BC. It had been vast enough to cover practically the whole of Lower Mesopotamia and drown most of its inhabitants. For the few who survived, it must have been the end of the world they knew, even if it was not that of the entire earth, as the legend gives it.

Flood traditions are very widespread, though they do not exist everywhere. They are found in India, Burma and elsewhere in southern Asia, in Australia and New Zealand, New Guinea and the scattered islands of the Pacific, in North and South America, Mexico and in some European regions. Most of these stories resemble each other in general pattern, as records of a worldwide inundation sent by the gods, from which only one divinely favoured hero and his companions escaped, but they vary, naturally, in their details. India has several versions, of which the earliest known is preserved in an ancient treatise, the *Satapatha Brahmana*. In this it is related that the hero, Manu, was first warned and then helped by a fish. He alone survived the flood. When it was all over, the world was empty, but because he desired children, he practised austerities and offered in sacrifice butter, sour milk, and curds and whey. Out of these substances a woman was miraculously created and from the union sprang a new race of human beings – the race of Manu.

Deucalion and Pyrrha

Similarly, in the early form of a Greek flood legend, as told by Pindar in the 5th century BC, every living creature was destroyed, with the exception of Deucalion and his wife Pyrrha. These two weathered the storm for nine days and nights in an ark which Deucalion had constructed, and which finally came to rest on Mount Parnassus. When the floods had ceased they came down from the mountain and, at the bidding of Zeus, they too created mankind anew, by throwing stones over their own heads. As they struck the ground, the stones thrown by Deucalion became men and those thrown by Pyrrha became women. In this tale it is not recorded how the animals were preserved or re-created, but in a later version, which more closely resembles the Babylonian story and may have been influenced by it, Deucalion is said to have taken into the ark with him two of every kind of land animal, both the harmless and the dangerous, and these, by the power of the gods, lived together in harmony.

There was also a Greek tradition that Deucalion's flood was not the only great inundation in the history of the world. There had been two others, one before it in the time of Ogyges, king of Thebes, and one after it, when Dardanus was driven from his homeland by a sudden and terrible, but apparently not a worldwide, flood. He escaped upon a raft, or according to another version upon an inflated skin, and drifting to Mount Ida, he landed there and in due course became the founder of the city of Troy.

Most North American Indian tribes have some myth or folktale about a deluge, often with extremely odd causes, such as the tears of a deserted superhuman husband, or water from the punctured belly of some vast monster. Mankind is often saved by a warning from a culture hero; for instance, Dog warns a man to build a raft, in Creek mythology. Many Indians, especially western tribes, held to the belief that everything was once underwater, until the hero, usually called Earth Diver, brought up some soil from beneath the water and so caused the origin of the earth.

In his *Folk-Lore in the Old Testament*, Sir J. G. Frazer has pointed out that the mythologies of Africa and of northern and central Asia contain no stories of a universal deluge, and this appears to be true of western Europe also. With the coming of Christianity, the biblical flood legend was, of course, accepted as divinely revealed truth, and continued to be so accepted for many centuries afterwards, but it does not seem to have superseded any pre-Christian west European myth of the same type. There are, however, several well-known traditions of partial and local floods caused, not by rain storms, but by land subsidence and violent encroachments of the sea.

Tales of Cities in the Sea

One of these stories is the Welsh legend of the Lowland Hundred. This was a tract of land lying westward of the present west coast of Wales, submerged now under the waters of Cardigan Bay. According to the most familiar variant of the tradition, it was a fertile and prosperous territory, 40 miles long and 20 miles broad, which stretched from Bardsey Island to the River Teifi. It was low-lying and was defended from the sea's encroachments by a system of embankments and sluices. It contained 16 noble cities, of which the chief was called Caer Gwyddno. The site of this vanished town was commonly supposed to be marked by a collection of large underwater boulders at the far end of Sarn Cynfelin, a rocky ridge running some seven or eight miles out to sea. This ridge, and two others like it, are natural formations, but in popular belief they were until fairly recently held to be either man-made causeways or parts of the defensive embankments.

The legend relates that in the early years of the 6th century AD, Gwyddno Garanhir was Lord of the Lowland Hundred, and Seithennin, son of the king of Syved, was keeper of its embankments. One night, when a great feast was held, the latter became exceedingly drunk and either through simple carelessness or as a drunken prank he left the sluices open.

In consequence the sea broke through the defences and in a very short time overwhelmed the whole territory. Only a few people managed to escape, including Gwyddno Garanhir, his son Elphin and Seithennin himself.

Another still more dramatic Welsh story – or perhaps a localized variant of the same story – is told of the lost land of Tyno Helig. This was a little kingdom, or chief's territory, which once extended northwards from the Carnarvonshire coast and is now sunk in Conway Bay. Over it, at some rather uncertain period between the 5th and the 7th centuries AD, Helig ap Glannawg is said to have reigned, and to have lived in a palace which bore the name of Llys Helig. Tradition said that this palace was situated some two miles out to sea from the present coastline, and that occasionally, when the tide

was unusually low, some ruined parts of it could be seen under the water. However, in 1939 F. J. North destroyed this interesting tradition by proving that the 'ruins' were in fact an accumulation of Iron Age boulders.

The catastrophe which destroyed Tyno Helig was popularly supposed to have been caused by the sins of the ruling family, and to have been prophesied by a disembodied voice four generations before it occurred. In one version of the tale, it was the crimes of Helig himself, or of his ancestors, that called down retribution upon the land, though he and his sons saved themselves by swift flight and thereafter led godly lives. In another, it was his daughter and her lover who were responsible. The daughter loved a man of low degree, but she would not marry him because he did not possess that sign of rank, a gold torque. To obtain one, he murdered a nobleman. As he was burying the corpse, he heard a voice crying, 'Vengeance will come!' He fled from that place, but when he told the girl what had happened, she sent him back to find out how soon the vengeance would come. The voice replied, 'In the time of the children, and of the grandchildren, and of the great-grandchildren, and of the great-great-grandchildren.' On hearing this, Helig's daughter said there was nothing to fear, for she and her lover would be dead by then.

They were married and lived to see their own great-great-grandchildren. One day, a great feast was held at Llys Helig, at which their kin of all four generations were present. A maidservant was sent to fetch more wine from the cellar, and found it half-full of water, with fish swimming about in it. She ran back to the hall and told the bard who, according to one variant, was the only person sufficiently sober to appreciate the danger. He, recognizing that the long-prophesied doom had come at last, fled at once, taking the maid with him. These two were the only survivors, for immediately after their flight the sea rushed in and all the land of Tyno Helig was drowned.

Lost Lyonnesse

Farther south, in Cornwall, we find the tradition of lost Lyonnesse. This legend is perhaps better known than any other British tradition of the same type because, in the course of time, it became involved with the Arthurian romances and the story of Tristan. Lyonnesse, which in Cornish was called Lethowstow, lay between Land's End and the Scilly Isles. Like Lowland Hundred, it was fertile and prosperous, with many flourishing villages and no less than 140 churches. There was also at least one great city, the site of which was said to be marked by the rocks now called the Seven Stones, lying some seven miles westward of Land's End. This place is still sometimes named 'the Town' and William Camden, in the 16th century, remarked that fishermen had been known to drag up windows and other traces of buildings there with hooks.

This land sank like the others, though here there is no tradition of sin or drunkenness to account for the disaster. The sea must have been encroaching alarmingly for some time before the final calamity, for the legend states that one man, the ancestor of the Trevilion family, took fright at its daily inroads, and sent his wife and family into Cornwall for safety. No one else apparently realized the danger, and Trevilion himself escaped only at the last moment, riding on a swift horse towards the higher ground of the Cornish mainland and reaching it only just in time. Every other dweller in Lyonnesse was drowned.

Legends Based On Fact

In western Brittany there is a more elaborate form of this legend which concerns the destruction of the city of Ker-Is. This city once flourished amid fertile lands that are now under the sea. Its site is usually given as in the Bay of Douarnenez, but in some versions of the tale it is said to be submerged off other parts of the Breton coast. It was protected from the sea by a strong dyke and by sluice gates, but it perished in the end because of the wickedness of its inhabitants who, though they were Christians, had fallen into evil ways.

Like Lyonnesse and Lowland Hundred, Ker-Is was believed to have vanished at some time in the early 6th century. It is of course obvious that so late a date is impossible. There is no evidence whatever, geological or historical, for the occurrence of floods of such magnitude as recently as the 5th or 6th century AD. The detailed accounts of noble cities, Christian churches, intricate sea defences and sinful human beings with known names and pedigrees are clearly later embellishments of what was probably once a far simpler story. Yet these ancient tales cannot be dismissed entirely as mere products of fantasy and imagination. It is a fact that the coasts of Wales, England and Brittany formerly extended farther than they do now, and that subsidences were still taking place when the lands thus lost were inhabited by our forefathers of the Bronze and Early Iron Ages. Traces of human habitation in regions now well below high water mark have been discovered by archeologists, such as, for example, the field walls on the submerged sandflats between some of the Scilly Isles, and artefacts in Mount's Bay and round the coast of Gower. If the men who made and used these things were forced by the encroaching waters to abandon their homes, they would have their own exciting tales of disaster to tell, and these, handed down for centuries and gradually becoming more elaborate, would become part of the traditional lore of the regions to which the first tellers migrated.

It is true that the legends take no account of the slowness of geological change, or the fact that the submergence of the lost territories was gradual and intermittent. In all the stories the inundations are swift and sudden. This may be partly due to the telescoping effects of time and repetition and a sense of drama, but here too it is possible that there is an element of fact. Unusually high tides and strong gales together can cause sudden local floods, limited in scope but violent enough, especially in low-lying areas, to do great damage and destroy life and property in a very short time, perhaps even in a single day. If this happened in the past, as it must have done more than once, it is easy to see how the legend could grow, a few drowned hamlets becoming in retrospect populous cities and their surrounding fields an entire kingdom.

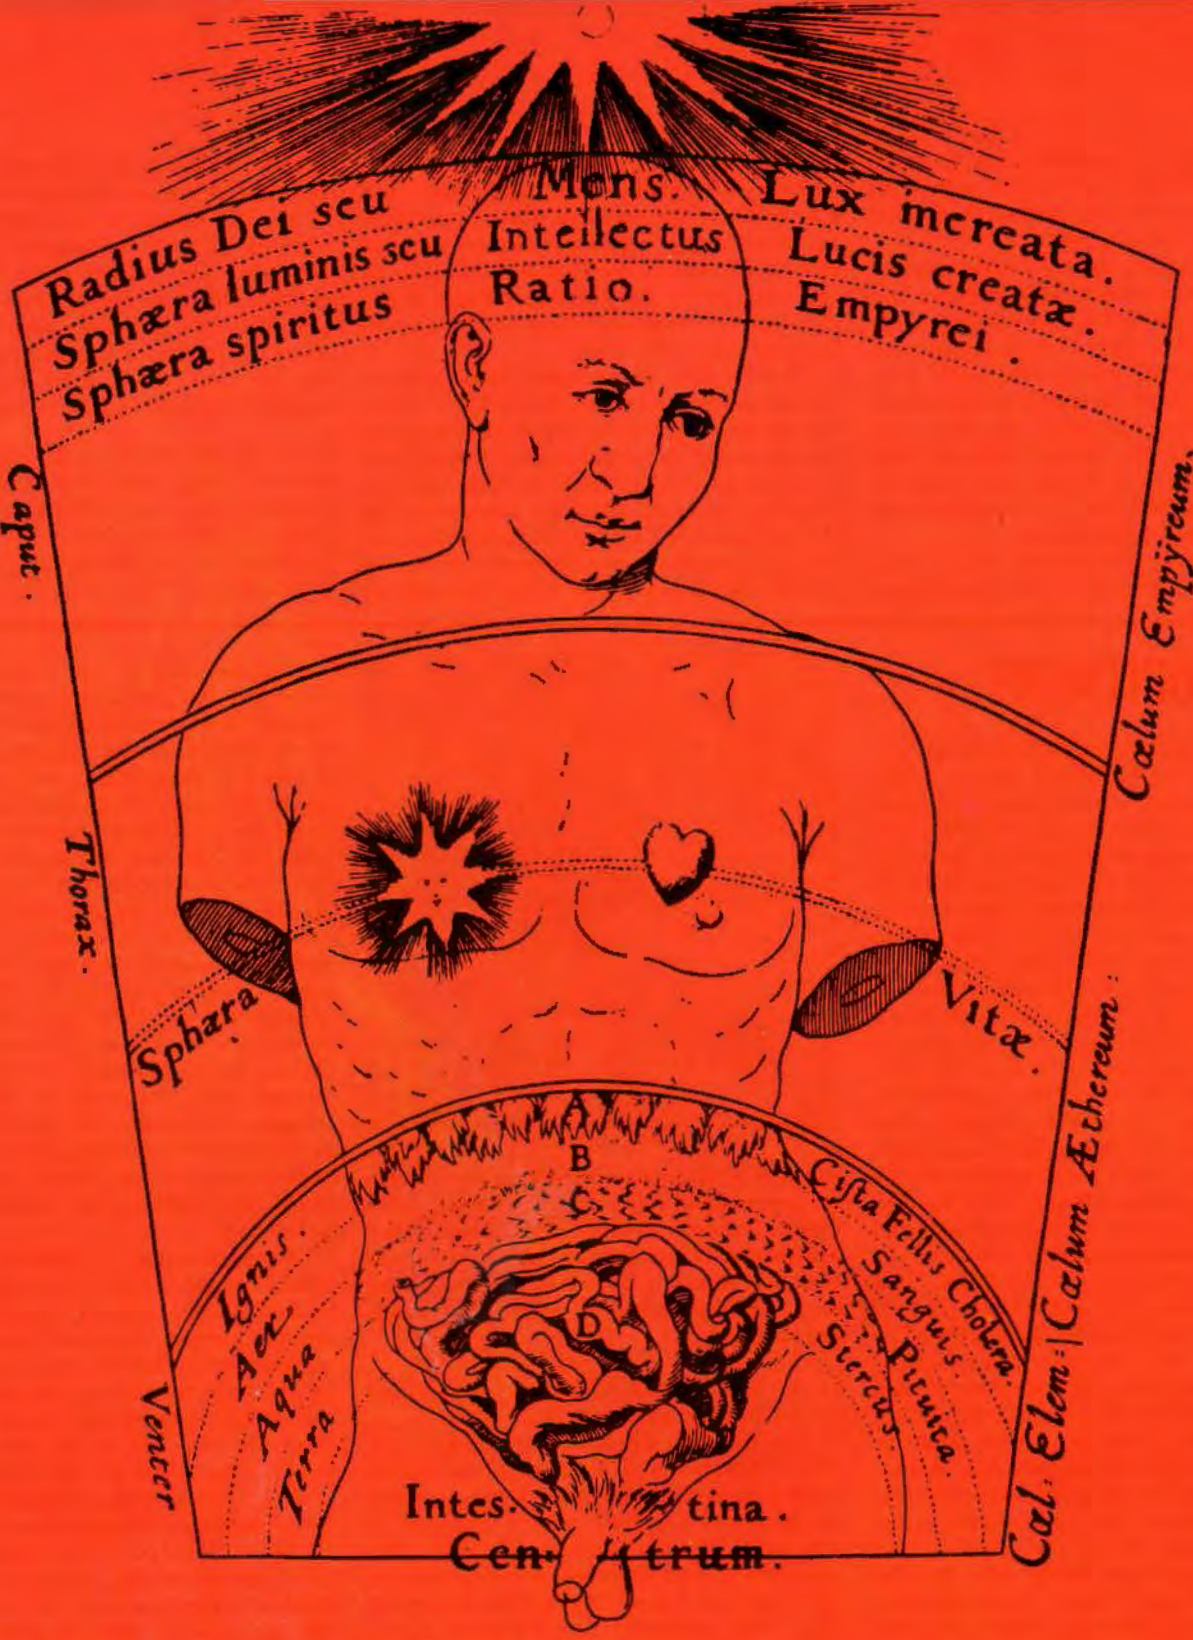
Gerald Cubitt



Robert Fludd's key to universal anatomy; the physical and spiritual attributes of archetypal man, the microcosm, are shown to have their exact counterparts, on a larger scale, in the universe, the macrocosm

ROBERT FLUDD

AN ENGLISH PHYSICIAN and mystical philosopher, Robert Fludd was the son of Sir Thomas Fludd, paymaster to Queen Elizabeth's army in France and the Low Countries. Robert Fludd at first intended to become a soldier but abandoned this idea in favour of a life of study. Literature, philosophy, theology, medicine and especially physics, all attracted him and he was particularly fond of contemplating the marvels of Nature. To widen his knowledge he travelled on the Continent for six years, making a careful examination of everything of a rare or curious nature and seeking the company of famous scholars, with some of whom he formed lifelong friendships. It was at this time that he became acquainted with the writings of Paracelsus.

He returned home in 1605 and entered Christ Church, Oxford, where he obtained his medical degree, becoming a Fellow of the College of Physicians in 1609. He set up in practice in London where he died at the age of 63.

Fludd is one of the leading English representatives of the school of medical mystics whose principal claim was the possession of the key to universal science. During his lifetime he was famous, though success brought him many detractors who accused him of making his patients the victims of occult practices. Despite this he was very popular with the public, and respected by learned men like John Selden (1584–1654), the brilliant jurist and antiquary. Abroad his ideas were opposed by some scholars, including the French philosopher and mathematician Pierre Gassendi.

Unlike Paracelsus he made no permanent addition to the list of known drugs, nor did his researches lead to discoveries in physiology, chemistry or surgery. His works are encyclopedic in character; in them he deals with all the sciences, arts and manufactures of his times; he writes of astrology,

alchemy, the art of warfare, how to make musical instruments and even offers an explanation as to the best method of crossing rivers without getting wet.

Fludd's works are indeed an odd mixture of rather curious science, book-learning and occultism. He does not deduce his ideas from facts, but acquires them through meditation or sheer erudition; yet he frequently tries to demonstrate them by means of a scientific experiment. For example, to show the identity between the divine substance and the light of the sun – an idea which he developed from the Cabala – he makes use of a kind of inverted thermometer.

He apparently discovered the Cabala while writing his *History of the Macrocosm*, in which he states that man is a miniature version (or microcosm), physically and spiritually of the universe (the macrocosm); he straightway began to demonstrate his system all over again, basing it this time on the teaching of the Rabbis, instead of the classical philosophers which until then had been his chief authorities.

Fludd's chief importance lies perhaps in his knowledge and exposition of the Cabala, though like many of his predecessors in the task he failed to extract a clear system from it. At least in his work we can find the principal ideas of cabalistic speculation on the unknowable God, on sexual cosmogony, on the correspondences between the various worlds. His other claim to be remembered is to be found in his spirited defence of the Rosicrucians in several of his treatises.

Fludd's influence is hidden rather than obvious. It is to be detected in Milton, for instance, and other poets of the 17th century. In more recent times occult writers like Madame Blavatsky owe some of their ideas to Fludd's works and others of his time, for all that these later exponents have covered them with a kind of Indian veneer.

FLYING OINTMENT

AN ANCIENT and very widespread belief held that witches could fly through the air, riding upon broomsticks, staves, forks, or upon the backs of demons in animal form, and sometimes, though more rarely, without any visible support. Usually they made ready for their journey by smearing their bodies, or the objects upon which they rode, with a magical ointment given to them by the Devil, or prepared according to his instructions.

It is known how some of these flying ointments are made because a number of English and Continental writers in the 16th and 17th centuries described the methods; all the recipes contained extracts from strongly poisonous plants. The ingredients most commonly listed were aconite, deadly nightshade, hemlock, and the boiled fat and marrow of babies who had been stolen from their homes before they were baptized, or dug up from their graves. Reginald Scot in his *Discoverie of Witchcraft* (1584), recorded that the 'bowels and members' of such children were seethed in a cauldron, and the thickest part of the resultant grease was used as a basis for the ointment. Other ingredients mentioned in various prescriptions were cinquefoil, sweet flag, poplar leaves, the blood of bats or lapwings, parsley, soot and, if human fat was omitted, some sort of oil. Francis Bacon who, like Reginald Scot before him, was inclined to ascribe the supposed witch flights to imagination or drug-induced delusions, noted in *Sylva Sylvarum* (1608) that 'the ointment that witches use is reported to be made of the fat of children digged out of their graves; of the juices of smallage (wild celery), wolfbane, and cinquefoil, mingled with the meal of fine wheat; but I suppose that the soporiferous medicines are likest to do it.'

Although the use of flying ointments was widely credited, there was curiously little evidence for it in the recorded confessions of the witches themselves. Claire Goessen, a Belgian witch, confessed in 1603 that she had flown to the sabbath on more than one occasion, riding upon a staff smeared with an unguent. In 1460, in northern France, five accused women admitted that the Devil gave them a salve which they rubbed on their hands and on a small wooden rod, and then placing the rod between their legs, they flew

Michael Holford

Above **A witch is smeared with flying ointment in preparation for flight: detail from David Teniers' *Scène de Sorcière*. One explanation of the witches' ability to fly was that the ointment contained a hallucinatory drug *Right* Painting of witches by Austin Osman Spare**

away, 'above good towns and woods and waters' to their meeting-place.

The Swedish witches of 1669, who rode 'over Churches and high walls' to Blocula upon a beast provided by the Devil, said that he gave them 'a horn with a Salve in it, wherewith we do anoint ourselves'. The members of two Somerset covens confessed in 1664 that, before they went to their meetings, they smeared their wrists and foreheads with a greenish oil, 'which smells raw', and which their Spirit gave them, 'and then they are carried in a very short time, using these words as they pass, *Thout, tout a tout, tout, throughout and about*.' The impression given in these, and other similar confessions, is that the occult properties of the ointment were essential to the power of flight, but evidently this was not always the case. Some witches spoke of flying without any preliminary anointment, simply by straddling a staff, or a straw, or a hollow stalk, and uttering an incantation. In *Disquisitionum Magicarum* (1599) Martin Delrio remarked that the Devil was able to carry witches to the sabbath without the help of any unguents, and that he often did so; but for several reasons, he preferred that his servants should first anoint themselves.

Learned opinion was never quite unanimous on the question of whether witches actually flew or merely imagined that they did. Most writers on the subject accepted that demonic transportation, with or without the use of flying ointments was possible, and did in fact occur. There were however others who held that the witches' confessions of flight were due to hallucinations or vivid dreams. As far back as the 9th century, the document known as the Canon Episcopi condemned as demon-induced error the claims made by certain women that they had flown through the air with Diana, riding in large companies upon beasts over immense tracts of country in the dead of the night. Such women were deceived by sinful fantasies inspired by Satan, who 'deludes the minds of his subjects in sleep, so that the victim believes that these things, which only her spirit experiences, she really experiences in the body.'

A tale recounted by Nider in *Formicarius* (1517) suggests that flying dreams could be caused by the magical ointment itself. A certain woman anointed herself with an unguent while she was sitting in a kneading-trough. She fell asleep and dreamt that she was flying, rocking the trough so violently that she fell out of it and injured her head. John Cotta in *The Triall of Witchcraft* (1616) quoted an Italian story related by the natural philosopher Giambattista della Porta (1540–1615) concerning a woman who, having rubbed herself with ointment, went into a trance, from which she could not be roused, even when shaken and beaten. When she finally woke of her own accord, she declared she had been flying over seas and mountains, and could not be convinced that she had been asleep in her own room all the time.

In an appendix to Dr Margaret Murray's *Witch-Cult in Western Europe*, Professor A. J. Clark pointed out that the strong poisons contained in flying ointments would have definite physiological effects, especially if rubbed into skins broken by scratches or the bites of vermin. Aconite produces irregular action of the heart; hemlock and belladonna (deadly nightshade) produce excitement and delirium. An unguent containing a combination of these drugs could cause delusions which, in some cases, might account for the witches' confessions of magical flight.

Philip Daly

In 1973, ex-U.S. President Jimmy Carter said he had sighted a UFO. Carter, a trained naval commander with experience of navigation by the stars, is just one of thousands of people who report that they have seen UFOs. In the following articles, an astronomer and a sociologist discuss the phenomenon.

FLYING SAUCERS

THE TERM 'FLYING SAUCER' was coined on 24 June 1947. An American businessman making a routine flight in a private aircraft reported 'a chain of saucer-like things at least five miles long . . . flat like a pie-pan and reflecting the sun like a mirror'. His story was widely publicized, and the suggestion was made that the objects were nothing more nor less than spaceships from another world. More accounts followed, some of them as fascinating as they were unexpected. George Adamski, a café-owner in California, wrote a book describing his encounter with spacemen from Venus; Cedric Allingham, in England, reported meeting a Martian while bird-watching on the Scottish coast, and so on. Flying saucer societies sprang up like mushrooms, though before long some of them tried to drop the original term and substitute the more dignified 'UFO' – Unidentified Flying Object.

Saucer reports are of two main kinds: descriptions of meetings with spacemen, and more sober accounts of objects seen in the sky. So far as the visitors from space are concerned, it must be said that the evidence is – to put it mildly – rather slender, in as much as it rests entirely upon the statements made by isolated individuals; if extraterrestrial beings really wanted to contact us, it might be thought more logical for them to bring a saucer down in, say, Piccadilly Circus or Times Square rather than reveal themselves to café-owners and lone ornithologists such as Adamski and Allingham. Reports of unidentified objects or UFOs are sometimes quite plausible, but again there is no concrete evidence that the objects are artificial. A very thorough investigation carried out by a University of Colorado group, supported by a panel of scientists from the National Academy of Sciences, issued a lengthy report in 1969 to the effect that virtually all UFO sightings are due to natural phenomena – balloons, meteors, reflections of light and so on – and that little could be gained by investigating them further.

It is always dangerous to be too dogmatic, and one certainly cannot deny the possibility that the earth might be visited by extraterrestrial beings: after all, life is probably widespread in the universe. On the other hand, it seems as certain as anything can be that there is no intelligent life in our solar system, except on the Earth, so that the saucers would have to come from tremendous distances amounting to millions of millions of miles. For our present purpose it is permissible to assume that flying saucers are not, in fact, visiting spacecraft. With this qualification, let us examine the reasons for the spread of the UFO cult.

It is, of course, entirely harmless, and this must be stressed at the outset. Many of the flying saucer believers are not only completely sincere, but utterly dedicated – and they include some famous names. Air Chief Marshal Lord Dowding, Chief of Fighter Command during the all-important days of the Battle of Britain, often stated his belief in saucers as visiting spaceships; so also Professor Hermann Oberth, whose classic book *Rakete zu den Planetenräumen* (The Rocket into Interplanetary Space), published in 1923, was the first true mathematical treatise upon what is now the science of astronautics. Neither Lord Dowding nor Professor Oberth claimed to have seen a saucer at close range, and still less to have talked with an extraterrestrial being; they examined the evidence, and put their personal interpretations on it, which is of course entirely permissible.

The Divine Astronaut

Generally speaking, there is a close link between flying saucer theories and what may be loosely termed mysticism. Many devotees of the UFO societies are of an exceptionally religious turn of mind, and many of them are biblical fundamentalists, while Spiritualists and astrologers are also well represented. It has been claimed, for instance, that many of the miracles reported in the Bible are nothing more or less than rather garbled versions of interplanetary visitations, and in 1969 the London *Sunday Mirror* even ran a series of articles under the

Some people report that they have not only seen flying saucers, but that they have also met the spacemen who fly them *Far left* Artist's impression of the flying saucer which Joe Simonton of Wisconsin claimed he had seen *Left* He was nicknamed 'Pancake Joe' after he related how he was handed a pancake by the flying saucer men who landed in his backyard *Above* Under hypnosis Mr and Mrs Barney Hill of America gave a detailed description of the flying saucer and the saucer men they had both seen

title 'Was God an Astronaut?' This was based on the findings of E. von Daniken, of Switzerland, who claimed that spacemen from another world came to Earth not only in biblical times, but even before. According to von Daniken, Egyptian mummies are simply time-travellers who have been 'frozen' by means of techniques passed on to the pyramid-builders by the extraterrestrial beings.

Also, there is a link with the cult of Atlantis, the mythical land which is said to have developed an amazingly high degree of civilization before being drowned beneath the ocean waves (see ATLANTIS). Desmond Leslie, co-author with George Adamski of *Flying Saucers Have Landed*, equates the 'vimanas' or flying machines which the Atlanteans are supposed to have possessed with UFOs, building up a picture which sounds outwardly convincing. There is yet another link with the idea that mankind has evolved from beings who used to inhabit another planet, and destroyed it by means of nuclear warfare. This is claimed by various UFO groups – notably the Aetherius Society, whose beliefs are described in the following article.

One reason for this sort of belief is the feeling that we of the present day are in danger of destroying ourselves in very similar fashion. Unfortunately, the danger is very real indeed; weapons capable of wiping out civilization actually exist, and could be unleashed. Subconsciously, the flying saucer believers are trying to give out a warning and their advice is eminently sound even though few scientifically-minded people can credit that anything of the sort has happened in earth history.

Most UFO followers claim – and with excellent reason – that our science has far outstripped our civilization, and that we have developed weapons which we are too undeveloped to control, just as a small boy playing with matches in a roomful of fireworks is likely to damage himself and others. It is reassuring to think that there may be friendly advanced beings watching over us, ready to come to the rescue if need be. This is different from a more conventional religious belief in an all-powerful God of goodness, but the underlying theme is of the same type, and it provides a feeling of security in our desperately uncertain world. On the other hand, there is the idea put forward in a book called *The Living Universe*, written in 1963 by J. Hebwynd and V. A. Rytov, who maintain that hypothetical races living on Venus are likely to leave us in splendid isolation until they are satisfied that we are no longer a potential danger!

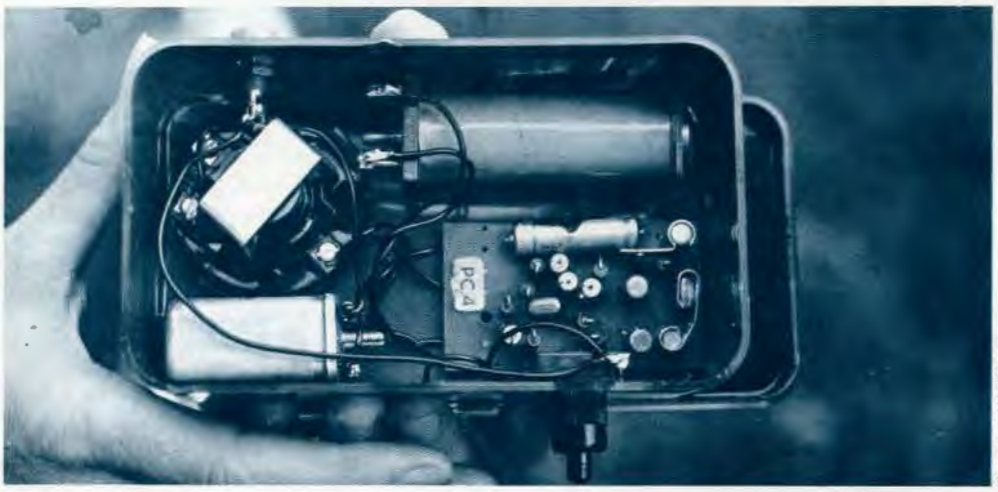
Veil of Secrecy

Astrology is also involved. Indeed, it may be said that astrology, the Atlantis cult, pyramidology and flying saucer beliefs tend to go together and this is understandable enough. Signs in the sky are reported in this connection – as, for instance, at Warminster in Wiltshire, where a local height, Cradle Hill, has been said to be the scene of many saucer phenomena during recent years. Here a team of watchers has been led by Sir Arthur Shuttlewood, a journalist by profession, whose sincerity is certainly not to be doubted. He, like many others, holds that the spacemen are visiting us with the aim of helping us over our present difficulties – and again we come back to the desperate wish to find that we are not to be left at the mercy of our own follies.

Escapism may also play a fairly major role. Much of what is read in the newspapers, described on television and broadcast on radio is very 'down to earth', and we have to admit that a great deal of world news is unsettling and unpleasant. To range out beyond everyday matters, into the realm of the intriguing and the unknown, provides a mental relaxation as well as a feeling of hope – and this leads on in turn to wishful thinking. A bright light crosses the sky, and is widely observed. It could be a weather balloon, a meteorological phenomenon or even a secret aircraft; but how much more alluring to regard it as a spaceship from another world.

One excellent case of this sort of thing occurred in April 1969, when a brilliant object flashed across Britain. It was seen from Selsey on the south coast across the Southwest, Wales and the Irish Sea, and was immediately claimed as a flying saucer. Actually it turned out to be a meteorite, as was proved when fragments of it were found in Northern Ireland. Had these pieces not come to light, as would have been the case if the object had fallen into the sea, doubts would have remained and another UFO would have been listed in the saucer societies'

Roy Flooks



Paraphysical Laboratory

records. It is only too easy to believe what one would like to believe.

In any cult which is beyond the run of everyday experience, there is a suppressed belief that officialdom is deliberately withholding essential knowledge. This is certainly true of flying saucers, as is brought out in the writings of various authors such as Major Donald Keyhoe, of the United States. Keyhoe maintains that world governments know quite well that we are being visited by aliens, but that the information is being kept back for political reasons. Again the 'veil of secrecy' idea brings an aura of mystery and even glamour to the whole question, and the cult is strengthened as a result. If people in general believe that something is being hidden from them, they will do their best to find out the facts. Occasional writers who suggest that the saucer men are hostile, and their visitations are being kept secret because of the danger of world panic, are not taken very seriously – and this, too, is significant.

Martian in Braces

There remain the hoaxers and the practical jokers, of whom there have been many. Flying saucer reports lend themselves to this sort of activity, but unfortunately it is never easy to tell which accounts are deliberately faked and which are not. There was, for instance, the luckless writer who described his adventures on board a saucer piloted by a beautiful lady from another world – and who was promptly sued for divorce by his wife. Cedric Allingham, who wrote an interesting book entitled *Flying Saucer from Mars* (1955), has been accused of insincerity, and certainly his alleged photograph of the Martian whom he claimed to have met on a lonely stretch of coast in north Scotland does not look very convincing; for one thing, his trousers seem to be held up by a rather obvious pair of braces. But again it is impossible to be sure one way or the other, and Allingham's book has much less of a mystical trend than most others of its kind.

It may well be that the saucer cult has achieved its wide popularity largely because of our changing ideas about the universe as a whole. Originally, Earth was regarded as the supreme body, lying at rest in the centre of all things, while the celestial bodies were provided for the special benefit of mankind. Even when Earth was shown to be a normal planet moving round the sun, men still thought that they must be particularly important. Nowadays our view is very different. The sun itself is a typical star, and is only one of 100,000 million suns in our star system or galaxy, while the number of similar galaxies is unbelievably great. It is

Above **Examples of unidentified flying objects photographed over America. According to the findings of a recent investigation into 'flying saucers', carried out by a team of researchers at the University of Colorado, virtually all sightings of this kind may be attributed to natural phenomena, such as balloons, meteors and reflections of light** ***Left*** **Machine used by UFO researchers to track down 'saucers'**

the height of conceit to suppose that in all this host, our sun is the only star to be attended by a life-bearing planet. And in this case, why should not other beings have reached a level of technological development great enough for them to overcome the immense distances, and make contact with us? Even though astronomers say – justifiably – that there is no proof that this has happened, we cannot rule out the possibility. And there can be few people on Earth who would not welcome the opportunity to meet men from other worlds.

Yet on the whole it is likely that the main factor is the realization that our civilization hangs by a thread; the wisdom of more advanced races might save us, and there is a strong wish to believe that helpers are not far away. Once the idea has been put forward, it is bound to develop; the misty evidence of the 'ancient teachings' is brought forward in support, and the whole edifice of UFO belief rises from such foundations.

It is not easy to decide upon the future of the cult. Flying saucer stories had their heyday in the 1950s, before the beginning of the Space Age with the launching of Russia's first artificial satellite in 1957; then, it was easy to claim that scientists might after all be wrong, and that evidence of past or enduring civilization would be found on the moon and at least some of the planets. With the advance of space research, the situation has become much clearer. No thinking man can now maintain that there is advanced life upon the moon: Venus has been shown to be hopelessly hot, and Mars is hostile by any standards. Therefore, if the saucers are still taken to be spaceships, they must be assumed to come from planets moving round other stars – and the plausibility of the whole idea is greatly weakened. But the subconscious wish to believe in friendly beings watching over us is too strong to be dismissed so easily, and there are a great many people who would like it to be true.

PATRICK MOORE

The Aetherius Society

At first sight the teachings of the Aetherius Society appear to be an elaborate form of science fiction. They deal with life on other planets, flying saucers and transportation in space, communication between planets and the guidance of less advanced planets like Earth, which are in danger of destroying themselves by their own folly. For the members of the cult, however, the difference is clear. Their teachings are not the inventions of a novelist's imagination but the authoritative messages of spiritually advanced mystics who actually live on Venus, Mars or Neptune. Through their founder, George King, the members of the Aetherius Society are the privileged recipients of regular messages from space. He is the appointed Terrestrial Channel Number 1 and is able to go into a trance and transmit, in English, the voices of Aetherius or the Master Jesus from Venus and of the contact called Mars Sector 6, who is based on an artificial satellite belonging to Mars.

The cult apparently originated in London on a Saturday morning in May 1954, when George King heard a voice saying 'Prepare yourself. You are to become the voice of the Interplanetary Parliament'. Uncertain what this meant, King, who had some previous experience of spiritual healing, was visited by a powerful *guru*, or mystic, who instructed him in the skills that he would need to perform his appointed mission. He was also instructed to reduce his personal possessions to nothing. It will be noted that this account of the beginnings of the cult has common features with the origins of other religious and quasi-religious movements which stem from some striking happening to an individual.

The early transmissions from outer space took place before gradually growing audiences, usually in the Caxton Hall in London. The Interplanetary Parliament was identified as a body anxious to help the world. Flying saucer sightings were explained both as part of a survey of the Earth and by the fact that some craft had been sent into the Earth's atmosphere to absorb the harmful effects resulting from atomic radiation.

The varieties of different 'sightings' that had been reported were given greater credence by a careful description of the forms and functions of the different spacecraft that were used. In a pamphlet prepared on the flying saucers George King argues that they are sent to Earth on the direct orders of the Interplanetary Parliament. The main purpose is to make a metaphysical survey of the Earth.

The saucers mainly come from Mars and Venus. Among them are the 'mother ships' which are cigar-shaped and may vary between two-thirds of a mile and 1000 miles in length. The type called 'Star of Bethlehem' is used only by the Great Cosmic Masters. Another type, Satellite Number 3, is a large craft which enters the Earth's orbit to radiate spiritual energy during the periods of 'spiritual push'. It is during these periods that the members of the Aetherius Society are exhorted to special efforts since their spiritual and religious practices are then, apparently, enhanced 3000 times. This satellite is not visible and cannot be detected by radar. All spacecraft are apparently powered by magnetic force, and an attempt is made in the literature published by the Aetherius Society to authenticate the scientific processes involved. Explanations are also given for the apparent ability of the craft to become invisible at will to observers on Earth.

The Venusian Master Jesus

On 23 July 1958 the three year long 'Operation Starlight' began and the movement received its first transmission from the Master Jesus, discovered to be a Venusian. This event took place on Holdstone Down in Devon and included the transmission of Twelve New Blessings, which rapidly became a central document for worship services by the members. The development of worship gave a definite focus for group meetings and emphasized the social aspects of the movement. Most significantly, the discovery of the Master Jesus helped to reconcile the Society's ideas about space with the Christian teaching which the members had received before they joined the movement. Further emphasis is given to this by the remarkable description of the meeting which took place between George King's mother, Mary King, and the Master Jesus in a spacecraft on the night of 19 January 1959.

This event, which is described in great detail in the publication *Cosmic Voice*, involved the collection of Mary King from a pre-arranged rendezvous and her travel in a flying saucer to link up with a larger vehicle. The Master Jesus then took the copy of The Twelve Blessings which she had brought with her and blessed it. The blessing ceremony included reference to George King as 'The one Whom Thou didst choose to be a Leader Among Men of Earth in this their New Age'. This additional authentication for George King's mission was further developed in the conversation which Mary King had with the captain of the spacecraft. He explained that in a former incarnation both she and the then secretary of the movement, Grace Abercrombie, had known Jesus and that in her case this explained her intense love for him. It is this part of the description which led some of the followers of the Aetherius Society to assert that she was Mary, the mother of Jesus, in an earlier incarnation and that consequently George King was Jesus returned to Earth. This suggestion has been strongly denied by George King in more recent publications.

Charging the Mountains

Three years were spent by George King and his close associates in climbing a total of 18 mountains in the United Kingdom, the United States, Australia, New Zealand and Switzerland. The purpose of these trips was to 'charge' the mountains with spiritual energy by establishing a link, through George King, with the power of the Space People. Another mountain in Africa had been charged by one of the space intelligences, Saint Goo Ling, to make a total of 19 mountains in all.

These mountains have become places of pilgrimage for the movement; the pilgrimage is a means of tapping the spiritual power of the holy mountain. In a transmission by the Master Aetherius on 27 July 1962 further force was given to these pilgrimages by the information that the Space People themselves have linked all the charged mountains by underground connections, which can be used to balance and improve their metaphysical power.

More recently, the Aetherius Society appears to have concentrated on consolidating its teachings and its organization. By 1962 the headquarters had been established in Los Angeles, although the London headquarters has also been maintained. George King adopted the title Reverend at about this time and subsequently a Doctorate of Divinity has been added to his title. His two lieutenants in the United States, formerly Belgian air hostesses, and the Society's secretary in Britain have also been designated as 'Reverend' in recent literature. The Society has arranged a wide range of lectures, spiritual healing meetings, publicity and instruction to the followers in

Aetherius Society

Members of the Aetherius Society believe that through their leader, George King, they are in communication with advanced beings from outer space who regularly visit the Earth's orbit in gigantic spaceships. The purpose of their visits is to keep watch over man, who is in danger of destroying himself through his own folly

the tasks needed to prepare the world for the New Age, which will come about through the activities of the Space People.

The hopes of the movement were given further support by the announcement of the Cosmic Initiation of the Earth by the power of the Sun during the summer of 1964, as the result of a complex process achieved by a gigantic spacecraft. It is this power, now stored in the Earth, which will bring about the New Age at the appropriate moment.

There can be little doubt that the cult developed in part as a response to the general uncertainty about outer space, the reported sightings of flying saucers and the increasing interest in the space research programmes of the major powers. Neither the teachings of the Churches nor the wisdom of science could give authoritative answers to the new range of questions which people were asking about space. For those unprepared to accept the reservations of cautious scientists, there may well be attractive qualities in a cult which claims to have positive answers to resolve their doubts. The Society offers this certain knowledge and, indeed, a direct means of contact with space people themselves. The Society's solution satisfies those who have come to the movement from leanings towards mysticism, those who have approached it with an interest simply in flying saucers, which are now given a positive role in the salvation of mankind, and those who are seeking a new interpretation of Christianity. The belief-system of the Aetherius Society has been successfully developed into a consistent and logically related pattern which provides a satisfying reinterpretation of existence for its members, who at the same time gain the status of the potential elect in the New Age of which they are the earthly handmaidens.

J. A. JACKSON

Rustic dramas portraying the life-cycle, still performed as far apart as Britain and the Balkans, include characters which can be traced back to the fertility gods of the Middle East

FOLKPLAYS

TWO SEASONAL PEAKS, the summer and winter festivals, stand out prominently in the British calendar of folk customs. The summer customs stretch from Easter to harvest time, while winter covers customs from Michaelmas to Ash Wednesday.

Central to the summer group are the May Games and the Tree of Life, a term used to include both Maypole and Cross. The main feature of the winter group is the life-cycle, a dramatic portrayal of the death and resurrection of Nature as experienced at the turn of the year in Europe. This folkplay survives as fragments of a festival which must reach right back into Neolithic times. In the British Isles, it is known under a variety of names, the most common being the Christmas Mummers; these are play actors, local village folk, who disguise themselves by wearing masks or by blacking their faces with soot. They are known as guisers or guizards in the North of England, Geesers or Geese dancers in Cornwall. In some localities, the players appear at Easter and are called Pace-Eggers, or at Hallowe'en or All Souls Eve, when they are known as Soul Cakers. In the Isle of Man the actors are the White Boys and in Scotland the Galatians. Many of the plays revolve round St George and his hand-to-hand combat with such adversaries as the Turkish Knight, the Black Prince of Paradise and Bold Slasher.

Another set of folkplays portrays the life-cycle from another angle and with a different set of characters. Since these plays are acted on Plough Monday and include a courting or marriage scene, they are called Plough Plays or Wooing Plays. They have also been found as an integral part of the elaborate sword dances in the North of England. Irrespective of type all these plays depict the life-cycle and symbolize the continuing vitality and fertility of Nature.

Although Christmas mumming as a widespread village custom has largely died out in Britain, it survives overseas in the West Indies, Newfoundland and in those parts of North America where the English traditions have been carried on by settlers. Often the mumming is little beyond the disguising of faces and dressing up in garments of the opposite sex, wearing masks, or blackening the face with soot and visiting neighbours' homes to dance and sing. If a masquerader should by mischance be recognized, this is everywhere regarded as bad luck.

Central to the plot is the death by combat, or ritual murder, of a hero at the hands of antagonists. This sacrificial death is lamented and is followed by a cure or resurrection, and the mystery of life is celebrated in song and dance. The following outline of a Christmas mummers' play performed and recorded at Symondsbury in West Dorset recently, is more elaborate than most versions and contains features not often found associated in any single version.

There are four separate scenes: the exploits of St George, Tommy the Pony (a three-legged hobby-horse), a rough wooing and the 'singing of the travels'. The actors, all men, are disguised, St George and the 'Champions' wearing tall hats with paper streamers or ribbons hanging over the faces, except for Jan, the husbandman, dressed in a smock and Bet, his wife, in long-skirted dress and bonnet. Jan carries a club made out of a young crab-apple tree. Jan enters further disguised as Father Christmas to act as 'Presenter' and to prepare the way. He then introduces the next character whom he calls 'Room'; this is an accretion for normally the Presenter himself will say 'make room'. Introducing himself, Room goes on to tell of how St George in his travels met and married the King of Egypt's daughter. He then calls in the King of Egypt, who in turn summons St George. The latter boasts of his deeds and during his vaunting, one of his friends, St Patrick, enters. He offers to help St George to fight his battles and kills the first of the antagonists, Captain Bluster, who then retires back-stage to kneel on one knee leaning on his sword. The next antagonist reels in somewhat drunk, is slain by St George and joins Captain Bluster. The third adversary enters, is slain by St George and joins the other two victims while St George, wiping his blade,

calls on Colonel Spring. St George at once repeats his success, but Colonel Spring, after kneeling 'dead' beside the other three, suddenly rises to fight again before he is finally killed. The two victorious champions St George and St Patrick then express deep sorrow, lamenting for the dead men's wives and children. After discussing the merits of various doctors they call on a doctor who appears dressed in silk hat and morning coat. He talks of his travels and his skill, bargaining for a large fee before he gives his services. St George hands him a bag of money. Boasting and showing off he produces his bottle of medicine, elecampane, which cures 'all sorts' and after giving a drop to each of the four kneeling victims in turn, restores and dismisses them.

Fortune Telling Horse

In the second scene Bet enters leading in Tommy the Pony; the mummer, completely covered with a cloth, leans forward on a pole which protrudes from the cloth and is surmounted by a wooden horse's head. Bet mounts the back of Tommy and is riding him cleverly when Jan enters; she challenges him to ride Tommy. Jan accepts but is at once thrown by the hobby-horse. In a fury, Jan picks up his club and fells Tommy to the ground. Bet laments the death of her pony and persuades Jan to help her to revive it. They 'lay on hands', first blowing on them to warm them and swinging their arms to make the blood flow. They try to lift Tommy up but he falls down again. Defeated they call on the Champions who march in and set the horse back on his three legs. Bet now announces that her pony tells fortunes and asks Tommy to smell out certain evil-doers; the hobby horse picks out several innocent victims, to the delight of the spectators.

The third scene opens with Jan and Bet quarrelling. Jan knocks down Bet who lies as if dead. After much rude fooling, she is revived by the Doctor, and in the next scene Jan and Bet and the Pony form a family group. The other mummers march round the group once clockwise and once anticlockwise singing a version of the folk song *The Serving Man and the Husbandman*. At the end of each round the singers stand facing centre while Jan in reply speaks his verse rejecting the life of luxury and ease enjoyed by the serving man. At once the ring of mummers repeat their round dance, singing the verses for Jan to speak his unqualified rejection, each time seconded warmly by Bet. The Doctor makes a final speech inviting the mistress of the house to tie a piece of ribbon upon the Christmas holly bough, when on behalf of the mummers he wishes her and everyone present a happy Christmas.

The fundamental features of this type of play are the 'making of room' which may include a sweeper or whiffler to clear the space for the mystery drama; the 'calling on' or introduction by the Presenter of the combatants and other actors in turn; the dispute leading to death; the lament; the call for the Doctor; the cure and the quete or collection of the reward, important because by contributing to the collection the spectators become participators and so able to share in any benefits from the magic luck.

The other type of folkplay, the Plough Plays, belong, broadly speaking, to the Christmas season; they were performed usually in January, on the first Monday after Epiphany. The performers call themselves Plough Jacks, Plough Stots, Boggons or even Morris Dancers. Their leader is not St George but a 'Fool' accompanied by a man in woman's clothes called Bessy or Betty. There is some sort of conflict with a death and revival but there is also a wooing in which the Fool vies with his eldest son for the hand of the 'Fair Lady'. There is confusion and overlapping of incidents in the two types of play. St George may appear in the Plough Play and challenge and kill the Fool who is then revived by the Doctor. The Fool then courts and marries the 'Lady'. The Fool's wooing may be found without either the combat or the cure. Some of the dialogue has obviously been borrowed from printed sources which would suggest some contact between strolling professional actors and local folk mummers.

There are many European variants of the Masquerade, some leaning toward the popular carnival festivals, some preserving an intensely individual tradition as in the Basque festivals of the *Mascarades* and the *Pastourelles*. One primitive surviving custom

The Christmas mummers' play is a dramatic portrayal of the death and resurrection of Nature as experienced at the turn of each year: the sacrificial victim is restored to life in this scene from the Bampton Mummers

Brian Shuel

is the *'Poklade'* the pre-Lenten 'Play' of the Adriatic coast of Yugoslavia performed on the two days before Ash Wednesday. In this custom there are three chief actors, a Fool, a Priest and a Baba or Witch. They are served by a retinue of a score of dancers in two contingents, ten men dressed as girls and ten girls dressed as men who dance alone and together. The three characters carry bags of soot and ashes which they throw over themselves and at the spectators when they are not fooling or behaving in an obscene manner.

In the case of the Rumanian version of the folkplay the action takes place within the hilt and point circle of sword dancers who never cease to 'step' while the play lasts. Here the hand-to-hand combat is between a Turk and a Russian. The latter is slain and an 'Orthodox Priest' attempts but fails to revive him. One more parallel may be mentioned from the village of Haghios Gheorgios in Thrace, where a festival is kept two days before Ash Wednesday. The leading actors are two 'gypsies', who must be married men, wearing head-dresses of animal skin brought down over the faces to form masks. Their shoulders are so heavily padded as to make them hump backed. Their hands are blackened and they wear sheep-bells round their waists. One carries a cross-bow made to shoot ashes from a horn and the other a phallus. With them are two unmarried boys dressed as their wives. An old woman, the Babo, carries a basket with a doll to represent a bastard baby. More gypsies with blackened hands carrying rods, whips and swords and a bagpiper complete the troop.

In the play proper, the first scene shows a gypsy man and wife sitting down forging a ploughshare. Then Babo cries that her bastard is too big for the basket and he becomes the Phallus-bearer and marries one of the Brides. The second scene shows the Cross-bow bearer stalking the Phallus-bearer whom he shoots. There is a lamentation and suddenly the victim comes to life. The forging of the plough is continued and a complete plough is then brought on drawn by the 'girls' while the blackfaced gypsies drive it. Later the two masked humpbacked gypsies are beaten with rods.

Actors of Prehistory

Further comparison of these Balkan folkplays emphasizes their close resemblance to some of the British examples. Were it not for the European analogues it might well have been assumed that the St George Mummers Play and the Plough Play were mere rustic echoes of the strolling theatrical companies familiar to country folk since Tudor days. Theatrical plays have been written round the legend of St George since the 16th century but it seems certain that the folkplays in origin long antedate any such dramatic invention and that it has been an integral part of country life familiar as an old tradition to Shakespeare and to playwrights long before his time.

The portrayal of the life-cycle with birth, death and resurrection is pre-Christian and probably pre-civilization. The principal actors can be traced back through recorded history to prehistory. The Fool and Baba or Bet under different guise can be traced to the Middle East where they merge with the Priest-King and the fertility Earth Goddess. The Mother Goddess has been traced to the earliest centre of civilization in Anatolia where she was worshipped by the Hittites. Later she appears in classical mythology as Artemis, Cybele and Demeter and in the still more familiar figure of Diana of the Ephesians. Ashes and soot must have been fertility emblems since earliest husbandry depended on burning a patch of forest or scrub to make room for the mystery of the sprouting seed.

Thus the folkplay in its various forms may be regarded as a starting point for investigation into mythology, drama and religion as well as more homely institutions such as Punch and Judy, the Pantomime and the Harlequinade. Indeed one can take any of the folkplay characters and embark on a voyage of surprising discovery.

Similar basic themes are found in the folktales of different ages and different parts of the world; even such a sophisticated, period tale as 'Cinderella' can have primitive origins

FOLKTALES

THE CUSTOM OF STORY-TELLING goes back to prehistoric times, and no race, nation or tribe has yet been recorded which had no stories; the habit is common to primitive savages and elaborate civilizations. Furthermore, incidents and practices which are easily explained in the savage tales make unexpected appearances in the civilized ones: often we can only judge the age of a story by the presence of these fossils embedded in it.

The Cinderella story, as we know it best in the urbane, courtly style of the 17th century Perrault, seems a very civilized affair indeed. There is a cruel stepmother, certainly, there are ugly stepsisters, but their cruelty is sophisticated and modern. They make Cinderella into a servant and a drudge, taunt her and mock at her, but there are none of the barbarities of some fairy tales. The story is an affair of a court ball and a royal marriage. The cruel sisters, instead of being put into a spiked barrel and rolled downhill, or some such atrocity, are forgiven in the end and have good matches found for them. The fairy who engineers the happy ending is a fairy godmother – a curious anomaly, combining Christian and pagan elements. One would say that never was there a story that was more securely rooted in its period, yet when one examines other variants of the Cinderella type more primitive things begin to emerge.

The Highland tale of The Sharp Grey Sheep is a good example. The whole setting here is simpler and less sophisticated. A native turn is given to it. The festivity here is not a ball, but attendance at church. What is most significant however, is the supernatural machinery. This is supplied not by a fairy but by an animal, which is killed by the wicked stepmother and is

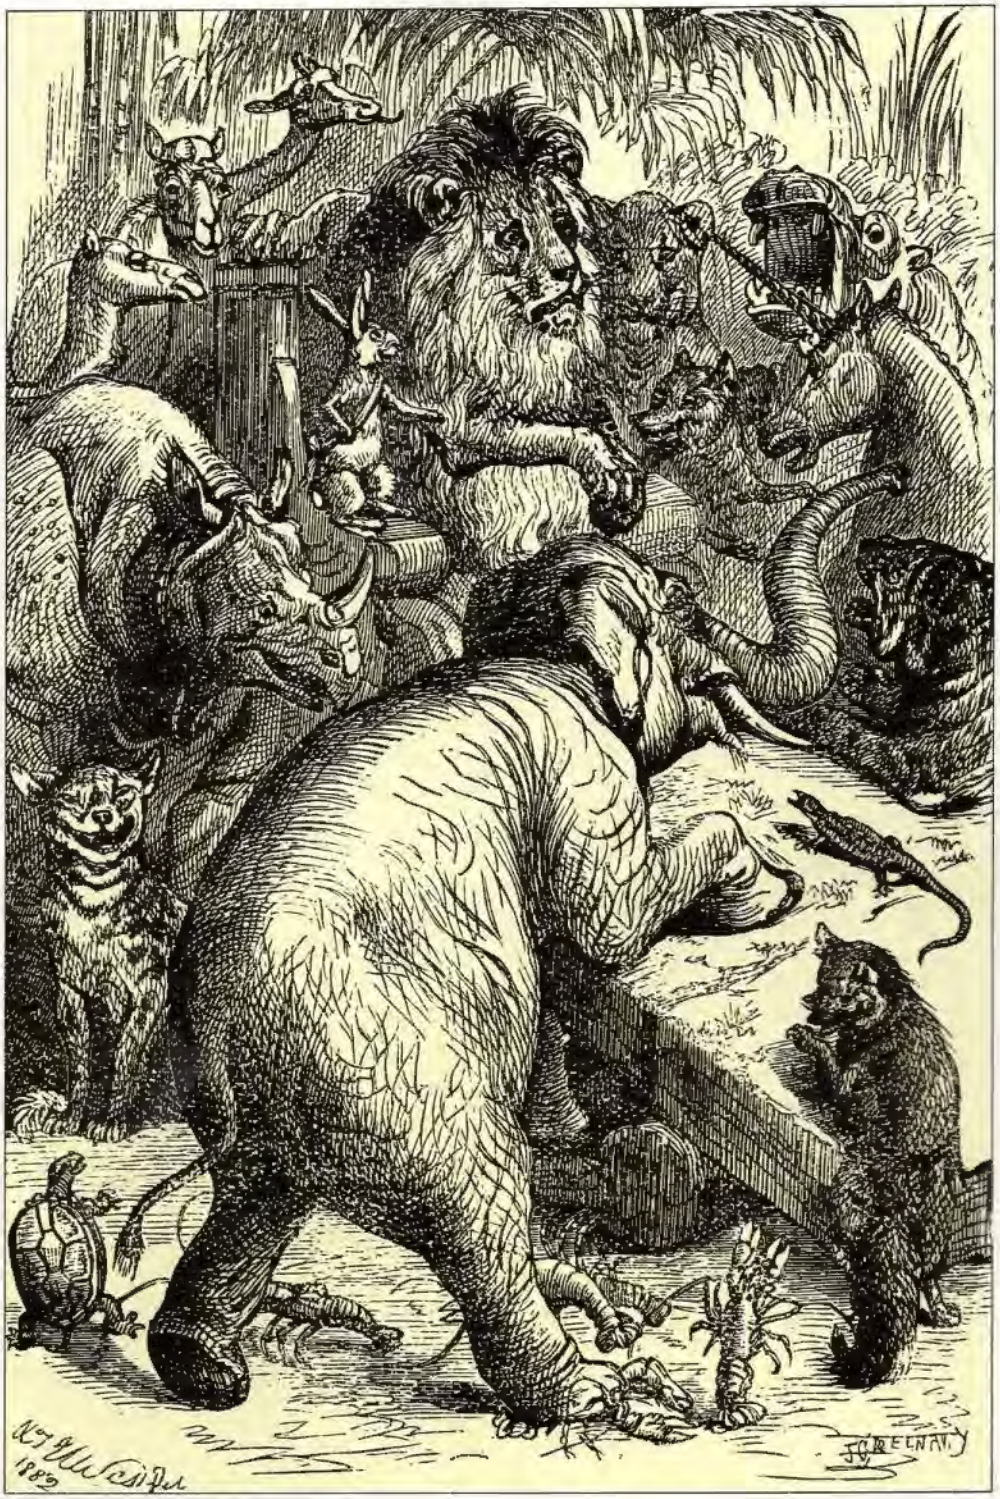
revived by putting together its bones and skin. In another version it springs up as a tree when its bones are buried. This is a motif in a Russo-Karelian version, The Wonderful Birch, to be found in Andrew Lang's *Red Fairy Book*. Here the animal who befriended the heroine was her own mother, turned into a sheep by the witch who supplanted her. It is probable that we arrive here near to the original tale, in which the magic was worked by the ancestral totem animal. Where we find these transmigrations and revivals in another form after death we guess at an early origin for the tale.

All this, however, is conjecture; but there are certain stories that can be dated. An example is The Tale of the Two Brothers, which was deciphered from an Egyptian papyrus at least 3000 years old and contains themes which are found again and again in tales told all over Europe up to the present day. It is a tale of the 'separable soul'. The hero hides his soul in a sycamore tree and his false wife betrays his secret to her lover, the Pharaoh, who has the tree cut down. Then the hero dies, but his brother finds him and brings him back to life and he takes the form of a sacred bull. His wicked wife has the bull slain, but he again takes the form of a tree; and when she has that cut down one of the chips flies into her mouth, and the hero is born again from his own wife; when he comes to manhood he destroys her as a punishment for her treachery.

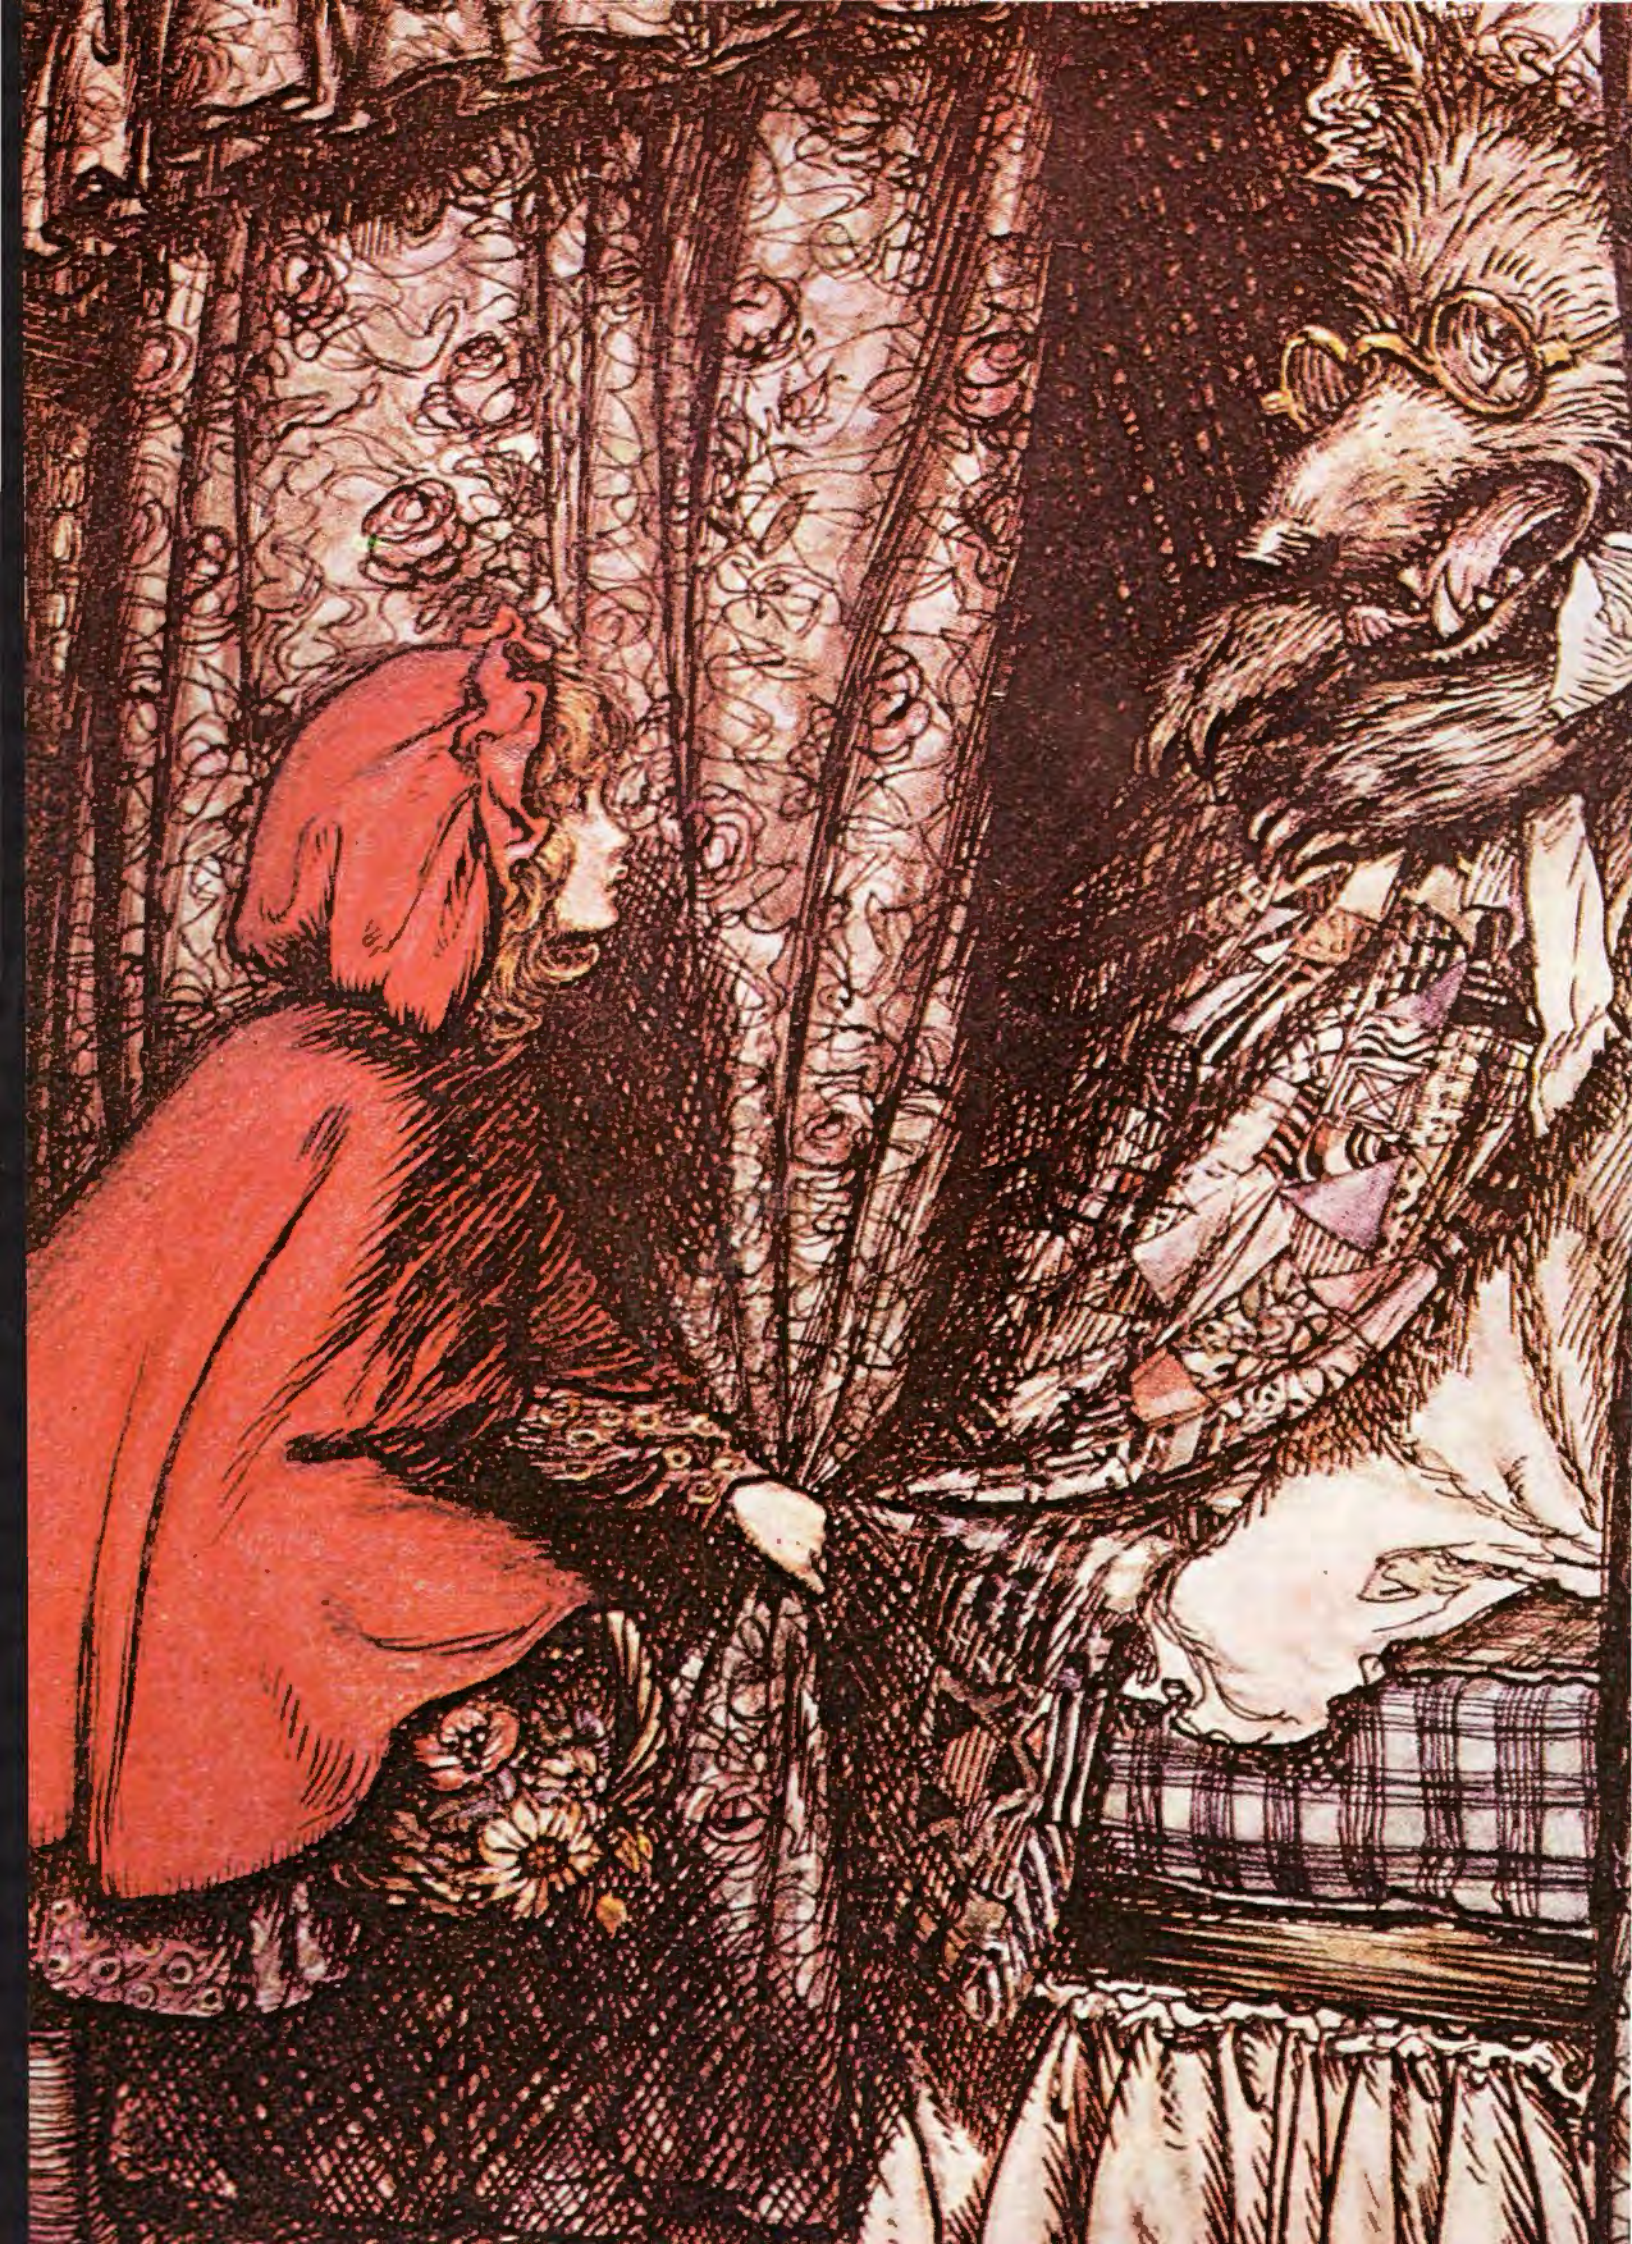
Here we have the same motif as in the more primitive Cinderella story mentioned earlier, in which the slaughtered sheep becomes a tree. (The idea that a birth follows the swallowing of some object occurs in the beautiful Irish tale of Midir and Etain which was dramatized in modern times in *The Immortal Hour*; Etain was a fairy girl who was turned by a jealous rival into a gnat, after which a mortal queen swallowed her and she was born again as a mortal princess.) Usually in modern folktales it is a giant or a witch whose soul is kept in a hidden place for safety. Often it is in an egg, and the giant cannot be killed until the egg is broken on his forehead. Until quite modern times this was told, not as a story, but as a solemn piece of belief. In Sarah Hewett's *Nummits and Crummits* she tells of a witch in Somerset who believed that she could not die until a bucket of toads under her bed was destroyed. She had hidden her soul in one of the toads, and she lingered on in pain until a neighbour destroyed them.

Andrew Lang in *Custom and Myth* traced the plot of the Jason legend through various modern versions, Nicht Nought Nothing, The Battle of the Birds, The Master Maid, through Red Indian, Samoan and Finnish versions, and found many remarkable resemblances. The main plot is the same, that of a hero in the power of an evil magician, who sets him impossible tasks, which the hero performs through the magic of the magician's daughter, who has fallen in love with him. The two lovers take flight, pursued by the magician, and make good their escape by flinging behind them delaying objects. In the Jason myth, which is realistically treated, Medea murders and cuts up her little brother and throws the fragments into the sea, and his father is delayed by gathering the floating members to give them burial. In the fairy stories magic objects are thrown behind the lovers, which transform themselves into obstacles, a comb into a forest, and so on. In all the stories the daughter's impiety is somehow punished, generally by a magic forgetfulness on the lover's part. In the Jason legend there is a fatal quarrel between Jason and Medea; in the Theseus and Ariadne story, which is another version of the same plot, Ariadne is deserted by Theseus on the island of Naxos; in the later fairy tales the lovers come together in the end. The excavations at Cnossus show that there is some historical foundation to the legend of the labyrinth of Crete and the fight with the Minotaur; the fact that some historical basis can be found for the Theseus legend does not however mean that the story originally sprang from there. Quite a slight resemblance seems to have the power of attracting to it a pre-existent legend.

The question of the origin of folktales has exercised scholars ever since folklore became a recognized discipline. How did these stories come to be told in the first place,



'De Elephent squashed anudder one er de Crawfishes,' from the Uncle Remus stories by Joel Chandler Harris. These stories are based on African folktales carried to America by slaves and were probably also influenced by the Great Rabbit of Algonquin Indian mythology



and how is it that strikingly similar tales can be found all over the world? These two questions were hotly debated by the folklorists and scholars of the 19th century. The first great theory on the origin of folktales was put forward with great erudition by Max Müller. According to him nearly all folktales – even the homeliest – had their foundation in solar myths, Sanskrit names for sun, dawn and sky, forgotten and distorted by a 'disease of language'. He cut the ground from under his opponents' feet by maintaining that no one could argue about the origin of the Indo-Germanic tales without a sound knowledge of Sanskrit. Such ardent disciples as George Cox pushed his theories to extreme lengths. Another group of scholars, the 'anthropological school' next arose, which did not completely abandon the solar myths, but found the origin of many of the tales in primitive fertility rituals and animistic belief. Andrew Lang was a notable exponent of this school of thought, which originated with Sir Edward Tylor and continued in the works of Sir James Frazer.

A slightly different theory put forward by Jane Harrison and later supported by Lord Raglan is that the folktales developed as an explanation of half-forgotten ritual. In more modern times it has been pointed out that those tales which employ the symbolic archetypes of the unconscious mind have a greater survival value than others.

Transmission of Tales

When we come to the question of transmission, various theories have again been urged. It used often to be said that all our European folktales originated in India and were carried through Europe on the waves of Indo-Germanic invasion. It is certain that many of them are very old and that many resemble each other too closely to have arisen independently. It seems an unproved assumption, however, that no tales arose later, and this theory does not account for the similar tales to be found in Australia, Japan and among the American Indians.

Folktales, handed on from generation to generation of ordinary people, are now being systematically catalogued by students of folklore, and their origins, similarities and diffusion are being carefully investigated; illustration to 'Red Riding Hood', by Arthur Rackham

Where there is an urge to tell tales some originators will be found. It must be noticed too, that tales are often classed together because of general similarity of theme such as might arise out of the human situation independently. All stories about cruel stepmothers need not stem from an archetype Cinderella story; there are second wives all over the world, and jealousy is, unfortunately a common human emotion. Where a difficult situation is insoluble and a happy ending is needed the Supernatural Helper might be paradoxically described as the natural solution.

There are said to be only eleven basic plots in the world but when we come to an intricate succession of detailed happenings some tales are too close to each other for them to arise by any other means than borrowing. Here we can sometimes date the twin stories by the details they have in common. Where, for instance, we have a coach in two stories we may be sure that one derived from the other in the 17th century or later. There were carts and chariots before then, but not coaches.

It must be borne in mind that there are other methods of tale transmission as well as mass migration. One shipwrecked sailor if he stays long enough to learn the language can carry a tale from Ireland to Japan. Foreign wives must have had great influence in transmitting tales in their time. Gypsies and tinkers have taken the place of wandering bards; slaves carried the Brer Rabbit stories from Africa to America. There are endless ways in which tales can be transmitted, but they must find congenial soil before they can take root.

The modern emphasis on folktale problems is rather on assembling data than on shaping theories. There are two principal ways in which this research can be carried out. The first is by the classification of all known tales in their relevant types and the second is the production of monographs on particular tales and their variants. The two methods are complementary to each other.

The fullest method of classification, now used in all national archives, is that instituted by the Finnish scholar Antti Aarne and completed by Stith Thompson. According to this system, all recorded tales are divided into broad classes: animal tales, ordinary folktales, novelle, religious tales, and so on, and each recorded plot within these boundaries is given a number. Some tales, of course, escape the mesh and have to be separately listed, but these are mostly tales with a local or national diffusion, and not those that have qualified as international tale-types.

There is one great class of tale which is hardly represented in this type list and that is folk legend. The omission is intentional; there is a broad distinction between folk narratives and folk legends. The former are folk fiction, not supposed to be factual, whereas legends were believed by the people who told them to have actually happened. Sometimes very similar tales are narratives and legends respectively. An example is the Jason legend, which has almost the same plot as undoubted fairy tales, like The Battle of the Birds, but was told of a hero supposed to have an historical existence. Some work has been done on the legends, but the lists of migratory legend types mostly relate to particular areas. Much work remains to be done here. A monumental work invaluable in studying both narratives and legends is Stith Thompson's *Motif-Index of Folk-Literature*. A motif is the separate strand of a tale, a perfect folktale is made up of a collection of motifs, though some anecdotes consist of only one motif.

Much progress has been made. New techniques of collecting have been worked out, the history, background and characters of tale-tellers is now studied, and each teller's variations on a story to suit different audiences. Nearly every country has established archives of folktales, and these are rapidly becoming crammed with tales accurately reported and carefully documented. The time will soon come when the emphasis can shift from collection and cataloguing, and we can set to work again on the problems of origin and diffusion.

FOOD & DRINK

When Sir Charles McCarthy was killed by the Ashanti in 1824, the chiefs devoured his heart, and his bones were kept as national fetishes

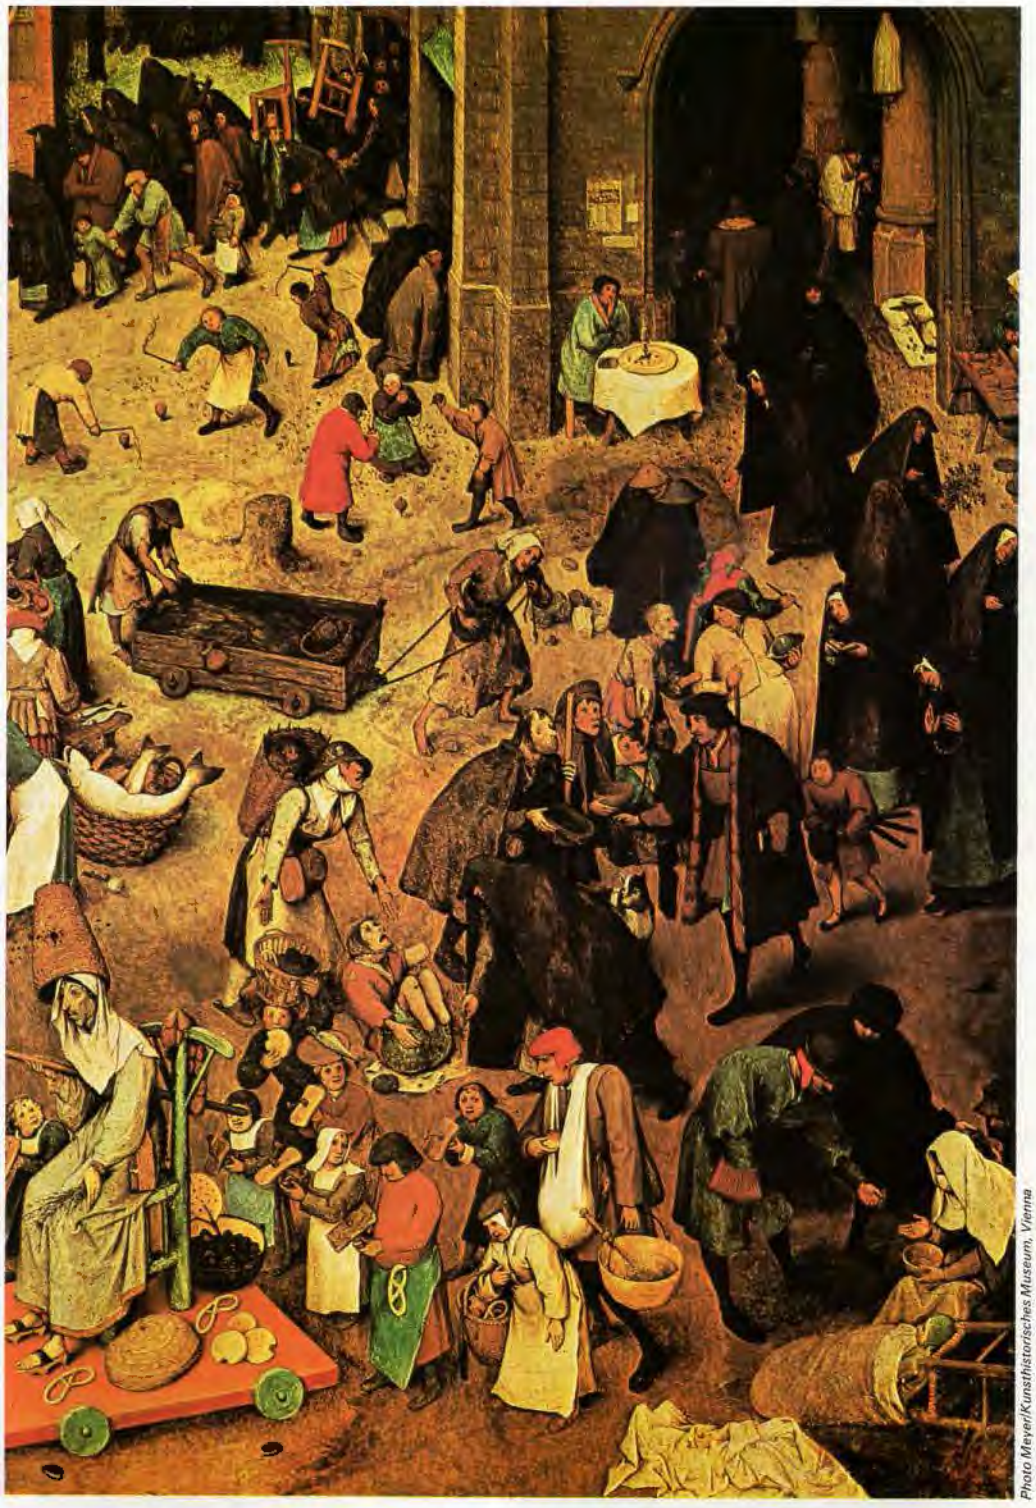

Photo Meyer/Kunsthistorisches Museum, Vienna

The idea that to eat a person is to obtain his characteristics is contained in the cannibalistic rituals of primitive tribes and the symbolic consuming of the god in both pagan and Christian religions

SINCE THE DEEPEST NEEDS of man's nature are reflected in religion, myth, magic and superstition, it is hardly surprising that beliefs, ceremonies and prohibitions relating to food and drink should be found in all of them.

The idea expressed in the saying 'Man is what he eats' is basic in many primitive societies: men are thought to acquire the characteristics of the animals (or human beings, or gods) that they consume. Indians in Ecuador eat birds, monkeys and game rather than the flesh of heavier animals because they believe that such a diet will make them more agile. Some East African tribesmen used to eat the hearts of lions in order to acquire the courage of lions and avoided hares' hearts lest they should become as timid as hares. In different parts of the world, however, the attributes of the same animal may be variously assessed: in Borneo, for instance, the young warriors avoided venison because the deer was thought of as an animal that is easily scared; but North American Indians preferred to emphasize the deer's speed and sagacity. In *The Golden Bough*, Sir James Frazer records that 'a Chinaman in Seoul bought and ate a whole tiger to make himself brave and fierce', and that 'a North American Indian thought that brandy must be a decoction of hearts and tongues, "because," said he, "after drinking it I fear nothing and I talk wonderfully."'

So much for the mythical virtues derived from eating animals, of which many more instances could be given. But the same principle has been widely extended to the eating of human flesh – most often the heart and liver of a conquered victim. Sometimes

Breughel's *Battle Between Carnival and Lent*: Carnival was traditionally the period preceding Lent, taken up with feasting and revelry, in anticipation of the Lenten fast. Here King Carnival, astride a barrel and brandishing an impaled pig's head, confronts Lent, a wretched old woman holding out a wooden shovel with two herrings, the symbol of meagre fare

Left Goya's painting of the Roman god Saturn devouring his son: Saturn was identified with the Greek god Cronus who reigned in heaven until deposed by his son Zeus. He devoured his own children because one of them was fated to overthrow him, but Zeus escaped with the help of his mother Rhea *Right* Central to the action of the Christian Mass is the taking of the consecrated bread and wine; Christians disagree about whether this ceremony is symbolic or whether it is a literal 'eating of the god', the consumption of Christ's body and blood *Far right* Cannibalism is often based on the belief that by eating a person you acquire his characteristics

when a particularly gallant enemy was killed in battle, parts of his body were cut off and burned to ashes: the ashes were mixed into a kind of paste, and this was preserved until it was time for the tribal initiation rites, when it was solemnly distributed to the youths who were being initiated into full membership. In 1824, when Sir Charles McCarthy was killed by the Ashantis, the chiefs devoured his heart, and his bones were kept as national fetishes. Even today cannibalism is sometimes practised ceremonially, either to inherit the dead man's virtues or with the purpose of ensuring future food supplies. One person is responsible for this vital task – the king or chief of the tribe or a specially hallowed rainmaker. If there is a drought, and consequently a poor harvest, the unsuccessful rainmaker is likely to be killed; parts of his body are eaten ritually, the rest scattered over the fields in the hope that these may be thus fertilized. Until fairly recently a rain-making priest in the mountains of Ethiopia would be stoned to death if the harvest failed – and his nearest relatives had to cast the first stones at him.

The Witchety Grub

Imitative sympathetic magic is involved also in attempts to maintain the supply of food. Where fish is a main article of diet, a model of a fish may be thrown into the water and prayers chanted; or a wizard will mime the movements of a swimming fish. As recently as the late 19th century, in the Scottish Highlands, when boys went fishing without success, they would make as if to throw one of their party overboard and haul him in like a fish: it is recorded that the charade sometimes worked.

The most famous and the most elaborate example of this imitative magic is probably that formerly found among the Asunta, in the barren lands of Central Australia, where the tribes are divided into totem clans, a totem usually being an edible animal. Some of the tribesmen eat an insect called the witchety grub; so there is a clan whose totem is this grub. In order to ensure the increase of this insect for the use of the community, the men would sit inside a structure of branches shaped roughly like its chrysalis; they then shuffled out, squatting, and sang of the grub's emergence from the chrysalis. Comparable pantomimes were intended to

Giraudon

Mary Evans Picture Library

safeguard the supply of emus and white cockatoos.

A more macabre method of ensuring a good crop was used by the Lange tribe in Uganda at a festival held every five years. On this occasion there would be a raid on a neighbouring tribe, the Kumam; a tribesman and his dog were killed and their genital organs cut off. The scrotum of the man and that of the dog were stuffed with millet seed, and a rain dance was performed, and the millet shared out. The men took this specially treated millet home and mixed it with the ordinary seed before sowing. The results were said to be excellent. Such practices, horrifying as they seem today – not least to the educated Africans of Uganda – were truly a part of religion, in its magical aspect; magic seeking to provide, at whatever cost in human suffering, for the most basic human requirements.

Give Us Our Daily Bread

As civilizations advanced, less crude methods of achieving this end were evolved; but every civilization at whatever stage of development, has celebrated with special observances the seasons of sowing and harvest, and in these observances may always be traced vestiges of the same reliance on supernatural aid. Ancient Romans and Greeks, Jews and the various branches of the Christian Church – all have had their harvest festivals. In England, although the old festival of Lammas on 1 August was marked by the offering to God of a loaf made from the new wheat (the word Lammas is a corruption of loaf-mass), the Harvest Festival as it is now observed in the Church of England is a re-introduction from around the 1840s. With its piles of fruit and gigantic marrows, it is a function almost entirely pagan in feeling, with a thin top-dressing of orthodox Anglicanism. Equally pagan, but no less religious in origin, is the custom, still observed in Essex, Suffolk, and elsewhere, of weaving ornate 'corn dollies' from the last sheaf of corn cut on the last day of harvest. It was once believed that the spirit of the corn dwelled in them and that they must be kept safely until the next spring to ensure continuity. The Church is officially 'as by law established' in England and one large-scale farmer is reported annually to invite the rector of his parish to bless his crops, paying him £50 for doing so, and charging this as a necessary expense against income-tax – with a note to the Inspector of Taxes: 'I defy you to assert publicly that this does not improve the property.'

Among Christians, as among believers in other faiths, certain important occasions in life are observed not only by religious ceremonies but also by secular feasts; christenings, weddings and funerals are marked by the serving of special food and drink. In everyday life, believers are admonished to show thankfulness for their food: the prayer most frequently recited by Christians of every allegiance is the Lord's Prayer – a central petition in which is 'Give us this day our daily bread'. The custom of saying grace was once common among the middle and upper classes in Britain although nowadays it is mainly observed at public banquets and institutions. This constant reiteration of Christian concern for material goods and needs has parallels in other religions also – even among those great religions of the East which repudiate the flesh and bodily desire and aspire to pure spirituality. Some worshippers of Krishna, for instance, make an offering at his shrine – a plate full of food – before starting a meal. They believe that then the food they are eating has been blessed (and even, mysteriously, consumed) by Krishna, and that meditating on him while they eat will increase their resources of spiritual energy. (The anthropologist Malinowski held that the Trobriand Islanders did not understand the association between food and the maintenance of bodily strength: they ate simply because they wanted to, out of greed, or because it was the custom.)

Dangerous Food

At least as important as the positive aspects of sympathetic magic in the feeding habits of human beings are the negative aspects – the thou-shalt-nots of myth and magic which can conveniently be summed up in the word taboo. Positive magic means doing something to produce a desired result: negative magic means avoiding an unpleasant result by *not* doing something.

Even taboo, however, is not wholly a negative concept. It embraces two meanings that may seem to be opposite. A taboo person or object is untouchable, either because, being a tribal chief, a totem animal

Photo Chris Mackie

The person who touches a taboo object or eats taboo food becomes taboo himself, and if he survives, has to undergo lengthy penances and purifications

or god, he or it is too potent and sacred to be touched by lesser persons, or because, like a pregnant woman (in many primitive cultures) or the caste of untouchables in India, the person or thing is considered too unclean to be touched. In the first case, the profane contact will bring a terrible retribution on the toucher: he has been guilty of presumption, since in the words of Freud 'to touch is the beginning of every act of possession, of every attempt to make use of a person or thing.' Even an accidental offender may be so overwhelmed by guilt that he will not recover from his shame. The case is recorded of a healthy young Maori who happened to see the remains of a meal by the roadside and ate it without knowing that the food had been that of a high-ranking chief. As soon as he was told this, 'he was seized by the most extraordinary convulsions and cramp.' He died at sundown.

In the second case – taboo meaning unclean – the infection is equally transmitted by touch. The person who touches a taboo object or eats taboo food becomes taboo himself, and, if he survives, has to undergo lengthy penances and purifications. The common factor between these two concepts is that, whether the person or thing is too holy or too unclean to touch, to touch him or it is dangerous. According to W. Wundt, in *Voelkerpsychologie*, the distinction between the two meanings did not exist in the earliest stages of taboo: there was simply a demonic power within the person or object that punished the toucher by bewitching him.

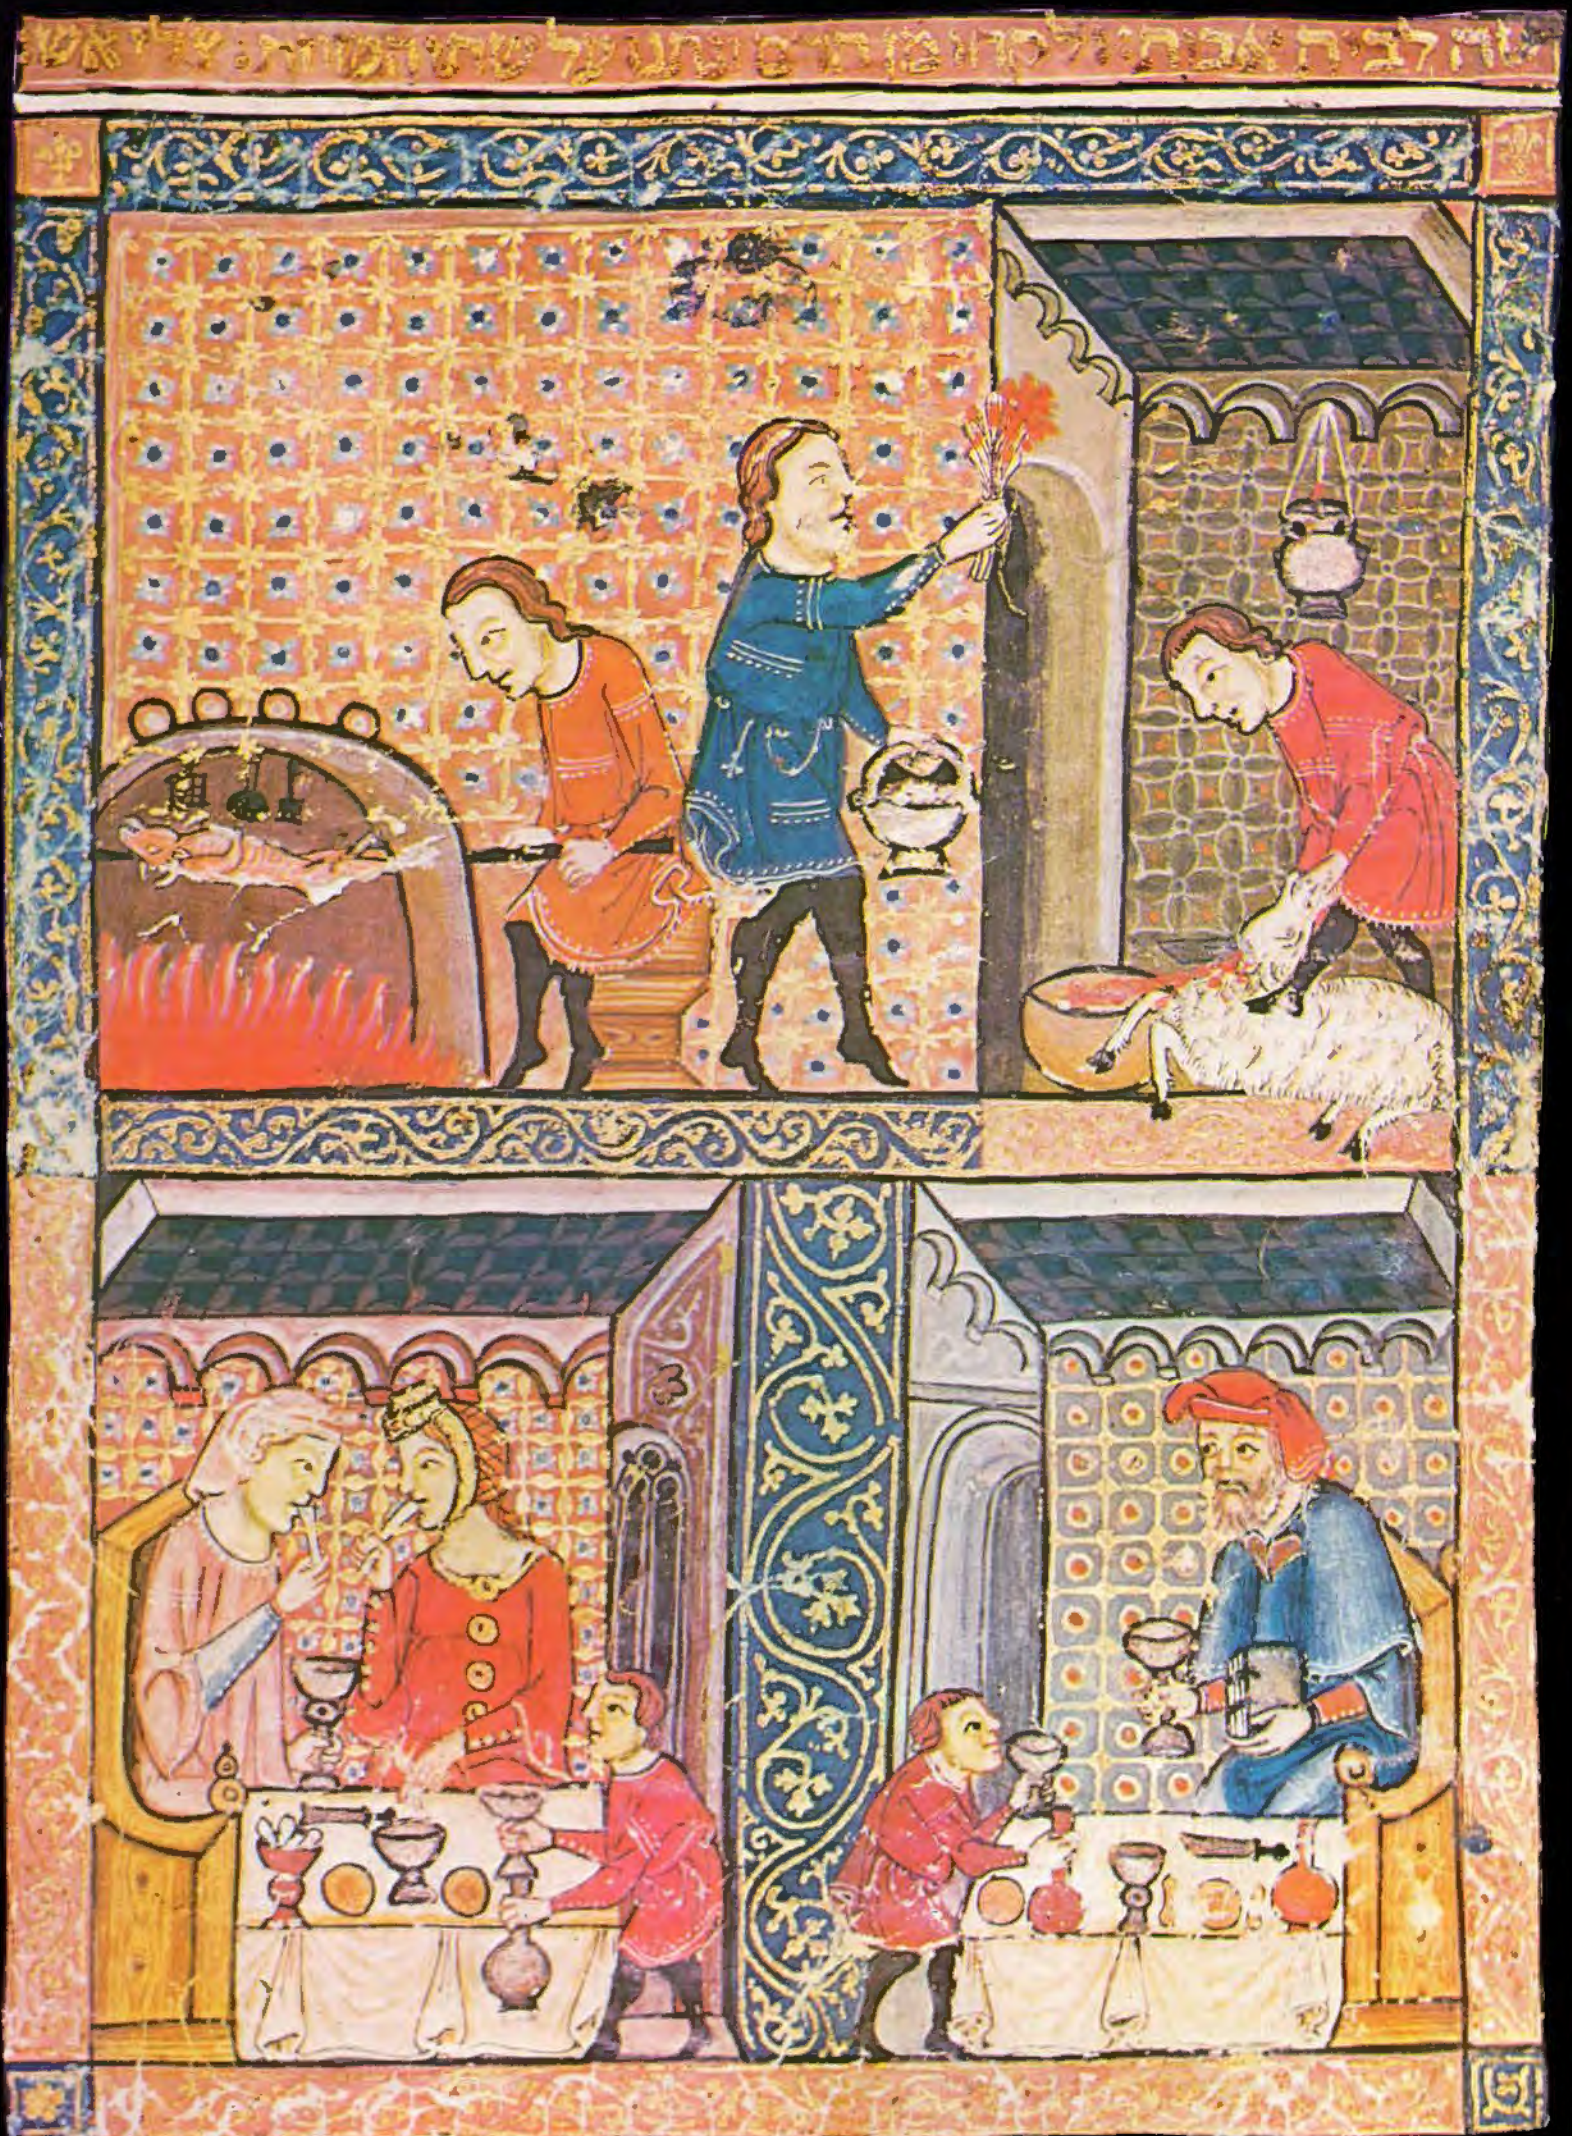
Above **Sugar skulls eaten by Mexicans on All Souls' Day when Catholics pray for the souls suffering in purgatory** ***Right*** **The Jewish observance of Passover, from the John Rylands Haggadah. The Passover meal consisted of a sacrificial lamb eaten in thanksgiving to God, benedictions, readings from the Bible over cups of wine, and the eating of unleavened bread**

The most obvious example of food taboo that is still widely observed is, perhaps, the dietary system of Orthodox Jewry. This is based on the Mosaic law as originally recorded in certain texts in the books of Genesis, Exodus, Leviticus and Deuteronomy. The prohibition: 'You shall not boil a kid in its mother's milk', occurs first in

Eve's Dinner Party

But I will haste and from each bough and brake,
Each Plant and juiciest Gourd will pluck such
choice
To entertain our Angel guest, as he
Beholding shall confess that here on Earth
God hath dispensed his bounties as in Heav'n.
So saying, with dispatchful looks in haste
She turns, on hospitable thoughts intent
What choice to choose for delicacy best,
What order, so contriv'd as not to mix
Tastes, not well joined . . . fruit of all kinds,
in coat,
Rough or smooth rin'd, or bearded husk, or shell
She gathers, Tribute large, and on the board
Heaps with unsparing hand; for drink the Grape
She crushes, inoffensive must, and meathes
From many a berry, and from sweet kernels pressed
She tempers dulcet creams . . .
A while discourse they hold;
No fear lest Dinner cool; when thus began
Our Author. Heav'nly stranger, please to taste
These bounties which our Nourisher, from whom
All perfect good unmeasured out, descends,
To us for food and for delight hath caus'd
The Earth to yield . . .
So down they sat,
And to their viands fell, nor seemingly
The Angel, nor in mist, the common gloss
Of Theologians, but with keen dispatch
Of real hunger, and concoctive heat
To transubstantiate; what redounds, transpires
Through Spirits with ease; nor wonder; if by
fire
Of sooty coal th' Empiric Alchimist
Can turn, or holds it possible to turn
Metals of drossiest Ore to perfect Gold
As from the Mine. Meanwhile at Table *Eve*
Ministered naked, and their flowing cups
With pleasant liquors crowned . . .

John Milton *Paradise Lost*



Exodus 23.19. Like all these Jewish dietary rules, this has been interpreted and elaborated by Rabbinical scholars: it is still taken to mean, in practice, that milk may not be drunk, or butter eaten or used in cooking, at a meal at which meat is eaten; and strictly *kosher* restaurants would refuse to serve a glass of milk if it were ordered at such a meal. More specific detail about permitted and forbidden foods is given in Leviticus, chapter 11 and Deuteronomy, chapter 14. The orthodox are allowed to eat beasts which are cloven-hoofed *and* cud-chewing, such as the ox, sheep and goat, but not to eat beasts which are cloven-hoofed but not cud-chewing – the swine – or cud-chewing but not cloven-hoofed – the camel, coney and hare. Finny and scaled fish may be eaten, but not shellfish. Eagle, raven, owl and many other birds are forbidden, but 'clean fowls' are permitted. Winged insects that 'go upon all fours' are forbidden, except for 'those which have legs above their feet with which to leap on the earth'; the locust and the cricket however are allowed.

Kosher (that is 'fit' or 'proper') meat is not only the flesh of one of the permitted categories of animals: it must have been killed by approved methods, which involve draining all the blood from the body. No animal which has died naturally may be eaten. Indeed – a clear parallel with the taboo customs of other cultures – anyone who merely touches or carries the carcase of such an animal 'shall wash his clothes and be unclean until the even.'

These dietary laws were instituted, according to Jewish authorities, 'for reasons of hygiene and the avoidance of idolatry.' Many non-Jews also regard them as sensible safeguards in a hot climate. This is so; but there is clearly no hygienic need for their continued observance in cool climates, and with modern refrigeration. This survival is valued by Orthodox Jews as a symbol and reminder of the earliest traditions of their race and of their special calling as Yahweh's chosen people. Non-Jewish anthropologists would see it rather (examining it objectively, and without any trace of anti-semitism), as an example of the tenacious hold on the human consciousness and practice of primeval taboos even when they have long ceased to have any practical relevance.

Sir James Frazer, analysing the Jewish taboo on the pig, remarks that (in pre-Christian centuries) 'the attitude of the Jews to the pig was ambiguous'. He goes on to say: 'The Greeks could not decide whether the Jews worshipped swine or abominated them. On the one hand they might not eat swine; but on the other hand they might not kill them. And if the former rule speaks for the uncleanness, the latter speaks still more strongly for the sanctity of the animal . . . we must conclude that, originally at least, the pig was revered rather than abhorred by the Israelites. We are confirmed in this opinion by observing that, down to the time of Isaiah, some of the Jews used to meet secretly in gardens and eat the flesh of swine and mice as a religious rite . . . And in general it may perhaps be said that all so-called unclean animals were originally sacred; the reason for not eating them was that they were divine.'

Forbidden Flesh

There are striking similarities between the dietary laws of Judaism and those of another great religion that has grown and spread in Asia, Africa and elsewhere – Islam. The Koran forbids 'only that which dieth of itself, and blood, and swine's flesh.' The traditions and sayings of Mohammed supplement these injuctions: animals are unlawful food unless slaughtered by a method similar to that of the Jews, also if slaughtered by an idolater or an apostate from Islam.

Food can become unclean for a Moslem by contact with unclean persons or things. It is recorded that one extremely strict Moslem was away from home and his wife was busy, when their baby began to cry: to quieten him, a young woman who was visiting gave her breast to the baby. The father came in, snatched the baby from her, and held it upside down to drain out any of her milk, for fear it might be tainted if her observance of the dietary laws were less scrupulous than his own.

In general, however, the strictest observance of such taboos in Islam and Judaism, as in other religions, is nowadays tempered in practice with common sense. Wine is forbidden in the Koran, but most non-Moslems who have Moslem friends have known some of them to indulge, at least in private, in a glass of wine or beer. A Moslem prominent in public life will not do this in a public place; and few of these are so fortunate as a former Aga Khan – hereditary spiritual leader of the Ismaili community – who was able to drink as much champagne as he liked, since by miraculous dispensation it turned to water as it passed his lips. Even a comparatively lax Moslem, however, while sharing a bottle of wine at dinner, will scrutinize most carefully any stew or soup set before him, to satisfy himself that it contains no fragment of flesh of the forbidden pig.

Whether Frazer's theory of the origin of the dietary taboos of Judaism and Islam applies to the domestic animals which are kept as pets in many countries, especially in Europe and America, is a matter for speculation. Cats, which were venerated in ancient Egypt, receive almost comparable attention from their owners in these Western countries, and dogs probably receive even more. These are modern versions of totemism: both animals are taboo as food, and so are eaten only at times of extreme necessity, as during the siege of Paris in 1870 or the siege of Madrid in 1936.

Eating the God

Certain attitudes, it seems, are common to both 'savage' and 'civilized' man, although in the more advanced societies a refined and often impressive symbolic ceremonial replaces the crude brutalities of primitive ritual. The devout Christian invokes Christ as the 'Lamb of God' and shares in a sacred meal; and this meal, however elevated the thoughts and emotions of those partaking of it, has something in common with the primitive tribal practices of which Frazer writes in the section of the *Golden Bough* entitled 'Eating the God'.

Indeed Catholics insist that the central action of the Mass – the sacrament of Christ's body and blood – is not merely a 'spiritual' or memorial rite, and that the

F. H. C. Birch/Sonia Halliday

Michael Holford

consecration by a priest of the elements of bread and wine brings about such a change in them that Christ himself is *really* present on the altar. So, after the consecration of the bread and the wine, those who approach the altar or pass before it bow the knee in homage to the divine presence; and when they share in the Communion – consuming token portions of the consecrated elements – they will thereby be strengthened and purified. No Catholic will agree with the scepticism of the Roman orator Cicero, who sneered at the sacraments of the corn god and the wine god. 'When we call corn Ceres and wine Bacchus, we use a common figure of speech; but do you imagine that anybody is so insane as to believe that the thing he feeds on is a god?'

Cicero anticipated the unbelief of modern humanism; but the age-long instinctive consensus of mankind is against him. When the Christian missionaries arrived in Mexico and in India, they found that the ancient local religions had their rites of transubstantiation: in Mexico, the pagan priests turned bread into the true body of their god; in India the Brahmins taught that the sacrificial rice-cakes were changed by the priests into actual human flesh.

But why is there this almost universal belief in the sacramental principle that real values can be conveyed through material instruments and, in particular, that this principle reaches its highest expression in a meal at which a divine entity – a totem animal, a god or a substitute for a god – is solemnly eaten by the worshippers?

There could be many explanations of the phenomenon. Freud followed Darwin in thinking that the first society – like that of the higher apes – was a 'primal horde' led by a violent chief or father, jealously possessing all the women and eventually killed by the strongest of the younger males. Later came the totemic clan, in which 'the totem animal is really a substitute for the father'; the totem animal was taboo – but on special occasions its killing and eating strengthened the clan's sense of kinship with it. (See also numerous articles, including BREAD; CORN; HARVEST; MASS; TABOO.)

TOM DRIBERG

The privileged position of the fool, the clown and the jester allows him a wide latitude for satirical comment on sacred institutions. By provoking laughter and bringing suppressed anxieties to the surface, he often plays a therapeutic role

FOOL

SHREWD MEN of all times and places have pretended folly ur madness as licence for social satire: the fool of ritual, court and stage, whatever his type, is no fool. Some types of fools have been jesters; others have impersonated fearsome supernaturals. The jesters were sometimes unfortunates who provoked laughter by their infirmities as cripples, idiots or dwarfs, but more usually they excelled in agility and intelligence. The ancient Egyptians for instance imported dwarfs from Central Africa – pygmies who were acrobats and clowns – and the Aztec ruler, Montezuma, engaged acrobatic clowns to amuse his court.

The heyday of the medieval fool came after the Crusades. Sometimes a superior jester was permanently attached to a court, like John Heywood in the retinue of Henry VIII and Kunz von der Rosen in the cortège of Maximilian I of Austria. Sometimes he wandered about, like Till Eulenspiegel of Germany, Italy's Bertoldo, Turkey's Nasa Eddin, and India's Muladeva, all famous wits of history and legend.

In the Middle Ages buffoons would travel on foot or occasionally in style with a patron's following. Clever buffoons could dance, turn cartwheels, juggle, sing and compose satirical verses. Some had a company to enact the burlesques. The majority were men, but an occasional female acrobat impersonated Salome, or groups of girls accompanied gleemen, as dance partners for trained bears.

The fools of the Renaissance (thought to be descendants of the Roman mime) provided entertainment during banquet interludes and during intermissions in the vast spectacles of the 17th century English, French and Italian courts. In Elizabethan masques they played roles as professional dancers. In elegant mythological pageants and in tragic dramas they provided interludes of relaxation comparable to the comic relief in Shakespeare's tragedies. After the decline of European courts, they moved to the professional stage, as characters in the *commedia dell' arte* and later became the tragi-comic figures of ballet productions – not only Harlequin but also Punchinello, Scaramouche and Pierrot.

The Fool in Folk Drama

A ritual fool plays a symbolic role in a number of British folk plays associated with Morris dances, sword dancers and mummers. Whether he wears tatters or motley, a fool's many coloured dress, the fool climaxes his clowneries in a symbolic death and resurrection.

In Christmastide dramas there emerge the central figure of the Fool or Medicine-Man, and his group of assistants who, disguised with black faces, form a secret society, of which he himself is the head. His 'act' is to suffer death in order that the community shall survive. His 'sons' (the members of the secret society) have to kill the head of the house, their 'father'. While he acts this sacrifice he visits the underworld, taking with him all the accumulated evils, burdens and difficulties of the past year. When his task is done he returns a revived leader, to resume his earthly responsibilities fortified for a new year.

An example of an English folk play in which the Fool plays a chief part was recorded at the end of the 18th century in the village of Revesby in Lincolnshire. The Fool has six sons, played by sword dancers, who plan to kill him. The Fool plays for time but eventually submits to the inevitable, is slain and falls dead – only to spring up again, claiming that he still has another life. The complicated sword dance pattern leading up to his death is repeated and the Fool is killed a second time. The sons lament the father whom they have killed, who once again revives and recounts his experiences out of the world. The Fool and his eldest son then vie for possession of the Lady (a man-woman); the Fool wins her and the performance ends with the actors joining in a final dance.

At times the Fool is associated with animal impersonations. He may wear a fur cap, a tail, and a bladder. He is dressed in skins, as leader of a company pulling a decorated Fool Plough on Plough Monday, usually the Monday after Epiphany, before ploughing begins.

In other European festivals the Fool skips about in human guise, with groups resembling Morris dancers, such as the Basque *Mascarades*, and the *Schäfflertanz* of Munich. Or he leads a company of uncouth dancers in animal masks, the *Bugios* (monkeys) of the Portuguese *Mouriscada*. On St John's Day at Sobrado in Brazil the Fool-Leader, wearing church vestments, rides into town backwards on a pony, sowing flax. He harrows, then ploughs with an upside-down yoke. During the battle between the Bugios and an orderly array of Mouriscos he is captured, but the Bugios recapture him with the aid of a dragon, and then the demons join their conquerers in saintly dance.

In the Austrian Alps, at Midwinter, shaggy creatures leap to promote the year's growth of crops – the *Schemen* of Imst, the *Huttlerläufer* and the *Zottler* of the Tyrol and the *Perchten* of Salzburg. They enact a battle with a troupe of victors in high, flowered hats. These masqueraders cavorted in medieval carnivals. Before that, they celebrated pagan vegetation rites, the Perchten as impersonations of the ghosts in the deity Berchta's train.

A cloven-hoofed, underworld deity became the devil of medieval lore, miracle play, and carnival, and he still capers and

Cartoon of the Duke of Wellington as the Lord of Misrule, by William Heathy: in the Middle Ages the Lord of Misrule held court each year for a brief period and conducted the Christmas festivities

John Webb

clowns in Iberia and Catholic Latin America. He is sooty, red or green, has horns and a harpoon tail, and wields a pitch fork. He is ushered in by fireworks, smoke and a sulphurous stench. Groups of devils dance elaborate quadrilles in Catalan carnivals.

Mexican Demon-Clowns

In Mexican carnivals the devils may be in the company of a skeleton and comics masked as native tigers, turkeys or goats and bulls. During the Yaqui Indian Easter fiesta in the Sonora region, three men in black, bearded masks leer and caper. The *Pascolas* (old men of the fiesta) are ritual hosts; they use exorcism gestures, dance without masks and amuse the crowd with obscene raillery.

During the same Easter fiesta, the Chapayekas, members of a votive clown society, impersonate demons and enact parodies, wearing long-nosed, long-eared, horned, hairy masks of goatskin. During Good Friday processions they stamp, wriggle their hips, rattle their belts of deer and goat hooves and clatter wooden staves. On Easter Sunday they burn their paraphernalia, destroying the malignant powers.

The Chapayekas appear related to clown societies of tribes north of the border – thus, in New Mexico, the *chapio* of Acoma and Laguna Pueblos, the *tsaviyo* of San Juan, the *k'apio* of Taos.

The tsaviyo of Pueblo Indians are also called *abuelos* – grandfathers – when they perform with the *Matachines*, relatives of the Morris men. With long whips they tease a Torro, a boy wearing the hide and hair of a bull, kill, quarter and revive him. Their attire varies from ordinary clothes to cowboy outfits, from rubber masks to hide masks recalling the Chapayekas.

Some tsaviyo are eerie rather than funny. On the eve of December 21 the white tsaviyo appears from the hill east of San Juan. He belongs to the winter moiety, the group of clans in charge of winter ceremonies for animals. He wears white hide trousers and a white kilt, moccasins, and hide mask. He has a fox fur collar, mica earrings, ear flaps, eye slits, and frosted hair. On December 22 the black tsaviyo of the summer moiety, the group whose responsibility it is to manage the crops, appears in a natural-coloured hide costume, yellow moccasins, and a black mask similar to the white tsaviyo's. Both have come from Truchas Peak, in the mountains, hence the frosting. They whisper in Spanish falsetto.

On December 23, just before dusk, both come out to make the people sweep the plazas. Dance officials go to the head of the town, below the cemetery, to meet the tsaviyo. 'Whitie' jumps and walks counterclockwise through the north plaza, around to the winter chief's house. He strikes his whip on the *nansipupinge*, a sacred stone pile symbolic of the earth centre, and the town's ceremonial centre, before entering the house. The summer 'blackie' goes clockwise by way of the south plaza to the summer chief's house west of the house block, and he strikes the ground with his whip. They enter the house of each chief and are welcomed to the town, before retiring to the sanctuary. Their ritual directions are significant, counterclockwise around the north for the winter, and clockwise around the south for the summer.

Other ritual clowns such as the *Koshare* of the Keresan tribe, and the *kosa* of the Tewa weave among dancers or act parodies. They represent spirits of the ancestors and arrive from the east where the dead are reborn. These clowns wear the ghost markings, black and white stripes on their bodies, white or black rings about the eyes and mouth, and a black, ragged apron. Traditionally, their poked head-dress was used in mankind's emergence from the earth, to bore a hole for exit. During rain and corn dances they bounce and gesticulate on the side lines. They are beyond censorship and may enact satire of sacred institutions, of the Catholic Mass, of tourists. Sometimes they discipline initiates or frighten spectators. Yet their first purpose is to amuse the people, as their name, 'the delight makers', indicates.

Other tribal comics enact preposterous roles. In western New Mexico, the mud-covered *Koyemshi* of the Zuni eat filth and engage in obscene interludes between masked dancers. They symbolize the spirits of the dead. In Arizona the Hopi god of death, war, fire and night, Masauwu, appears in a huge mask and performs all natural actions in reverse.

Maskers of the Great Plains

The Crow Indians of the Northern Plains have a society of fools who use mud for body paint and smear their cloth masks with charcoal. They ridicule whatever they wish, they fall down, pretend to die laughing and engage in obscene behaviour. In the 'hot' dance of the Dakota tribe, the *heyoka* immerse their arms in hot water and complain that it is cold. In breechclouts and white paint, they represent the god Haoka, stretching to giant height or crouching to dwarf size. The *windigokan* of the adjacent Bungi act foolishly in obedience to a dream of the thunder god. They burlesque warriors during ceremonies, wearing long-nosed sackcloth masks; they used to handle coals or hot water.

In the east, humpbacked *haduhi* of the Iroquois effect cures by means of ashes and grotesque dancing. They amuse and terrify the spectators in their big ceremonies at Midwinter. At the Onondaga ceremonies near Syracuse, New York, these False Faces sometimes wear their traditional black or red masks of basswood. Sometimes they put on ridiculous costumes and stone masks, to parody their own sacred rites for the bear or eagle spirits. In female garb one man burlesques the sacred food-spirit dance of the women.

To the south, in North Carolina, the Cherokee 'boogers' enact more ribald and caustic Midwinter satire. Each man selects a character for ridicule and an appropriate mask of wood or gourd, to represent a foreigner – German, Spaniard, Southerner – or growling bear. Some carry an imitation phallus under a quilt or sheet and they expose it to women and girls. Frank Speck in *Cherokee Dance and Drama*, emphasizes their boisterousness: 'The maskers are systematically malignant. On entering, some

Jesters, sometimes dwarfs or cripples, but more usually clever men who could dance, sing and compose satirical verses, held privileged positions at medieval courts: 15th century MS from the British Museum

of them act mad, fall on the floor, hit at the spectators, push the men spectators as though to get at their wives and daughters, and chase the girls toward the crowded walls'. During a round dance they engage in erotic display. In the course of their solo acts they give vent to suppressed aversions toward white men, as living beings or ghosts. They used to have magic powers for cure through their association with ghosts.

Release Through Laughter

Satire, social or personal, appears as a universal function of the fool, from the European court jester to the Cherokee booger. In other parts of the world laughter permits and releases pent-up indignation. The pygmies parody rites imposed by Negro tribes. The African Azande poke fun at individual foibles. Korean comics imitate a headman and clerk in ragged modern suits. Similarly, in the Mexican carnivals, fools imitate city people and tourists; buffoons in ragged suits harass photographers.

Taboos and repressions find a vicarious outlet in the phallic play of fools. Outside Europe the sex play may be as overt as the lewdness of the ancient satyrs. Papuan clowns make passes at women spectators; clowns of the Crow Indians enact a form of copulation between a male actor and a man dressed as a woman.

The chthonic or underworld function is related to the reverse behaviour, the backwards actions and speech, the progression contrary to the customary circuit, as in death rites. It is also expressed in elements of costuming; black and white stripes, black and white diamond design, or face whitening (the mark of the modern circus clown and of the mime, Marcel Marceau); or blackening with soot, at one time obligatory for all Morris dancers. The soot is especially potent, because of its derivation from purificatory fire.

Plant potency is symbolized in the foliage of England's Leafy Fool, the Green Man (see GREEN). Animal potency remains in

Right **The Fool, the first of the major trump cards from a French Tarot pack: a symbol of holy madness, he stands for the Nothing which contains the potential existence of all things** ***Far right*** **Fools can be sad as well as funny: a melancholy circus clown**

horned masks and shaggy or tattered clothes. The court jester's outfit with the horned fool's cap is similarly derived.

Suppressed fears of ghosts or other malignant spirits come to the surface in the grotesqueries of Europe's Dances of Death, the Koshare, and the African *Widah* spooks; in the demonic drolleries of the Bugios, the devil, and the Tibetan demons.

Often the demons also cure diseases, as in India, Ceylon and in the Iroquois False-Face ceremonies. But generally the fools are not frenzied shamans. Their therapy is mental rather than physical, and it is through their fantastic comedies that they bring anxieties to the surface. By inducing laughter they may avert any violent expressions of indignation and anxiety in their audience.

FORCES

THE CLASSICAL GODS and goddesses ruled the life of men and of Nature and controlled certain, not always very clearly defined, spheres of influence or departments of life: Mars as the ruler of war, for example, or Mercury as the god of trade and commerce. The European magical tradition, which has its roots in pagan antiquity, also classifies the phenomena of the world in terms of the powers which control them, though these powers are no longer thought of as gods but as impersonal forces or currents of energy which are at work behind the surface appearance of things (see also CORRESPONDENCES).

In popular astrology the planets, which are named for Roman deities whose characteristics have powerfully influenced the astrological nature of each planet, cause events on earth and influence the personalities of men. They are traditionally the forces which cause events or, from a more modern point of view, their positions in the sky provide evidence of the way in which the governing forces of the universe are at work. Similarly, numerologists classify human characteristics and all the other phenomena of the world in terms of nine basic forces or 'vibrations' which correspond to the numbers from 1 to 9 (see ASTROLOGY; NUMEROLOGY).

Much modern occultism, influenced by cabalistic magic, is based on the idea of ten basic forces, the sefiroth of the Cabala's Tree of Life (see CABALA), which are linked with 'spheres' and numbers. The spheres come from the medieval picture of the universe, which was generally accepted until the 16th century and which saw the universe as a construction of concentric spheres, fitting one inside each other like the skins of an onion. The outermost sphere belongs to God, the next to the fixed stars, the next seven to the planets known in antiquity (the stars which move), and the innermost sphere to Earth. It is through these spheres that the soul must climb on its way back to God after earthly death, and through them too that the magician hopes to climb on his way to knowledge and power.

Although occultists no longer regard this picture as an accurate diagram of the construction of the heavens, they accept it as a secret and spiritual reality, as the pattern or design which exists behind all outward appearances. The sefiroth, planetary spheres and numbers correspond as follows:

Number	Sefirah	Sphere
1	Kether	God
2	Hokhmah	Fixed Stars
3	Binah	Saturn
4	Hesed	Jupiter
5	Geburah (or Din)	Mars
6	Tifereth	Sun
7	Netsah	Venus
8	Hod	Mercury
9	Yesod	Moon
10	Malkhuth	Earth

These correspondences, with their wealth of classical, cabalistic, astrological and numerological associations, provide the clues to the nature of the great driving forces of the universe, to the way in which the universe evolved, and to the ladder which leads from man to God.

Briefly, the *first* sphere is the force of God as First Cause, as Prime Mover, as the Unity behind all diversity, and the soul which reaches this sphere reaches God. It unites and reconciles the opposite qualities of the second and third spheres, which are respectively active and passive. The *second* sphere is the active principle in God and in the universe, the Father, the force which causes all action, change, growth, evolution. The *third* sphere is the passive principle, the Mother of all things, the force behind everything which is negative rather than positive, potential rather than actual, stable rather than changing. Hokhmah is what acts, Binah is what is acted upon. Binah is linked with Saturn, the planet of fate and time, the inevitable and eternal, and the energy of Saturn as ruler of death is the force which magicians attempt to tap in operations of death (see DAYS).

The next two spheres are those which govern evolving life and are again opposites. The *fourth* is the force which constructs and organizes, corresponding to Jupiter, seen as the benevolent ruler and organizer of gods and men: the *fifth*, Geburah, is the force which destroys and disorganizes. In the human body, for instance, Hesed is said to

Bodleian Library

In popular astrology the planets, named after Roman deities and influenced by their characteristics, are traditionally the forces which cause events on earth and influence the personalities of men: 12th century English manuscript showing the planets

lie behind the building up of food into tissue, Geburah to lie behind the breaking down of tissue in the expenditure of energy. Geburah corresponds to Mars, the planet of violent destructive energy, inspirer of hatred, cruelty, havoc and war, and the force appealed to in magical operations of hatred and violence.

These two opposite forces of construction and destruction are reconciled and joined in the *sixth* sphere of Tifereth and the sun: the sun which nourishes animals and plants with the constructive energy of Hesed and which also withers them with the destroying force of Geburah. This is the sphere of the life-force, of vital energy, of the drive which impels all things to cling to survival.

The next three spheres again constitute two opposites and their reconciliation. The *seventh* is the force which lies behind the senses and passions, love and desire, instinctive drives, automatic and unthinking reactions. It is the sphere of the animal man as opposed to the civilized man, of the natural as against the contrived, of the full-blooded as against the inhibited, of impulse as against thought. The *eighth* sphere belongs to the force of intellect, reason, logic, considered reactions, ingenuity and of what are to magicians the highest abilities of the mind – inspiration, imagination, intuition. The two are balanced and united in the mysterious *ninth* sphere of the moon, the shadowy depths of the personality where each man's true self lies concealed, and of the magical power of the true self which springs from the combination of a man's highest mental faculties with his animal drives.

Finally, the *tenth* sphere of Malkhuth and Earth is 'the whole kingdom of God'. It unites and contains the forces of the whole Tree, as the number 10 contains those from 1 to 9, and also restates the number 1 (God) on a different plane.

A terrifying psychic experience led Dion Fortune to become a truly original writer on the dark and hidden aspects of the mind

DION FORTUNE

OCCULTIST, PSYCHOANALYST and novelist, Dion Fortune – whose real name was Violet Mary Firth – was born in 1891 and died in 1946. At a very early age she showed signs of extreme sensitivity to people and places and it soon became evident that she possessed strongly developed psychic faculties. Brought up in a Christian Science household, her marked independence of spirit and her penchant for prolonged day dreaming caused much anxiety. The power of imagination plays a great part in occultism, and in later years she learnt to make use of reverie, properly controlled and directed, in the kind of occultism she was to teach and practise.

When she was about 20 years old, Violet Firth suffered a traumatic experience which determined the course of her life. It occurred while she was working at an educational establishment. Her employer, the principal, was a domineering and unscrupulous woman of a particularly malevolent disposition, who had studied the techniques of yoga for many years in India. When Violet unwittingly antagonized her, she responded by attacking her with a form of yoga resembling hypnosis, perverting the process so as to produce destructive emanations. The attack left the girl shattered in mind and body. 'It was this experience which led me to take up the study of analytical psychology, and subsequently of occultism' she wrote in her most characteristic book, *Psychic Defence* (1930), a study of the abuses of occult power and the ways in which the victim can protect himself. Violet Firth first trained as a Freudian psychoanalyst and throughout her life retained a strong interest in psychology, publishing several books on the subject under her own name. 'As soon as I . . . watched the dissection of a mind under psychoanalysis,

Right **and** ***Far right*** **Drawings by Steffi Grant of the ground and ceiling plans of the Vault of the Adepts of the Golden Dawn. Dion Fortune believed that her initiation into this occult society had healed her of the damaging effects of a 'psychic attack'** ***Below*** **The only known photograph of Dion Fortune**

I realized that there was very much more in the mind than was accounted for by the accepted psychological theories'; it was in order to understand these unexplained aspects that she originally took to occultism.

The terrifying contact with an undoubted practitioner of black magic was also the starting point of her later researches into ways and means of combating mental interference and domination by one person, or group, over another. She learnt how to diagnose and counteract the most insidious kinds of psychic attack; and soon developed and mastered the ability to travel in her astral body, to extrude her etheric double, to scry in the spirit vision, and similar practices of operative occultism (see ASTRAL BODY; DOUBLE; SCRYING). It was not until she was initiated into an esoteric society, the Hermetic Order of the Golden Dawn, that she was fully healed from her encounter with evil forces. She claims that initiation sealed her damaged etheric body, which, since the time of her experience had been leaking energy like a broken vessel. In the Golden Dawn she applied herself systematically to the study and practice of magic, and emerged a fully fledged occultist. Her own group – The Fraternity of the Inner Light – was founded in the 1920s and is still in existence.

Under the assumed name Dion Fortune she wrote widely on the occult, her most important book being *The Mystical Qabalah* (1935); much of her material was related to Aleister Crowley's researches in the sphere of magical correspondences and symbolic affinities. Towards the end of her life these two adepts, both of whom were intent upon reviving the ancient mysteries, exchanged a number of letters (see CORRESPONDENCES; CROWLEY).

Like many occultists, Dion Fortune also used fiction as a vehicle for her ideas, well aware that she could disseminate truths otherwise incommunicable to uninitiated minds. Her novels are mainly concerned with the lives of ordinary people who, in the course of their experience, become so disillusioned through sorrow or suffering that their minds are forcibly turned inwards. This introversion taps the memories of previous incarnations; the individuals thus gain insight into the purpose of their present lives and are able to act accordingly.

Black Isis

Two novels, *The Sea Priestess* (1938) and *Moon Magic* (published posthumously in 1957) throw a great deal of light on her magical personality. In them she relates the history of a priestess of Isis who comes to restore paganism to a world that has lost touch with the elemental forces that make life truly dynamic. But it is not the Isis of simple unregenerate Nature, or primal emotional and sensual pleasure, but the

power of the Black Isis, the primordial and elemental essence of Woman in her power aspect. Mated to its complement in the male, stripped of the accretions of civilization by the realization of inherent divinity, this power is capable of effecting profound transformations in human consciousness.

Black Isis embodies the *sakti* (power) that destroys all that is inessential and obstructive to the soul's development. It is the power that liberates the spirit of man from the confines of limited experience. The basis of Fortune's practical work involves the bringing through into manifestation of this sakti, by the magically controlled interplay of sexual polarity. This is embodied in the priest, or consecrated male, and the specially chosen female. Together they enact the immemorial Rite and form a vortex in the ether, down which the tremendous energies of Black Isis rush into manifestation.

Dion Fortune believed that her work would form a nucleus enabling the ancient Temple mysteries to operate once more. She was, indeed, a priestess of the Western esoteric tradition, the ground plan of which is the Tree of Life which forms the subject of *The Mystical Qabalah*.

FORTY

THE NUMBER FORTY has been sacred and mysterious to peoples as far apart in time and place as the ancient Babylonians and the modern Eskimo. In the British Isles, the superstition about St Swithin's day, the original meaning of the word quarantine, and proverbial sayings like 'Life begins at forty' are all survivals of ideas and beliefs prevalent in the ancient Near East, where the fundamental associations of the number forty were with weather, health and hygiene.

The Babylonians attached a very special significance to forty, and called it *kissatum*, meaning 'the excellent quality', which they understood as an expression of fullness, and the universe conceived as a totality. The number forty was sacred to Ea, the god of sweet waters, who was also the supremely intelligent god. Forty was the number of offerings to the gods at important festivals in Babylon, and at Nineveh the regular period for mourning and fasting was forty days.

Probably under the influence of Babylon, other ancient Semitic peoples regarded forty as a sacred number, and right down to modern times the Mandaeans, a religious sect living in the Shatt al 'Arab, have preserved rituals connected with forty which are specifically Babylonian in origin. Among the Hebrews the sacred numbers were at first twelve and forty.

After seven, forty is the most frequently mentioned sacred number in the Old and New Testaments, as it is also in the Talmud. The earliest association of the number forty was with days, and the association with years and finally with objects came later. In Genesis 7.12, the rain which causes the flood lasts forty days and forty nights, and in Exodus 34.28, this is the time Moses spends with God on Mount Sinai. In the New Testament, Jesus spends forty days in the wilderness at the time of his temptation. The children of Israel walked forty years in the wilderness, and it was the period for the desolation of Egypt. Applied to things, forty denotes a large or impressive number. Among many examples in the Bible could be quoted forty kine, the forty sockets of silver in the construction of the Tabernacle, forty camels' burden, forty shekels of silver, and

Giraudon

The Temptation of Christ: Jesus fasted for forty days in the wilderness, during which time he was tempted by the Devil

forty cubits long. The number forty from ancient times had a special importance in connection with pregnancy and childbirth. In Leviticus 12.1–4, the rule is laid down that a woman is unclean for forty days after giving birth to a male child, and during this period is not allowed to touch a hallowed thing or come into the sanctuary. This seems to be linked with the notion, prevalent among many ancient peoples, that human pregnancy lasted 280 days (seven times forty) and that forty-day phases were of particular importance in the development of embryos, young animals and even plants.

The Greeks developed the notion that the first forty days of a pregnancy were critical. According to Aristotle (384–322 BC) it was believed that the fortieth day was the day on which the male child was believed to stir in the womb for the first time; this was already an ancient belief in Aristotle's day. The followers of Pythagoras (6th century BC) had a well-developed theory about the forty-day phases of pregnancy, according to later authors. They celebrated the safe passing of the fortieth day, for which they had a special name, regarded the fifth forty-day period as the time during which the foetus began to move down, and the sixth, from the two-hundredth to the two-hundred-and-fortieth day, as the most critical.

The belief that women are unclean for forty days after childbirth is found in many parts of the world today, and was held by the Babylonians, the Israelites, and, as a 2nd century BC inscription from Lesbos shows, by some at least of the ancient Greeks. According to ancient Greek notions, the first forty days also marked a defined phase in the life of a new-born baby: Aristotle remarks that children do not smile or shed tears until they are forty days old.

From this particular connection with pregnancy and childbirth, the forty-day period took on a general significance for health and hygiene. It was a critical period, according to Hippocrates and other Greek medical writers, in the development and treatment of certain diseases, and this belief survived long enough to make quarantine – as the word itself indicates – originally a period of forty days. The phases of certain stars also contributed to the belief that forty was a sacred number. The ancient Greek poet Hesiod (8th century BC) says that the Pleiades – a constellation which loomed large in the imagination of all ancient peoples – disappear for forty days each year. The associations of the phases of the Pleiades with changes in the weather, taken with this observation of Hesiod's, probably accounts for the ancient and very widespread habit of making up rules about agriculture, fishing, sailing and hunting based on forty-day periods. The tradition that the flood lasted forty days and forty nights derives from this astronomical lore, and may have led to the frequent association of the period of forty days with mourning, fasting, penitence and atonement.

A Drink for the Dead

The idea of forty-day cycles in the weather has been perpetuated in many superstitions found in rural America – for instance that the weather on Ash Wednesday will 'rule' the weather for the next forty days, or that if it rains on 1 June it will rain for the next forty days and nights.

These ill-omened associations of the number forty may account for the belief, especially prevalent in Slav and neighbouring countries, that the soul of a dead person continues to dwell on earth for forty days. In these countries it was the custom until quite recently to place a jug of water beneath the icons in the house for forty days after the funeral, and to inspect it daily to see if the dead person had drunk any. Another train of thought behind these customs was that the first forty days after death were peculiarly significant in the same way as the first forty days after birth.

To philosophers of the great Pythagorean and later schools, the purely arithmetical properties of the number forty may also have played a part in its sacred history; but there is no evidence that such mathematical speculation ever entered the mainstream of folk traditions, in which the forty sons of Abdon the Pirathonite, the forty martyrs of Sebaste, the forty thieves of the Arabian Nights, the forty summers that besiege thy brow, and the forty days and forty nights of Christ's temptation in the wilderness are all part of a unified whole.

(See also NUMEROLOGY.)

The Romans believed that gods and goddesses, divinely descended heroes and the celebrated twins, Romulus and Remus, all played a part in the founding of Rome

FOUNDING OF ROME

THE NAME OF AENEAS, the Trojan warrior who is first mentioned in Homer's *Iliad*, is linked in legend with the foundation of Rome. In the *Iliad* Aeneas's mother, the goddess Aphrodite, and the god Poseidon predicted that his heirs would rule over the Trojans in great glory; thus of all the Trojans only Aeneas was assured of survival after the Greek conquest. The figure of Aeneas also belonged to the series of legends on the wanderings of heroic warriors after the Trojan War. Because of the incidence of towns and other coastal landmarks which anciently bore names similar to his, Aeneas became the archetype of the wandering refugee who founded cities. The most remarkable of his postwar exploits were his visit to Carthage and a contribution to the beginnings of Rome, whose Italian empire was destined to fulfil Aphrodite's prophecy of the Trojan's enduring dominion. The legend of Aeneas's activities in the western Mediterranean is far older than Virgil's epic poem the *Aeneid*, which was published after the poet's death in 19 BC.

In this poem Aeneas flees from the sacked city of Troy in the company of his son Ascanius and his aged father Anchises. After many adventures Aeneas reached Italy where various sites were connected with his visits and dedications. Aeneas strengthened his band of Trojan followers by a dynastic marriage with the native princess Lavinia, whose father Latinus offered land to the Trojan and shared his kingship with Aeneas.

In some accounts Aeneas is represented

The mythical founders of Rome, Romulus and Remus, were the sons of Mars and a mortal maiden. Cast adrift on the river Tiber, they were rescued by a she-wolf and reared by her until found by a shepherd: Rubens' painting of the twins being suckled

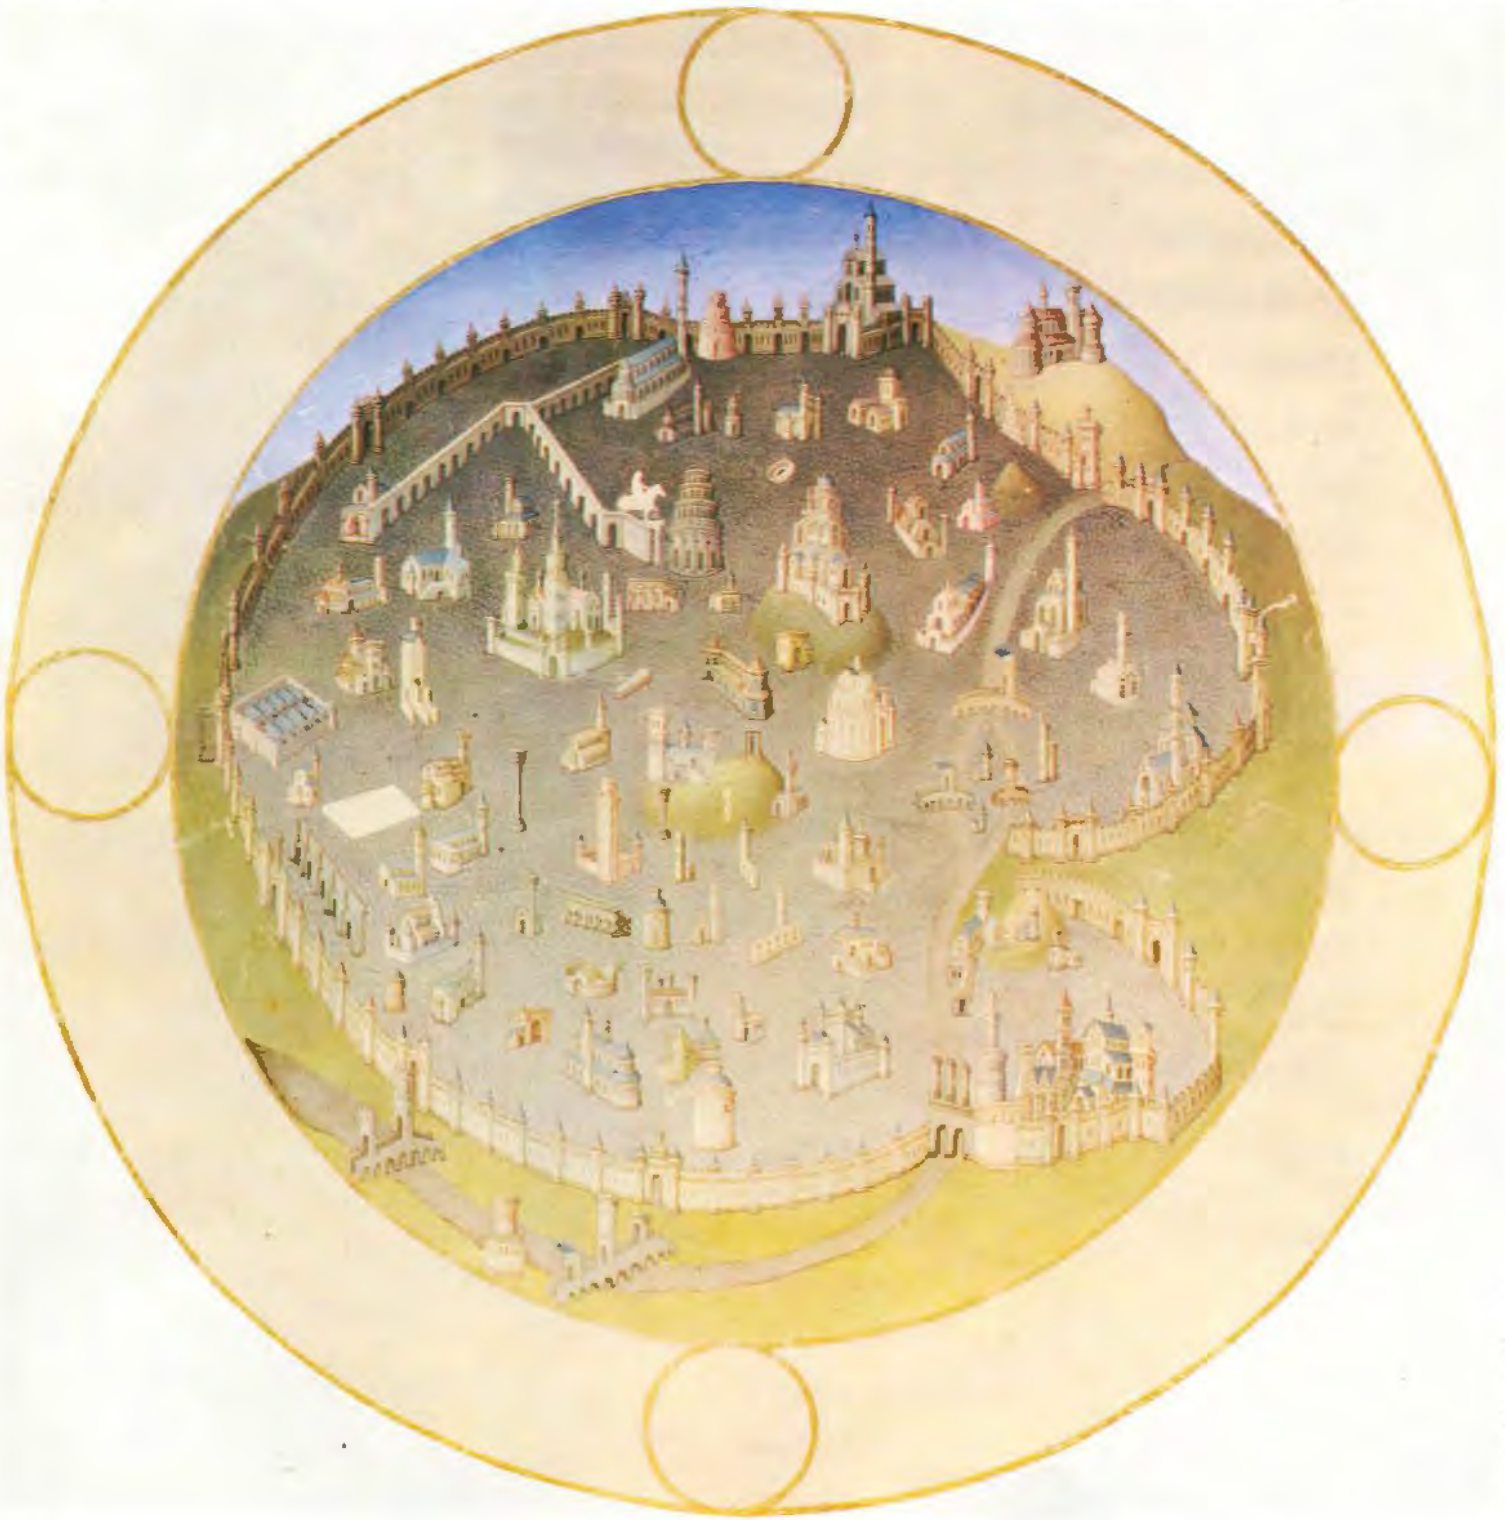
Scala

visiting the place which would later hold the city of Rome founded by his descendants. However, Aeneas himself never played an actual role in the foundation. Before the Romans began to investigate and record their origins there already existed two reports of the relationship between Aeneas and his descendant Romulus, who according to the older reckoning was the grandson of Aeneas. The accepted date of the destruction of Troy as around 1200 BC and the tradition of the foundation of Rome as c 753 involved both Greek and Roman scholars in a chronological discrepancy. This they solved by creating a dynasty of kings, usually named *Silvii*, who ruled over the people of the ancient Latian city of Alba Longa.

According to the literary tradition of the Silvian dynasty, Amulius deposed his brother, the rightful king Numitor, and consecrated his niece, Rhea Silvia, to the goddess Vesta so that she would remain forever childless. The maiden was loved by Mars and she conceived and gave birth to twins who were exposed to die. They were borne along by the Tiber and brought to land near the site of an archaic Roman shrine, the Lupercal and its neighbouring holy fig tree, the *Ficus ruminalis*: both landmarks play an important role in the legend of the twins. Although the literary devices of the tale bear the marks of a Greek legend, it also bears unmistakable traces of Roman invention by its attention to well-known local landmarks. The names of both Romulus and Remus refer to places: Rome itself and Remoria or Remona, evidently an old name of the Aventine Hill. Indeed Romulus itself means no more than 'Roman'.

Wolf-Mother or Wanton?

The Lupercal was a grotto at the foot of the Palatine Hill attached to the cult and ceremonies of the two old religious fraternities of *Luperci*, the *Fabiani* and *Quinctiales*, who annually purified persons and places during the festival of *Lupercalia* on 15 February. In consequence of the linguistic derivation of Lupercus from *lupus*, 'wolf', the Romans believed that a she-wolf had suckled the newborn twins. The suckling itself was suggested by the



Musée Condé de Chantilly/Giraudon

Ficus ruminalis, the name of which was thought to have come from an obsolete word for teat and the verb *ruminare*, 'to chew'. In fact, the manifest sense of the fig tree's variant names, Romula and Romularis, and the obsolete name of the Tiber river, Rumo, demonstrate that the sense of ruminalis was 'Roman'. In any event, the story of the wolf and the twins was already well established in 296 BC when two Roman magistrates dedicated a statue group of the three at the Lupercal.

A later rationalization of the tale attempted to suppress the unlikely animal by reinterpreting the wolf as a *lupa*, the common Latin designation of a whore. In this account the twins are discovered by the shepherd Faustulus who entrusted them to his wanton wife, Acca Larentia. A minor goddess, she was worshipped at her shrine in the place called Velabrum, also situated at the foot of the Palatine Hill.

Marking the Boundary

Reaching manhood among Faustulus and his fellow shepherds, Romulus and Remus assumed the leadership of a band of cattle-rustlers who plundered the territory of the usurper Amulius. Caught and brought before the deposed Numitor, Romulus and Remus pleaded so eloquently and regally that their identity became known to their own grandfather. Thus reunited and aware of their rightful inheritance, the twins overthrew the usurper and restored their grandfather. Yearning for their old haunts and impatient of waiting their turn at the Alban kingship, they returned to the place where the waters of the Tiber had once set them down. In the tradition of Alba Longa as the mother-city of Latian towns, they led a proper Alban colony to found a new city on the site. The brothers quarrelled over the colony's location and name and decided to seek a sign from the gods to settle the matter (see AUGURY). Remus took his place upon the Aventine Hill and Romulus upon the Palatine, and both watched the heavens for a sign. To Remus first appeared six vultures, but twelve vultures flew into Romulus's line of vision. In this fashion the god Jupiter indicated to the colonists the site and name of Rome.

Romulus himself drew the sacred boundary of the city which the Romans called a *pomerium*. The manner of marking the boundary was to plough a furrow with a team of a cow and a bullock. The plough had to be lifted over the place of each gate. The cow was yoked on the inside of the boundary, apparently to invite fertility within the city, and the bullock on the outside, to keep sterility beyond the town's boundary. Romulus forbade his brother to leap the boundary, a magical act evidently bringing ill-luck and in the most frequent version, himself slew Remus who taunted the founder by leaping over it.

Romulus's foundation was *Roma Quadrata*, 'squared Rome', a formal colonial settlement on the Palatine Hill which does in fact yield the oldest traces of continuous habitation at Rome. Romulus divided his colonists into three major divisions called tribes and these again into 30 subdivisions, the *curiae*. Traditionally, the three tribes represented the ethnic constituencies of Latins, Sabines and Etruscans, while the 30 curiae served the gods of the common people and were also military units of the primitive army. The usual treatment of the foundation relates that the first Romans numbered 300 cavalrymen and 3000 foot soldiers. The features of the foundation legend are entirely drawn from the Romans' experience of later colonization in Italy.

Romulus reigned long and well, leaving a much larger kingdom than he had founded. One day while performing some public act in the Campus Martius – the field of Mars – he ascended into heaven and joined the gods. Later a certain Julius Proculus announced that he had seen Romulus, who told him that he had become the god Quirinus. This apotheosis of Romulus is closely connected with the cult of Mars (see MARS).

It was Mars who fathered the twins on the Vestal Virgin and it was from the Campus Martius that Romulus ascended to heaven. In addition the name of Numitor seems cognate with a title of Mars, 'Numisius'. The word *Quirinus* was

Scala

Left **An early 15th century plan of Rome from the Duc de Berry's *Book of Hours*, now in the Musée Condé de Chantilly *Right* Escaping from the holocaust of plundered Troy, Aeneas, ancestor of the future founders of Rome, bears his aged father Anchises on his back to safety: detail from a fresco designed by Raphael**

commonly a cult-title of at least two Roman gods, Mars and Janus. It probably comes from *curia* and thus means 'of the (Roman) *curiae*'. Apparently in no case did a founder who had given his name to the city enjoy an actual cult at Rome. Rather, the Romans chose to see in Mars Quirinus the figure of their founding father. The festival of Quirinus *(Quirinalia)* fell on 17 February, just two days after the festival of Lupercalia.

Romulus's divine appearance to Julius Proculus belongs to the ancestral pretensions of Rome's Julian clan. The surname Proculus is related to the fiction of the Silvian dynasty of Alba which had a king Proca or Procas. The Julii clan claimed that through their ancestor Iullus, another name of Aeneas's son Ascanius, they were directly descended from Aeneas and Venus. The clan, though patrician, had not maintained a continuously dominant position among the vigorous and long-lived Roman aristocracy which for centuries controlled Roman politics. Hence their pretensions to divine and heroic ancestry complemented the Julii's eclipsed history and family position. In this framework Gaius Julius Caesar had created a third confraternity of Luperci called after himself, since the other two archaic ones bore designations related to other patrician families. On the occasion of the Lupercalia in 44 BC Mark Antony, serving as a Julian Luperus, offered Caesar the diadem of a king. It is this event which Shakespeare portrays in his *Julius Caesar*. Finally, both Caesar and his adopted son Octavian fostered the cult of Venus Genetrix, Venus the Ancestress. Indeed when Octavian became emperor he adopted the preferred honorific title 'Augustus' rather than 'Romulus'. Augustus also restored the architectural embellishments of the Lupercal. Both Caesar and Augustus proudly bore the title Father of the Fatherland which had a significance peculiar to their clan alone.

Michael Holford

As the springhead of living waters, source of fruitfulness and life, fountains have been seen as the haunt of virgin nymphs and as bestowers of youth and wisdom

FOUNTAIN

AUTHORS IN ANTIQUITY were often at pains to stress the difference between fountains and springs, which are living and natural sources of water, and cisterns and wells, which are man-made stores of motionless water. To the modern mind, there is an obvious distinction between the two, but one which depends on mere physical qualities rather than divine or magical attributes of moving water.

Water which moves, glistens, and makes audible sounds is regarded in primitive thought as either living or inhabited by animate spirits. These spirits were gradually made more and more personal, until in the Old Testament we find this essentially pantheistic conception of the fountain assimilated into Jewish monotheism: in the book of Jeremiah, the Lord says, 'My people have forsaken me, the fountain of living waters', and more than one prophet alludes to the Messiah as a fountain which shall come forth.

Fountains are symbols of life itself, but more specifically they represent the source of fertility, the 'water of life'. The ancient Greeks peopled their springs with nymphs, and the original meaning of that word is 'nubile maiden'.

A typical Greek nymph myth is contained in the story of the huntsman Alpheios, who fell in love with Arethusa, a hunting maiden. She refused his advances, and took refuge in the little island of Ortygia in front of Syracuse harbour, where she was transformed into a fountain of fresh water. In despair, Alpheius turned himself into a river, but he still loved Arethusa as desperately as before, and so he sought a

In Hieronymus Bosch's painting *The Garden of Delight*, a fantastic fountain, symbol of life itself, gushes forth in the paradisal setting of the Garden of Eden: Old Testament prophets sometimes referred to the Messiah as the fountain which shall come forth

way under the sea until he reached Ortygia, where he mingled with the water of the fountain.

The Greeks, and other ancient peoples, attributed miraculous fertilizing powers to some fountains. There is a spring which still flows at a village on the eastern outskirts of Athens, where, according to Ovid, childless wives were taken in the belief that a drink of the sacred waters would cure them of sterility. The association between fountains and the bearing of children is found in more than one symbolical passage in the Old Testament, and a man's wife is referred to as his fountain in Proverbs: 'Let your fountain be blessed and rejoice in the wife of your youth.'

Fountains are the source of youth and rejuvenation and belief in a fountain of youth is world-wide. One Red Indian myth describes how it was created halfway between earth and heaven by two buzzards but was later destroyed for bringing only pain and grief to those who drank of its waters, as they outlived their children and their friends.

A Spanish writer of the last century says that long before his time a great many Indians travelled from Cuba to Florida in search of the fountain of youth, and rumours of its existence even attracted some travellers from Spain.

According to a Japanese legend, the white and yellow leaves of the wild chrysanthemum bring blessings from the fountain of youth, where Kiku-Jido the chrysanthemum boy dwells. The leaves were ceremoniously dipped in *sake*, the Japanese liquor that reputedly gives men health and a long life.

In mythology, fountains have been accredited with other powers besides that of conferring fruitfulness and everlasting youth. At Argos in Greece, the goddess Hera became a virgin again each year by taking a dip in the fountain of Kanathos. A similar idea underlies a Teutonic myth, which shows a strange blend of pagan and Christian beliefs. The shaggy wood-wife Rauhe Else came on all fours to the sleeping hero Wolfdietrich, begging his love. He agreed, on condition that she would be baptized. She carried him off to her own land, where she bathed in the fountain of youth, and was transformed into the lovely maiden Sigeminne.

Symbol of the Soul

One way that Christianity came to terms with pagan beliefs in the miraculous powers of fountains, springs and wells, was to transfer their guardianship to a saint, who now performed his own miracles making use of the revered waters.

Fountains have been regarded by many races as sources of wisdom. In an ancient Celtic myth the seeker after wisdom is drowned in a holy fountain, and in more than one Irish legend fountains are associated with the mysterious salmon of knowledge who gives advice to the hero. In Norse mythology, the god Odin goes to the fountain of the Nature spirit Mimir in which wisdom and cunning lie hidden. There he asks for a drink in exchange for a few sips of which he must pay the price of one of his eyes as a sacrifice to the fountain.

Some modern writers have sought to trace back these various mythological associations of the fountain to deeper underlying ideas. It has been remarked that in gardens, courtyards and cloisters, the fountain usually occupies a central position, and this has been linked with the four rivers which, in many mythologies issue forth from the centre of the earthly paradise. From this observation that the fountain usually occupies the central point, some writers have drawn the conclusion that the fountain is a symbol of the soul as the source of inner life and spiritual energy, and ultimately of individuality itself. Jung suggests that the fountain is a mother symbol and he also links it with the 'land of infancy', interpreting it as a symbol for the area of the unconscious responsible for the individual's moral behaviour patterns.

In mythology the fountain is not the formal construction of the kind found in courtyards and cloisters. It is essentially moving, living and natural water and there may be no need to look further than these characteristics to 'explain' the various myths and symbols that have grown up around the fountain.

(See also SPRINGS AND WELLS; WATER.)

FOUR

'FOR THOSE WHO exalt Four teach us a lesson that is not without value, that by reason of this number all solids have come into being.' This comment from Plutarch's *The E at Delphi* gives the key to the significance of 4 in Western numerology. The Pythagorean school of philosophy, which believed that the universe is constructed to a numerical pattern (see NUMEROLOGY), linked the number 1 with the point, which in theory has no dimensions; the number 2 with the line, which connects two points and has length but not breadth; and the number 3 with the triangle, which connects three points and has length and breadth but not height. To construct the simplest solid figure – the tetrahedron – a fourth point has to be added, above the triangle, and the four points connected. This suggested that the basis of the construction of all solid objects is to be found in the number 4.

Ever since, 4 has been the number of solids and solidity, of matter, of the way in which things are constructed. According to the old theory, everything is made of four elements (fire, air, earth and water) and four qualities (hot, cold, wet and dry). And 4 is especially the number of Earth, a solid object bounded by the four cardinal points.

It follows that someone whose name adds to 4 (see ALPHABET) is likely to be described by numerologists as solid and stolid, stable but sadly uninspired, like lifeless matter which lacks the vital spark. Plain and down to earth, he will be respectable, humdrum and stodgy, and will regard himself as a pillar of society.

Philip Rahtz

Four is particularly the number of Earth, bounded by the four cardinal points, and the cross which unites the four directions can be a symbol of 'the world'

Four is traditionally the unluckiest and grimmest of numbers because of its connection with earthly existence, which medieval numerologists saw as something gloomy, laborious, pain-filled and sin-ridden, contrasting unfavourably with the spiritual joys of life in heaven.

The association of 4 with agricultural labour, toil on the earth's surface, and so with the traditional stereotype of the rustic, gave the number its connotation of relentlessly hard work, usually for minimal and uncertain rewards. Those whose number is 4 are plodders, slow, cautious and conservative, suspicious of innovations and strangers. They have a bovine placidity, which is likely to be interrupted occasionally by violent outbursts of temper, these being the psychological equivalents of earthquakes and volcanic eruptions. For the same reason, they will suffer from attacks of indigestion, and they will also be afflicted with fits of melancholy.

The unfortunate 4 does have many good qualities. Most of the time he is as steady and reliable as the earth itself, practical and sensible, calm and collected, an excellent worker and organizer, good at detail and routine. But essentially, though many modern numerologists prefer to gloss it over, 4 is the number of poverty, disappointment and defeat.

Fourteen
In numerology, the number of change and transformation, because the moon changes from new to full, and from full to new, in 14 days. See MOON.

GEORGE FOX

THE QUAKERS have survived vicissitudes which have swept away many lesser sects which arose during the English Civil War period and after. That they should have endured for so long and have done so with relatively little change in their values and organization is largely due to their founder, George Fox (1624–1691). Although a mystic and a prophet, Fox had both practical sense and organizing ability. Perhaps above all else he acquired the gift of communicating not only precepts and doctrines but a spirit of patience, tolerance and uprightness that has marked Quakers since the end of the 17th century.

Fox was born at Fenny Drayton, Leicestershire, the son of a puritan weaver. Although apparently intended for the Anglican ministry, Fox received little education; and he was eventually apprenticed to a shoemaker. As a young man he showed a restless disposition that expressed itself in the endless religious debates of the time. He disputed with a number of neighbouring Puritan clergy without finding satisfaction and in 1646 he came to the conclusion that a minister ought to be more than merely a scholar. His own claim to religious knowledge could not, of course, rest on scholarship, and, like other sectaries, he came to emphasize the superiority of inspiration and revelation to mere 'book learning'. The sense of Christ dwelling within became the legitimation of his own preaching and, subsequently, of Quaker practice.

In the late 1640s, Fox travelled about Leicestershire, Derbyshire and Nottinghamshire preaching, testifying in churches and meeting with various groups of religious Nonconformists. The Baptists proved to be more receptive than others among the leading separatist groups, and from them and from the less clearly defined Seekers he won most of his following.

Fox's associates were known usually as 'Children of Light' or 'Friends of Truth'; the name Society of Friends was established ouly after his death although the term 'Friends' was often used. The name Quaker became current in the 1650s after a magistrate, Gervase Bennett, had thrown the expression at Fox during his trial in Derby in 1650. The word was already current, however, for sectarians who shook with the power of the Holy Ghost.

In his early years, Fox's preaching was clearly intemperate, and sometimes constituted a public disturbance, as when he went through the streets of Lichfield proclaiming 'Woe unto the bloody city of Lichfield'. Early Quakers sometimes prophesied the early coming of the Day of Judgement and were often identified as Ranters. Others rejected all conventions and felt obliged to go naked in the streets. Fox himself did not object to those who were conscientiously moved to make their nakedness a warning to all men, but he saw the unwisdom of the millenarian prophecies and urged his followers in 1653 not to 'go out from the Spirit of God' into their own notions. Under this type of counsel Quakers became more restrained.

Fox had his earliest success in the north Midlands and the north of England in Westmorland where Swarthmore Hall, home of Judge Fell and his wife Margaret became a great centre for Quakers. Margaret Fell married Fox in 1669 after ten years of widowhood. In the 1650s he and some seventy preachers sought to convert men in the southern counties. They met frequent persecution and imprisonment: Fox was imprisoned eight times in his life.

Theodore Heizel

Inner experience of communion with God, or the Inner Light, formed the basis of George Fox's teaching and is at the heart of Quaker belief: portrait by C. W. Peale

His preaching, while inspired by visions, had considerable social content. He spoke out against injustice, against low wages, capital punishment, cheating by merchants, drunkenness and enclosures; although he was less radical than the contemporary Levellers and Diggers, he was a convinced pacifist and advised against political involvements. Different as his theology was from that of the Puritans, he shared much of their social ethic and condemned dancing, sport and stage performances as vain, and enjoined Quakers to plain speech and dress.

He instituted regular monthly and yearly meetings among his followers who in the mid-1650s numbered about 30,000 and these became the working basis of Quaker organization. Many followers had been converted as communities of Seekers, and the strong congregational policy that Fox encouraged provided a safeguard against the dangers of individual inspirationalism. His teaching of the 'Light within' (modern Quakers use the phrase 'inner Light') was thus set in a context of firm community control which disciplined excess and reinforced the standards of integrity that Quakers were bidden to adopt. Fox appears to have had little sense of personal sin but felt the weight of sin in the wider world: his message was that Friends should see the Light of Christ in other men.

Fox continued to work at his *Journal* until his death at the age of 67 and this is still of great importance to Quakers. He also wrote over four hundred Epistles and various other doctrinal writings. The appeal of his message probably lay most strongly in his teachings that Christ has redeemed man from sin and eternal damnation, and that if man turns to Christ and listens to his inner promptings, he will be forever saved.

ST FRANCIS OF ASSISI

SAINT FRANCIS (Francesco Bernardone) was born at Assisi, a small city of Umbria in central Italy, in either 1181 or the next year. He died, also at Assisi, in 1226.

The age before his birth had been one of rapid change in Italy. A century (1050–1150) of widespread reform had been rich in capable and saintly popes, bishops, abbots and thinkers. Now reform and its institutions were beginning to flag. The cities began to expand and with increased population came an increase of those near or below subsistence level, as well as a new class of wealthy merchants and businessmen. The cities and towns formed small, intensely individual units, frequently at war with each other. It was in this turmoil of social and religious upheaval and questing that the orthodox orders of friars had their birth.

The son of a wealthy cloth merchant, Francis grew up at Assisi among a lively, pleasure-loving, extravagant group, and his energy and charm soon made him its leader. Then during a war between Assisi and Perugia (1201–2) he was captured and suffered a year's imprisonment. This was followed by a long illness and the first of a series of experiences which Francis began to interpret as divine warnings and invitations. In 1204, while embarking on another military mission, he was halted by a dream and he turned back to care for the needy and sick – particularly the lepers – and rebuilt the ruined church of San Damiano at Assisi. He then renounced his patrimony to become a hermit. Finally in February 1209 on hearing at Mass the gospel with the apostolic commission: 'Preach as you go . . . take no gold, nor silver nor copper in your belts' (Matthew, chapter 10) he accepted forever his vocation to follow the commands and counsel of Christ literally, and in absolute poverty.

He travelled the country preaching penitence and the imitation of Christ and was joined by his first brethren. In 1210 he visited Rome with 12 others and received from Pope Innocent III confirmation of a simple rule (the *Primitive Rule*) composed almost entirely of gospel precepts. For a short time the Little Brothers (*Fratres Minores*) lived together near Assisi at St Mary of the Angels, better known as the Porziuncula, traversing Umbria in couples, preaching and working for their daily bread. Such a group, with a manifestly saintly and magnetic leader, exactly met the religious demand of the age, and recruits flocked to join him. Their sisters heard the call and in 1211–2 Francis founded the House of the Poor Ladies by the church of San Damiano, for in the society of that day enclosure was essential for religious women. The nobly born Clare Favarone (later St Clare) and her nuns took vows of absolute poverty and were to pray for the brethren and assist them as best they could.

The numbers continued to grow but for a long while Francis refused to accept formal organization. Throughout his life he remained a magnetic, baffling leader who seemed often to despise elementary rules of prudence and commonsense, disappearing when most needed and unbending in the face of opposition, yet always possessed of luminous spiritual insight and wisdom in counsel.

Brother Sun

Before long a tension developed that was to continue in the history of the Order between the simple, exacting, heroic demands of Francis, accepted to the full by a few intimate followers, and the needs of a large body of friars, some of them men of learning and influence who, supported by papal authority, aimed at making his teaching viable by adapting it to the capabilities of the many. Cardinal Ugolino, first as devoted disciple and later as Pope Gregory IX, must take much of the credit – or blame – for translating Francis's intuitions into a code. For long Francis resisted: he wanted no order, no constitutions. If a brother heard the call he accepted the commands and counsels of Christ, and nothing else was needed. Compelled at last to write a rule, the so-called *First Rule*, he allowed Ugolino to promulgate it at a gathering of all the friars in 1221. It proved too exacting, too spiritual – or too vague – for the multitude, and after much suffering and labour Francis, assisted by others, rewrote it in language that was less spiritual and more

St Francis 'lived always on the spiritual level': he felt a unique sense of brotherhood with all living beings and the entire life of Nature. ***St Francis in Ecstasy,*** **by Bellini**

juridical. This, the *Second Rule*, was approved by Honorius III and has remained ever since in essentials the rule of the Franciscan Order.

This short account must omit many of the characteristic actions in the saint's life such as his missionary journey to Spain, or his sortie East with the crusaders, to be captured and to preach before the Sultan in Egypt, or missions of the friars to France, England, Germany, Greece, Morocco and elsewhere. In 1220 he resigned the official headship of his order, exhausted as he was both by illness and the oppostion to his ideals, and for the rest of his life he moved round Umbria surrounded by a group of his First Friars, of whom Brother Leo was the chief. In 1224 he went through a mystical experience on Monte La Verna, after which his hands, feet and side bore the five wounds of the crucified Jesus. Later he composed his magnificent praise of Creation, the *Canticle of Brother Sun*.

For the rest of his life he was ill and almost blind, but he retained his fortitude and spiritual clarity of mind, as also an exquisite tenderness towards his companions and friends. In his *Testament* he reiterated with poignant emphasis his commands of poverty, simplicity of mind, and avoidance of all privilege and honour. Cared for in his last weeks by St Clare at San Damiano, he died at the Porziuncula on 3 October 1226. He was canonized by his old friend Ugolino (Gregory IX) in 1228 and two years later was finally interred beneath a magnificent basilica bearing his name.

St Francis was indeed one of the most remarkable men of medieval Europe, in his personality, his creation of 'power-ideas' and his influence upon his contemporaries and posterity. While the Catholic Church has always venerated him as a saint with an immense following and as founder of a religious order which has for many centuries been the most numerous of all, he has been for many, both within and without the Christian allegiance, the most attractive saint of history.

The 'Only True Christian'

Francis, the gay, impulsive, naive, articulate Italian appears more clearly than any other historical character to embody the springlike delicacy of primitive Italian art and literature. His poetic masterpiece, the *Canticle of Brother Sun* is a hymn to the beauty of elemental creation – sun, moon, stars, wind, water – and of natural life in birds, animals and flowers. His unique sense of brotherhood with all living beings, his love of children, birds and animals is likewise entirely original, and this together with his wise and humorous treatment of his simplest brethren, admits us to his intimacy, without any reserve. His hatred of all that is mechanistic and legalistic in church life has endeared him to many at the present day.

He has been hailed as the most Christ-like of men, the 'only true Christian'. All saints by definition must be recognizable as followers and imitators of Christ, but St Francis as compared to a St Augustine or a St Hildebrand, will appear to many as it were a facsimile, a reappearance, of the Christ who walked in Galilee. No doubt this is to simplify, if not to blur the full vision of Christ. Yet if such a view misses many qualities of Jesus, Francis has a Christ-like capacity of seeing all creatures and all events from their centre, God, and in his last years he is seen more clearly than any other medieval saint as one sharing in the Passion of Christ. He resembles Jesus in another way also. Most men, faced with the eternal tension in religious life between law and liberty, choose one or the other on the purely human level, where law may become compulsion, and liberty, licence. St Francis, living always on the spiritual level, had the freedom of the sons of God, to whom law is a translation into words of their free choice. He would have nothing to do with monastic rules, canon law, scholastic theology, and dispensations because he had within him the law of life, the will of God.

But he was in no sense a revolutionary or as he used to be hailed, the first Protestant. He knew every least article of the teaching of the Church with the accuracy of a theologian, and he recognized in every detail the authority of priest, bishop and pope, the sanctity of the sacraments and the worshipfulness of the Bible

as the Word of God. Without all this, he could not, either in his person or in his order, have shared as fully as he did with St Dominic in the rebuilding of the Church. Therefore although many historians may say that he did no more than precipitate a vocation for which many of his contemporaries were groping, it was he who created the friar, a new type of religious person, differing from both the hermit and monk, who went out to the poor, to the city-dweller and to the pagan, calling the world to absolute poverty, and nakedly following the naked Christ on the Cross. The message of Francis was to live by the words of Christ accepted literally and fully. Like Christ's message it was uncompromising and impossible to human nature unaided. It was modified and glossed by those who came after, but Francis and his gospel remained and his call is still heard.

The life of St Francis presents many problems of chronology and critical interpretation, and none of the numerous modern *Lives* can be called definitive. The two classical pictures of the saint, St Bonaventure's *Life* and *The Little Flowers*, the one a model piece of hagiography, the other a jewel of early Italian prose, are equally unsatisfying; the former because of its selective, tendentious character, the latter because it is impossible to separate the historical and the mythical elements which are presented in it. The student of St Francis must go to the two *Lives* by his contemporary, Thomas of Celano, and to the mass of early reminiscences contained in the *Legend of the Two Companions*, the *Sayings of Brother Leo* and the enigmatic but fascinating *Mirror of Perfection*.

ST FRANCIS DE SALES

THE SON OF A NOBLEMAN of Savoy, in the French Alps, Francis de Sales (1567–1622), was one of the more attractive figures of the Roman Catholic Counter-Reformation. He was educated by the Jesuits in Paris and studied law in Padua where he took his final degree at the age of 24; he then returned home to the family chateau on the Lake of Annecy and resumed the life of a young aristocrat.

Ever since boyhood he had wanted to be a priest, and had retained this ambition despite his father's opposition. An opportunity seemed to offer when the provostship of the chapter of Geneva fell vacant; it was felt that this was a post that the son of a nobleman could suitably occupy and Francis was ordained priest and given the benefice, with his father's grudging consent, in 1593. He devoted himself to the service of the poor and undertook a mission in the neighbouring region of Chablais, preaching to the militant Calvinists with some success, despite the considerable danger of the task and threats of violence. Within four years the area had returned to Catholicism, in recognition of which he was appointed assistant bishop of Geneva and in 1602 he succeeded to the see. Francis immediately set to work on a heavy programme of reorganization and reform and his fame as a preacher and spiritual director spread. For the rest of his life he devoted himself to this work with tenacity and enthusiasm.

While he was preaching a Lenten course of sermons at Dijon in 1604 he met Jeanne Françoise Frémyot de Chantal, the recently bereaved widow of a baron. Francis became spiritual director to the unhappy woman, who was to find her vocation by becoming co-foundress of his proposed new religious order for women. Known as the Order of the Visitation, it was intended for those with 'strong souls in weak bodies', single women and widows who, by virtue of their age or infirmity, would be refused admission to the older orders and would have had difficnlty in observing the strict rules. Such an idea met with considerable criticism and the original plan had to be modified before it found approval in Rome: enclosure was insisted upon, though the founders had planned at first to allow the nuns to go out and undertake works of charity. These first nuns were guided by a sure hand during the early days of their order, and by the time of St Francis's death in 1662 there were nearly 20 convents in existence. It was at one of these that he died, at the convent of Bellecour in Lyons, on his way home.

Chris Barker

St Francis de Sales was instrumental in altering the attitude that to live a fully Christian life it was necessary to cut yourself off from the everyday world: he believed that a life of devotion is possible in the everyday world. Portrait of St Francis from the 1630 edition of his work on mystical theology, *Treatise on the Love of God*

A Gentleman of God

Francis de Sales was known throughout his life for his gentleness and kindness; he was always a man of moderation, displaying great courtesy and an unusual sensitivity towards the feelings of others. Today he is remembered principally for his writings. These were largely occasioned by the requirements of his work as spiritual pastor and by his efforts to make his diocese a dynamic focus of Christian faith. His most important book is probably his *Introduction to a Devout Life* which was instrumental in altering the firmly entrenched attitudes to what people considered constituted the devotional life. The prevalent view of the time, particularly in France, was that the only path to holiness, to living a genuinely Christian life to the full, was to enter a strict religious order, thereby cutting oneself off from the world outside. Francis opposed this idea and in his book he purported to show that a life of devotion is possible in the world and indeed that this is the duty of every ordinary Christian.

Francis's other great work is his *Treatise on the Love of God*. In the *Devout Life* he is dealing with the theology of asceticism, knowledge of God through self-denial and preparation; in the *Treatise* his subject matter is mystical theology, knowledge of God through spiritual communion. He speaks of the love of God as an obligation which binds us all and therefore gives instruction of a very practical nature.

Francis himself was not at first a contemplative; he only seems to have explored the possibilities of deep meditation under the influence of the works of St Teresa of Avila and through understanding and sharing the mystical experiences in the lives of two women under his guidance: Jeanne Françoise de Chantal and Madame Acarie. The *Treatise on the Love of God* was written as a result of this new interest and his own progress in the mystical state. In it he shows how each individual can and must attempt contemplative prayer and the book therefore forms a natural complement to the *Devout Life*. For St Francis the whole purpose of contemplation is conformity of the human to the divine will. His so-called prayer of 'simplicity' which is 'indifferent' to all reward, even an eternal reward, was to exert great influence in religious circles during the next two centuries and editions of the *Devout Life* continue to appear.

FREEMASONRY

Freemasonry began in the Middle Ages as an early trade union for builders. Its openness to all who accept a Supreme Being as the Great Architect of the world and its enticing air of mystery have made it the most papular of all secret societies

ONE DEFINITION of Freemasonry is that it is 'a system of morality veiled in allegory and illustrated by symbols'. Freemasons are members of a so-called secret society but membership is freely available to any man of good repute. There is no question of recruitment or invitation to join: individuals simply find their way to the Craft, mostly through a friend who is already a member.

Any brief attempt to explain Freemasonry's inner meaning, its historical development and its place in modern society, presents formidable difficulties. It is not that information is difficult to obtain. On the contrary, anyone sufficiently curious can learn a great deal from the available literature, which is enormous. A Masonic bibliography published in Germany in 1912 contains no fewer than 40,000 titles. It seems, however, that to begin to understand the inner meaning of Freemasonry one must belong to it, if only because the actual experience is more important and significant than merely 'academic' knowledge.

For the outsider the perplexing factors are Freemasonry's status as a secret society and the significance of the secrets that it allegedly so jealously guards. Again, it is often asked why so many adult and presumably sensible men should practise rituals that include secret words and signs. However, on the basis of any merely superficial assessment or, even worse, complete ignorance, it would be unwise to dismiss an international sociological phenomenon as complete nonsense.

The Craft, which is banned in all Communist countries, in Roman Catholic Spain and Portugal, although not in Italy, continues to attract members on a world-wide scale. Its appeal clearly operates on two different levels. For some the attraction is obviously social. The Lodge is an exclusive club and the business of 'working' a ritual is the prelude to a convivial meal. For others, however, Freemasonry's rituals, teachings and symbolism have a deeper and more spiritual content. In this context we encounter the Craft at its most attractive and significant level.

Band of Brothers

Freemasonry is neither a religion nor a substitute for religion. It embraces all forms of religious belief which conceive of a Supreme Being and in a Lodge men of all creeds meet in complete amity. Its rituals, which in some respects resemble short Morality Plays or moral charades, simply reflect in symbolic terms concepts of idealism, humanity, charity and fraternity.

But why the necessity for secrecy? This, too, has a symbolical meaning. The tradition was inherited from the old

The three ordinary degrees to which masons attain are those of Entered Apprentice, Fellow Craft and Master Mason *Left* The American Masonic Diploma awarded at the Third Degree bears the symbolic working tools presented to the candidate on initiation: the 24 inch gauge representing the hours of the day, the gavel, a symbol of conscience, and the chisel which stands for education *Above* The Masonic grip of the raised thumb, initially enabled members to recognize each other without openly revealing themselves

Operative or Working Masons, who because of the mobility of their profession, were denied the advantages of a static guild organization. The Lodges arose wherever masons were assembled for large scale building works, such as a cathedral, and formed a flexible network throughout the country. The masons required proof of professional skill before accepting an itinerant colleague as a master craftsman. If the newcomer knew the answers in their correct form to certain veiled questions, also certain passwords and signs, it conveyed to his interrogator that he really was a Master Mason, a master of his craft, and hence qualified to accept employment and if need be help from a fellow craftsman. In other words it was a form of primitive trade unionism.

Later the Speculative (Non-operative) Freemasons took over the traditional questions, passwords and signs, not as an antiquarian mumbo-jumbo, but simply to emphasize that oaths of fidelity, fraternity

Library of Congress/Syndication International

All Freemasonry in existence today can ultimately be traced to the Grand Lodge of England constituted in 1717

Chris Barker

and the like must never be taken lightly. Hence even Freemasonry's 'secrets' are symbolic. That they contain nothing incompatible with conventional religious beliefs is reflected by the fact that so many Anglican and Nonconformist clergy are Freemasons.

Gentleman's Club

Speculative Freemasonry was a British development of the early 1700s. Operative Masons continued into the 17th century, as survivors of the medieval guild system, with its complex traditions and practices in which mutual aid was a prominent feature. Then late in that century men who were not professionally connected with building began to join the so-called Lodges of the Operative Masons. This was probably done in much the same way that individuals still seek membership of one or other of the ancient Livery Companies of the City of London. Gentlemen also joined because they were interested in architecture or keen to have their own designs executed. Elias Ashmole, the antiquary, recorded in his diary that he was 'made a Freemason' at Warrington in 1646, and he certainly had no links with Operative Masonry.

The history of the transitional stage from Operative to Speculative Freemasonry is both sparsely documented and obscure, as is the early history of Speculative Freemasonry. However, a notable event occurred in the year 1717 when the members of four London Lodges met at a tavern near Covent Garden and constituted themselves 'A Grand Lodge pro Tempore (for the time being) in Due Form and . . . resolved to hold the Annual Assembly and Feast, and then to choose a Grand Master from among themselves, till they should have the Honour of a Noble Brother at their Head'. All Freemasonry in existence today can be traced, through one channel or another, to the Grand Lodge of England thus constituted in 1717. A 'Noble Brother' as Grand Master presented himself in the person of the Duke of Montague in 1721. Since then the office of Grand Master has always been held by one of noble or royal birth, for example a recent Grand Master has been H.R.H. the Duke of Kent.

Initially Grand Lodge must have been

Masonic aprons are decorated with symbols and emblems *Above* A drawing from an 1869 edition of *Vanity Fair* showing the Worshipful Grand Master the Earl of Zetland *Below* A calico apron *Below left* An apron from the English Lodge known as the 'Antient' Lodge

Chris Barker

an informal affair with not very much to govern. In 1721, however, the representatives of 16 Lodges commissioned Dr James Anderson (1684–1739), a minister of the Church of Scotland, to prepare and edit a slim quarto volume, published in 1723, that subsequently became famous as *Anderson's Constitutions*. The inclusion of 39 General Articles for the government of the Craft indicates the beginning of a more formal administration.

It is probable that the rituals were still in an early stage of development. In most Lodges there were only two degrees, namely those of Apprentice and Fellow. The modern system of three degrees, that is, Entered Apprentice, Fellow Craft and Master Mason, taken in three separate steps, came into being a little later.

There was a rapid expansion of interest in Freemasonry during the 1720s. A list of Lodges published in 1725 includes 64 names. The first Provincial Grand Masters, namely those for North and South Wales, were appointed in 1726. The first overseas Lodges were constituted in Bengal, Gibraltar and Madrid by 1728.

One of the most surprising features of Speculative Freemasonry's early history is the Craft's vigorous and speedy expansion in Europe. An English Lodge was founded at Paris in 1732 and three years later Freemasonry had reached Portugal, Holland and Sweden. The first German Lodge was established at Hamburg in 1737. During the next decade the Craft took root in many other European centres, although not without encountering, here and there, official hostility. The first Papal Bull against Freemasonry (*In Eminenti*) was proclaimed in 1738 by Clement XII.

According to F. L. Pick and G. N. Knight, the authors of *Pocket History of Freemasonry*, 'when Freemasonry spread beyond our Islands it fell into hands not content with the plain unvarnished story taught in its original home. The links with the homely operative past were not appreciated by the more modish followers of what was proving a fashionable cult, so a host of brilliant ceremonies were quickly developed, many of which proved ephemeral while others have lasted to the present day and are accepted and respected throughout the world.'

The 'plain, unvarnished story' refers to

The Entered Apprentice's Song

Come let us prepare
We brothers that are
Assembled on merry occasion:
Let's drink, laugh and sing:
Our wine has a Spring.
Here's health to an Accepted Mason.

The World is in pain
Our secrets to gain
But still let them wonder and gaze on:
They ne'er can divine
The word or the sign
Of a Free and an Accepted Mason.

'Tis This and 'tis That,
They cannot tell What.
Why so many Great Men of the Nation,
Should Aprons put on
To make themselves one
With a Free and an Accepted Mason . . .

Then join Hand in Hand
T'each other firm stand
Let's be merry and put a bright face on;
What mortal can boast
So noble a Toast
As a Free and an Accepted Mason.

Rev James Anderson *Book of Constitutions (1723)*

what was taught in Great Britain in the traditional three degrees. Masonic innovators in Europe, and later in North America, introduced many new Orders, Rites and degrees of great number and complexity.

Continental Lodges

The history of Freemasonry in France and Germany is particularly interesting. During the 18th century the Craft attracted many men of distinguished lineage in both countries. In France, for instance, the royal Duke of Orleans, nicknamed Philippe Egalité, presided over the Grand Lodge of France until it ceased to function during the Revolution. During the second half of the 18th century alongside the regular and so-called 'High Grade' Freemasonry there were, in both France and Germany, a number of Masonic sects that dabbled with alchemy and occultism, while in Germany there was the so-called Order of the Gold and Rosy Cross (see ROSICRUCIANS). In England during the 1880s the famous magical society, the Hermetic Order of the Golden Dawn adopted most of the latter's grades (see GOLDEN DAWN).

Of the 18th century French Lodges the most interesting is probably the Loge des Neuf Soeurs (The 'Nine Sisters' Lodge), whose membership included some of the nation's most progressive intellects: the astronomer Lalande, the mathematician Condorcet, and the publicist Camille Desmoulins, who led the storming of the Bastille during the Revolution. Benjamin Franklin, the American ambassador, was also a member. The hypothesis that the Freemasons and, above all, those in the Loge des Neuf Soeurs, instigated the French Revolution is untenable although it could be said that as the ideals of Masonry are toleration and free-thinking, their spirit influenced both the French and American revolutions.

Since the 1870s relations between the French Grand Orient and the United Grand Lodge of England have ceased because of the removal of the affirmation of the Great Architect of the Universe from the Grand Orient's Constitutions. To outsiders, at least, the question of whether Freemasonry is or is not agnostic has always been a complex one. A. E. Waite, a Masonic historian, has simply observed that there is no preponderating religious sentiment, but a tacit agreement to abide informally by certain conventions. In this respect the British genius for compromise is very evident.

The original growth of Freemasonry in Germany owes much to the support of Frederick the Great, who was initiated in 1738, two years before he ascended the Prussian throne. Successive generations of the Hohenzollern family were members of the Craft, the exception being the last Emperor, Wilhelm II, who was originally antipathetic and later hostile. Germany was the home of the legend that the First World War was instigated by 'international Jewry' which, in turn, was alleged to have dominated the French Grand Orient. Hence it is not surprising that as soon as the Nazis came to power in 1933 they ruthlessly suppressed Freemasonry and imprisoned or even murdered many members. Since the early 1950s there has been a modest Masonic revival in Germany.

In North America Speculative Freemasonry had already taken root by 1730, on lines approved by Grand Lodge in London. Benjamin Franklin, who was hostile to the Craft in the early days, nevertheless became a Mason in 1731 and remained devoted to the cause until his death in 1790. George Washington was Master of his Lodge when he became the first President of the United States of America in 1789.

Such is the size of the United States that there is no single Grand Master but, instead, a Grand Lodge for each State. Another feature of American Freemasonry is the very large membership of many Lodges. Some years ago the average membership in each of the thousand or so Lodges under the jurisdiction of the Grand Lodge of New York was about 280. It is also on record that very recently there were 43 Lodges in Texas with between a thousand and three thousand members. To anyone familiar with the intimate character of many British Lodges, with their 50–70 members, these very large numbers are somewhat intimidating.

In 1884 the pope issued an encyclical condemning Freemasonry: a cartoon appearing in *Puck* the same year satirized the conflict between the Church and Masonry

So much for the history of the Craft, but what of its detailed practice? The average modern Freemason, at least in Great Britain and the Commonwealth, is content to pass through the traditional three degrees which may be outlined as follows.

Secrets of Initiation

Freemasons meet in a specially furnished Lodge room. The Worshipful Master, the Wardens and other officers of the Lodge sit in their appointed places. In the ante-room adjoining the Lodge room a functionary known as the Tyler keeps guard to forbid the entry of strangers. First it is necessary to 'open' the Lodge in whichever degree is being 'worked'. A dialogue is held, in the form of questions and answers, between the Worshipful Master and various officers of the Lodge. Its time-honoured purpose is to remind the participants of the symbolical or allegorical nature of the ceremony they are performing.

When an initiation ceremony takes place the Lodge is opened in the First Degree. Outside in the ante-room the candidate is prepared by the Tyler. His collar, tie and jacket are removed and he lays aside his money: with this demonstration that the Lodge accepts him even in penury, he accepts the same obligation towards his fellow Masons. He is then led into the room blindfolded. The Tyler presents him to the Master and in reply to the question 'Whom have you there?' replies: 'A poor Candidate in a state of darkness.' The implication is that the darkness is spiritual but that he will be shown Light.

In the course of the ceremony the candidate swears a solemn oath not to reveal Freemasonry's secrets which, once again, are all symbolical. The blindfold is then removed. He is also shown certain grips and signs, a survival of the old Operative Masonry, and told certain words which refer to the symbolical building of King Solomon's temple.

He is presented with the First Degree Mason's working tools, and the Master explains their significance: the 24-inch gauge represents the 24 hours of the day, to be divided between prayer, work, refreshment and helping a friend; the gavel represents the power of conscience; the chisel represents the advantages of education. Finally the Master explains the symbolism of the First Degree tracing board, a rectangular plank containing a painted representation of the symbols appropriate to the First Degree. The Lodge is then 'closed' in the First Degree according to the appropriate ritual.

In due course the Entered Apprentice will be advanced, normally at intervals of about three months in each case, to the Second Degree (Fellow Craft) and finally to the Third Degree (Master Mason). In each case there is a specific ritual and the disclosure of more information. As a Master Mason the new Brother has nominally reached the end of the road although he can proceed further to the Royal Arch, which can roughly be described as an extension of Craft Masonry, and may later elect to ask for membership of the other available degrees and Orders. This is entirely a matter of choice.

The three Craft Degrees, then, form the basis of the whole Masonic system as practised in English-speaking countries. Together with the Royal Arch they form the sum total of Freemasonry as officially recognized by English Grand Lodge. However, for those who are interested there are certain 'Higher Degrees', such as Mark Masonry, the Knights Templar, the Rose-Croix and others.

It is possible to buy printed editions of the three Craft rituals but some material will be omitted. Any outsider can obtain at least a notion of the structure of these rituals. It appears however that nothing short of personal experience of participation in the rituals will serve to convey an understanding of what the Craft means to so many men. This means, in effect, that no outsider can ever really grasp Freemasonry's inner meaning.

The upheavals of the French Revolution shook even the stable structure of the Church. For a brief time, Christ was dethroned and Reason, the State and Nature worshipped in his stead

FRENCH REVOLUTION

THE POLITICAL AND SOCIAL upheavals of the French Revolution were inevitably to have repercussions on organized religion and worship. But a direct confrontation between the forces of the Revolution and the different churches was an unforeseen consequence, particularly in the case of the Catholic Church. To begin with, the lower ranks of the clergy were amongst the most enthusiastic supporters of the Revolution. When the different estates of the realm, representing the clergy, the aristocracy, and the commons met on 5 May 1789, and when the Third Estate quarrelled with the two privileged orders, they were gradually joined by the majority of the clergy, including several bishops. Religion and revolution seemed to go hand in hand: the National Assembly considered itself to be Catholic and proclaimed that no one was to be molested for his opinions, 'even his religious opinions'.

The Assembly's act which was to have grave consequences was the decree of 2 November 1789, which stated that all Church property was at the disposal of the State. The Revolution was now committed to the idea that the Church only possessed the use of its land and properties, and that in reality this belonged to the general community of believers. It was therefore possible for the State to take over this property and because of the financial crisis it was thought desirable to do so. As a corollary to this the State would have to maintain the clergy and the Church was to be independent of the papacy and foreign prelates. In July 1790 the Civil Constitution of the clergy was voted. By this it was stated that both bishops and parish priests were to be elected in the same way as other officials, that is to say by property owners. Elections were to take place on a Sunday, and since it was legally assumed that every Frenchman was a Catholic, no one was excluded on the grounds of religious disbelief. Bishops were expected to inform the Pope of their appointment, but they would receive canonical institution not from him, but from other bishops. When some of the clergy showed themselves hesitant about this constitution, the Assembly advised an oath of loyalty to be taken by all priests.

This oath caused a schism in the French Catholic Church. Already many of the higher clergy had hesitated since they found themselves despoiled of much of their wealth. But they now objected to a lay Assembly legislating in religious matters. When the Pope, who had for some time showed his disapproval, condemned the Civil Constitution in April 1791, this reinforced the refusal of many of the clergy to take the oath. Probably about half of the clergy and the overwhelming majority of the bishops refused to take it. These refractory clergy were particularly strong in the west of France, as well as in areas of the extreme north and of the east.

There thus arose a conflict in which it seemed certain that Catholics were hostile to the Revolution which if it were to succeed, would have to overthrow them. And measures of hostility against these unco-operative priests were accompanied by a development of non-sectarian and patriotic worship. Altars were placed in the open air on the occasion of ceremonies; the church of Sainte-Geneviève was transformed into a national Pantheon for the illustrious dead and received the ashes of Voltaire, a vigorous anti-Catholic; it was maintained that liberty of conscience was a property which had to be protected as any other property.

In April 1792, when France went to war, and again in March 1793, when there was a rising against the Revolution in the Vendée (in the west), the situation became more bitter. Many of the bishops

Musée Carnavalet/Bulloz

As the French Revolution progressed, Christian symbols were removed from churches and replaced by busts of such heroes of the Revolution as the anti-Catholic Voltaire, or Rousseau who accepted that man and Nature had been created by the Supreme Being but believed that Church institutions corrupted human nature: *Homage to Rousseau*, by Jeaurat de Bertry, showing the philosopher presiding over the 'Eye of Truth'

had emigrated and it was said that all priests, even all Catholics, had to be considered enemies. Since the Revolution was in danger, was threatened by foreign powers and by an uprising which was thought to be clerically organized, militant patriots began to talk of abolishing religion. A wide variety of anti-religious measures were taken: streets called after saints were re-named, priests were encouraged to marry, cemeteries were equipped with the inscription 'Death is an eternal sleep', the philosopher Descartes was honoured because he had caused men to reason rather than to follow blind faith, and the Gregorian calendar was replaced by the republican calendar (beginning with year 1, and instituting new names for days and months as well as new festivals). This movement is usually called the movement of de-Christianization. Its extent varied, but its most notable successes were often to be found in the provinces, and were the work of some representative of the Paris government.

The Deification of Reason

But the process of de-Christianization could not only be a negative one. It was necessary to have ceremonies to celebrate the Revolution; it was necessary to have religious ceremonies. There are a number of examples of how the signs of the Catholic religion were removed from churches, covered up, and replaced by a variety of other insignia. Sometimes the dedications were to 'Philosophy'; there were sometimes busts of philosophers, such as Voltaire and Rousseau; there were times when the churches, or the places where the ceremony was taking place, were decorated by busts of contemporary political leaders. It was quite frequent for the Virgin Mary to be replaced by a statue representing Liberty, or for young girls, wearing the red, white and blue of the Revolution, to parade in personification of the principles evoked by Republican France. Churches everywhere were changed into temples of Reason, since the French Revolution was supposedly the triumph of the reason of man. Superstition and tradition had been overcome; in their place men were using their unique gifts to organize the world as they thought best. It was natural that their god should be the god of Reason.

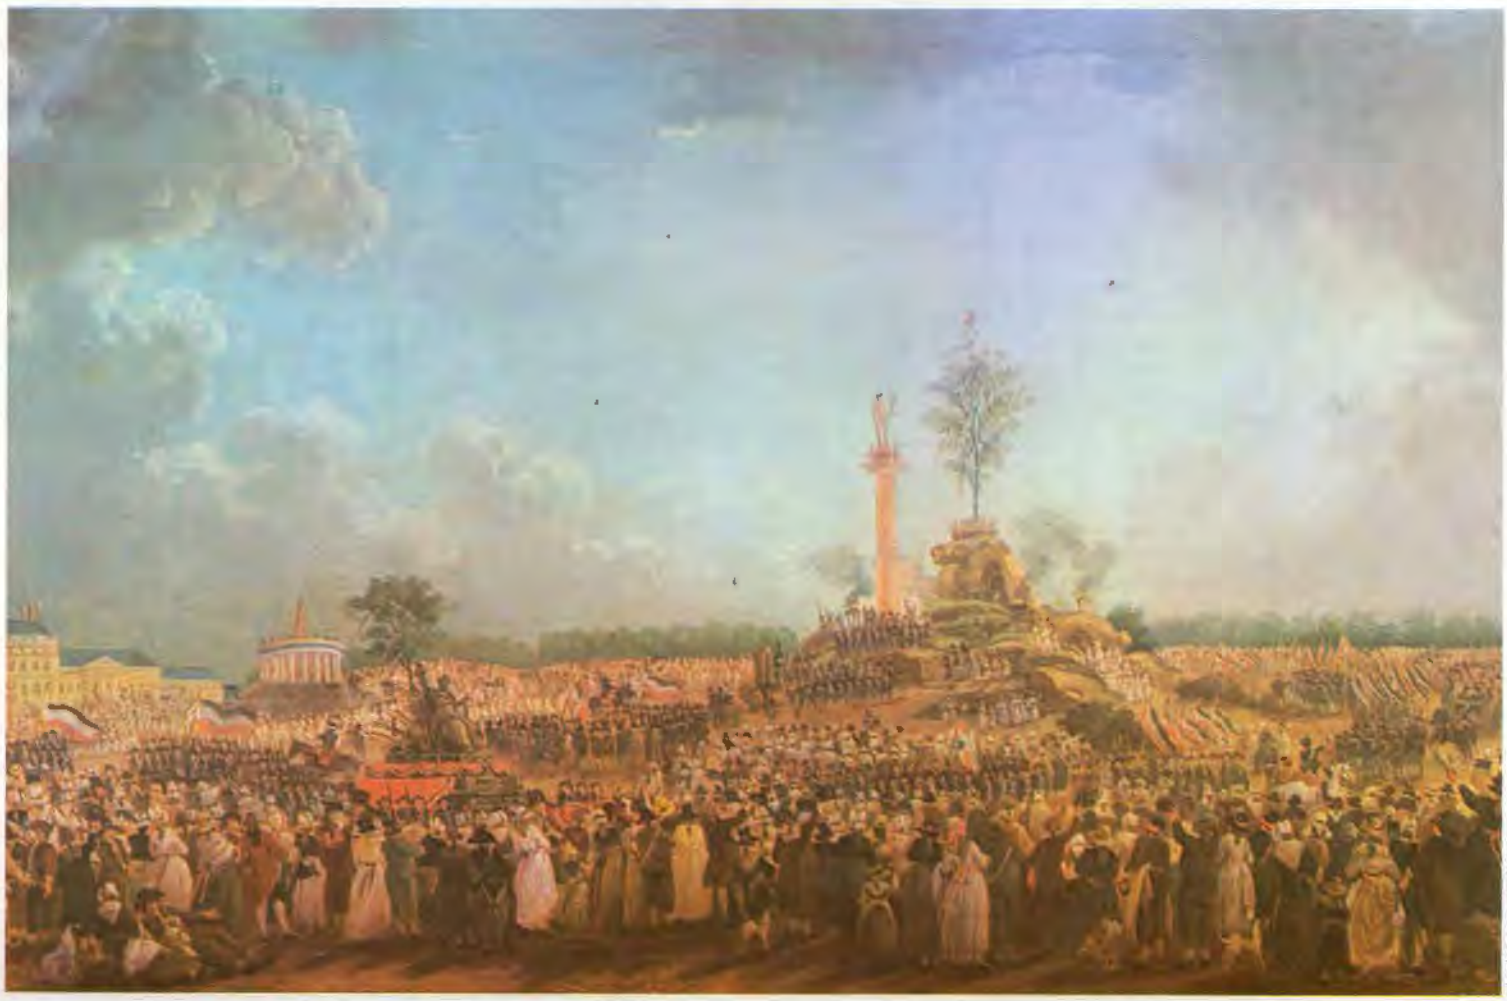
It was not only the Catholics who suffered from the movement of de-Christianization and the cult of Reason. Both Calvinists and Lutherans found themselves frowned upon and had to adapt themselves to new conditions, by abolishing Sunday worship and organizing their chief religious celebrations every tenth day to conform with the new calendar. But the effect of the whole movement seems to have varied according to the political and the military situation. Wherever there was danger to the Revolution, either from hostile powers or from French political opponents, the new cults were most energetically and insistently promoted.

Natural Religion

In April 1793 a Committee of Public Safety was appointed to supervise the executive. Clearly they were concerned by the religious situation. Their most famous member, Robespierre, was opposed to the progression of de-Christianization into irreligion and atheism. He believed that atheism was an aristocratic characteristic; whereas the worship of God was the religion of Nature, and such worship engendered the morality and understanding which made for good society.

He therefore launched the cult of the Supreme Being, which was officially organized in May 1794. By this decree the French people recognized the existence of the Supreme Being and the immortality of the soul; they declared that the best service of the Supreme Being was the practice of the duties of man; they respected the weak and the oppressed, they opposed treachery and tyranny; and a whole series of festivals commemorating dates both of recent French history and of Nature, were to be instituted. A great festival was organized in which Robespierre set fire to a statue representing Atheism and launched the reign of virtue.

It is not easy to know why Robespierre



Contemporary painting of the festival of the Supreme Being in Paris, at which Robespierre set fire to a statue representing Atheism and launched a new era of revolutionary virtue. The Supreme Being's existence had been officially decreed in May 1794

Musée Carnavalet/Bulloz

behaved as he did. Some have said that it was because he was a disciple of Rousseau (who believed that man and Nature created by the Supreme Being were good and pure, but that urbanization and institutions were corrupting man, who should return to his original kinship with Nature). Others have suggested that his whole view of religion was based on social utility, and that he would, in different circumstances, have accepted Catholicism. At all events the overthrow of Robespierre was accompanied by a lessening of the national emergency and early in 1795 some legal freedom was restored to Catholicism. It was not long before the return of clergy who had refused to take the oath of loyalty took place and a reconciliation was announced between the Revolution and Christianity. Liberty of religion was restored and Church and State were separated. This was the system which prevailed until Napoleon came to an agreement with the Pope in 1802.

It is difficult to judge how effective the religious innovations of the Revolution had been. It is certain that in many parts of France worship remained unaffected by events. Even where the cult of reason or of the Supreme Being was established the faithful sometimes attended holding their missals. Yet at the same time there was a middle-class which easily accepted forms of Deism, and historians have been impressed by the ease with which some of the peasantry apparently gave up their traditional religion and acknowledged the new forms of worship. The most that can be said is that all these matters have to be seen within the framework of events. Religious affairs of this period are part of the crisis of revolutionary affairs, and the two evolved together.

At Avignon, when he climbed onto a large stone to be worshipped the Devil turned into a great black goat: in the Savoy he turned into a black dog. The European witch mania had its early development largely in France

FRENCH WITCHCRAFT

THE PATTERN of witchcraft in Europe, as it emerged in the time of the great persecutions, combined two different ingredients. One was what could be called 'cottage-industry witchcraft', the use of spells and potions to work black magic or white. The second and newer ingredient was the belief that witches were the storm-troops of the Devil. The witch was now not a mere rustic wise-woman, who would provide a healing charm as readily as a poison (though this was what some of the accused witches may have been in reality). She – or he, there were plenty of male witches – was entirely dedicated to evil and had deliberately enlisted in the malevolent service of Satan (see EUROPEAN WITCH PERSECUTIONS).

In its early days, this picture of witchcraft was developed largely in France. It drew heavily on the accusations made against earlier heretical sects, and it was confirmed by putting leading questions to accused witches and torturing them until they confessed. They were forced to name other people as witches, who were then interrogated and tortured in their turn. Through the confessions and the books in which the persecutors reported their experiences, a clear pattern of witch behaviour and witch beliefs was built up, a pattern which may have attracted some people to bring it to life, to become witches of this new type which had now been generally recognized.

The central feature of the new witch religion was the sabbath, the meeting at which the Devil was worshipped (see also SABBATH). The earliest accounts of it which have survived come from the south of France, from Toulouse in 1335. A woman named Anne-Marie de Georgel confessed that many years before a tall dark man, who had fiery eyes and was clothed in skins, appeared to her while she was washing. He asked her to give herself to him and she agreed. He breathed in her ear and on the following Saturday, merely by willing it, she was somehow taken to the witches' meeting. The meeting was presided over by a goat, which taught her secret ways to work evil. She had used these secrets ever since and had done all the harm she could.

Another woman, Catherine Delort, said that every Saturday she fell into a curious sleep in which she was transported to the gathering of the witches. There she worshipped the goat and submitted her body to him and to the other witches. They worked evil by spoiling harvests and killing cattle, and at their meetings they feasted on the bodies of babies.

Both women stated a dualist view of God and the Devil which, coming from an area that had been the principal hotbed of Catharism in the previous century, suggests Cathar influence – whether in the minds of the women or the minds of their questioners (see also CATHARS; DUALISM). Anne-Marie de Georgel said that God ruled in heaven and Satan on earth. They were equal partners, locked in conflict throughout the ages, but she believed that Satan would soon triumph.

The effect of this type of confession in arousing popular interest and emulation is suggested by the fact that in 1352 at Carcassonne, not far from Toulouse, seven people were found guilty of mentally adoring the goat. They did this, allegedly, because they hoped to gain admission to the meetings of witches but failed because their faith was not strong enough.

A World Full of Witches

In the following century, from c 1425 on, there was an extensive persecution in the Dauphiné, spreading eastwards from Lyons to Grenoble and Briançon. One old man, Pierre Vallin, who was sentenced in 1438, confessed that he had given himself body and soul to the Devil long before. He had also given the Devil his baby daughter and the Devil had killed her. On the Devil's orders he used to stir up destructive storms by flailing the waters of a stream. He rode to the witch meetings on a stick and there copulated with the Devil, who took the form of a girl for the purpose.

The anonymous *Errores Gazariorum*, written c 1450 in a French-speaking region of Savoy, gives a more detailed description of the sabbath. It says that a new recruit is taken to 'the synagogue' (an early name for the gathering) by someone who is already a witch. He is presented to the Devil, who takes the form of a man or an animal, usually a black cat. He swears an oath to be faithful to the witch society, to bring in new members, to reveal none of the society's secrets, to kill small children and bring their bodies to the synagogue, to avenge all injuries to the society and its members. After this he worships the Devil, kissing him under the tail. Then the witches feast and dance. The lights are put out and the Devil cries *Mestlet, mestlet* (mingle, mingle) and there is a promiscuous orgy. Before they leave, in mockery of the Christian Eucharist, the witches urinate and evacuate in a cask.

The confession of a woman named Antoine Rose, a witch of the Savoy who was tortured and tried in 1477, confirms this description and adds some extra details. The first time she was taken to the synagogue she saw many men and women there, enjoying themselves and dancing backwards. The Devil, whose name was Robinet, was a dark man who spoke in a hoarse voice. Kissing Robinet's foot in homage, she renounced God and the Christian faith. He put his mark on her, on the little finger of her left hand, and gave her a stick, 18 inches long, and a pot of ointment. She used to smear the ointment on the stick, put it between her legs and say, 'Go, in the name of the Devil, go!' At once she would be carried through the air to the synagogue.

At the meeting the Devil would turn into a black dog which they all kissed, under the tail. He ordered them to do all the evil they could and gave them ointments and powders with which they could harm men and beasts. He also told them to worship him and not Christ, and not to adore the consecrated host in church but to spit it out. At one meeting a consecrated host was brought and they all trampled on it.

In 1452 a witch tried at Provins, near Paris, said there were only 50 or 60 witches in all France, most of whom carried mirrors in their hats. Five people were promptly discovered with mirrors in their hats, and were arrested. A small boy said that his father and mother had twice taken him to witches' meetings and that if they

The French magistrate and witch-finder, Pierre de Lancre, devoted the latter part of his life to energetically ferreting out evidence, real or imaginary, of devil-worship and witchcraft: he boasted of having consigned 600 witches to the flames. In his *Tableau de l'inconstance des mauvais anges (Description of the Faithlessness of Evil Angels)* he gives a first-hand account of his witch-hunt in the Basque region of France *Right* An illustration from the *Tableau* (1612) beneath which is de Lancre's description of the scene

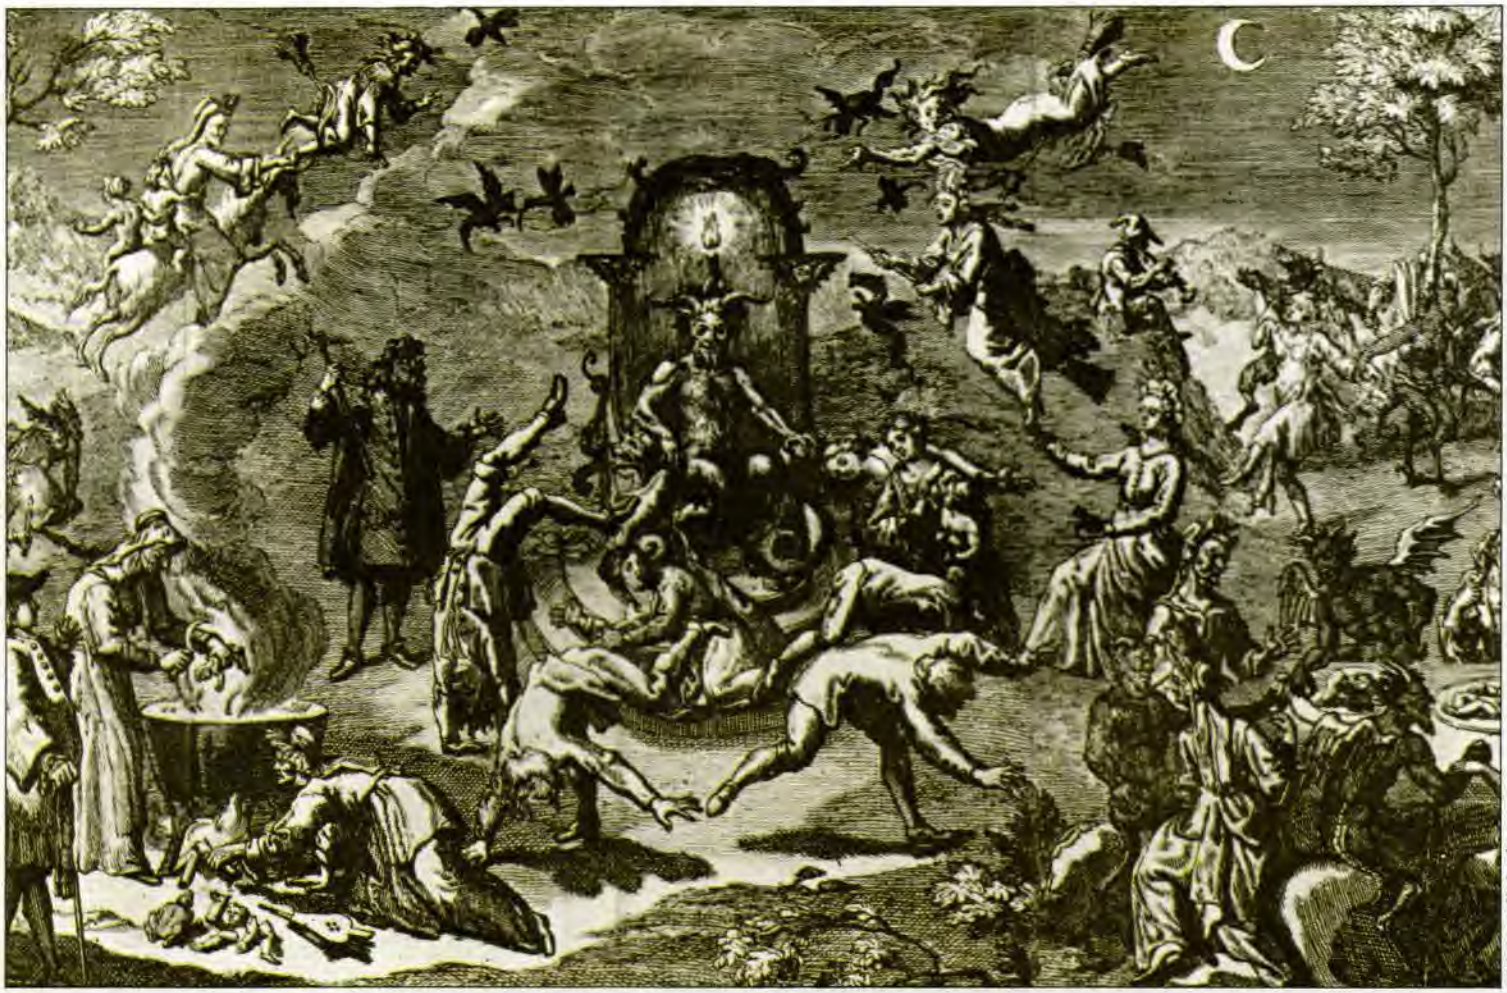
Satan is shown in the form of a goat preaching from a golden chair; the flame issuing from one of his five horns, is to light the sabbath fires. On his right sits the Queen of the sabbath and kneeling before them a witch presents a child she has abducted. Partaking of the sabbath feast are witches and demons: only the meat of corpses, hanged men, hearts of unbaptized children and unclean animals never eaten by Christians, are eaten. At the extreme right, poor witches who dare not approach the high ceremonies, watch the festivities. After the banquet, the devils lead their neighbours beneath a cursed tree where, forming a ring facing alternately inward and outward, the company dance in the most indecent manner possible. At the left of the picture musicians play in accompaniment to the dancing and below them a troop of women and girls dance back to back in a circle. A group of noble lords and ladies mingle with rich and powerful witches who are disguised or masked to avoid recognition and who conduct the important business of the sabbath. During the sabbath, witches arrive on pitchforks and broomsticks, or on goats with their children whom they will present to Satan. Children with sticks, to prevent toads from getting out of a stream, assist witches to brew poisons: one witch holds serpents and toads, the other skins them and throws them in the pot.

were stripped and searched, a raised white mark, the size of a pea or bigger, would be found on their bodies. This is an early reference to the famous 'Devil's mark'.

The suggestion that there was only a handful of witches in France was contradicted by the poet Martin le Franc, who maintained that in the mountain valleys to the east and south of Briançon anything from 3000 to 10,000 people attended the sabbaths, and that more than 600 women had confessed to copulating with demons at these gatherings. Alphonsus de Spina, a convert from Judaism who became a Franciscan, wrote a book called *Fortalicium Fidei* in c 1459, in which he says that witches were particularly numerous in Dauphiné and also in Gascony, in the south-west of France, where they met at a rock to worship a boar and kiss its backside. Many of them had been executed and in the house of the Inquisitor at T'oulouse there were paintings showing their meetings and also the punishments inflicted on them.

The insistence of so many persecutors on the enormous numbers of witches helps

Bibliotheque Nationale



Bibliotheque Nationale

An etching of the witches sabbath from an 18th century French book *The History of the Ridiculous Extravagancies of M Oufle,* a parody of de Lancre's *Tableau*

to explain the growing fear of them and the cruelty with which they were treated. The American scholar H. C. Lea commented: 'The world was full of them and no one knew whether his family and friends or anyone whom he might meet was not a sorcerer gifted with the awful powers granted by the demon. That the terror was fantastic and imaginary did not render it less real and it accounts for the craze which devastated Europe in the 17th century.'

Another important factor was the belief, found in many primitive societies, that what we regard as accidents of Nature are not accidental at all but are caused by the malice of witches. At Metz in 1456 and 1457 witch-hunts were sparked off by unusually bad weather which harmed the crops. Again in 1488 a disastrously cold summer was put down to witchcraft at Metz, and 28 people were burned.

All sorts of natural misfortunes, from minor illnesses to the failure of a harvest, were lumped together as *maleficia* or 'evil doings', and attributed to witches. In 1460 Martin of Arles announced that all *maleficia* involved an implied agreement to serve the Devil. Nicholas Remy, author of *Demonolatreiae* (1595), maintained that, 'Whatever is not normal is due to the Devil.'

The Witches of Arras

The linking of witchcraft with the worship of the Devil was originally the work of the Inquisition and was later adopted by the secular courts, though in the 15th century civil courts in France were still sometimes dealing with cases of witchcraft without bringing the Devil and the sabbath into it at all. By contrast, when a number of witches were examined by the ecclesiastical authorities at Arras in 1460, the suspects were tortured into confessing that they worshipped the Devil and had attended the sabbath. Their master appeared to them in human form but he never showed his face. (Presumably, if he existed at all, he was a man with his head covered or wearing a mask.) He made them all give him the obscene kiss. They feasted luxuriously until all the lights went out and there was a wild orgy.

One of the accused had been cruelly beaten by the Devil when he threatened to leave the society. Another had attended many meetings, holding a lighted candle in the Devil's honour and kissing him under the tail, had signed in his own blood a formal pact making over his soul to the Devil, and had used powders and ointments to harm men and cattle.

Altogether, 34 suspects were arrested and 12 were executed. It is interesting that apparently very few people believed in their guilt. A hundred years later the weight of popular opinion would go the other way.

The first work on witchcraft to be written in French was an anonymous pamphlet of c 1460, *La Vauderye de Lyonois* (Vauderye from the heretical sect of Waldensians), describing trials at Lyons. The Devil appeared at the sabbath as a man with horns and talons or in a variety of animal forms, and he spoke in a harsh and terrifying voice. The meetings were usually held on Thursday nights. In church, witches would not cross themselves properly but would make a kind of circle. They turned their eyes away at the elevation of the host and took consecrated hosts to the sabbath to be contemptuously fouled.

Full Flood

Almost all the accusations about the witches' behaviour at the sabbath had earlier been made against the heretical sects – including the worship of the Devil, his animal forms, the obscene kiss, the violent hatred of Christianity, the cannibal eating of babies, the promiscuous orgy. In the early 14th century the Knights Templar were accused of worshipping the Devil; trampling on crucifixes, copulating with demons, and obscene kissing. In the 14th and 15th centuries there were various trials of important personages, notably Joan of Arc and Gilles de Rais, in which accusations of witchcraft played a part and which helped to create popular belief in the prevalence of witches.

From the end of the 15th century the tide of persecution began to run at full flood. Year after year, suspects were nosed out, interrogated, agonizingly tortured and condemned. Forty witches were burned at

Toulouse in 1557, four at Poitiers in 1568, 18 at Avignon in 1582. In 1580 the political philosopher and witch judge Jean Bodin published *De la Démonomanie des Sorciers*, in which he observed that burning over a slow fire was an inadequate punishment for a witch, as it took only half an hour or so.

In Lorraine Nicholas Remy condemned 900 witches in a few years after 1581. There were witch-hunts in Normandy between 1589 and 1594, and again between 1600 and 1645. In Burgundy Henri Boguet exterminated some 600 witches and wrote the famous *Discours des Sorciers* (1602) which went through 12 editions in 20 years. In 1609 Pierre de Lancre descended on the Basque-speaking provinces north of the Pyrenees and claimed to have executed 600 witches in four months (see BASQUE WITCHCRAFT).

In the 17th century there was a rash of outbreaks of supposed demonic possession in convents (see articles on possession). Staggering confessions of witchcraft and deviltry were poured out by hysterical nuns. Some of these ravings were so improbable that they helped to undermine belief in the reality of witchcraft.

By about the middle of the 17th century the tide had turned. Occasional trials occurred down into the 18th century and belief in the old-fashioned type of witchcraft lingered on in country districts. As late as 1885 at Sologne a suspected witch was burned alive by her daughter and son-in-law. But the virtual end of the persecution of witchcraft as the Devil's religion came in 1670, when Louis XIV reprieved 12 witches who had been condemned at Rouen, commuting their death sentences to banishment from the province, and restoring the property which had been confiscated from them. A royal edict of 1682 helped to put witchcraft back into its much older category of 'superstitious practices' and 'pretended magic'.

The Devil's Mass

The Devil was the witches' god, and de Lancre said that they would go down on their knees to him and hail him as 'Great Lord, whom I adore'. A new member of the society would say to the Devil, 'I put myself entirely in your power and into your hands, recognizing no other god, for you are my god.' According to Boguet, before they began their feast the witches said a kind of grace, 'but with words full of blasphemy, making Beelzebub the author and protector of all things.'

A witch named Antide Colas confessed in 1598 that, 'Satan ordered her to pray to him night and morning, before she set about doing anything else.' According to Silvain Nevillon, tried at Orleans in 1614, 'they say to the Devil, we recognize you as our master, our God, our Creator.'

Since witchcraft had been identified as worship of the Devil, it was naturally a stock accusation that witches consciously and formally renounced the Christian faith. De Lancre quoted a girl of 16, named Jeannette d'Abadie, who said that she was made to renounce and deny her Creator, the holy Virgin, the saints, her baptism, her father and mother and family, heaven, earth and everything there is in the world.' She also said that she saw the children of witches being enrolled in the Devil's service by baptism at the sabbath. Silvain Nevillon said that the witches baptized babies and anointed their heads with oil, muttering phrases in Latin.

The belief that the witches perverted the Mass into a ceremony in the Devil's honour followed naturally enough from their notorious detestation of Christianity. Boguet said that the celebrant was an apostate priest who wore a black cope with no cross on it. Instead of the host he consecrated a piece of turnip stained black, and the congregation cried out, 'Master, help us!' At Aix-en-Provence, Madeleine de Demandolx accused the priest Louis Gaufridi (see AIX-EN-PROVENCE NUNS) of inventing the saying of Mass at the sabbath, consecrating the elements to Lucifer and sprinkling the wine on the worshippers, who responded with 'His blood be upon us and our children.'

Silvain Nevillon said that the sabbath was held in a house and he saw there a tall dark man, reading in an inaudible mumble from a book which had black and crimson leaves. Presently he elevated a black host and then a chalice of cracked pewter, 'all foul and filthy'. Another witch of Orleans, Gentien le Clerc, described how the Devil himself said the Mass. He wore a chasuble on which was a broken cross, and turned his back on the altar when elevating a black host and a black chalice. He muttered the words of the service from a book, bound in some soft and hairy material like a wolf's skin, and with red, white and black leaves. (See also BLACK MASS.)

The Black Goat

The Devil frequently appeared to his followers in animal form, and especially as a goat (see also GOAT). At Poitiers in 1574 he was 'a great black goat who spoke like a person.' At Avignon, when he climbed onto a large stone to be worshipped, he turned himself into a great black goat, though normally he appeared as a man. In Puy de Dôme in 1594 he was a black goat with a candle between his horns. He might also show himself as a dog or a cat, a bull or a stag, or even as a pig or a sheep. Many of the descriptions suggest a man wearing a mask and an animal's skin.

The Devil also very often appeared in human form. In 1567 a witch nf Amou in the southwest said that they all danced round a great stone on which sat a great black man, whom they called Monsieur. Françoise Secretain in 1598 said that the Devil was a great black man. Barthélemy Minguet of Brécy, tried in 1616, said that he saw the Devil at the sabbath 'in the shape of a man, who held a horse by its bridle, and that they went forward to worship him, each one holding a pitch candle of black wax in their hands.'

How much truth there is in these accounts, and in all the descriptions of the sabbath, is very hard to determine. It is clear that hundreds of innocent people were harried and tormented into confessing anything whatever that was demanded of them. But it seems quite likely that among the hordes of the innocent there may also have been a few whn were guilty.

The Black Book of Death

From the sentence pronounced against witches at Avignon, 1582:

. . . you and each of you have renounced the one and triune God, the creator of us all, and have worshipped the merciless Devil, the old enemy of the human race . . . in pledge of the faith professed in the demon you have given him a fragment of your garments; and in order that your name should be removed and obliterated from the Book of Life, by the command of the Father of Lies, with your own hand you have placed your sign in the black book of perpetual death and of the reproved and damned; and, in order that he might bind you more firmly to such great infidelity and impiety, he branded each of you with his mark or stigma, as being his own property . . . you and each of you have bound yourselves by oath to obey his orders and commands, trampling on the cross and the sign of the Lord; and in obedience to him, mounted on a staff and with your thighs anointed with a certain most execrable unguent prescribed to you by the said Devil, you have been carried through the air . . . to the appointed spot on certain days, and there, in the synagogue . . . by the light of a noisome fire, after many jubilations, dancings, feastings, drinkings and games in honour of the presiding Beelzebub, prince of demons, in the form and appearance of a most black and filthy goat, you have adored him as God, by acts and words . . . asking his aid to punish all your enemies and those who refuse you anything, and, taught by him, inflicting revenge, injuries and enchantments on men and beasts . . . you men have fornicated with succubi, you women with incubi . . . And what is the most detestable of all, when you receive the most august sacrament of the Eucharist in the church, by instruction of the said serpent ejected from paradise, you have retained it in your mouths and nefariously spit it out on the ground so as to insult our true and holy God . . .

H. C. Lea *Materials Toward a History of Witchcraft*

The artist, the mystic and the occultist are in touch intuitively with the hidden recesses of the mind: Freud developed a scientific method of exploring the unconscious which has influenced every aspect of contemporary life

FREUD

THE FATHER of psychoanalysis, Sigmund Freud can be ranked with Darwin and Einstein as one of the giants of the last 200 years whose work has radically changed Western concepts about the human animal, his environment and the relationship between the two. The extent to which Freud revolutionized conventional thought is apparent in the way in which it is now axiomatic that there are large regions of the mind of which people are normally quite unconscious, yet which have a direct influence on their conscious behaviour. And yet in the 19th century it was equally generally accepted that a person's character could be adequately deduced purely from his outward actions and behaviour. When in the 1890s Freud dared to uncover hidden motivations and when moreover he linked these with sexual drives, his ideas were immediately attacked for being not only impossible but indecent.

This attitude, although deeply rooted at the time, has not always been the accepted one. The phenomenon of man's ignorance of the unconscious aspects of the mind, in terms of the whole of human history, is a brief aberration. To understand what happens at these normally unconscious levels has never been easy, but the fact that these levels do exist has seldom been so steadfastly ignored as it was at this period. For several centuries Europe had forgotten almost as thoroughly as if it had never known what the religious, mystical and esoteric schools of East and West had always taught: that invisible and subtle levels of perception, even if not conscious,

A painting of Sigmund Freud at the age of 12 with his younger brother and five sisters. As a young doctor specializing in neurology, he isolated a cerebral paralysis in children which was later named after him

can influence human behaviour and states of mind; that the consciousness of these subtler or more fruitful perceptions can be obscured by a fog compounded of selfishness, fear, and wilfully immature demands of the personality; that dreams are messages from those unconscious regions of the mind whose myths and symbols embody instructive material which can dispel the fog.

This has been the concern of various so-called religious and mystical schools throughout human history and this essentially is the nature of Freud's contribution. Considered from this point of view, therefore, Freud was not the innovator and inventor of the ideas which have so captivated and caged 20th century thought, but his achievement was rather to re-introduce certain concepts which had been forgotten and, most important, to be the first man to find a way to scientifically explore the working of the human mind.

Search for the Inner Mind

Sigmund Freud was born at Freiberg, Moravia, in 1856, the son of an unsuccessful Jewish wool merchant. He spent most of his life in Vienna, but in 1938 when the Nazis annexed Austria he escaped to London where he died in 1939 at the age of 83. He studied to be a doctor and specialized in neurology, making a name for himself by isolating a form of paralysis, later called after him, and by the co-discovery of the local anaesthetic effects of cocaine. But in 1884 he became interested in the therapeutic uses of hypnosis, upon which he was to build his theories of psychoanalysis. In 1895 he and his colleague Josef Breuer published *Studies in Hysteria*, in which the two men examined the results of work in which they had used hypnosis to probe the minds of their patients. At the time this was a remarkably humane approach to hysteria, which was normally treated with a brutal lack of sympathy.

Shortly after the publication of this book, Freud quarrelled with Breuer and continued his researches alone. He gave up the use of hypnosis in favour of 'free association', in which patients were asked to relax on a couch and say whatever came into their minds, however absurd, unpleasant or obscene it might appear by everyday standards. When that was done it seemed that powerful emotional drives swept the uncontrolled thoughts towards the area of psychological conflict. Great relief – 'catharsis' – seemed to follow and Freud noticed that frequently forgotten and painful memories were found to relate to unpleasant, buried sexual experiences in childhood.

At about this time he also discovered a fruitful source of emotionally significant ideas in his patients' dreams, and decided that there must be some truth in the ancient theory that dreams had symbolic meaning and that they appeared to be disguised forms of repressed desires and needs. 'Instead of dreaming about a penis,' writes G. A. Miller in his recent book *Psychology*, 'the dreamer may substitute the image of a gun, a snake, a fountain pen, the number three, and so on. For masturbation the dream symbol may be climbing a tree or playing the piano. By recognizing these substitutions, therefore, it is possible to recover the true meaning of the dream.'

This passage indicates well the particular prejudice through which Freud filtered many of his ideas. The over-emphasis on sexual interpretation which he gave to almost every human motive from infancy onwards may in fact have been the product of his own personal obsession; colleagues and contempuraries have noted that Freud himself was a puritanical and inhibited man. Perhaps he exaggerated partial truth to look like a universal state of affairs, and he would have been encouraged in this by having to contend with the sexual repressions of the times.

In the summer of 1897, after the death of his father, Freud decided to apply to himself the techniques he had formulated. Using his own dreams as the principal source of study, he worked to discover the unconscious processes which were responsible for forming them. He published his major account of this work in 1900 in *The Interpretation of Dreams* and it took eight years to sell the first 600 copies. Apart from a small group of 'disciples' no one seemed interested, yet today this book is considered his most important work, and the final chapter contains the theory of the human mind which he was to amplify and develop in the period ahead.

The practice of free association had led him to make discoveries about various psychoneuroses which threw light on the workings of the normal mind. The three most fundamental were: the existence of the unconscious and its effect on the conscious; the splitting of the mind into layers as the result of internal conflict, the most important of which is repression; and the existence and importance of infantile sexuality, producing a sexual attitude towards its parents, with its accompanying jealousy and hostility, which he termed the Oedipus complex, from the ancient Greek myth of Oedipus.

In his early work Freud used a simple twofold distinction between the conscious and unconscious mind. Later he described the total personality as organized into three major systems – the id, concerned with the funnelling of energies and tensions; the ego, which is the administrative, daily self which deals with the interactions of the personality with the environment; and the superego, which represents the conscious, or the moral aspects of the personality, which passes judgements. Towards the end of his life Freud formulated two groups of instincts which provide energy for the id. One served the porposes of life and growth, and was called the libido. The second arose in the service of death – the 'death wish'.

The unconscious automatically 'represses' knowledge or feelings which upset the conscious mind, without necessarily being harmful to the personality. In some cases however, the repression seeks an outlet in a different form, frequently some type of inconsistent or unstable behaviour. The function of psychoanalysis in this case is to uncover and release the repression.

By the amplification of his elaborate theory on the development and maturing of the sexual instincts, he forced people to examine the idea that sex does not suddenly appear at puberty, but exists from infancy. He believed that the child's sexual gratifications came from different areas – 'erogenous zones' – at different ages, and that in unfortunate circumstances a child can become 'fixed' at an infantile stage, and by so doing develop personality traits corresponding to that particular level.

Freud and the Cabala

Although philosophers and poets in the past had guessed at the existence of the unconscious (indeed ten years before Freud's birth, Karl Carus, court physician to the King of Saxony, had stated that the key to the understanding of the life of the mind would be found in the region of the unconscious), Freud, with his techniques of dream analysis, free association, attention to symbolism and probing for buried memories was the first to discover a method of exploring this area. But undoubtedly his ideas were subject to influences in the climate of his time, including many forces which were later to be labelled 'Freudian'.

There was another more specific and powerful influence in his own background: the tradition of Jewish mysticism and the Cabala (see CABALA). David Bakan, in *Sigmund Freud and the Jewish Mystical Tradition* says:

> Freud often wrote with obscurity . . . motivated consciously or unconsciously to hide the deeper portions of his thought, and these deeper portions were Kabbalistic in their source and content. The Kabbalistic tradition has it that the secret teachings are to be transmitted orally to one person at a time, and even then only to selected minds by hints. This indeed is what Freud was doing in the actual practice of psychoanalysis, and this aspect of the Kabbalistic tradition is still maintained in the education of the modern psychoanalyst.

Bakan attempts to show that many of Freud's unacknowledged sources were Cabalistic. He quotes a passage of the *Zohar*, a Jewish mystical book of the 13th century, and sets it next to a passage of Freud's work, pointing out as he does so that the differences between the two texts are readily explicable in terms of Freud's own theories of substitution and symbolism.

But even if Freud had been conscious of the role that Jewish mysticism played in his work, as Bakan points out there were excellent reasons for not specifying the tradition. 'Anti-semitism' he writes, 'was so widespread and intense at the time that to indicate the Jewish sources of his ideas would have dangerously exposed an intrinsically controversial theory to unnecessary and possibly fatal opposition.'

Certainly, although Freud's theories were unequivocally materialistic and nothing approaching mysticism was allowed to disorder the psychoanalytic scheme of things, Freud himself showed an interest in subjects such as telepathy and extra-sensory

Freud and the Jewish Mystics

We find a conception of sexuality which is startlingly close to Freud's in the Kabbalistic tradition . . . Never in the Jewish tradition was sexual asceticism made a religious value. The commandment to be fruitful and multiply was always taken extremely seriously in both rabbinical and mystical traditions. In contrast with other ascetic forms of mysticism, the Jewish mystics ascribed sexuality to God himself. The Jewish Kabbelist saw in sexual relations between a man and his wife a symbolic fulfilment of the relationship between God and the Shekinah . . . It is to be noted that the ideal form of sexuality is conceived of as heterosexual, and in particular as realized in marriage. Marital sexuality becomes the symbol of creativity. Thus Freud's use of the idiom of sexuality as the basic one for the expression of all the deeper and more profound problems of mankind is entirely in the spirit of the Kabbala.

David Bakan,

perception. He looked for prophetic dreams in his patients – though found none – and was fascinated by the meaningful recurrence of certain numbers in his life. Several interchanges between Jung and Ferenczi, men who were more interested in the occult than Freud, suggest that he may have cut short a growing fascination for the mysterious and magical because it would have interfered with the organization of his own theories. Indeed in a letter late in life to the psychical researcher Hereward Carrington, Freud went so far as to say: 'If I had my life to live over again I should devote myself to psychical research rather than psychoanalysis.'

Apart from restoring the idea of the unconscious to Western culture, Freud's other important contribution was to produce a technical vocabulary more acceptable to his time – 'repressions' and 'complexes' rather than 'devils' and 'spells' – with which to begin to isolate concepts and mental 'sets' which folklore and superstition encompassed but did not understand.

After the initial derision and opposition Freud's concepts became so cemented into the structure of contemporary thought that it was difficult to be sure if any concept was entirely uninfluenced by his ideas. They permeated everything, for the ideas he tapped were potent, and inevitably were not contained within the confines of medicine and mental disorders, which were his special field. They spread into every sphere of contemporary life, and influenced the way in which Western society came to regard the arts, the social sciences, social reform, child rearing, and every problem regarding human relationships.

It is only recently that it has become much clearer that Freud's explanations do not account satisfactorily for all human needs; that though his insights and techniques can be valuable, a deeper human hunger seems to lie underneath the levels of being with which he is concerned. Jung showed almost contemporaneously with Freud that if there are many things in our own personalities we are unconscious of, there are also lying beneath these, as it were, vast unknown areas which we hold in common.

In Scandinavian mythology the gods and goddesses associated with fertility and peace were the Vanir: amoral deities concerned not with justice or morality but with bringing new life and power into the world

FREYR, FREYJA, FRIGG

ARCHEOLOGICAL REMAINS give us little help in visualizing these members of the Scandinavian community of gods and goddesses, since the only recognizable image surviving from the Viking Age is a little phallic figure in a pointed cap from Rallinge in Sweden, presumably an amulet, which is thought to represent the god Freyr. The goddesses go unrepresented, although their influence permeates the myths, and their symbols and those of Freyr are found continuously in pagan art. There is no doubt of the importance of these deities, and the medieval Icelandic historian Snorri Sturluson who collected many of the surviving myths, declared that Freyja alone of the gods still remained alive.

Freyr and Freyja were said to be the twin children of the Njörd, the god associated with fertility and the sea. They belonged to the group known as the Vanir, the deities of fertility, who were distinguished from the Aesir, the group to which Odin and Thor belonged. Frigg was the wife of Odin, occupying in the late myths the position of Queen of Heaven. It is not very easy however to differentiate her from Freyja. Both goddesses were invoked in child-bearing, both could fly in bird form, both were called weeping goddesses, and both were renowned as givers of good gifts to mankind. It seems as if they may represent different aspects of the ancient, ambivalent goddess of the earth who gave fruitfulness, and who ruled the realm of the dead. She was worshipped in Scandinavia from the Neolithic period, and small figurines of a woman with bare breasts, clad in a short skirt and neck-ring and with her hair in a plait, survive from the late Bronze Age, about a thousand years before Christ. In the myths of the Viking Age – from about the 9th century AD – Frigg appears primarily as wife and mother, while Freyja is the mistress of gods and men alike, accused of taking lovers everywhere and greatly desired by the giants. Possibly the older, Germanic Frija, wife of Wodan, who has given her name to Friday, was the predecessor of both goddesses.

Although we know little of Frija, one interesting myth about her has survived from an early chronicle of the Lombards, the *Origo Gentis Langobardum*, used by Paul the Deacon in the 8th century AD. Here Frija persuades her husband by a trick to give a name to the tribe who sought her help. She turned Wodan's bed to face the east, and then told the people to come out at sunrise, the women with their long hair hanging over the faces. 'Who are these Longbeards?' asked Wodan in surprise, and since he had bestowed a name on them, he was bound to give them the gift of victory that went along with it. There are similar stories of Frigg persuading Odin to support her suppliants,

Historiska Museet, Stockholm

In Norse mythology, Freyr was the god of peace, prosperity and fruitfulness, and there was a close link between the god and the king of the pagan community: grotesque Viking statue thought to represent Freyr

and it was said that she sent an apple to King Rerir, the founder of the Volsung race, when he sat upon a burial mound and besought her for a son: he shared the apple with his wife and the hero Volsung was born. The most important myth involving Frigg concerns the death of her son Balder. At his birth she sought to protect him from harm by extracting a pledge from all created things not to hurt him but she overlooked the humble mistletoe that was finally instrumental in killing him. After his death she called on all the world to weep for him so that he might return from the realm of the dead. This is perfectly in accord with the widespread and ancient pattern of the Earth-Mother Goddess lamenting over her dead son found in many parts of the ancient Mediterranean world (see BALDER).

Goddess of Giving

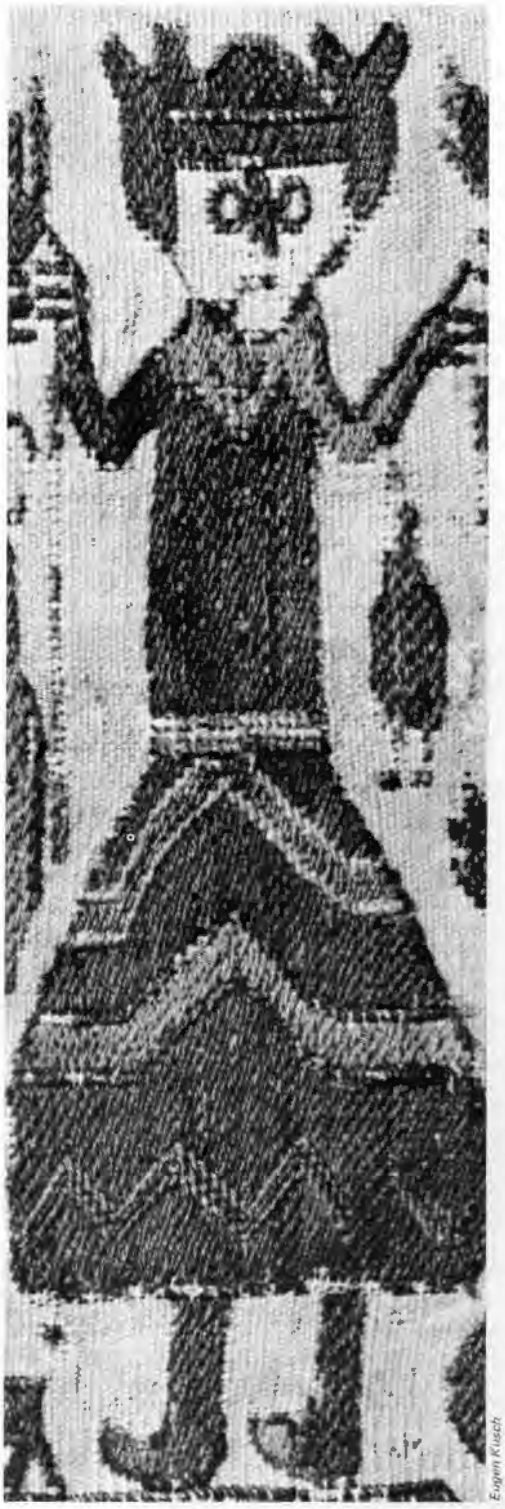
In the late Viking age however Frigg is overshadowed in the myths by the more vivid character of Freyja, called the bride of Vanir. Her name means 'Lady' while that of her twin brother and consort Freyr means 'Lord', and it is made clear that she was worshipped under many different names. Some, like Gefn, emphasize her as a Goddess of Giving and others suggest an association with crops or with the sea. The giantess Gefion, who turned her sons into giant oxen to plough round the peninsula of Swedish Zealand and make it into an island to give to her Danish people, probably represents another aspect of the same goddess of fertility, associated with the sea as well as the underworld. Idun, guardian of the apples of eternal youth which kept old age away from the gods, and which were once stolen by the giants with fearful results, may well be yet another personification of the same deity.

Freyja's famous treasure was her necklace (thought by some to have been a girdle) named Brisingamen, and this has been an attribute of the goddess since the Bronze Age. There is a story of how she obtained it from the four cunning dwarfs who made it, paying for her acquisition by sleeping a night with each in turn, and of how Loki stole it from her by entering her bower in the form of a fly, so that Odin could make use of it to strike a bargain with Freyja.

Freyr had his own ship, Skipbladnir, said to be large enough to hold all the gods, but small enough to fold away into a pouch when not in use. Tales of a supernatural boat which could travel with incredible speed may be linked with this magic vessel of the gods. There is a widespread tradition also of a boat which carries a divine child across the sea to become the founder of a kingdom, found in the opening section of the Anglo-Saxon poem *Beowulf*, and this tradition too seems to be associated with the Vanir. The practice of ship-burial, when the dead man or woman was laid on a boat in the grave, or burnt in one on the funeral pyre, seems to have been part of the Vanir cult. (See BEOWULF.) Horses, pigs and birds, all creatures associated with the fertility deities, were slain at the great ship funerals in Norway and Sweden in the Viking Age, while the seedcorn, hazel nuts and apples found in the Oseberg ship burial of the late 9th century are typical symbols of fruitfulness. It has indeed been suggested that the young woman buried with great pomp at Oseberg may have been a priestess of the Vanir. A beautiful little carved wagon was found buried with her, recalling the famous description by Tacitus of the journey of the goddess of fertility through parts of Denmark in the 1st century AD. He calls her Nerthus or Mother Earth, and describes her journey in a wagon unseen by men, bringing prosperity and respite from war and welcomed everywhere by the people. The resemblance between the name Nerthus and that of Njörd, father of Freyja, provides us with what may have been an earlier pair of deities of the fertility cult.

Sacrifice of Horses

Freyr and Freyja owned a golden boar, named Gollinborsti or Goldbristles, reckoned among the treasures of the gods. The boar was a widespread symbol of the pagan period, especially on helmets, since it was thought to protect the worshippers of the Vanir in battle (see BOAR). One such helmet, surmounted by a gilded boar with gold studs for bristles and ruby eyes, has survived from the Anglo-Saxon burial mound at Benty Grange in Derbyshire, and similar helmets are pictured on metal plates from 6th century



Eugen Kusch

Frigg, the Norse mother goddess and protectress, appears with the gods Thor and Wotan on a detail from the 12 century Swedish tapestry of Skog in Hälsingland, in the Stockholm Historical Museum

Sweden. The early kings of Sweden possessed helmets with names like 'Battle Boar', and these may have been used as boar masks in ceremonies connected with the Vanir.

The horse was also sacred to the Vanir, and there are references to horses sacrificed to Freyr, and of a horse dedicated to the god by its owner, which no man was allowed to ride. This forms the theme of one of the famous Icelandic sagas, that of Hrafnkel, priest of Freyr, and while this is not a historical account, it probably preserves partly remembered traditions of earlier customs. There is every indication that the horse sacrifice, a regular ritual for centuries over a large stretch of Europe and Asia where horse-rearing played an important part in men's lives, was an essential rite in the cult of the Vanir. We have an account of Hakon the Good, the first Christian king of Norway, attempting to avoid the ceremony but being forced to conform by the people, and this describes the king presiding at the sacrifice, eating the flesh and drinking the blood of the slaughtered animal. The custom of horse-fighting, described in the sagas and also shown on early memorial stones, may have formed part of the sacrificial ritual.

There was a close link between Freyr and the king of the pagan community, and ancestor kings in their burial mounds, like those at the sacred place at Old Uppsala in Sweden, appear at times to be identified with the god. Freyr was said to have been carried round the land to bring blessing to his people after death, before he was laid in a mound and the same is told of King Frod of Denmark, an early ruler whose reign was represented as a golden age. The name Frod was apparently borne by many Danish kings, and seems to have been another title of the Vanir god, possibly meaning 'fruitful'.

Orgies and Ecstasies

The main emphasis in the Vanir cult was on the maintaining of the existing order, and in particular of the seasonal round which brought new life and food to sustain it. Men turned to the Vanir for help by divination and Freyja's name is associated with one particular divination rite, that of *seidr*, which she was said to have taught to the gods. This was usually performed by a woman known as a *völva* or seeress, who sat on a high platform and fell into a trance induced by the singing of spells, after which she answered questions on certain aspects of the future, particularly about the coming season or the destinies of children. *Seidr* could also be a dangerous activity, used to bring harm and even death to others. There was one type of horse sacrifice too, when the skull and sometimes the whole carcass of the horse was raised on a pole and used as a hostile rite against an enemy. Such practices as these no doubt belong to the darker side of the Vanir cult, hinted at but seldom clearly defined in the literature, which led to bitter condemnation by the Church. The Vanir were indeed amoral deities, concerned not with justice nor morality nor the keeping of oaths, but essentially with the bringing of new life and power into the world. This power might be put to good or evil purposes, and such life-bringing deities are always worshipped in strange, even revolting forms, with orgies, ecstasies and sacrificial rites. To some extent the cult would seem to rival that of Odin, god of magic, ecstasy and the dead, and the myth of the war between the Aesir and the Vanir, which ended in a truce may be based on this. Thus it was that Freyr and Njörd came to Asgard to join the Aesir, while both sides spat into a bowl to symbolize their agreement, and with its contents fashioned the wise giant Kvasir, from whose blood was formed one of the greatest treasures of gods and men, the mead of inspiration. Indeed the three main cults, those of Odin, Thor and the Vanir, between them covered the main needs and concerns of men, and while there was some overlapping and occasionally enmity between them, the picture as a whole is one of acceptance, and of the gods dwelling peaceably side by side, in accordance with the myth.

Friday

Day of the week named after the Germanic goddess Frija, wife of Wodan: it has particularly grim associations for Christians as the day on which Christ was crucified: it was long costomary for Christians to eat no meat on Fridays; traditionally an unlucky day on which to put to sea or get married, but lucky for those born on Friday, for 'Friday's child is loving and giving'.

Although the frog is said to be the enemy of the moon and the greedy devourer of the earth's waters, his medicinal properties are widely valued

FROG

IN MYTHOLOGY, the frog appears comparatively rarely but, when he does, he seems to evoke either extreme repulsion or respect. The ancient Jews, for instance, regarded him with abhorrence. In the book of Revelation, seven angels 'pour out on the earth the seven bowls of the wrath of God'; when the sixth does so, 'three foul spirits like frogs' appear; 'demonic spirits, performing signs'.

The Jewish attitude to frogs doubtless goes back to the early days of their culture, when these creatures were called up by Moses and Aaron as the second plague of Egypt (Exodus, chapter 8). The Egyptians themselves, on the other hand, clearly regarded the frog in quite a different light: Heket, their gentle goddess of childbirth, had the head (and sometimes the entire form) of a frog and, in a variant of the Egyptian myth of the creation of the world, she and her ram-headed husband Khnum were the first to 'build men and make gods'.

The frog also plays an important part in a central Asian creation myth, in which Otshirvani the creator and his assistant Chagan-Shukuty came down from heaven and saw a frog playing in the primeval waters. Chagan-Shukuty picked it up and put it on its back on the surface. Otshirvani sat on the frog's stomach and told his assistant to dive and see what he could find beneath the waters. After repeated attempts, Chagan-Shukuty brought up some earth. At Otshirvani's behest he sprinkled it on the frog which sank, leaving the little earth, just big enough for the divine pair to rest on, afloat on the deep. As

The frog makes one of his rare appearances in Greek mythology in the legend of Leto's wanderings after she has given birth to Apollo and Artemis. To revenge herself upon rude shepherds who prevent her from quenching her thirst in a pool of water she changed them into frogs: earthenware plate in the Victoria & Albert Museum, based on a 16th century Italian woodcut

they slept, Shulmus the devil came and saw his opportunity to destroy the gods and the still tiny earth by flinging them into the waters. But when he picked up 'the earth' it grew so that he could not see around him; he ran, but the more he ran the bigger grew the earth. Finally, he gave up and dropped the now enormous earth just as Otshirvani awoke. Shulmus escaped to continue his evil work in new ways. In other Asian myths the frog supports the world (as he does in Ceylon, beneath a turtle, a snake and a giant).

The frog is also connected with the deluge myths found in many parts of the world. In Queensland, Australia, the aborigines say that a great frog once swallowed all the water in the world, causing great drought and suffering. It occurred to the people that if only they could make the frog laugh, he would bring up the water and all would be well again. Several animals did comic turns and dances for him; but he remained unamused until the eel, by squirming and wriggling about, made him roar with laughter. As he laughed the waters burst out, flooding the world and drowning most of mankind.

The Huron Indians of North America have a similar story saying that all water was in the belly of a huge frog until Ioskeha, the great hero of creation, stabbed him and returned the waters to the lakes and rivers. In other North American legends animals brought order to the world, which was then destroyed by monsters bearing fire and flood; according to the Alaskan tribes, one of these demons was a monstrous frog-woman.

Naturally enough, for many peoples the frog is associated with rain. This is especially so, it seems, in India and South America. Orinoco tribes in Venezuela have kept frogs captive and beat them in time of drought. A hymn in the Hindu *Rig Veda* seems to show that frogs were worshipped for bringing rain or that, awakened themselves by showers, they brought long life and prosperity; the gods granted rain when the frogs croaked but the moon killed them with the dew. It was also thought that the much-needed moisture could be summoned from the skies by pouring water over a frog or by hanging it up. In Malaya the same result could be achieved by swinging it on the end of a cord. Some Chinese tales say the dew brings frog spawn down from the moon; the frog is called the 'celestial chicken'. By contrast, the Shan and the Karen tribes of Burma regard the frog as the enemy of the moon, the demon that swallows it at eclipses.

In Europe, the frog figured chiefly as an ingredient of magic and was highly regarded in the 'medical' half-world between magic and science. Although toads were preferred to frogs in the practices of witchcraft, the latter were certainly credited with magical qualities; in some countries frogs were always killed on sight because they were thought to be witches. In America and other countries, though, it was deadly bad luck to kill a frog; at the least it would make your cow's milk bloody. Here the frog is a creature of positive magic; it is lucky if one enters your house, or if you dream of frogs. You make a wish on the first frog heard in spring; and gamblers will be winners if they meet a frog in the road on their way to gamble. American superstition still retains the belief that a hook-shaped bone of the frog will act as a love charm, if placed among the clothing of the person whose love is being sought.

Beliefs in the frog's medicinal powers go back a long time. Pliny the Elder, who died in 113 AD, discusses the 'magic' (which he himself professed to regard as silly or wicked) introduced from the East into the Graeco-Roman world. In this magic the frog had a variety of uses. It would be carried around a cornfield and buried in the centre before sowing, and dug up before harvest. It would be hung up in orchards and vineyards to protect them from fog and storms, or in a granary to preserve the grain. A person found to be suffering from acute inflammation of the left or right eye could be cured by hanging the corresponding eye of a frog round his neck. The physician Galen considered that to hold a frog, boiled in water and vinegar, in the mouth for some time is quite good for toothache. A later Latin physician, Marcellus, who lived in about 400 AD believed toothache could be cured by spitting in a frog's mouth and asking it to take the pain away; an Arabic text of the 9th century recalls an ancient belief that a woman who performed the same action would not conceive for a year. On the other hand, the primitive Wends, Slav tribes, maintained that it was the frog and not the stork that brought new-born children.

The frog was used in medicine until the 17th century. Sufferers from epilepsy were said to have been cured by a powder made of frog's liver; and the eye of a frog, plucked before sunrise and swallowed, or worn as an amulet, was a remedy for fever. It still functions in folk medicine. In American belief a soup made from nine frogs will cure whooping cough. In other cures the disease has to be 'transferred' to the body of a frog by some magical and usually inhumane process. For instance, to cure headache, you must bind a live frog to your head and keep it there until it dies.

The transformation of the Furies from vengeful fiends to benevolent guardians of the established order reflects the typically Greek belief in the triumph of reason

FURIES

IN THEIR ORIGINAL and best remembered form the Furies are among the most fearsome products of the Greek imagination. They are the avengers, three loathsome and implacable female beings, fulfillers of curses and especially of curses called down upon those who murder their elder kith and kin. Born of blood, roused from hell by the shedding of blood, they are satisfied only by the blood of their quarry.

In the dreadful beginnings of the gods, Uranus, lord of the sky, fathered the Titans upon Gaia, the earth. Uranus was afraid of his children and hid them away in the body of their mother. At length she could bear it no longer and persuaded Cronus, her youngest son, to attack her husband (see CRONUS). Cronus took a sickle and castrated his father, and when the blood from Uranus's genitals fell upon the earth, his wife, she conceived and bore the Furies. It seems strange that they, whose chief task was to hunt down the betrayers of blood kinship, should themselves have been born of their father's blood, shed by their brother. But they came into being out of an act of revenge that was done in defence of their mother; and it is the rights of mothers, even when they are unjust, that they uphold with particular ferocity.

The ancient authors describe the Furies with relish. They are horrifying in appearance and they stink. With snakes in their hair, they brandish torches and metal-studded whips. They bark like bitches, virgin hell-hounds. They have suitably ominous names: Alecto, 'the Endless'; Tisiphone, 'the Retaliator'; Megaera, 'the Envious Rager'. Although their main duty was to avenge those murdered by their kin, they also sometimes took it upon themselves to right the established order in other ways.

The Greek word for Furies was Erinyes, and they were also called Maniai 'raging women', and, more interestingly, Eumenides, 'the kindly ones'. This last name may have been given them by prudence and, almost, wish-fulfilment, rather as the Black Sea, noted for its violent storms, was called the Euxine or 'the Calm'. Robert Graves, writing of the Furies, says it was 'unwise to mention their (real) name in conversation'. But it is perhaps more likely that the name, at least in historical times, is a sign of a typically Greek habit; the taming of something wild not by weakening it but by finding a place for it in an existing ordered system.

The classical Greeks, heirs to a fierce and ancient myth like that of the Furies, emphasized the positive and preserving, rather than the negative and destructive, aspect of these savage beings. They dwelt on their role as guardians of the social order more than on their being avengers of crime. And as guardians the Furies were kindly. Moreover, an educated 5th century Athenian would be quite prepared to accept the Erinyes, the avengers, as credible inhabitants of a mythical, heroic past, as doubtless did those who lived in that past; but as a citizen of his time he would more readily believe in the Eumenides, the guardians of the proprieties and values of his urban society.

Ancient, Mindless Fiends

This transformation of the Furies, in nature and role as well as in name, is vividly portrayed in the *Eumenides* of Aeschylus, which is concerned not only with the Furies' most famous pursuit, but also with their being tamed, and established as Athenian divinities.

The drama opens in the precinct of the temple of Apollo at Delphi. Orestes has come there in the hope of throwing off the Furies who are, quite literally, after his blood. For he has killed his mother Clytemnestra, and also her lover Aegisthus, for their murder of Agamemnon his father. Orestes did this terrible deed out of duty, his inescapable duty to avenge his father at any cost; and he did it after much agonized self-questioning, and having sought the guidance of Apollo. But the Furies, more ancient beings than Apollo, know nothing of this duty. Their fate-appointed task is to track and destroy all those who slay their elder kin, and particularly those who kill their mothers. Mitigating circumstances or the code of the younger gods mean nothing to them.

At the beginning of the play, the Furies are lying senseless on the ground, put to sleep by Apollo. It is possible to see that they are female but they are too loathsome to be called women. Their skin is black, they are dressed in foul rags. Their breath is hot as they snort in their disgusting sleep and a noisome ooze drips from their eyes. Apollo gazes at them in horror, for they are hated by both gods and men. He is of a younger, more gracious generation of divinities, dwelling in the bright sunlight and, god though he is, he has far more in common with the man Orestes, trapped in the toils of conflicting duty, than with these ancient, mindless fiends from the gloom of Tartarus.

Clytemnestra, however, thinks differently.

'Ghastly yet magnificent fiends', the Furies were originally avengers whose main task was to track down and destroy those who had murdered their elder kin, particularly those who had killed their mothers: 18th century statue in the Kunsthistorisches Museum, Vienna

Photo Meyer

Despite their fearsome origins, the Furies were eventually transformed into guardians of the social order, and were often depicted as grave winged maidens, sometimes carrying torches: relief on a sarcophagus showing one of the three sisters who has come to take away the soul of a dying warrior

Her ghost appears and rebukes the Furies for sleeping. They begin to whine and moan. As they writhe awake they spit out their first words, a ferocious string of sounds: '*Labe, labe, labe, labe, phradzou!*', 'Seize him, seize him, seize him, seize him, mark him!'. They revile Apollo who, a younger god, has broken the ancient laws by harbouring a doomed transgressor of these laws. He turns them out of the sanctuary. They are eager to go, for Orestes has fled to Athens to throw himself upon the mercy of Athene. During his flight Orestes has tried to expunge his guilt by ritual purifications but the Furies remain unplacated.

We see them in pursuit and then, having reached Athens in their 'wingless flight', performing a horrific *danse macabre*. They shriek of human blood, the scent of which fills them with delight. They intend to suck the living blood from Orestes and take him alive to hell to torture him there. They boast that their song drives their victim mad, binds his soul and withers his life. The gods may not touch or impede them in the inexorable task set them by fate. They do not care if they are dishonoured and despised. Nothing can hinder them, although they are separated from the gods by 'a light not of the sun'.

Respectable Matrons

Athene enters and is amazed at the extraordinary and revolting spectacle. But when the Furies explain themselves she says she knows their lineage and name. They, somewhat surprisingly, say they are willing to let her judge Orestes, since they reverence her and her birth. This the beginning of their transformation, though at this point they probably trust Athene more than Apollo simply because she is female, and they expect her to side with the mother rather than the son; they are soon to be disappointed by Athene's championing of the rights of the male over the female.

Orestes puts his case to the goddess. She is sympathetic but is afraid that if the Furies are cheated of their prey the venom of their resentment will fall on the ground and afflict the land with 'intolerable and perpetual pestilence'. Athene therefore decides to have the issue tried by her court of citizens, the Areopagus.

The Furies accept this decision but declare, in effect, that if Orestes is acquitted all the ancient virtues will be subverted by a new permissiveness. They call themselves 'the Furious Ones that keep watch upon mortals', particularly concerned to guard parents from impious children. Some fear, they say, is good and should 'abide enthroned as guardian of the heart'. Although the content of the Furies' speech, the sacredness of the ties of kinship and filial reverence, is similar to their earlier ragings, the tone is now very different. There is a stern and lofty conservatism, an almost matronly respectability, which contrasts very strongly with the savagery and odiousness of the first scenes of the play. One feels the Furies have had a bath and changed their clothes. But when Orestes is acquitted, by the casting vote of Athene, their rage breaks out anew. The younger gods 'have ridden down the ancient laws', they cry in Athene's face, and, quite forgetful of their acceptance of her arbitration, they threaten to poison and pollute the land.

The final scene of the play depicts Athene's difficult struggle to placate the Furies. She offers them a temple and a home in Athens, and a role as guardians of the city and its virtues. For a long time the Furies refuse, enraged at the decision of the court. But although they are furious, it is now only because they believe ancient justice has been violated; they no longer shriek for blood. They are outraged but they are no longer hounds from hell. Gradually, in a dying fall, they succumb to Athene's pleadings and promises and move off in a solemn procession to dwell in a cave beneath the Acropolis, and to watch over the well-being of the city.

In the surrender of the Furies, these ghastly yet magnificent fiends, and their acceptance of a tamer role as guardians rather than avengers, we may see the triumph of reason over unreason; 'the furious ones' have become 'the kindly ones', a characteristically Greek transformation.

GALAHAD

'BUT IN THE SIEGE Perilous there shall no man sit therein but one, and if there be any so hardy to do it he shall be destroyed, and he that shall sit there shall have no fellow.' These are Merlin's words in Malory's *Morte D'Arthur* and the knight who had no equal and who took his appointed place in the Siege Perilous, the empty seat at the Round Table, was Galahad.

The coming of Galahad to Camelot, one year at Pentecost, marked the beginning of the quest of the Grail and the end of the fellowship of Arthur's knights. A sword had been found, embedded in a great stone and with lettering on the pommel which said that only the best knight in the world could draw it out. Lancelot refused the attempt but Gawain and Perceval tried and failed. When the knights sat down to eat at the Round Table, an old man came in, leading the young Galahad without sword or shield but with an empty scabbard. The old man led Galahad to his place at the Siege Perilous. The other knights marvelled and showed Galahad the sword in the stone. He drew it lightly out and settled it in his scabbard. Arthur himself, of course, had drawn a yet more celebrated sword from a stone in his own youth (see ARTHUR).

A greater portent was in store, for after a tournament in which Galahad proved his prowess as a fighter, when they all went to supper they heard a terrible roll of thunder, a ray of bright sunlight shone into the hall, 'and all they were alighted of the grace of the Holy Ghost.' Unlike Christ's disciples who spoke in tongues at the first Pentecost, with which a parallel and a contrast are being drawn here, the knights sat as silent as if they had been struck dumb. 'Then there entered into the hall the Holy Grail covered with white samite, but there was none might see it, nor who bare it.'

Awestruck, Gawain and most of the other knights vowed to go in search of the Grail. King Arthur sadly lamented that he had been bereft of 'the fairest fellowship and

Sir Galahad, by Dante Gabriel Rossetti, in the Tate Gallery: it was Galahad's stainless purity that won him the Grail

Unlike the other Arthurian heroes, Galahad's history does not go back into the pagan past. He was a character deliberately invented to contrast the ideal of the perfect Christian knight with the brave but essentially worldly ideals of chivalry. He was fitted into the older tradition by making him the son of Lancelot by Elaine, conceived after Lancelot had been bewitched into mistaking her for his mistress, Guinevere. *Left* Galahad asleep under a tree, resting from the adventures of the quest, from an early 14th century French ms *Above* Galahad, from a 13th century ms *Below* Galahad with Lancelot and Elaine, from *Roman de Lancelot du Lac*, 14th century

the truest of knighthood that ever were seen together in any realm of the world: for when they depart from hence I am sure they shall never meet more in this world, for they shall die many in the quest.'

The Saintly Knight

Malory drew the material for this part of his work from the French *Queste del Saint Graal*, written in the early 13th century, and Galahad 'had no fellow' in more senses than one. He was a literary interloper, not a hero of pagan legend more or less Christianized, but a character invented by the author of the *Queste* and a wholly Christian invention at that. His name comes from Mount Galaad – Gilead in English translations of the Bible – in the Song of Solomon (chapter 6), a passage which had already been interpreted as referring to Christ. Galahad is not quite Christ himself but he comes very near it. He is the holy knight who is free of mortal sin and, in this version of the legend, the only one who penetrates fully to the heart of the mystery of the Grail. Like Christ, he is descended from King David, and in the *Queste* a monk tells him that his coming must be compared to the coming of Jesus, adding hastily, 'in semblance only, not in sublimity'.

Galahad was fitted into the older Arthurian traditions by making him the son of Lancelot by the fair-Elaine, daughter of the lord of the Grail castle, conceived after Lancelot had been bewitched into mistaking Elaine for his adored mistress, Guinevere. But the fruit of this intended adultery is the purest of mortal men and with his coming the ardour of the knights turns away from the duties and pleasures of chivalry in the world of the Round Table, from jousting, courtly love and adventure for its own sake, to search for a different, spiritual world in the quest of the Grail.

Galahad ends the fellowship of Arthur's knights because he devalues it, which accounts for the attacks that lovers of the older stories have launched at him as a prig, an inhuman cardboard saint. His character was strongly influenced by the ideals of the Cistercians, a monastic order of great influence at the time when the *Queste* was written. At one point in it a hermit lists the Christian virtues in order of importance: chastity ranks highest (with lust as the root of all evils), followed by humility, patience, justice and charity. These are scarcely the virtues, nor the order, which the older heroes would have adopted.

Galahad's virginity is strongly stressed. He is pure of body and pure of heart. He is also kindly and merciful – he does not kill an opponent if he can avoid it – but he seems inhuman, partly because he is totally concentrated on his task but more because he has no failings. Unlike some of the other knights, he makes no spiritual progress during the quest, because he is perfect to begin with.

The knights set off in quest of the Grail and Galahad comes to an abbey of white monks (Cistercians) where there is a shield which kills or wounds everyone who takes it. It bears a red cross on a white ground and can be carried only by the finest knight in Christendom. The symbolism of the white and red is explained later in the story when Galahad is told, 'you are as pure and virginal compared to other knights as the lily flower, the symbol of virginity, is white beyond all other. You are the lily of purity, you are the true rose, the flower of strength and healing with the tint of fire: for the fire of the Holy Ghost burns in you so brightly...'

Victoria & Albert Museum/A. Fleming

Galahad receives the key of the Castle of Maidens, after rescuing them from slavery to seven knights, who represent the seven deadly sins: ivory casket, c 1320

The Vision of Heaven

Galahad rides many journeys and finds many adventures. With Perceval and Bors he comes to a miraculous ship (the ship of Faith) in which is the sword that struck what Malory called 'the dolorous stroke', the blow that killed King Lambar and turned his kingdom into the Waste Land. Lambar, the *Queste* explains, was the father of the Maimed King, who had himself tried to draw the sword. At that instant he was transfixed through both thighs by a flying lance, in punishment for his presumption, and the wound had never healed.

Galahad took this sword and eventually, after years of search, the three knights came to the castle of Corbenic, the home of the Maimed King and the Grail. Here they saw the Grail itself, the dish from which Christ ate the Passover lamb at the Last Supper, and also the Holy Lance, with which the crucified Christ was wounded in the side and from which drops of blood were still falling. They saw a vision of Christ appearing from the Grail, and he said to them: 'My knights, my servants and my faithful sons who have attained to the spiritual life whilst in the flesh, you who have sought me so diligently that I can hide myself from you no longer, it is right you should see some part of my secrets and my mysteries . . . Take now and eat of the precious food that you have craved so long and for which you have endured so many trials.' He gave them the Communion from the Grail and 'it seemed as though the essence of all sweetness was housed within their bodies'.

Galahad no longer desired to live, for the Grail had revealed to him 'those things that the heart of man cannot conceive nor tongue relate'. He had been 'translated from the earthly plane to the celestial, to the joy of the glorious martyrs and the beloved of Our Lord'. After further adventures Perceval became a hermit and Bors made his way back to Camelot. But Galahad, who had seen the supreme vision of heaven, could not return to the world of men. His prayer to die was granted and his soul was borne to heaven by rejoicing angels. A hand came down from the sky and took the Grail and the Lance, and carried them to heaven also, and no man has ever seen them since.

GAMES

The Myths of Play

Hockey was played by the Wichita Indians in spring, to symbolize the conquest of winter; it is one of the many games which have religious or legendary connections, the subject of the first article. The second describes the ideals which gave birth to the Olympic Games

GENERALLY PLAYED for entertainment and recreation in the modern West, games have been recorded throughout history, and often reflected the social customs, and sometimes the religious beliefs, of the players. Some of the older games claim a legendary or mythical origin, and, because chance plays a large part in their attraction, divination, fortune telling and magical beliefs are in many cases associated with them.

Distinctions may be drawn between a sport such as archery, once of national importance and the more familiar ball games such as football and hockey. There are also games of chance played mainly with cards and dice, and board games such as chess.

Archery originated in the Stone Age, when small, delicately chipped arrow heads were used for hunting and in war; in Saxon England they were called 'elf darts' and were treasured as charms.

In ancient times arrows were widely regarded as mediums for divination and fortune telling. In Palestine, Chaldea and Arabia the usual method was to shake the quiver in front of an image of the god being addressed, and note which arrows, previously marked, fell out. When Nebuchadnezzar, King of Babylon, was unable to decide whether he should attack Jerusalem or Ammon, he used several methods of divination, one of which was the shaking of arrows (Ezekiel, chapter 21). Also in the Old Testament is the story of how the dying prophet Elisha laid his hands on those of Joash, King of Israel, as the latter shot 'the Lord's arrow of victory over Syria'. He then commanded the King to strike the arrows on the ground, and prophesied that Joash would overcome Syria in battle as many times as he had struck the ground (2 Kings, chapter 13).

In fairy tales the hero often shoots an arrow into the air and follows its path to fortune. Arrow heads are found buried under the foundations of buildings or built into

Games are often mysterious matters, closely linked with social and religious customs ***Facing page*** **Chess is one of the most ancient of board games, its origin obscured by a mass of legend and mythology. A 'war game', it is rich in symbolism: scene from** ***The Seventh Seal,*** **in which the returning Crusader plays chess for his life against Death** ***Right*** **A game similar to chess was played in Ancient Egypt: scene on an Egyptian tomb, c 1300 BC** ***Above*** **In classical Greece dice were made from bones, and were originally instruments of divination; eventually this method of determining the wishes of the gods developed into a gambling game in which the winner was the player who received the best 'omen' when the dice were cast: Greek statuette in terra cotta, 300 BC**

the walls of houses or churches to protect them from evil influences, and they were at one time placed in stables to protect the animals from disease.

Wherever there is anything which may be used as a ball, there is a potential game; ball games have been played through the ages. The balls used may have been 'natural', such as pebbles, a block of wood or a lump of clay, or they may have been fashioned from wood, bone or ivory, made from plaited straw, or from strips of skin or fibres. A skin or woven cover may have been stuffed with hair, wool or other material, or inflated with air. Unfortunately all except those made of stone or bone were perishable, and there is little archeological evidence of their existence, although the remains of balls

made from skin filled with grass or hay have been found in early Egyptian tombs.

Rubber balls were used in South America long before rubber was first brought to Europe; in North America red and yellow balls symbolized the sun, and ball games celebrated the conquest of day over night, and light over darkness.

Football is one of the most popular and possibly one of the most sophisticated games in the world today; but in its primitive form, needing nothing more than an object to kick and someone to kick it back, it has been an obvious form of game since unrecorded times. It is not mentioned by name until the 14th century, and then chiefly in prohibitions as, for instance, when Edward III told his sheriffs to suppress football as the game interfered with training in archery.

Medieval football was independent of grounds and of rules. The ball was placed in a neutral place, often the churchyard, and the villagers, perhaps a hundred to a side, hurled themselves on it, and attempted to carry it off to their base.

Traditionally the game was played on Shrove Tuesday when it symbolized the conquest of spring over winter. As a contest between married and unmarried men, the game appears to have been a relic of a fertility rite. Shrovetide football was also played vigorously by women as well as men until well into the 19th century, a custom that has continued into modern times.

In Chester, football was believed to commemorate kicking the head of a captured

Modern football is one of the most popular and possibly one of the most sophisticated of modern games; in fact, in its primitive form, requiring only an object to kick and someone to return it, it has been played through the centuries. In various parts of the world the game has acquired a symbolic meaning, sometimes as a fertility rite, sometimes portraying the conquest of spring over winter *Above* American football: although the rules are sophisticated, this version still retains some of the roughness of the game which was played in medieval times *(below)* where 'there one's maim'd, who never saw the ball': this 17th century illustration from Henry Peacham's *Minerva Britanna* is probably the earliest one showing organized football *Right* Football players by Rousseau, 1908

Played since classical times, hockey has a ritual significance in some parts of the world; in Morocco, for instance, it is played to induce rain *Above* Until comparatively recently hockey in England was a rough game, not suited to 'weakly or timid players': illustration from *The Popular Educator* by F. Wentworth, published by Cassell

Dane; in Derby it was thought to celebrate a local victory over the Romans. At St Ives in Cornwall the Mayor used to throw a ball coated with silver, perhaps a relic of sun-worship, from the pier and crowds fought for it, without limit and without rules.

Hockey, which is known as 'hurling' in Ireland, and 'shinty' in Scotland, possibly originated in Persia; a similar game was played by the Greeks and Romans. In Morocco it appears to have some connection with fertility rites, as it is played in the spring to induce rain and at other times if there is a drought.

The Wichita of Oklahoma believed that the game was handed down to them by a mythical ancestor, and it was played during their spring festival. The team with the green hockey sticks and balls overcame the opposing side, symbolizing the conquest of winter. In the south-western desert region, the Hopi Indians believed they could foretell the maize yield by playing hockey with a buck-skin ball filled with seeds. If the seeds spilt out the harvest would be good; if the ball failed to burst, crops would fail.

Princely Pastimes

Chess, one of the oldest and most honoured of board games, originated in Asia and is commonly assumed to have been brought to Europe through the Arabs. 'Checkmate', from *shah mat*, 'the king is dead', is derived from Arabic, but it is not known whether the Arahs were introduced to the game in Persia or in India. Early names for the game, and for some of the pieces, are Indian.

An Indian legend, one of the many concerning the origin of the game, relates how chess was invented by the wife of the giant Ravana, King of Ceylon, to entertain him when Rama, the mythical hero of the *Rama Yana* (which dates from about 500 BC), was besieging him in his palace. But gaming boards and primitive chessmen have been discovered by archeologists in Palestine on sites which date from 1500 BC or even earlier. Boards, with small blue pottery cones and pyramids, were revealed when a large house near Jerusalem was uncovered; and inlaid gaming boards have been discovered in Crete.

The Crusaders are generally credited with bringing chess to England from the East after the Crusades of the early Middle Ages, but there is evidence that the game was known long before then. In Irish folktales King Arthur plays chess with the Irish knight Owain, and the chieftain-god Midir the Proud wins the fairest maid in the world by checkmating Eochaid, the King of Ireland.

Playing cards are believed to have descended from the Tarot cards, which are popularly supposed to have been imported into Europe by gypsies, who originally brought them from Egypt. The modern pack of 52 cards came to England from France in the 15th century. These have been used for innocent amusement and for reckless gambling, for divination and for fortune telling ever since.

There are many superstitions connected with playing cards, which the Presbyterians nicknamed the Devil's Picture Book or the Devil's Bible. A player will get up and walk round the table, or he will turn his chair round, to change his luck. A number of cards have their own superstitions such as the Ace of Spades, which is connected with death, and Nine of Diamonds, known as the 'curse of Scotland'. Sailors and thieves regard all cards as unlucky; cards are thrown overboard in a storm and no thief will include a pack in his loot. (See CARDS.)

Gambling with dice was common in ancient times in Egypt, the Far East, Greece and Rome; and there is possibly even earlier evidence of the use of a form of dice for gambling, or for divination, in the pebbles painted in red ochre, which were found among artefacts dated to about 7000–5000 BC, in the cave of Mas d'Azil in France.

The dice used in classical times were derived from the little cuboid bones known as *astragali* which are found in the joints of many animals, especially sheep, and in human ankles. They have been discovered on the site of Ephesus in Asia Minor, and in Sparta. Bone or wooden dice, their six sides marked with dots or numbers, were commonly used for telling fortunes.

ALISON H. QUIGGIN

The Olympic Games were described as 'the Flower of Festivals, excellent as water, bright as gold, brilliant as the noonday sun'

The Olympic Games

The first Olympic Games of which there are historical as opposed to mythical records, were held in 776 BC, to mark a truce between the states of Elis and Pisa in western Greece. For the next thousand years they were one of the greatest unifying influences in the Greek world, providing satisfaction in athletic accomplishment for both competitors and spectators, and also pleasing the gods who were thought to look down with favour on the highest achievements of mortals.

The Games had their origin in the myths surrounding the feats of god-like creatures, once mere men, who existed in the heroic age of Greece. Hercules is said to have cleansed the Augean Stables, the sixth of his twelve labours, by diverting a river at Olympia, the site where all later Olympic Games were held.

The ancient Games developed partly as a result of man's desire to predict the unpredictable. There was a primitive anxiety that the earth might never come to life again after winter. With the soil bare and food scarce, who could give an assurance that another year would bring a fresh harvest? The saviour of the harvest was the person with the magic of victory in him, the athlete born of Zeus the sky god. A simple race was the way to choose this man.

Later the man who embodied all the qualities of goodness or excellence was sought. Bronze statues, probably modelled from the victors, overlooked the stadium and were called *zanes*, a word that is derived from Zeus. In this way the heroes of the ancient Games were almost deified.

Rule of Nakedness

The Games developed until in the 5th century BC, the poet Pindar described them as 'the Flower of Festivals, excellent as water, bright as gold, brilliant as the noonday sun'. This was a superlative extension of athletics to the world of art, poetry and sculpture, but the importance of the Games still lay in the search for one man, a hero who embodied all this excellence.

It is not known for certain why the Games were held every four years if they were associated with an annual event; but it is probable that the Greeks felt that a complete cycle consisting of a sun cycle and a moon cycle was required. Using their primitive algebra, they calculated this to be four years.

In the early Olympic Games the prize for the Olympic victor was a crown of wild olives, possibly showing that the victor represented vegetation, that is, he was the new life of the year. Alternatively the olive crown could have represented simply the great distinction of the victor, and have been of no value in itself.

The honours were shared fairly equally among the various city-states. Athletes came from all parts of Greece and at the time of the Games there was a general truce to hostilities. The contests were open to all men of true Greek descent. The only woman admitted to the Games was the priestess of Demeter, the corn goddess. In fact, this rule acted as a spur to contestants' mothers and sisters, and there are various stories of women obtaining entry disguised as men. In an attempt to restrict entries to men, it is said that the rule of nakedness was extended to trainers as well as contestants.

Apart from the chariot races, the main contests were four running events, boxing,

The lighting of the Olympic flame is a recent innovation, but in symbolizing a period of truce for the Games, it perpetuates a tradition that originated in classical Greece, and emphasizes the ideals that are common to both the ancient and modern Olympic Games: scenes from *Olympische Spiele*, directed by Leni Riefenstahl

two types of wrestling, and a pentathlon consisting of javelin, discus, long jump, running and wrestling, in each of which the competitors took part. This basic pattern of events remained almost unchanged for a thousand years.

The runners completed distances which were multiples of the *stade*, about 180 yards. The name of any man who achieved a particular combination of victories for the first time was recorded. Our word 'agony' is derived from *agon* which is Greek for an athletic contest.

When Rome inherited the power of Greece the Games became more international, professionalism crept into sport, and the Games eventually became a great tourist attraction. Physical training was carried out in gymnasia which were also known as centres of learning. Intellect and physical fitness were not thought to be mutually exclusive, as has so often been the case in other civilizations.

Sport has never since been held in such esteem, yet at the same time the Greeks had a sense of proportion. For instance, the delicate and skilful art of wrestling was preferred to the more brutal boxing, and was the sport of the common man.

The early Christian Church rejected all athletics, believing that they were a pagan indulgence. By the 4th century AD the Games had become vulgar and discredited, and they were finally abolished by the Christian Emperor Theodosius I in 393 AD.

The Olympic Games owe their revival in the 19th century largely to the enthusiasm of Baron Pierre de Coubertin, the French educationalist. The first of the modern series of Games was held in Athens in 1896 and since then they have been held every four years, apart from the intervals caused by the two world wars.

Competitors must take an oath declaring that they are true amateurs, and the winners are awarded silver-gilt medals. In victory ceremonies the flag of the victor's country is raised, and his national anthem is played. The lighting of the Olympic flame, a modern innovation, accompanies the release of pigeons from the stadium, to signify a period of truce for the Games just as, more than 2000 years ago, the city-states of Greece agreed to keep the peace during the ancient Olympic Games.

India's most sacred river is divinely personified as the goddess Gongo, whose most important role is that of purifier from sin; every year many thousands of Hindus travel to the Ganges seeking to benefit from the cleansing powers of its waters

GANGES

THE INDIAN RIVER most renowned for its incomparable sanctity is the Ganges, known in Sanskrit and several other Indian languages as Ganga. Its source lies in the Himalayan region of Tehri, 13,800 feet above sea-level. Draining the western Himalayas and the northern slopes of the Vindhya range, the Ganges flows eastwards and near the town of Allahabad it is joined by the Jumna. The two rivers enclose a fertile expanse of land known as Doab or Antarvedi, which is thought to be the holy land of the early Hindu settlers. In Bengal the Ganges is joined by its greatest tributary, the Brahmaputra. The total length of the Ganges is 1557 miles.

The belief in the sacredness of the Ganges does not stem from the earliest period of Hindu history, for according to the oldest Aryan traditions embedded in the Vedic hymns, the rivers Jumna and Sarasvati were considered even holier, and in the *Rig Veda* the Ganges was mentioned only twice. But as the Aryans spread from the Punjab eastwards along the broad and fertile Ganges valley, respect for the river deepened and the sanctity of the Ganges was firmly established by the second half of the first millennium BC.

Like other natural phenomena, the Ganges was personified as a divinity, the goddess Ganga, who is still the object of a widespread cult. Some myths represent the Viyadganga, or 'heavenly Ganges' as flowing from the toe of the god Vishnu. According to a legend contained in the epic *Rama Yana*, the Ganges was brought down from heaven by the prayers of the saint Bhagiratha, in order to purify the ashes of King Sasava's 60,000 sons, who had been burnt by the angry glance of the sage Kapila. The goddess Ganga was angry at being brought down from heaven, and the god Shiva, to save the earth from the impact of her fall, caught the river on his brow, and compelled its waters to flow through the labyrinth of his matted locks.

Hindu mythology regards the goddess Ganga as the wife of the King Santanu, to whom she bore a son, Bhishma, one of the heroes of the *Mahabharata*. Sometimes she is also identified with Parvati, a mountain goddess and wife of Shiva, or other forms of the mother goddess. Many temples on the banks of the Ganges are dedicated to the goddess Ganga. Most important among them is the Ganga shrine at Hardwar, near the source of the river, while in Benares, the holy

According to Hindu mythology, the goddess Ganga, divine personification of the Ganges, was angry when she was brought down from heaven; to save the earth from the impact of her fall, the god Shiva caught the river on his brow, and its waters were compelled to flow through his matted locks

city on the bank of the Ganges, the goddess is worshipped as Annapurna, the goddess of food. Images of Ganga are found also in other parts of the country such as the cave temples of western India; and representations of Ganga and the river goddess Jumna flank the entrances of many temples built during the 4th and 5th centuries AD, the classic Gupta period. Whereas in northern and western India, Ganga is usually depicted as a woman, south Indian sculptures often represent her as a water-sprite, who is half woman, half fish.

'Hail Mother Ganges!'

In popular Hindu religion Ganga appears invariably as a benevolent figure, bestowing good health, offspring and prosperity on her worshippers. But her most important function is that of a purifier from sin, and in this respect, her waters are believed to be specially efficacious at points where the Ganges joins tributaries such as the Jumna. Though the water of the Ganges and other sacred rivers has the power to purify, it should itself be protected from impure contacts: the pollution of the Ganges, in particular, is a serious outrage. According to orthodox tradition a Hindu should not cross a river unless it is necessary and he should not bathe in it naked. He should not spit directly into the water but spit first on his palm, which he should then wash. A Hindu woman in her menses must not bathe or wash clothes in a river, and a pregnant woman should neither wash in a river nor cross it. This also applies for 40 days after the child's birth.

The purifying power of water in general, and of Ganges water in particular, is partly due to its cooling power. Many Hindu practices are based on the idea that power is heat and that cooling this heat with water renders the power innocuous. Water is also believed to destroy the evil power of spirits, and to avert the Evil Eye. Ganges water possesses all these qualities to the highest degree. The reverence of Hindus for the Ganges is non-sectarian: all castes seek to benefit from its power of purification and its blessing by bathing in the sacred water. High merit is gained by pilgrimages to the Ganges, and pilgrims catching their first glimpse of the river shout 'Hail Mother Ganges'. Every year many thousands of Hindus travel to Benares and other sacred places on the banks of the Ganges and bathe in its waters. Many shave their hair and offer it to the goddess Ganga, reinforcing the physical link between themselves and the sacred river in this way.

A special festival in honour of the birthday of the goddess Ganga is held in April or May, when her devotees bathe and give alms, and little girls float dolls on the water. The supervision of these bathing fairs lies in the hands of a special class of Brahmins, known as Gangaputra, 'sons of the Ganges'. The greatest of these fairs is held every 12 years when Jupiter enters the sign of Aquarius.

Hindus utilize the power of Ganges water on many other occasions. It is carried to all parts of India by pilgrims or professional carriers and is used as a charm to repel evil spirits; it is also put into the mouths of the dying, and sprinkled over bridal couples to encourage fertility.

To die on the banks of the Ganges is believed to improve a person's chances of a happy fate in the afterlife, and for this reason the sick are carried to its shores and the dying immersed in its water. Many Hindus have committed suicide by hurling themselves into the confluence of the Ganges and Jumna in the hope of gaining a blissful future life. Those living within reach of the Ganges cremate their dead on its banks, and throw the ashes and unburnt bones into the water. If this is not possible, the ashes may be dispatched to one of the holy places on the Ganges to be cast into the sacred river.

The sanctity of water is firmly rooted in Hindu belief. When Brahmins perform their daily ablutions, they invoke the holy rivers, among them the Ganges and all its sacred branches. Often they offer oblations to water by casting into rivers small pieces of gold and silver, and sometimes pearls and other valuable jewels. When rivers were first spanned by railway bridges passengers threw coins into them in order to propitiate the divinities manifested in the rivers. While such customs have gradually become obsolete, the belief in the sanctity of the Ganges and other sacred rivers continues to be an important and enduring element of Hindu ideology.

C. VON FÜRER-HAIMENDORF

GARLIC

ALTHOUGH MOHAMMED is recorded as saying, when he refused a dish containing garlic, 'I am a man who has close contact with others', garlic *(Allium sativum)* has a widespread reputation as a beneficent vegetable.

It probably originated in central Asia, and there is a Mohammedan tradition that garlic sprang up where Satan, as he was expelled from Paradise, placed his left foot, while the onion appeared from his right footprint.

The Jews' oriental origin is reflected in their liking for garlic and the Talmud's direction that numerous foods should be seasoned with it. Although the Crusaders have been credited with bringing it to Europe, it is clear that it was eaten in ancient times in both Greece and Italy, where it was thought to give strength and courage. Virgil tells how countrymen ate a salad called *moretum*, made from bruised garlic and thyme leaves, flour, cheese, oil and vinegar. Now, of course, no French or Italian meal is likely to omit garlic.

One of the earliest accounts of the magical properties attributed to garlic is in the writings of Theophrastus, the Greek philosopher who lived in the 4th and 3rd centuries BC. He describes how the ancient Greeks placed it at crossroads to sustain and propitiate Hecate, underworld goddess of magic. With her pack of hell-hounds she was often to be found where roads met, as well as at tombs and scenes of crime, and her three-faced image was frequently erected at crossroads. Garlic was among the offerings placed before these statues.

According to Pliny, both garlic and onion were regarded as divine by the Egyptians and were invoked when an oath was made, and Juvenal, the Roman satirist, said that 'Each clove of Garlic hath a sacred flower'.

Poor Man's Treacle

The belief in garlic's magical qualities is found all over Europe, Asia Minor, India, China and Japan and the plant is widely believed to give protection against witchcraft and the Evil Eye; its Sanskrit name means 'Slayer of Monsters'. The 16th century Flemish botanist Clusius tells of German miners taking cloves of garlic down mines for protection against evil spirits. At Bologna in Italy, on the Festival of St John, everyone bought garlic to ensure a successful year free from poverty.

Garlic was placed in a new-born baby's cradle during the dangerous interval between birth and baptism, together with other protective substances such as salt and iron. In Sicily it was put into the beds of women during childbirth, and making the sign of the Cross with garlic charmed away certain kinds of tumour. Placed in an English child's socks it mitigated whooping-cough; while a Cuban might avert jaundice by wearing a necklace of 13 garlic cloves for 13 days.

Some of these beliefs are clearly only extensions of the actual and believed virtues of garlic as both food and medicine. In the process of time, garlic became thought of as a cure-all; in the 2nd century AD, the physician Galen called garlic *theriac*, which originally meant an antidote to poison and later a universal panacea. Chaucer and other writers refer to it as Poor Man's Treacle, which is a corruption of 'Theriac'.

This faith in garlic's beneficence stemmed partly from the Doctrine of Signatures, with its assertion that objects are related to each other even by insignificant attributes; a proposition that led to the belief that 'like cures like' (see DISEASE). In Lauremberg's *Apparatus Planterum* the author points out: 'The tissue of Garlic is ruddy: it expels blood. It has a hollow stalk, and it helps affections of the wind-pipe.'

Garlic is recommended to prevent sunstroke, cure dropsy, relieve hysteria and drive out intestinal worms. It was also thought to be a specific against leprosy, a cure for smallpox, and a protection against plague and other infectious fevers. It was reputed to make cocks more aggressive during cock-fighting, horses strong, and if placed in the ground it would cause moles to 'leap forth'.

Garlic's genuine values include an undoubted tonic and toning-up quality; it probably helps digestion and is used in lotions for skin disorders. In the First World War the raw juice of garlic, placed on swabs of sphagnum moss (a type of moss which grows in bogs) was used as a successful antiseptic dressing.

Garter
Part of the insignia worn by members of The Most Noble Order of the Garter: founded by Edward III c1348, it is the highest order of knighthood, comprising the sovereign and 25 knights: according to legend, it was established after Joan, Countess of Salisbury, accidentally dropped a garter while dancing with the King, who having restored it to her made the remark, *'Honi soit qui mal y pense'* (evil to him who thinks evil of it): the garters worn by a bride were thought to bring good luck, and modern witches often wear garters as badges of rank.

Gathas
The name given to certain sections of the *Zend-Avesta*, the sacred writings of the Zoroastrian religion: generally believed to have been composed by the prophet, Zoroaster, himself, they contain hymns and poems mainly addressed to the supreme god, Ahura Mazdah: these holy writings are still used by the Parsees, the surviving followers of Zoroastrianism.
See ZOROASTRIANISM.

Miraculously conceived and born, Gautama Buddho, founder of Buddhism, achieved Enlightenment after six years spent practising extreme austerities, and after being assaulted by the Evil One and his demons

GAUTAMA BUDDHA

SIDDHARTHA GAUTAMA, the Buddha or 'enlightened one', also known as Sakyamuni the Sage of the Sakya tribe, is unlike most ancient Indians in that tradition furnishes enough supposed facts about him to sustain a lively controversy over the exact year of his death. All Buddhist traditions agree that he was 80 when he died, so if he died in 483 BC (the middle date of the three currently proposed by scholars), he was born in 563 BC. His father, Suddhodana, was a chieftain in the borderland town of Kapilavastu, 150 miles north of Benares. His mother, Maya, was his father's cousin.

The canonical texts tell little about the birth of the Sage of the Sakyas. In the later *Lives* of the Buddha, however, a charming birth-myth is told, adorned with much detail. When the Bodhisattva (future Buddha) decended from the Tusita Heaven, Queen Maya dreamed that a white elephant entered her body, and as a result she conceived without defilement. After a preternaturally happy pregnancy, she withdrew to the garden of Lumbini. There, standing up and grasping the branch of a tree with her right hand, she gave birth to the Bodhisattva from her right side. His birth, as immaculate as his conception, gave his mother no pain. A hermit sage came and predicted that the infant would grow up to become either a universal monarch or a Buddha. Queen Maya died seven days after the birth of her son. Her sister Prajapati became Suddhodana's second wife and cared for the future Buddha.

The legends of Gautama's youth picture him mastering the standard branches of learning, and the sports and martial arts proper to a member of the Kshatriya caste. The Pali Canon barely mentions that Gautama had a son and a wife. The non-canonical *Lives* elaborate a fine tale of his betrothal, marriage and eventual fatherhood. They say that he was engaged at 16 to a beautiful Sakya girl of noble family whose name is most often given as Yasodhara. The *Lalita Vistara* adds a typical Epic episode in which the girl's father withholds his consent until Siddhartha proves his worth by winning a public athletic contest, the high point being an archery match. After his marriage, Siddhartha lived 13 years in his palaces surrounded by great luxury, attended by singing and dancing girls, and, the legends say, shielded from acquaintance with worldly strife and suffering by his father, who feared that his son would indeed leave the household life as the hermit had predicted.

The *Lives* present the prince's awakening to the existence of suffering in a dramatic manner. One day Gautama went for a ride in his chariot, and saw a decrepit old man. On later rides, he saw a diseased man, and a corpse. Questioning his charioteer, he learned that old age, disease and death come to all men. While brooding on this realization, he rode out again, saw a religious wanderer, and resolved to leave the household life. He arose in the middle of the night, and took a last look at his wife and his newborn son, whom he called Rahula, 'the fetter'. He rode

C. M. Dixon

After living a life of luxury, shielded from worldly strife and unhappiness, Siddhartha Gautama was dramatically awakened to the existence of suffering when riding through the city; he resolved to leave home and become a wanderer: relief in the Victoria & Albert Museum, showing Gautama riding in his chariot

out of the city some distance, dismounted, cut his long hair, and sent his charioteer back with his horse. He traded garments with a hunter and joined the ranks of homeless wanderers.

Gautama's first teacher, according to the canonical accounts, was the ascetic Arada Kalama, who taught a way of meditation. Having mastered this teaching and found it insufficient, Gautama went on to study under Udraka Ramaputra, who taught a path of trance leading to 'the realm of neither perception nor non-perception'. Thinking that there must be something higher, Gautama moved on and, in the company of five other ascetics, practised extreme austerities for six years, starving himself till he became utterly emaciated. When such mortifications did not produce great insight, he abandoned them and began eating again, whereupon the five ascetics left him disdainfully.

All traditions agree that Gautama attained the Great Enlightenment in his 35th year, in about 528 BC – on the full moon night of Vaisakha (April–May) while seated under the Bodhi Tree (also known as the Bo-Tree) at Bodhgaya in the Indian province of Bihar. The *Lives* say that Mara the Evil One tried to prevent the Enlightenment; he assaulted Gautama with an army of fearful demons, with arrows of desire, and with invocations of Mara's own moral might. Gautama remained unmoved, and Mara departed.

The Pali Canon says that on the eve of the Enlightenment Gautama entered the first, second, third and then fourth meditative trances. In the first watch of the night he attained memory of his former lives. In the second watch he achieved a super-knowledge with which he saw the passing away and rebirth of living beings. This cosmic vision showed that good deeds lead to good rebirths, and bad deeds to bad afterlives. In the third watch, he achieved knowledge that for him the outflows (sensual craving, craving for existence, and ignorance) had been extinguished, that he was now an *arhant* (adept), a Buddha (awakened one), free from further rebirth.

The Four Holy Truths

The Canon says that the new Buddha hesitated to declare the Dharma, thinking it too difficult for anyone to understand. But Brahma came down from his heaven and implored him to teach the Doctrine, saying that many receptive people were suffering for lack of it. This awakened the Buddha's compassion and he saw with his cosmic vision that Brahma was right.

The Buddha set out for the Deer Park at Sarnath, near Benares, where he delivered his first discourse to the five ascetics who had been his companions. He proclaimed the Middle Path between sensuality and self-mortification, and declared the Four Holy Truths. His preaching manifested the Dharma in the world, and when the five ascetics were converted and became arhants, the order of monks came into existence.

The Canon relates in abundant detail the founding of the orders of laymen and laywomen, the conversion of the most famous disciples and of his own family, the sending forth of missionaries to various parts of north India, and the friendship and patronage of kings and wealthy merchants. He taught for 45 years and saw his religion spread and flourish. Finally he was taken gravely ill, apparently with dysentery. At Kusinagara, 60 miles south-east of Kapilavastu, he lay down between two trees and died, surrounded by disciples.

The canonical Pali accounts of Gautama's life abound in miracles and prodigies. The later *Lives* and commentaries add new wonders and magnify the old ones. All the sects participated in this process, and the monks, who wrote most of the texts we have, were at least as avid wonder-mongers as the laity. At no stage now discernible is the Buddha-story the life of Gautama as it happened. But it is a tale of the highest religious and artistic power, uniting the Buddhist community's evaluative re-creation of its founder with substantial recollections of his life.

First a pagan hero, then the flower of Arthur's chivalry, Gawain failed in the crucial test of the search for the Grail

GAWAIN

THE FIRST of King Arthur's knights to dedicate himself to the search for the Grail was the one whose spiritual bankruptcy was most clearly demonstrated in the quest. Originally a hero of pagan legend, Gawain became the very model of a chivalrous knight, famous for courage, loyalty, generosity and courtesy. But in the later stories he is overshadowed, first by Lancelot and then by Galahad.

His name may be derived from the Welsh *Gwallt-advwyn*, 'of the bright hair' or 'of the splendid hair', reinforcing the link between Gawain and the sun found in some of the French romances and in Malory's *Morte D'Arthur*. Gawain's strength increases all through the morning, as the sun's does, until noon when it wanes again. But little emphasis is placed on this and Gawain's solar connections have lost their significance in the stories which have survived.

Gawain appears in various Welsh tales as Gwalchmai, one of Arthur's leading captains. In *Peredur*, for instance, he is famous for his prowess as a fighter, for good faith, and for courtesy and tact. Arthur says of him, 'He does more with his fair words than we by dint of our arms'. In *Culhwch and Olwen* he is 'the best of walkers and the best of riders', who 'never came home without the quest he had gone to seek.'

In Geoffrey of Monmouth (see ARTHUR) Gawain is Arthur's nephew, a hothead and a notable warrior. In the campaign against the Romans he starts a skirmish when greatly outnumbered, because he is infuriated by the sneers of the enemy, and he strikes one opponent such a terrible blow with his sword that he splits him through helmet and skull down to the breast. He is killed in battle at Richborough when Arthur's army lands to settle accounts with the treacherous Mordred.

William of Malmesbury, writing a few years before Geoffrey, said that in 1087 the tomb of Arthur's noble nephew Walwin had been discovered on the Welsh coast. It was 14 feet long. In a sculpture of c1100 at Modena Cathedral in Italy, Galvaginus is one of the knights helping Arthur to rescue Guinevere.

The Broken Sword

Chrétien de Troyes portrayed Gawain as the pattern of chivalry. No lady in distress ever appealed in vain to 'the good and gentle lord Gawain', and to equal or outdo him was the final test of heroic valour. The early 13th century German poet Wolfram von Eschenbach said of him in *Parzival* that: 'on the battlefield his heart was a fortress, towering so against sharp attacks that he could always be seen in the thick of the fray. Friend and foe acknowledged that his battle-cry rang loud in pursuit of fame . . .'

In the Austrian Grail romance *Diu Krône* Gawain is successful, but generally he loses stature when the story-tellers take him out of his native element of courts and fair ladies, jousts and battles, and send him in search of the Grail. The first sequel added to Chrétien's *Conte del Graal* in the late 12th century contains a hauntingly mysterious account of Gawain's experiences at the Grail castle. Riding a horse which he allowed to carry him wherever it would, Gawain came to the sea and a wide causeway, stretching far out to sea. Trees grew on each side of the causeway and roofed it over, making it frighteningly dark. Gawain hesitated but his horse bore him on willy nilly, and at the end of the causeway he found a house, where he was greeted with excited joy and the words, 'Fair sir, God has brought you to us, and long we have desired your coming.'

Gawain was left alone in a spacious hall, in the middle of which was a bier covered with a great scarlet cloth emblazoned with a gold cross. Lying on the bier was a corpse, and on its breast half of a broken sword. Presently a king and his courtiers came in and sat down to feast, with Gawain honourably placed at the king's side. The food was served by 'a rich grail' which moved about by itself, and which also filled the golden cups with wine. At the end of the meal the company vanished and Gawain was left alone with the bier. Now he saw a lance with blood flowing down its shaft, standing upright in a vessel of silver. The king returned, bringing the other half of the broken sword. He asked Gawain to fit the two halves together, to see if they would

Bodleian Library Colour Filmstrip

Bodleian Library Colour Filmstrip

Gawain was one of the greatest heroes of the Round Table, famed for courage and courtesy. *Above* Setting out on a quest he takes leave of Arthur and Guinevere *(left)* and rides through a forest *(right)*. *Facing page* 14th century illustration to *Sir Gawain and the Green Knight*, a story which may contain echoes of a ritual combat between Winter and Summer. Gawain cut off the Green Knight's head with an axe. The Green Knight cheerfully picked it up and rode away. A year and a day later, Gawain had to stand a blow from the Green Knight in his turn

reunite. Gawain tried, but without success.

The king sadly told Gawain that he had failed in his mission, but thanked him for his courage in making the journey and offered him any gift he cared to ask. Gawain, who had been riding all night, was very sleepy by now but he forced his eyes open and asked to be told the truth about what he had seen. The king explained that the lance was the one which pierced Christ on the cross, and that the sword was the one which struck the fell blow that destroyed the kingdom of Logres. By this time Gawain could listen no longer and fell asleep.

When he woke he was lying in a field. The house of mysteries had disappeared. Bitterly reproaching himself for not staying awake, Gawain rode away through a countryside rich in woods, meadows and streams. The country people hailed him with, 'Sir, you have both slain and healed us.' What had been the arid Waste Land the night before had turned green again the moment he asked about the bleeding lance but if he had kept awake to learn why the Grail served, then: 'No one could tell the great joy that would have come of asking.'

Blind to the Sacred

In this story Gawain has at least partially succeeded. In another French tale, *Perlesvaus*, he fails entirely. He is told that when he reaches the Grail castle he must ask a question (this is a stock motif in the romances) and he is told what question to ask. But when he sees the Grail, he 'is lost in thought and such great joy fills his mind that he thinks of nothing but God.' He is despairingly urged to speak, for this is his last chance, but he fails to hear and remains wrapped in contemplative silence.

According to the Prose *Lancelot* of the early 13th century, Gawain failed for a far less creditable reason. He saw the Grail as a chalice, 'the richest vessel that might be beheld by the eye of mortal man'. But it was carried by a girl of astonishing beauty and unfortunately the hero was far more interested in the girl than in the Grail. For this he was thrown out of the Grail castle, dragged through the streets of the town in a cart and pelted with dung and mud.

In the *Queste del Saint Graal* (see GALAHAD) Gawain is shown failing totally because he does not understand that the search for the Grail is a spiritual quest, not a knightly adventure of the accustomed type. Relying on his own plentiful resources of courage and honour, he is incapable of seeing that he cannot win the Grail without God's help. He is unfavourably contrasted with the saintly Galahad as part of the *Queste's* attack on the worldly values of chivalry and on the ideal of the knight as the supremely self-reliant man instead of the supremely God-reliant man. As P. M. Matarasso puts it, 'He is so rooted in the creed of his caste, so embedded in the secular, that the sacred passes him by unrecognized'. The *Queste* says that 'he enjoyed a more widespread popularity than any man alive' but one of its numerous moralizing hermits tells him that his faults are lechery and pride, and the lack of the Christian virtues of chastity and humility.

This picture of Gawain colours his character in Malory though at the end, when the Round Table is finally brought to disaster, he is given back something of his old high quality. Opposing his half-brother Mordred and his brother Agravaine, he remains loyal to Arthur. Wounded in combat with Lancelot, his last actions are attempts to heal the breach between Lancelot and Arthur. He dies, and is buried in a chapel in Dover Castle and, Malory says, 'there yet all men may see the skull of him, and the same wound is seen that Sir Lancelot gave him in battle.'

The Beheading Game

In Britain meanwhile, Gawain had remained an admired hero and he is the central character of a magnificent 14th century poem, *Sir Gawain and the Green Knight*. Arthur's court was at dinner in Camelot when a trumpet sounded outside and in came a tall and terrifying figure. His skin was as green as grass, his clothes were green, his horse was green, and he carried holly in one hand and a monstrous axe in the other.

The Green Knight proposed what he cheerfully called a game. He would allow the Round Table's champion to deal him a blow with the axe, on condition that he had the right to return the blow a year and a day later. Gawain accepted the challenge, took the axe, and struck the Green Knight a blow that cut off his head. The Green Knight merely picked it up and rode off, carrying his head by the hair.

When the time came, Gawain rode north to seek the Green Knight and came to a handsome castle, where he was welcomed by the lord of the castle and by the lord's surpassingly lovely young wife. The lady made every effort to seduce Gawain, who resisted her with great difficulty. Gawain and the lord struck a bargain that each would give the other whatever he acquired each day. Gawain failed to keep the bargain for he did not hand over to the lord a magic girdle which the lady gave him, telling him it would keep him from all harm.

On the appointed day Gawain rode out and met the Green Knight. He readied himself for a lethal blow from the axe but the Green Knight gave him only a light tap that just nicked the flesh. He then explained

British Museum

that he was really the lord of the castle in disguise, that he had not killed Gawain because the knight had honourably refrained from making love to the lady, and that he gashed him for concealing the gift of the girdle. The whole adventure had been devised by an enchantress to test the honour of the knights of the Round Table.

The story ends with everyone happy, except Gawain, who feels he has disgraced himself and laments 'the faithlessnesss that was found in me'. His fault was to break his word to the lord of the castle to save his own life, for he hoped that the magic girdle would protect him from the Green Knight's axe. It is a fault he is bitterly aware of but one which few human beings could readily condemn, and Arthur's court agree that each knight of the fellowship shall wear a green belt for Sir Gawain's sake, as a mark of honour to him and of renown to the Round Table.

The main incidents in the poem, including the beheading game and the trial of the hero's virtue, occur in earlier tales but there is no precedent for the greenness of the Green Knight. It has been suggested that the uncanny challenger was green because it was the fairy colour, or alternatively that the beheading challenge is based on fertility ritual, green being the colour of vegetation (see GREEN). There are probably traces in the Green Knight of a figure representing Winter who fights an annual combat against Summer but, whatever pagan motifs have survived in the poem, the attitude of the author is that of a Christian, though a Christian far more admiring of the code of chivalry than the author of the *Queste*.

GELLER, URI

BORN IN ISRAEL in 1947, Uri Geller has now become something of a psychic superstar. He has given displays of his psychokinetic talents in many public contexts, and is best known for his skill in bending metal. He can also apparently start clocks, stop elevators, and does very well in experiments in ESP, such as sending and receiving images by telepathy. Reactions to him are mixed. The author Colin Wilson believes that he is an unconscious 'medium' for psychic energy.

GEMATRIA

THE FACT that the letters of the Hebrew and Greek alphabets also stood for numbers is the basis of *gematria*, a method of finding hidden meanings underlying the surface of a written text by turning a word into a number and then finding another word which has the same total. An example is the word 'money' in the passage: 'And the king said to Haman, "The money is given to you . . ."' (Esther 3. 11). The letters of the Hebrew word add up to 165, and the word for 'gallows' also adds up to 165, so the money was said to foreshadow the gallows on which the wicked Haman was to hang.

Most examples of this kind are the work of ingenious commentators but there are several probable cases of the use of gematria in the Old Testament itself. For instance, Abraham is said to have 318 retainers (Genesis 14.14), a figure apparently based on the name Eliezer, which adds to 318. Eliezer was the only one of Abraham's servants whose name was remembered.

Gematria has a long history in Jewish mysticism, especially among Cabalists, but it also has been used by Mohammedan and Christian numerologists. Jesus as Alpha and Omega, the beginning and the end, was symbolized by a dove because the Greek word for 'dove' (*peristera*) adds to 801, which equals the number values of the Greek letters alpha and omega.

(See also NAMES; NUMEROLOGY.)

GEMINI

ACCORDING TO THE TRADITIONAL system, people who come under Gemini, the third sign of the zodiac, are those who were born between 22 May and 21 June. Gemini, whose sign is the 'heavenly twins', is ruled by Mercury, the planet of speech and writing. The smallest planet, Mercury is never further than 28° from its father the sun, and is associated with children and education. People whose zodiacal signs are ruled by this planet usually succeed at school, and they are often attracted to professions such as the nursing of young children and teaching, also to academic careers. Often talented writers, they frequently succeed as authors or journalists.

Geminians have the reputation of not taking things too seriously and certainly seem to enjoy life. In fact, Geminians hate loneliness and enjoy parties, even those 'in line of duty'; for this reason they often do well in official positions. The motto of the person born under this sign seems to be 'Life's a game', but despite this Geminians will sometimes devote themselves to causes and, as they do not take danger any more seriously than they take anything else, they sometimes acquire a reputation for devotion and heroism, often to the surprise of those who think of them as casual, playful and frivolous. Curiously enough, this sign came out top in a statistical study designed to reveal under which sign the largest number of physicians are born.

Bodleian Library Colour Filmstrip

Gemini is represented by the 'heavenly twins'. Castor and Pollux: illustration from a 12th century treatise on astrology

Youthfulness is another Geminian trait, carried occasionally to the extent of childishness in people old enough to know better. Some Geminians talk their own private language, or at least have a few private words or abbreviations of which they are especially fond; this may occasionally take the form of family slang, or even using 'baby talk' on unsuitable occasions.

Music, astronomy, and mathematics are all subjects which are said to interest Geminians. Although they are not averse to taking risks, soldiering has no attractions for them; according to the Roman astrologer Manilius, Geminians 'wish war and trumpets far away'.

Because Gemini is represented by the twins, Castor and Pollux, astrological writers have often insisted on the 'two-sided' nature of this sign, but this should not be taken too seriously; many people, other than Geminians follow two trades at once, or change their careers in middle life.

Geminians are said to be quick-witted, good at repartee, and easily able to change from one type of business to another. They find this easy because, however seriously other people may take them, they never take themselves entirely seriously. They sometimes play tricks for the mere pleasure of admiring their own skill. To a Geminian scientist, science is just fun and cannot have moral implications.

Most Geminians, however, appear to be quite ordinary respectable people, in spite of their love of playfulness which is never far below the surface.

Gloucester City Museum

Genius

Latin word for each man's guardian spirit: literally 'the begetter', the genius seems to have been the procreative force in a man; it was honoured in Roman birthday celebrations; in English, genius means the characteristic intellectual or artistic endowment of a person, or a person of extraordinary abilities.

See GUARDIAN SPIRITS.

GEOMANCY

THE ART OF DIVINING by means of 'magicked' earth cast upon sacred ground is known as geomancy, a broad term which includes scrying by inspecting the configurations made by scattered pebbles, the blowing of dust upon a smooth surface such as a marble table-top, the strewing of grains of sand, or seeds, themselves born of the earth. Geomancy can also be practised by falling into a trance when watching the ashes on the hearth, or even by gazing at dead leaves floating on a forest pool, or at thrown twigs, matchsticks or spillikins. The word is derived from two Greek words, *gaie*, *ge*, the earth and *manteia*, divination.

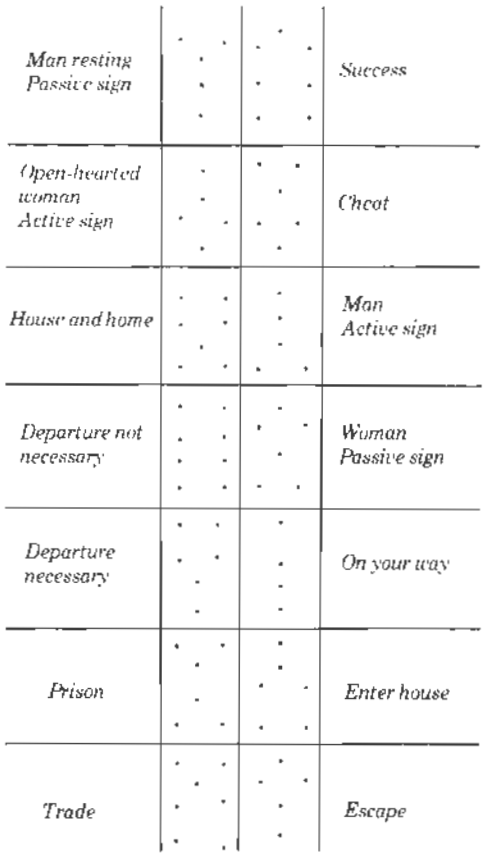
These ancient methods of uncovering the past, grasping the significance of the present and revealing the future, as well as of reading character, are closely linked to many others, such as the use of ink blot patterns or the shapes made by melted lead or candle wax dropped into a bowl of water. The divination of objects cast upon the earth also developed into the interpretation of lines or dots made more or less haphazardly on paper with a pencil.

The trigrams and hexagrams of the *I Ching* or Book of Changes of the Chinese, which is still consulted by seers and fortune tellers in the East, are a development of early geomantic methods of divination; and these same methods are the basis of the system of numerology developed by the Chaldeans in Mesopotamia, and used by the Jewish Cabalists in their interpretation of the Bible. They are also apparent in the theories of Paracelsus, and in the writings of mystics and philosophers such as Raymond Lully and Robert Fludd.

There appears to be an underlying link that connects all methods of divination from the most primitive, naïve or humble to the most advanced, complex and exalted; from the geomantic casting of pebbles, coloured marbles or a few selected semi-precious stones, from tea-leaf or coffee-ground reading, to the reading of hands or feet; from the interpretation of the bumps of the head or the moles of the body, to the 'science' of astrology. For if that which is above is reflected in that which is below, a basic

concept of magic, it follows that what is revealed in the heavens by planets may be discerned down below in the apparently random fall of a handful of earth. The opposite, too, applies.

In the divinatory ritual of casting earth, sand, pebbles, sticks, arrows, small bones, marbles or jewels, as in the inspection of tea-leaves, coffee-grounds, ink blots and other kinds of intentional, if random, splodging or scratching, the seer looks for, and attempts to interpret, certain formations, numbers and densities. It is by no means easy to put down in writing what these are likely to be and exactly what they signify.

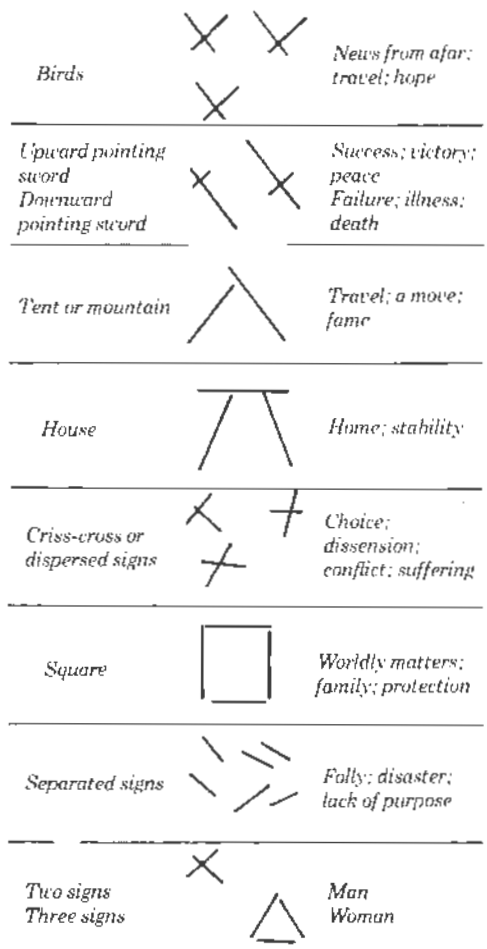


(a)

The art should really be passed from one seer to another, from teacher to pupil 'outside words' as a Zen Master would say. Words come from the lips of the seer only as he perceives clairvoyantly the message given by his oracular method. This is probably why so little has been written concerning the more primitive methods of geomancy, while the much later and more sophisticated systems have been dealt with fully.

The basic number configurations in the diagram (A) above are said to correspond to planetary signs and the zodiac. Needless to say a certain amount of imagination or guesswork is required of the seer if he is to identify them, as earth or other thrown things rarely fall in a uniform way. These interpretations of the patterns most likely to be found were given by a Moslem gypsy.

Geomantic methods of divining vary from land to land. They are still practised by village witches, gypsies and tinkers, and by desert nomads. Individual seers have their own preferences as to procedure. Generally the material to be used is carefully chosen and 'magnetized' or blessed by the seer, and the surface upon which it is to be cast is magically consecrated according to instructions received from an initiate or master.



(b)

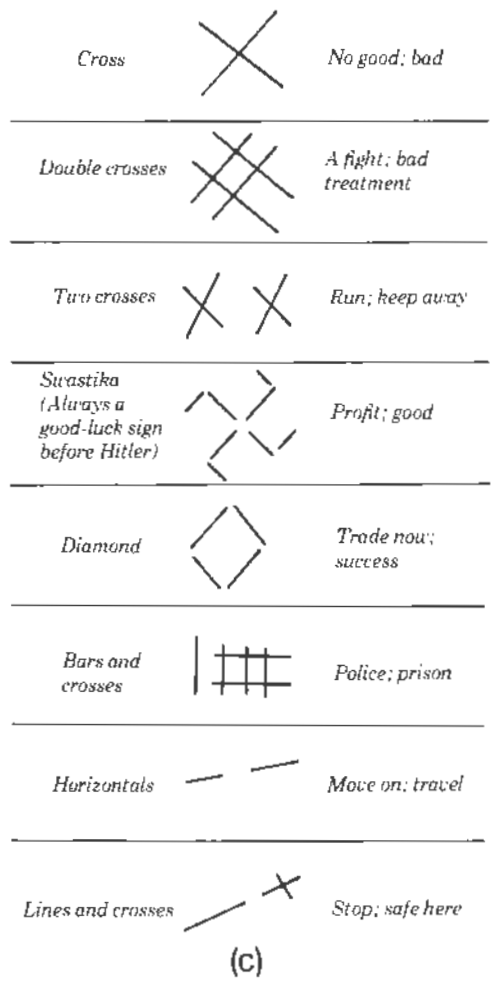
Earths are selected for their colours, a red or white earth being highly valued, for example, and a magic circle or square is traced with the first and second finger upon the ground where the earth is to be thrown. Generally the seer holds a handful of earth in his left hand and, after uttering some magical formula under his breath, casts it down. But occasionally the person who is asking the question is invited to hold and to cast the earth for himself. The interpretation follows after the seer has concentrated for some moments on the configurations that have appeared. When the prediction has been made, he removes all traces of these by passing his right palm over them. Sometimes the seer draws lines or signs in the earth or sand as he begins a reading.

Discerning clear configurations in earth or sand is not easy, and a simpler method for the would-be geomancer to use is to take a number of matches, hold these for a few moments while concentrating, and then throw them down. Some of the configurations are in the diagram (B) above.

Tinkers throw twigs not only for divination, but also arrange them in special groups, or cut meaningful incisions in trunks of trees, as indications for other 'travellers' coming the same way later on. A similar method is also used by true Romanies. Some of the configurations which they look for in fallen or thrown twigs, or those that have been deliberately arranged, are shown in the diagram (C) below.

Divining by sand, originally an Arabian form of divination, is also practised in the West: dry silver sand is poured into a tea-tray to a depth of two to three inches, and smoothed flat. The seer is blindfolded and holds an ivory stick or long pencil. His hand is guided over the tray while he goes into a trance. Meanwhile the person who is seeking information tells the seer what he wants to know. After a while the diviner will feel an impulse to press the stick into the sand; when he does so the stick begins to move of itself, the hand being but its support. The stick is allowed to wander as it pleases, but only when it stops of its own accord does the diviner remove the blindfold from his eyes. He is now at liberty to scrutinize the marks, signs, letters, numbers, words or sentences that have been traced. From these he deduces the decree of fate.

A simple 'Y' for 'yes' and 'N' for 'no' answer many questions, but the initials of people concerned with the questioner's request, and numbers referring to quantity, time, age, or date, may also appear. Often a whole message may be written out. Occasionally the words are written backwards and must be read from right to left, or the message must be viewed in a mirror. Some Arabian seers say that the area of sand that they have squared off for this art, the tea-tray in Western practice, represents a year, and that a series of horizontal marks tells the months



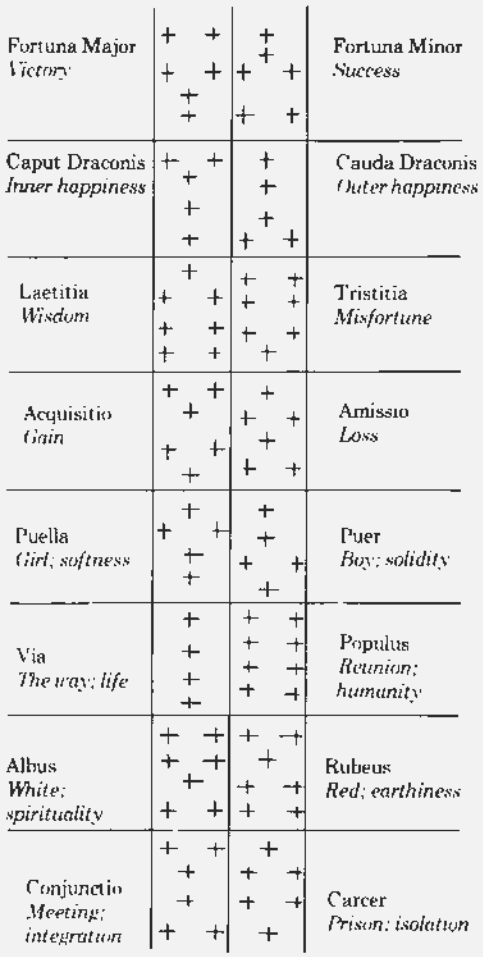
(c)

that are relevant to the questions posed.

As in the case of other such trance or automatic methods of prediction, the sitting should not be allowed to continue for long periods; the strain on the seer is great, and the moving stick will show a resistance to proceeding and may even write 'stop'. Some sticks have been known to scribble swear words when they are being overworked by the diviner, or unduly tormented by an importunate questioner.

Simple signs that can be easily interpreted are: long lines for journeys; wavy lines for crossing sea, desert or mountain; short lines foretell guests; crosses indicate obstacles to be overcome, trouble, illness or restrictions; diagonal crosses represent affairs of the heart; and marriage is shown by circles. Large, irregular circular areas are a sign of family problems or bad luck while triangles indicate success when upright, misfortune when reversed.

It is possible for an individual to practise divination on his own behalf, using only a sheet of paper and a pencil. After formulating his question, he half closes his eyes and focuses them on the paper, which should be held as far away as is practical. Making his mind blank, he makes four sets of four parallel, horizontal lines of random dashes, as many dashes as he feels inclined to make in each line, with the pencil. The number of dashes in each line in each of the four sets are then counted. If there is an uneven number of dashes in a line, one cross should be marked while two crosses represent an even number; the crosses should be marked one below another, to form a pattern. By comparing the patterns of each of the four sets of crosses with the groupings shown in the diagram on the left, he will find the answer to his question.



After passing out of the hands of the huntsman-soothsayer of the cave dwellers, the art of geomancy was practised by the prophesying maidens and crones who embodied the corn goddess of early agricultural peoples, and by the priests of antiquity. Roman augurs, initiated by the Etruscans, exchanged earth for corn, and practised geomancy by inspecting the signs revealed by grains that had been scattered by their poultry. In Scandinavia, runic letters replaced pre-alphabetic symbols; and in spite of persecution, the methods used by the Jewish Cabalists of old still retain a living power of prophecy.

The 'forbidden science' survived all attempts to destroy it; it flourished, and was elaborated upon by some of the finest minds of the Middle Ages; and was even more openly expounded as the Renaissance dawned upon the West. Once men had broken through the stranglehold of the Inquisition, a tide of reasoned spirituality surged through Europe, and continues to this day. Much that was mere superstition was perhaps perpetuated; but much that was essential and beneficial for the future of humanity has also been transmitted.

BASIL IVAN RAKOCZI

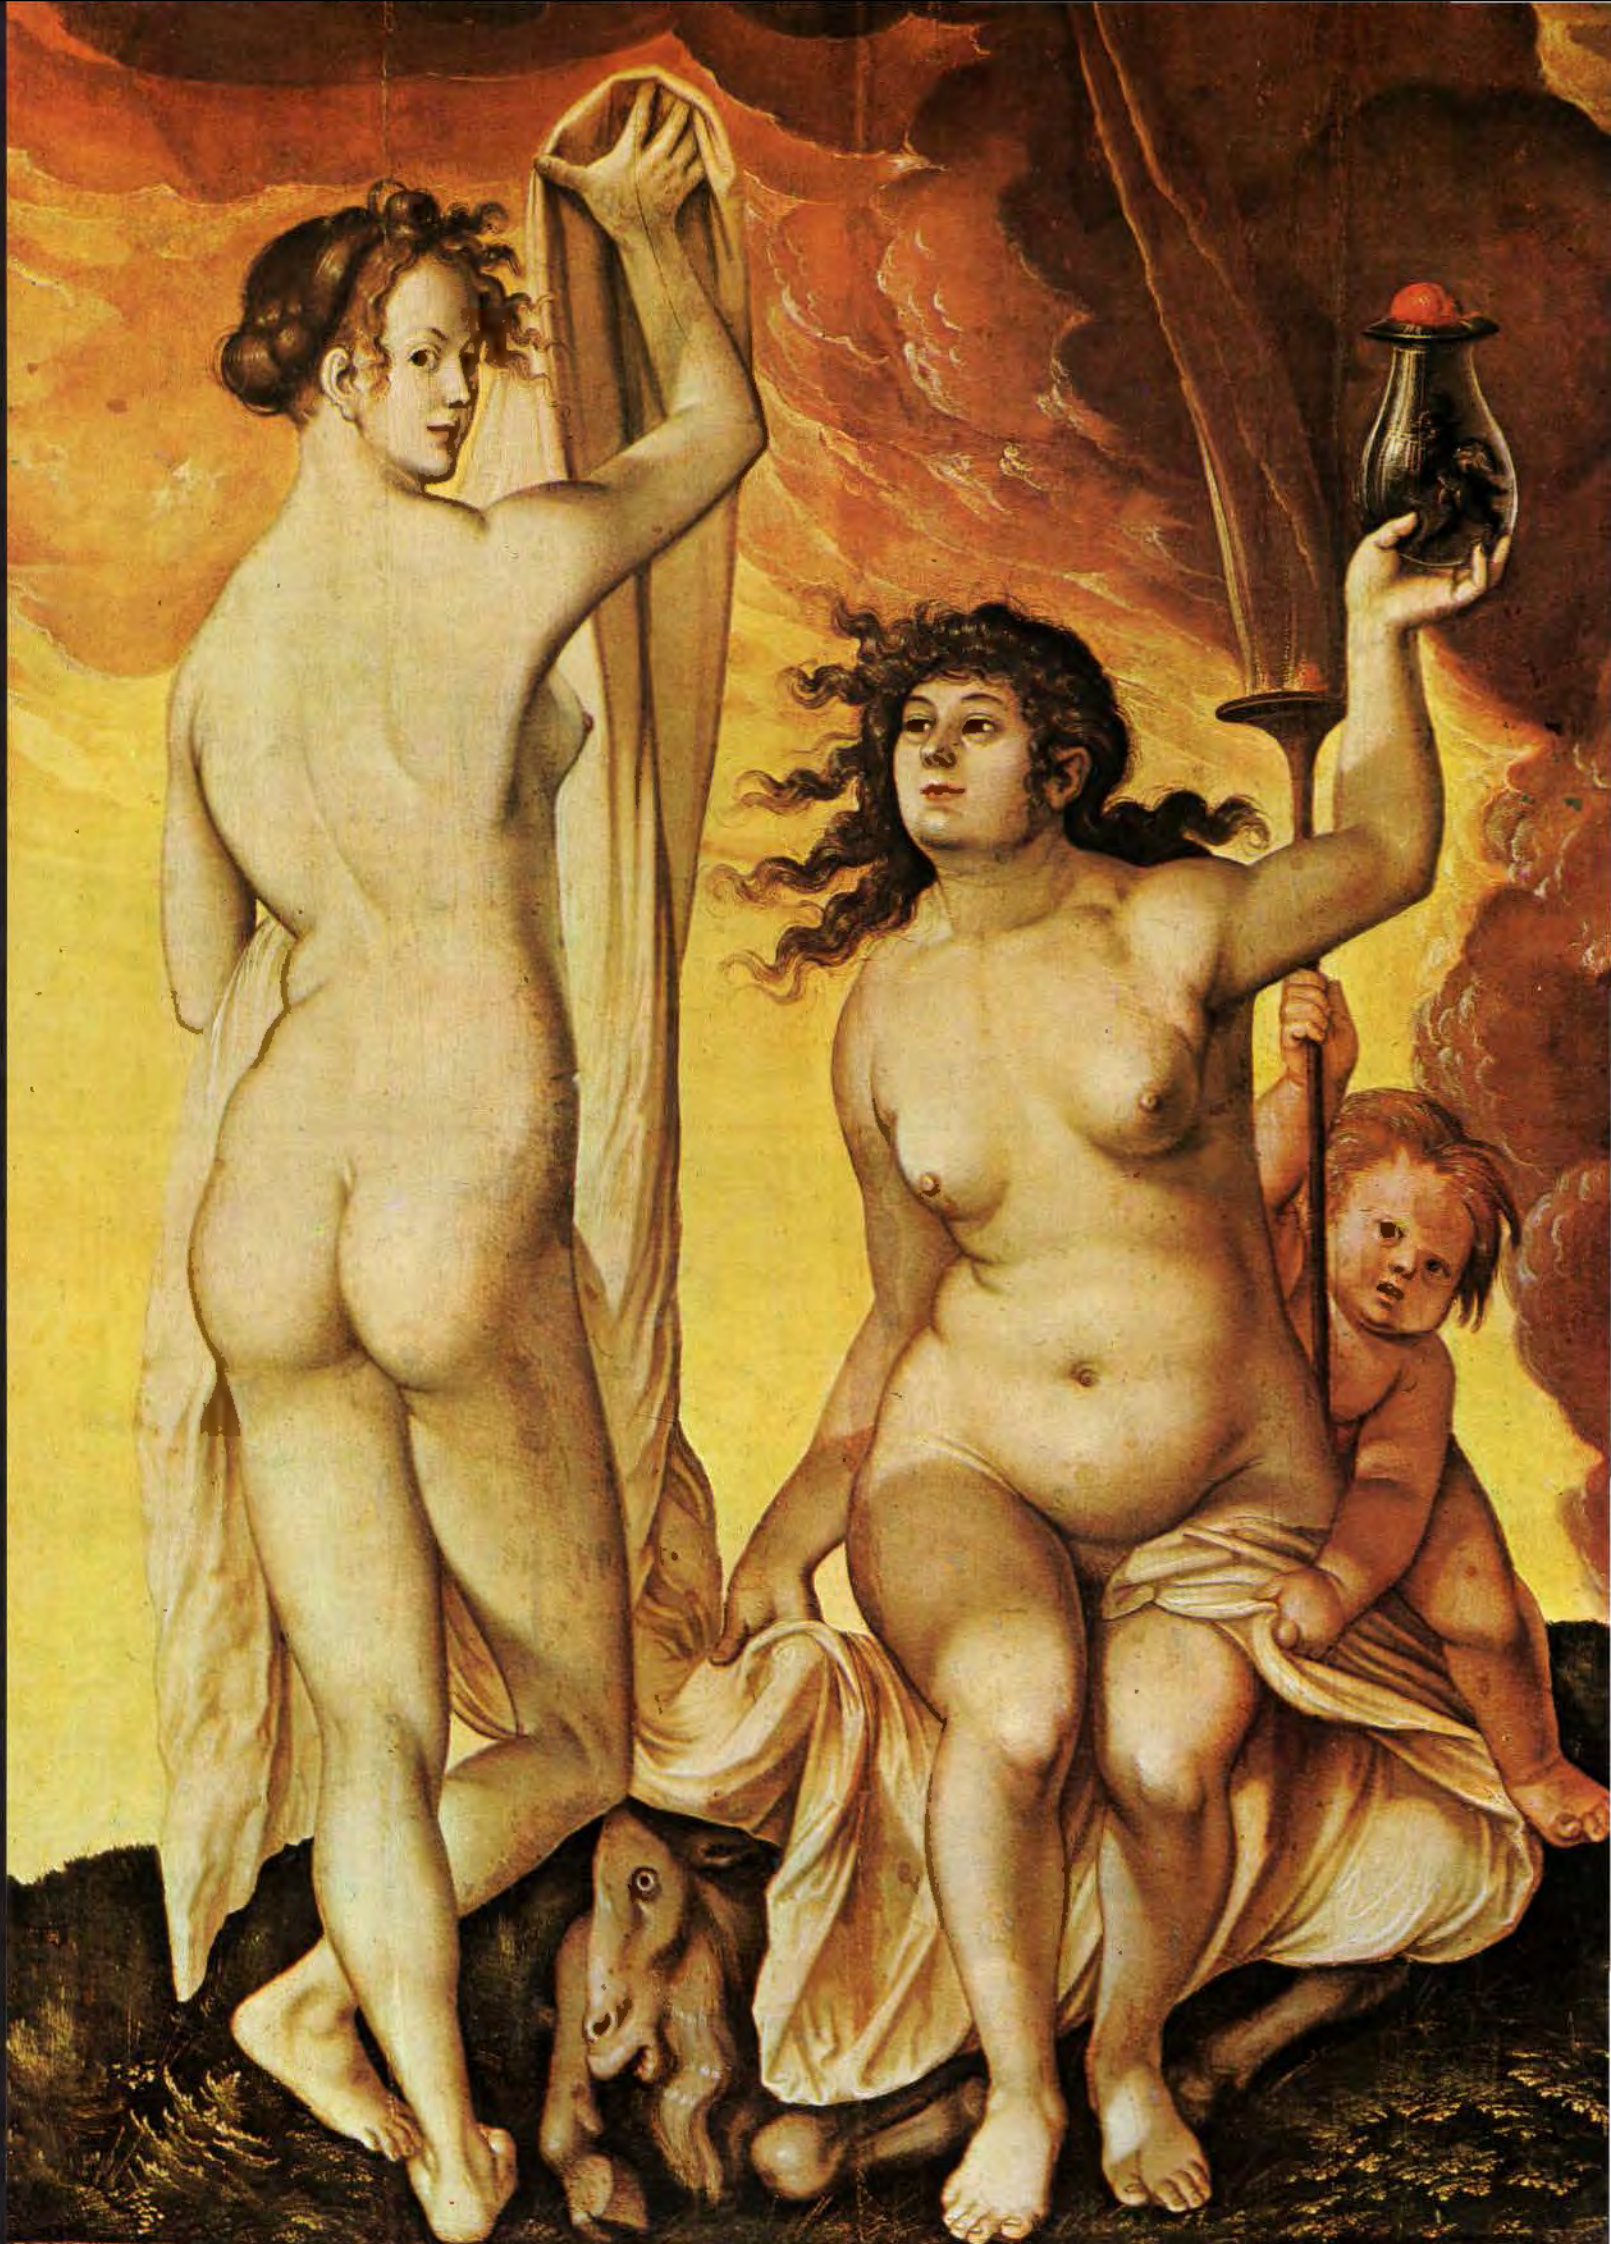
Witch trials began comparatively late in Germany but the scale, ferocity and ruthlessness of the mass persecutions of Franconia and the Rhineland were unparalleled elsewhere in Europe. The use of torture to induce confessions was not only sanctioned but prescribed by the law of the Holy Roman Empire, to which the multiplicity of states belonged, and before torture commenced, it was the custom for a priest to bless the instruments. In all it is estimated that by 1775, the date of the last execution for witchcraft, more than 100,000 men, women and children had been put to death

GERMAN WITCHCRAFT

ALWAYS UNJUSTLY PERSECUTED, the victim of the notorious witch trial era was the defendant in legal proceedings which followed the judicial procedure as laid down by the Inquisition; this contained certain features which automatically put the accused at a disadvantage particularly in that he or she was not allowed a defence. Witches could be seized and imprisoned merely 'on suspicion'. In other words, on circumstantial evidence alone. This general principle of the legal code in force at this

In Germany, notorious for its witch persecutions, the law ordered that suspected witches should be tortured into confessing; 16th century methods of torture included disembowelling, beheading, gouging out the eyes, cutting off the ear or hand, and flogging

Cornell University Library



period, whereby informing against a witch was enough to gain her immediate arrest, had alarming consequences during the witch persecutions.

During local outbreaks of witch hysteria, sometimes leading to hundreds of convictions, many communities erected so-called 'witch towers' or 'witches' houses' which served as special jails for this type of prisoner, and in which incredibly sadistic outrages took place. Defence witnesses were not even admitted to the witch trials and relatives of an accused person were allowed to visit him only on condition that they agreed to try and persuade him to make a confession of his witchcraft activities. Such confessions could not be made seriously, for most of the offences with which the accused were charged, such as a pact with the Devil, the ability to bewitch, visits to the sabbath and intercourse with the Devil, cannot in reality be committed.

The majority of court records are of a monotonously stereotyped nature. The accused victims made their confessions – usually extracted under torture – according to a standard formula, prepared by the local torturer, and based on those used in the trials against demon-worship dating back to the 4th century. The Emperors Constantine, Valentine and Valens established the use of the Roman penal code, including the practice of torture, against sorcerers, as supporters of a subversive pagan group; and the confession formulae continued to be used by executioners and torturers during both the heresy trials and the witch persecutions over a thousand years later.

Climate of Terror

The sentence in the witch trials was of equally stereotyped severity. In the majority of cases the accused witch was sentenced to death by burning. He or she might be strangled or executed with the sword beforehand as an act of clemency. If methods of torture failed to produce a confession from the more resolute defendants, they might subsequently be sent into exile; this was more common during the later phases of witch persecution. Those permanently invalided by torture were often pushed over the border in carts.

The whole process contains all the ingredients of mass suggestion but it was always accompanied by protest, misgivings and opposition. The reality of law was experienced as the justice of terror, the essence of which consists in the fact that the terror could not openly be referred to by name.

The principle of suspicion made such a climate of terror possible. To be denounced as a witch was enough to destroy the lives of both rich and poor alike. Even into the latest phase of the witch persecution era, merely associating with a witch, or with a relative suspected of witchcraft, was thought to be proof of one's own guilt. Devil-worship was believed to be transmitted to a child either by its godmother, skilled in magic, or through its own mother, shortly after birth.

There is a basic sociological difference between a magic-orientated culture, believing in the existence of men and women gifted with the power of sorcery, and the notorious witch persecutions of the 12th to 18th centuries. It lies in the belief that 'we', as members of an orthodox Christian community, neither wish nor are able to practise magic, but that there are others, outsiders, apostates, enemies of civilized man, who can perform these arts. Magic and witchcraft, therefore, are imputed to an imaginary group of antagonists in order to be persecuted. The object is to exclude the concept of magic, so that we can put our trust in the natural order of things, and prevent the laws of causation from being repeatedly brought into question through the work of the Devil.

While the persecutors themselves think in terms of magic, that is to say, believe in the existence of witchcraft, their aim is to free the world of the plague of sorcery through 'extermination', a word often used in demonologies. With fire and sword they prepare the way for a magic-free world. They effectively disseminate witchcraft mania by instilling a morbid fear of persecution. As far as the man in the street is concerned, the victim *must* have been guilty of witchcraft otherwise it follows that the Church, the courts and the government have been accessories in the most terrible murder. But this adoption of the persecution ideology into the public consciousness always remained ambivalent. There was an element of doubt in nearly every individual case, if not in general. This is apparent in one of the first German testimonies, that of Mathias Widman, who was Court Chaplain to the Elector Friedrich von der Pfalz in Heidelberg in 1475. On the one hand Mathias Widman describes the horrible rites performed by witches, and the heretical Gazariorum sect, only to make an exception of those people known personally to him who have been indicted for witchcraft. This more or less sympathetic reaction to the persecution victims is typical of the majority of people.

Children on Trial

Particularly striking is the adoption of these ideas by children and youths in those areas where the trials had been in process for some time. Gangs of children 'hounded' suspected witches with unusual venom, before the unfortunate victims were finally imprisoned. They accused each other of sorcery and boasted that they could bewitch people as if it were a game, without understanding the serious implications of their actions. They invented imaginary stories of nightly feasts and revels, reminiscent of delusions caused by fever. The authorities pounced on such tenuous information and children's trials were frequent, at which small children would appear not only as witnesses but also as defendants.

The most comprehensive account of these conditions is given by Friedrich Merzbacher in his book *Die Hexenprozesse in Franken (Witch Trials in Franconia)* published in 1957. He gives a detailed account of the wave of witchcraft trials in the Bishopric of Würzburg in the 17th century where 900 people were tried between the years 1623–1631 alone and the even more notorious Bamberg trials of the decade 1623–1633 (see BAMBERG WITCHES).

It seems highly probable that some of the major figures in this network of persecution were psychopaths and people suffering from paranoia. At the same time, the presence at these trials of credulous and perhaps intimidated local dignitaries, as well as those who commanded the respect of the common people – priests of both denominations, lawyers, scholars and writers – helped to guarantee recognition of the witchcraft ideology and its perpetuation.

Crime and Corruption

There are, however, many examples of witch-finders being motivated by criminal urges to line their own pockets through blackmail and exploitation. Jakob Bithner, an official of the province of Styria, provides just one example of this corruption. He was originally given the task of ridding the countryside of vagrants, mostly disbanded mercenaries; he took it on himself to include 'those criminals who dabble in sorcery', and eventually became a professional witch-finder. After trapping his suspects he would hand them over to the authorities for payment. Similarly, a soldier named Geiss of Lindenheim offered his services to the town's officials as a witch-finder, hinting that the church and a local bridge could be repaired as soon as enough money had been accumulated from the richer citizens by means of witch trials. Geiss instituted a true regime of terror, until public indignation forced him to flee.

It is possible to compile a whole list of these clearly recognizable criminal types; men such as the infamous Count Balthasar Voss or Noss, who carried on his activities for 15 years, and boasted that he hoped to achieve 1000 convictions. In 1603 the Supreme Court of the Holy Roman Empire intervened to put an end to his excesses.

Many persecutors, like Jörg Abriel from Schongau attracted a large number of followers. They were not in a position to overrun villages and communities on their own authority, because they required the legitimate sanction of a secular or ecclesiastical body. But in the same way that hand in glove with criminals there is often a respectable 'front' man, so at Esslingen, near Stuttgart, for instance, the fanatical witch-finder Nagogeorgus was supported in his actions by the judge of the nearby village of Wiessenstein. Sometimes, however, individual itinerant witch-finders were seized by enlightened magistrates and prevented from doing any more harm. An executioner's assistant from Eichstätt, who had started to propagate rumours of witchcraft, was punished at Nuremberg. Hans Schock from Fürstenfelden in Austria, who had attempted to earn money by denouncing suspected witches in Strasburg and Basle,

Witches were popularly believed to be able to ruin crops and wreak havoc on the countryside: in this painting by Hans Baldung Grien two witches, accompanied by a goat and a dwarfish child, invoke a storm; one of the witches holds up a bottle containing an imp she has captured

Joachim Blauel/Städelsches Kunstinstitut Frankfurt

was finally sentenced by a court to death by drowning.

If we begin to reckon up and to pursue the names that appear in court records, it becomes increasingly clear that in this whole system, designed to torment people with oppressive nightmares and induce delusions, there were in fact at any given time only very few fanatics in local positions of authority and a minority of sadists in the terror groups.

Evil Breeds More Evil

The relationship between criminals and respectable men in positions of authority, on the one hand, and their atrocities which were upheld by a legalized doctrine of terror, on the other, were far from simple: the situation was not purely one of induced delusion. There was also the factor of revenge; especially where terror practices were employed, the infliction of wrong set up a chain reaction, so that injustice was passed on. This is particularly evident in the accounts of the activities of a man named Kothmann, who later became mayor of the town of Lemgo. During the first wave of mass trials in the area, Kothmann's mother was burned as a witch, and coming from an affluent family background, Kothmann was forced to roam the country as a poverty-stricken law student. He finally returned to Lemgo where he ingratiated himself with the then mayor, an influential man and former witch-hunter. After the latter's death in 1666, Kothmann assumed the role of intriguer and on the basis of his terrorist activities was elected, like his predecessor, to the position of mayor. With the assistance of a group of self-seeking accomplices he set about revenging himself on all those families who had held positions of authority and respect in the town at the time of his mother's death. Although these citizens complained and presented petitions to the regional authorities, the Supreme Court and the Church, Kothmann remained in office until his death in 1684 and was responsible for the execution of 90 people. At the end he undoubtedly believed in his own delusion, but his motives almost certainly included a desire to revenge himself on society.

Spreadeagled on his back, a victim of the German witch-hunting mania is confronted by one of his persecutors in this 16th century allegorical illustration; beyond him a woman is seized by an evil beast

Repeated efforts to keep the hysteria in check were made by a number of lawyers and others in positions of authority. In 1628 Vice-Chancellor Hahn of Bamberg became a victim of the persecution because of his known leniency towards the witches. If one were to erect a memorial to any one resistance figure, however, it would be to the Jesuit Father Friedrich von Spee. As a result of his experiences as a confessor to the witches of Würzburg, he wrote a book *Cautio Criminalis* in which he examined and exposed from his first-hand knowledge the whole process of witch persecution, from a sociological standpoint. In spite of his work being published anonymously in 1631, he was forbidden to make his views known and was disposed of discreetly by being sent as confessor to those sick with the plague. Spee sympathized with the predicament of accused witches who had implicated themselves under duress. The unfortunate victims were only entitled to the services of a confessor if they first gave a guarantee that they would not recant their previous confessions – so that they were put in the impossible position of either having to admit their witch crimes, or, if they recanted, being subjected once again to the rigours of torture and the extracting of a new confession. Spee began to doubt if witches really existed and was convinced right from the beginning that the number of genuine witches was negligible.

Showing a remarkable understanding of the group psychology which underlay the persecutions, he came to the conclusion that the impulse which led to the witch trials originated at the lowest level of society and worked its way up; that the persecutions were engendered by the common people themselves, 'the irrational and, generally speaking, jealous and base rabble'. In process of time the people had become accustomed to the witch trials and pressure was brought to bear therefore on those in authority to act. 'If the authorities did not immediately seize upon baseless rumours', says Spee, 'there would be a great outcry that the officials themselves were afraid for their wives and friends, and that they (the common people) were being hoodwinked by the rich.'

The publication of this book at such a period in history, by a man who had reason to fear for his life, shows that it is possible even in such stressful circumstances to examine detachedly the process of terror involved in the witch persecutions and to see it clearly for what it was.

GERMANEN ORDER

THE CHIEF SIGNIFICANCE today of the Germanen Order, which flourished from 1912 to about 1922, lies in the fact that some of its members had connections with the early National Socialist Movement, and that it cherished so many of the myths that prevailed in extremist German nationalist circles. For instance, there was the delusion that the truly German master race (*Herrenvolk*) was descended from heroic Nordic ancestors who were fair-haired and blue-eyed, representing a racial ideal. Then there was the obsessive belief in the existence of a 'Jewish peril'. Jewry as a whole was said to represent a world-wide conspiratorial movement, and there were many who believed in the existence of a small, secret and immensely powerful international group of Jews who sought to rule the world. Since Freemasonry was supposed to be dominated by Jews, this also represented an international conspiracy.

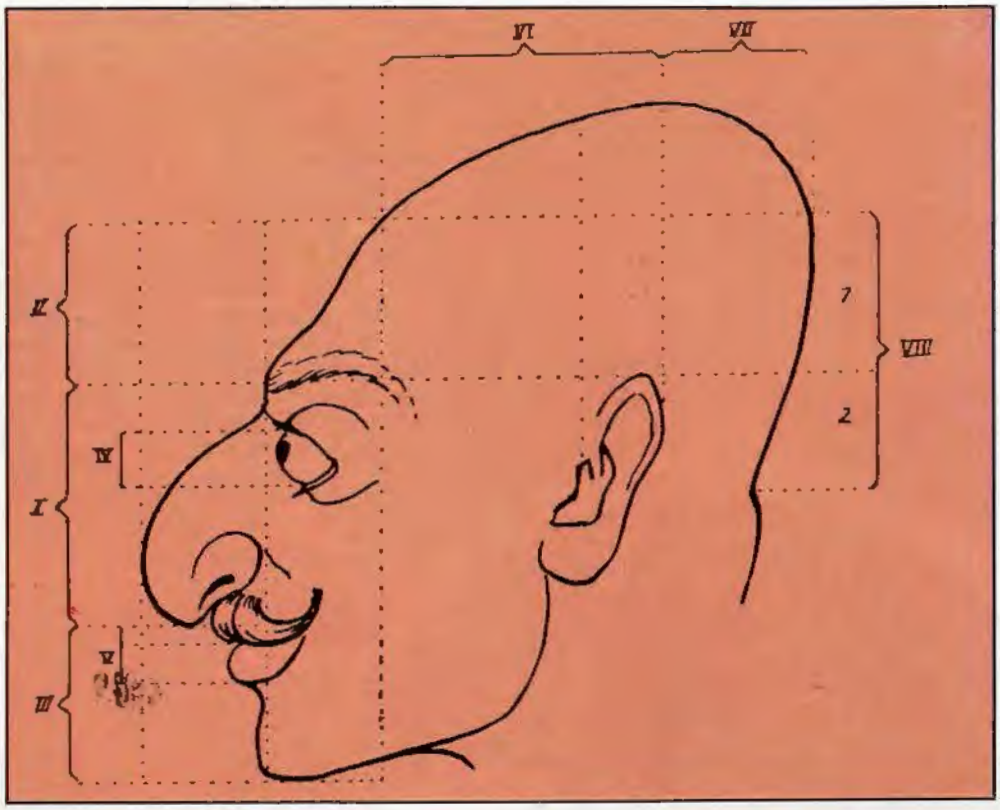
There were several reasons for the decision to establish the Order on pseudo-masonic lines. Unconsciously, at least, there was the desire to use their opponents' 'magic', in the form of rituals. Also, they supposed that secrecy was essential to prevent the Order being penetrated by Jews.

The founders of the Order were all obsessional antisemites. They included Theodor Fritsch, publisher of the antisemitic periodical *Hamm[illegible]* Philipp Stauff, an obscure journalist, Professor Heinrich Krager and Hermann Pohl, who was probably a renegade Freemason.

Candidates for admission were required to sign an attestation that they had no Jewish blood in their veins and were not married to a Jewess. A photograph was also necessary because the Order's physiognomical experts were confident of their ability to identify Jewish descent at a glance.

Candidates for membership of the Berlin lodge of the Germanen Order had their skulls measured with a 'platometer' to make sure that they conformed to the Order's 'Nordic' racial ideals: 30 years later Heinrich Himmler organized a similar measuring operation on Russian prisoners

Wiener Library



Wiener Library

Ullstein

The only known copy of an initiation ritual of the Germanen Order is preserved at the German Federal Archives. While the candidate waits in an adjoining room the Master and his two Knights take their places. They are clad in white robes and wear helmets adorned with Wotan's horns. 'The Master of the Music' sits at the harmonium and the Lodge members enter singing the Pilgrims' Chorus from Wagner's *Tannhäuser*. The candidate, who is blindfolded and wears a pilgrim's mantle, is brought into the Lodge room. He listens to a solemn address from the Master and is informed that what separates him from the Hebrews and members of other inferior races is 'our Ario-Germanic concept of the world and life'. The Bard ignites a sacred flame and the bandage is removed from the candidate's eyes. The Master takes Wotan's holy spear and holds it in front of him. His two Knights cross their swords upon it. Meanwhile the Music Master plays extracts from *Lohengrin*.

The Order was more or less inactive during the First World War. In 1916 Hermann Pohl made an undignified exit and founded a rival order. The original Germanen Order became active again in 1919; the Grand Duke Johann Albrecht of Mecklenburg, a prototype German nationalist, was Grand Master. In 1920 the three 'secret chiefs' of the Order were General von Heimerdinger, Dr Bernhard Koerner, a cranky member of the former Prussian College of Heralds, and Eberhard von Brockhusen, a Pomeranian landowner. The latter was as much anti-Polish as antisemitic. It is clear from surviving documents that he and Koerner were followers of Guido von List (1848–1919), the Viennese occultist; also that much of the Order's lunatic teaching came from this source (see LIST).

However, while the Order's leaders were conducting their eccentric ceremonies, links were being made with such right-wing conspiratorial groups as the notorious Organization Consul.

At Munich early in 1919 members of Pohl's splinter group, led by Baron Rudolph von Sebottendorff, were deeply involved in the right-wing opposition to the short-lived Communist regime. Some of Sebottendorff's people had close links with the German Workers' Party, which Hitler joined in September 1919 and speedily transformed into the National Socialist German Workers' Party. Hitler was never a member of the Germanen Order and had no use for it. Indeed, when he came to power previous membership of the Order precluded an individual from attaining any rank in the National Socialist Party.

After 1922, the history of the Order is obscure. It is possible that it was obliged to dissolve or go underground.

ELLIC HOWE

Above **A non-Nordic face, drawn by Burger-Villingen, inventor of the platometer. The Germanen Order's founders, who were violently antisemitic, shared the 'master race' delusion that later influenced the Nazis. Johann Albrecht, Grand Duke of Mecklenburg *(below)* was at one time Grand Master of the Order**

The slaughter of prisoners of war and the deliberate damage of the spoils of battle – evidence of which has been found in the peat bogs of Denmark and north Germany – was part of the tribute which Germanic tribes paid to their gods in return for victory

GERMANIC MYTHOLOGY

THE STUDY of Germanic mythology is complicated by the shortage of contemporary records and the extent to which the Germanic people are spread over northern Europe. We first hear of tribes of German-speaking peoples sharing the same general religious beliefs in about the 4th century BC, when they were established in the south of the Scandinavian peninsula, the islands of the Baltic and the land between the Rhine and the River Vistula. Subsequently they spread further into Scandinavia, while the tribes of the Angles and Saxons migrated from Germany into Great Britain from the 5th century AD onwards. Thus scattered, the Scandinavian and Anglo-Saxon branches tended to develop their religious beliefs along distinctive lines.

The greater part of present-day evidence for the early beliefs of the Germanic peoples was written down long after their conversion to Christianity, and therefore needs to be treated with caution. Germany and Anglo-Saxon England were converted by about the 7th century AD. The conversion of Norway, Denmark and Iceland, however, did not take place until about the 10th century, and that of Sweden later still, so that Scandinavian literature provides us with much of our information about the heathen gods in their later, Scandinavian forms. The Icelanders in particular retained a great interest in their heathen past, and mythological poems and stories of heathen times were written down in their monasteries along with conventional Christian works.

The pagan Germanic tribes left no written material, apart from their brief inscriptions in runic letters on stone, bone or metal, since only with the coming of Christianity did they learn to read and write Latin letters and make books on parchment. Runic inscriptions are notoriously difficult to interpret, but sometimes give valuable information about the worship of the gods or the practice of magic. Contemporary written accounts come mostly from Greek or Roman historians, of varying reliability. We depend considerably on the *Germania* of Tacitus, which was written at the end of the 1st century AD.

Place names can tell much about the distribution and importance of the various cults, while the titles given to Germanic deities in Roman times, proper names, and names of the days of the week also offer valuable clues about the heathen gods. One invaluable source is archeology: cult images, ritual objects, burial customs and holy places may be revealed by archeological discovery, and in this way it is possible to check the reliability of literary evidence.

Remains from the Scandinavian Bronze Age, a period dating roughly from 1400 to 600 BC, provide the earliest evidence of mythology in northern Europe. Extensive carvings on the rocks of Sweden, Denmark and Norway of scenes which appear to be associated with religious ritual, together with tiny bronze figurines and ritual objects recovered from the peat bogs, enable us to reconstruct something of the cult of the Earth Goddess, continuing from the Neolithic period (in northern Europe about 2000–1400 BC). In the late Bronze Age, about 600 BC, she seems to be pictured as a woman with bare breasts, wearing a neck ring and a short skirt and with her hair in a plait; these characteristics probably explain the offerings of plaits of hair and neck rings recovered from the Danish peat bogs. There is evidence also for belief in a male god of the sky. Male figures have been found holding axes and wearing horned helmets, and also a gigantic figure brandishing a spear. It is difficult to know whether these figures represent independent deities, one primarily connected with the sky and the seasons and the other with battle, but what is known of other early religions suggests

'Odin calls to the prophetess on the edge of Hell' by Fuseli. Odin was the Scandinavian equivalent of the Germanic Wodan, lord of the dead and the god of magic, poetic inspiration and frenzied rage. He went to Hel, the country of the dead, and called up a prophetess from the grave to learn the secret of the fate of the god Balder

Michael Holford

that they may be different aspects of the high god who ruled the heavens and the journeying sun, controlled the seasons of the year, and also led his followers in war. Certainly the axe and the spear were of great importance in the Bronze Age as symbols of divine power.

There is also evidence of twin deities, a divine male pair who are mirror images of one another. Horned animals like the stag, as well as the bull, the horse, the boar, the bird and the serpent, are already important religious symbols at this period. There is some evidence for the ritual sacrifice of such creatures, and also of their association with the deities of earth and sky.

Supreme God of the Sky

In the Iron Age (from 600 BC onwards) we find the earliest evidence for a specifically Germanic religion. There are again indications of the worship of a supreme god of the sky, whose name is thought to have been Tiwaz. This was the god whom the Anglo-Saxons in the 5th and 6th centuries worshipped as Tiw in England, while he was remembered in Scandinavia as Tyr. The third day of the week, Tuesday, was called after him throughout the Germanic world. The name Tiwaz is related to the Greek Zeus and to an earlier form of the Roman name for Jupiter, and these names are all thought to be derived from the Indo-Germanic word for god, probably associated with the light of the shining heavens. The Anglo-Saxon Tiw is remembered in a number of place names, including Tuesley in Surrey, Tewin in Hertfordshire and Tysoe in Warwickshire.

Only one major myth about Tyr survives in Scandinavian legend, but this is an important one. It is the story of how he alone was able to bind the Fenris wolf, a monster which threatened the safety of the gods. As the wolf grew huger and fiercer, none but Tyr dared come near him, and the creature broke all chains and fetters laid upon him. Finally a magic chain was wrought by the dwarfs, which looked like a silken cord but was impossible to break. The wolf was suspicious of it, but finally agreed to have it round his neck if Tyr would place his right hand between the wolf's jaws as a pledge against treachery. The wolf found that all his giant strength could not break this leash, and in his fury he bit off the god's hand, so that Tyr remains one-handed. This connection between Tyr and the power to bind is an important one in northern symbolism.

It is possible that one of the most mysterious accounts of the worship of a Germanic deity in the Roman period, described by the Roman historian Tacitus, also refers to Tiwaz. We are told that the Semnones, a tribe living between the Rhine and the Oder, worshipped a god called God and Ruler of All. They met with other tribes yearly near a sacred wood, held in great awe as a holy place, and anyone who entered this wood had to be bound with a cord as a symbol of humility. He might not get to his feet again if he stumbled but must roll over the ground. It is not clear from this account whether this was a divination ritual, or a sacrificial ritual to determine a victim, or both, but the connection with binding is important.

Tiwaz was equated by the Romans with the god Mars, also a god of the third day of the week, and so must have been seen by them primarily as a god of battle. One of his titles however was Mars Thingsus, which associates him with the *Thing*, the local assembly where free men met to deliberate together. This aspect of Tiwaz was taken over by Thor in the Viking Age.

The swearing of oaths on weapons and the sacrifice of weapons in thanksgiving for victory are both known to have been part of the cult of the Germanic gods. Tacitus states that the Germans sacrificed for victory to Mars and Mercury, that is, to Tiwaz and Wodan (or Wotan). One form which this took was the slaying of captives taken in war, and there is also archeological evidence for the plunder won in battle being deliberately damaged and then thrown into pools or left lying in heaps on the ground. Such offerings have been recovered from the peat bogs of Denmark and North Germany, and the great finds like those of Vimose and Nydam have added considerably to our knowledge of Germanic weapons and craftsmanship from the 2nd to the 6th century AD, as well as emphasizing the religious awe and stern discipline which demanded such costly sacrifices. Tacitus records that the Hermundari and the Chatti both vowed to sacrifice everything which they won in return for victory, and that the Hermundari, who were successful, carried out their vow.

Ruler of the Dead

Such practices began in Roman times, and may be due to the increasing influence of the cult of the god Wodan among the Germanic peoples. It had become customary a little earlier, in the Celtic Iron Age in Denmark, to bury weapons in the graves of the wealthy dead, and to leave in their graves dishes of roasted meat, with cups, jugs and horns of wine and mead, the equipment for a feast. Since in the Viking Age both weapons and feasting were consistently associated with the kingdom of Odin in the other world, such practices may indicate the spread of the cult of his predecessor Wodan among the Germans. Wodan was the god who ruled the land of the dead and was also associated with inspiration and magic. He was a god of cruel sacrifices, and his human and animal victims are said to have

Michael Holford

The eagle was the bird of Wodan, probably partly in imitation of the Roman eagle of Jupiter. Small eagle brooches and figures of eagles on shields, like this one from Sutton Hoo, were used by the Germans as amulets to ward off danger

been suspended from trees. References to such sacrifices come from Greek and Roman writers and are in general corroborated by what we know of the worship of the god Odin in later times in Sweden.

Another aspect of Wodan may be represented by traditions of the Wild Hunt, a host passing through the sky on stormy nights. The riders were on black horses and were followed by wolflike hounds, which could be heard baying in the air, and in some parts of Sweden, Denmark and Germany the leader was said to be the god Odin or a spirit called Wode. Since Wodan was a wandering, restless god, the leader of spirits of the dead, who was associated with the horse and the wolf, this may well be a genuine pagan tradition going back to pre-Christian times.

Wodan's name is probably connected with the Gothic *wut*, which signifies fury or extreme mental excitement. The name Odin (Othiun) in Old Norse appears to have had a similar basis, coming from an adjective applied to a violent storm or fire but also used for poetic genius or furious rage. Odin was the god of magic, inspiration, ecstasy and intoxication, and the Germanic Wodan and Anglo-Saxon Woden may be assumed to have had the same general character.

Odin, as god of battle, was followed by his Valkyries, the battle spirits who went out to choose the slain, sometimes described as dignified women on horseback and sometimes as bloodthirsty creatures revelling in slaughter. Such battle spirits were known earlier to the Germanic people, and female spirits called the Alaisiagae, with various symbolic names associated with battle, are mentioned along with Mars on stones at Housesteads on Hadrian's Wall.

A Grim Pun

The raven and wolf, creatures of the battlefield, are also closely linked with Odin. These are the vultures of the north, feeding on corpses of men and beasts, and as such would seem to belong to the sinister cult of the dark power Wodan rather than to Tiwaz, the god of the sky. They were not viewed solely as scavengers, since Odin was attended constantly by two ravens which flew round the world to bring him tidings and came to tell them in his ears. The symbol of a figure or a human head between two birds, which seem to be pecking it from either side, was known both to the Germans and the Celts. It might be seen as a grim pun in the German heroic style, representing the birds which peck at the corpse and the hanged man, and at the same time serve as the messengers bringing tidings to the god of death.

The eagle also was a symbol of the god, partly imitated no doubt from the Roman eagle which stood for the divine Emperor and which was carried by Roman armies. Small eagle brooches and fine eagle figures on shields, like those on the great ceremonial shield from Sutton Hoo, were used by the Germans as protective amulets. Another widespread symbol of the god was the spear, which in Norse literature is called Gungnir; one of the great treasures of the gods, it was flung over the host which Odin had doomed to defeat. The spear was an important symbol in the Bronze Age, and may have been originally the weapon of Tiwaz as god of battle. Little silhouettes in bronze, dating from the 6th and 7th centuries, of a warrior riding a horse and carrying a spear – often a weapon of exaggerated size – are found widely distributed over the Germanic continental area.

The Axe and the Oak

While there is a considerable amount of evidence for the cult of Wodan among the Germanic peoples, there is far less for that of the third of the main deities whom they worshipped, the god Donar (Thunor to the Anglo-Saxons), whose name connects him with thunder and after whom the fifth day of the week, Thursday, was named. Donar was identified by the Romans with both Jupiter and Hercules; the first association was evidently based on the power of the god over the storm and the thunderbolt, while he was linked with Hercules because he was seen as the protector of men against giants and monsters.

Clearly the functions of Donar must have overlapped considerably with those of the sky god Tiwaz, and his cult may have belonged to the tribes who lived in the thickly forested areas of Germany. It was linked with the oak forests of England, and places named after him are found in Saxon rather than Anglian districts. They are often formed from the element *leah*, meaning a forest clearing, like Thunderley and Thundersley in Essex. The name Thunaer is included in an early Saxon renunciation formula as a heathen god to be renounced by the Christian convert. Donar may have been represented by the oak tree or the axe before figures of the gods in human form became known among the Germans owing to Roman influence.

Donar's thunderbolt was symbolized by the axe, a sign of divine power from Neolithic times onwards. At some stage in the north it came to be pictured as a hammer, and tiny hammer-shaped amulets have been found in Anglo-Saxon graves. Prehistoric stone axes and fossil stones known as 'thunder weapons' were treasured in Denmark, Germany and England up to modern times; they were held to protect the house against lightning, fire and other calamities, and they were carried by German soldiers as protection against bullets in the Franco-Prussian war. A case was recorded from northern Germany in this century of a farmer who kept three prehistoric stone axes in the house and laid them in the first holes made by the drill at sowing time, and there is no doubt that the thunder god was associated with the fertility of the earth as well as the control of storms and the well-being of the community.

The deities known in Scandinavia as the Vanir, gods and goddesses connected with fertility, are the hardest to trace in early Germanic mythology. Clearly the worship of the Earth Goddess continued throughout northern Europe from the Neolithic period onwards. In the Viking Age this goddess had many names, of which Freyja is best known, and the sixth day of the week, Friday, was called after her predecessor, Frija, throughout the Germanic world. No convincing evidence of cult places called after her has survived in England, although some of those called 'Friday' may have been associated with the goddess.

German goddesses of bounty are known from Roman times, and stones of this period from England and Germany show two or three seated goddesses with fruit, bread or horns of plenty, or sometimes one figure alone. The sacred place of one of these goddesses, Nehalennia, has been found under the sand on the Island of Walcheren in the Netherlands, and it is clear that travellers appealed to her for a safe crossing over the North Sea.

Evidence for a male god like the Swedish Freyr, Freyja's brother, is harder to find. However, naked phallic male figures in wood and metal, roughly shaped with bearded faces, have been found in Denmark and North Germany, dating from the Roman period. A male and a female figure in wood from Braak in Schleswig-Holstein might well represent twin fertility deities; they are simple but impressive shapes, larger than human, which have by chance been preserved in the peat. Freyja's symbol, the boar, which she shared with the male fertility god, is well represented in Anglo-Saxon England.

Twin Gods

Tacitus mentions twin gods called the Alcis who were worshipped along the North Sea coasts in the 1st century AD. They could have developed from the twin deities of the Bronze Age, and would correspond with the protective brothers known to the Greeks as the Dioscuri, the sons of the sky god. There are what might be twin gods on the gold horn from Gallehus, dated about AD 500, and twin dancing figures on helmets of the 6th century. There is little sign of such twin figures in the literature of the period except for pairs of brother kings in early Swedish tradition, and the Anglo-Saxon pair Hengest and Horsa, whose names mean Stallion and Horse, and who are said to have led an invasion of England in the 5th century; the Dioscuri were consistently associated with horses.

Other myths concerning the gods and their world may be dimly glimpsed in Germanic tradition. The myth of the creation of the world from the body of a giant may have been associated with Tuisto, who according to Tacitus was the father of Mannus, the ancestor of the German race; he would be equivalent to Ymir in Norse mythology. A belief in the ultimate destruction of the world, an important element of Norse mythology, was probably also known to the pagan Germans.

There are indeed many isolated clues to the lost mythology of the Germanic peoples in the pagan period, and the study of their rich symbolism, constantly coming to light in fresh finds of decorated cremation urns and brooches and weapons of the Roman and later periods, will doubtless help us in due course to integrate these, and to gain a fuller knowledge of early religion among the Germanic tribes.

Left **Bronze statuette of an Indian female deity, 'waging war against the enemies of religion'; her gesture shows disapproval of the forces of evil** ***Right*** **Early Christian roadside cross from Ravenna in Italy. The thumb and two fingers pointing upwards represent the Trinity. The same gesture is used by the Pope in blessing the faithful**

Certain gestures are found to recur in widely different times and cultures, for the language of hand and body is international. In a few countries, however, like India and Bali, ritual gesture has developed into a complex and distinctive art form

GESTURE

TO CONVEY MEANING without words, attitudes of the body and especially movements of arms and hands are employed. The effect is to give a dramatic charge to meaning by acting it out in a universal sign language, for good gestures, except for certain specialist ones, are immediately comprehensible.

In fact everyone without realizing it knows a great many ritual gestures. There is the Fascist salute of the open hand flung up, which was taken from the ancient Roman salute; it showed that a man held no weapon and therefore came in peace. The corresponding Communist clenched fist implies determination and even a threat, and seems to say: 'But I do have a weapon!' In medieval religious art God is shown with open hand, and rays are often represented coming from his fingers. The open hand was a sign of victory in Phoenicia, and the Roman legions used it in a similar sense, putting it at the tops of their standards as shown on Trajan's column in Rome.

Fingers are crossed 'for luck'. The original intention was the ceremonial stoppage of evil influences, and legs or arms were crossed for the same reason. Three fingers closed, leaving the thumb and little finger erect, gives the sign of the Horned God or 'Devil'. This sign has a long history: called the *mano cornuta* in Italy, it was earlier a general sign for the moon goddess, and used in the cults both of Dagon in the Near East and of Brahma in India. The hand turned sideways, with first and little fingers

only extended, is popularly supposed to avert the Evil Eye and is in wide use in Italy and the Near East.

The Devil has much to do with luck, and lucky charms are often sold showing the Devil with his fingers to his nose, in vulgar parlance 'cocking a snook'. The gesture appears to be sexual in origin, nose and thumb being reckoned as phallic symbols.

The most famous popular gesture of recent years, the V for Victory sign popularized by Sir Winston Churchill, seems to be a horns-up sign, implying the power of a horned animal. Another version of this gesture is the old sign of Tudor and earlier times 'Horns to you,' used for telling someone that his wife is being unfaithful. This hoary jest, which never failed to amuse on the Elizabethan stage however often it appeared, was based on the idea that the wronged husband was supposed to be sprouting horns on his brow.

The thumb appearing between the first and second fingers is the common Italian gesture *fica*, 'I don't care a fig,' called *manus obscaena* in late Roman times. It showed contempt to the highest degree. But the thumb has a more noble siguificance: extended, in Christian baptism it is used for making the sign of the cross in water on children, following the Old Testament custom of using the thumb to apply blood in the ritual of ordination (Leviticus 8, 23–4; Exodus 29.20). Thumbs up or down was the sign whereby the Roman Emperor signified life or death to the defeated one in the gladiatorial shows of the ancient world.

A Catholic priest celebrating Mass makes use of gesture to indicate to the congregation the point of the service which is being reached. For the most part these gestures arise naturally from the action. When the priest is offering prayer on behalf of the people, he holds the hands open and upward and facing towards the altar. Facing away from the altar, the priest raises one open hand to bless the people. The pope, and later a bishop as well, could bless instead with the third and little fingers closed, so that the thumb, first and second fingers were left to represent the Trinity. This is the ancient *mano pantea* represented at Pompeii, and also well known in India.

To express penitence the right hand bent inwards strikes the breast. Rather more distinctive is the gesture commonly used whilst holding the Host. The priest holds the hands together with thumbs parallel and first fingers bent, having the tips joined upon the tips of the thumbs; the Host is held between the four tips, while the three other fingers are extended joined.

Christianity and Islam share the gesture of joining the thumb and first finger in a circle, leaving the other three fingers extended. The Greek Orthodox Church used it in blessing, and with hands in this position the Moslem recites his creed. A certain threat is implied if the hand is held horizontally; when elevated it means love.

The common ritual gestures of the Buddha are in effect four. The seated Buddha calls the earth to witness with the downward pointing right hand, whilst he receives from above with the upward turned left hand laid in his lap. When the Buddha's hands are together they are holding the begging bowl. When one hand is held up, palm outward, this is known as 'turning the wheel of the law', as this is the gesture which would be used to spin a real wheel. It is also the general 'teaching' position, and is used when Buddha is in the standing position with the staff of pilgrimage. The other seated position is that of meditation, with the hands simply folded on the lap. The reclining Buddha has one hand upturned, receiving guidance during repose; the other arm supports the head, the eyes being closed.

Seated Bodhisattva 'receiving from above' with hand turned upward. A Buddha's hand pointing down is 'calling the earth to witness', if the hands are together they are holding the begging bowl, if one hand is held up with the palm outward it is called 'turning the wheel of the law'

William MacQuitty

The Movements of Magic

Ceremonial magic naturally employs many gestures. In one of the more intelligible the arms are outstretched to form a cross with the body, expressing suffering and death, applied in Egyptian magic usually to Osiris; this action also occurs in the Christian Mass. In another gesture the forearms may be held up in a St Andrew's cross, making the pentagram and signifying a rising from the dead. The gesture of the Egyptian god Shu, supporting the heavens with uplifted hands, also occurs in the Mass as a gesture of offering thanks and prayer.

Magical gestures can be traced back to Neolithic and even to Paleolithic times. At St Duzac, Brittany, is a menhir (ancient monumental stone), one of whose carvings shows a god with arms held up supporting a goddess. This bell-skirted lady has her arms crossed, but her hands are held up in a gesture that may mean the union of true hearts or possibly signifies the stopping of birth. At the top is a pre-Christian figure with the arms extended upon an equal-armed cross.

The ceremonial gestures of ancient Egypt may be deduced from pyramid and tomb reliefs and paintings. In funeral ceremonies the first thought was perhaps to raise the soul. This idea is expressed by holding the hands, palms upwards, above the head. Actual mourning was a matter of holding the arms in a gesture of throwing dust upon the head, and uttering the cries of the professional mourner. Intercession with the gods for the dead is shown by the arms held directly upward. To send away the threatening evil spirits from the dead a pushing movement was made. The ceremony of making offerings to the gods involved specific gestures such as the picking up of the offering and making the offering in the sign of the lotus, which was the most usual flower to be offered; the double lotus is a much fuller and more striking gesture than the single one.

Some of the most striking examples of the use of ritual gesture appear in dance forms. Of the fully developed systems the greatest are those of India and Bali.

Language of Signs

Of great antiquity, the Hindu dance is generally considered to be based on the 108 poses carved in the Gopurams (terrace passages) of the temple of Shiva Nataraja – (Shiva as lord of the dance) at Cidambaram in southern India. The Hindi word *Natya* means both acting and dancing; that is, gesture with meaning is recognized as an essential part of the dance. Thus there are 108 standard *mudras* or hand gestures in the classical Hindu sacred dance, single or double-handed – the most complete gesture language in the world.

The meaning is essentially mythological; its elements came, it is said, from the basic four sacred books of the *Vedas*. The main centre of action and movement is in the upper body rather than the legs. Poses are prescribed for features and head: there are 52 types of glances, 13 positions for the mouth and 20 for the head and neck. There are also numerous prescribed postures for the hands.

Perhaps the most significant and easily recognized positionings are those that portray a god, of which there are some 16. Five positions represent various manifestations of Shiva: the three-eyed god, the cobra-crowned one, he who wears the moon in his tresses, he who rides the bull, and the Creator of earth and heaven. The monkey god Hanuman has two earthly hands pointing down. The popular Krishna and his milk-girl mate Radha are shown by five gestures. A goddess in general has a mudra of protection – hand up – and of bestowal – hand down; the particular goddess is shown by attaching to the general mudra the gesture depicting her mate.

The more general gestures, like this one, often have several meanings according to context. Of these, the *pataka* means Brahma, victory or grace, and is shown by an open hand held up as a blessing. It shows awareness of the god or gods and, when pointed downwards, awareness of the lower worlds. Two hands joined together, palm to palm, and accompanied by a bow, is the usual Indian polite greeting, called *angali*; the hands thus held over the head are used in salutation to deities. When the palms are a little separated they form a gentler gesture used when addressing the elderly.

The palm in Indian dance symbolizes the calm centre of action – the meditative control over the five senses or fingers agitated around it. To show the palm as the most important part of the hand is basic to the Indian dance.

The dances of Bali are also highly developed, including mythological acting partly derived from India, the miming of beasts and birds, the use of masks, and trance possession. The wealth of gesture defies representative selection, while the costuming, especially the head-dresses, would of itself constitute a major study.

Sometimes called 'the greatest Moslem after Mohammed', Ghazali combined theological orthodoxy with mysticism, and scholarship with a profound understanding of the human soul

GHAZALI

KNOWN TO WESTERN EUROPE in the Middle Ages as Algazel, Abu Hamid Mohammed ihn Mohammed at-Tusi al-Ghazali, mystic, theologian and jurist, was born in 1058 at Tus near Meshed not far from what is now the north-east frontier of Iran. His mother tongue was Persian, but he and his brother Ahmad were taught to master Arabic, the sacred language of Islam, at a very early age.

Abu Hamid Ghazali had a far-reaching education in the various branches of Islamic learning, at Tus, Jorjan and finally at Nishapur, where at the age of 19 he became a pupil of the theologian Juwayni for whom the Vizier Nizam al-Mulk had specially founded a school. Here Ghazali remained for about eight years, completing his education in theology and law, and even at that early age his teacher described him as a 'bountiful ocean' of learning. From others, both at Tus and Nishapur, he received instruction in Islamic mysticism, that is, Sufism.

It was not long before he attracted the attention of the Vizier himself, who sent him in 1091, at the age of 33, to be professor at the famous Nizamiyya school which he had founded in Baghdad. Here Ghazali lectured for four years, mainly on theology and law, and was considered among the most eminent men of the capital.

After four years of brilliant success in Baghdad, Ghazali went through a brief period of scepticism from which he was saved, to use his own words 'by a light which God threw into my breast'. As a result he became keeuly aware of the futility of the life he was leading as compared with a hermit's life of contemplation. But at first he could not bring himself to break away. He tells us that for six months in 1095 he was torn between the attractions of his life in Baghdad and 'the claims of the hereafter', and that finally providence intervened by afflicting him with a temporary impediment in his speech which made it impossible for him to lecture. This decided him. But he knew that if his plans were suspected, his friends would do everything in their power to stop him from giving up his work, and the Caliph himself might intervene.

He therefore let it be understood that he was going on the pilgrimage to Mecca and would shortly be back. In fact he went to Damascus, where he spent two years, more or less in solitude, for the purpose of meditation. From there he went on to Jerusalem, and from there he did make the pilgrimage, after which his family persuaded him to return to his native Tus where he continued to live as far as possible in retirement. It was here that he wrote his most famous work – one of the most frequently consulted treatises in all Islamic literature – *The Revival of the Religious Sciences*, the aim of which is to restore spiritual significance to every aspect of Islamic life.

In 1105, ten years after the momentous change in his life, great pressure was put upon him to take up teaching again, this time at the Nizamiyya of Nishapur where he himself had received most of his education. He agreed to do so partly because he knew that such outward activity would no longer have any power to disturb his inner life – 'though I went back, yet I did not go back' – and partly because some of his Sufi friends persuaded him that it was his destiny to be the 'renewer of the religion' that the Prophet had promised for the end of every century; and few indeed are those Moslems who would deny that Ghazali had that function for the fifth Islamic century. Before his death in 1111 he had again returned to Tus, where he had Sufi disciples and a hermitage.

Breadth of Vision

It has been said that Ghazali was the greatest Moslem after Mohammed. If this is an exaggeration, the fact that the remark could be made at all is highly significant, pointing as it does to a rare combination of qualities seldom to be found below the rank of prophethood. Ghazali was remarkable for the wide scope of his comprehension with regard not only to the different branches of learning but also with regard to the souls of men. He was truly great because his extreme versatility was knit together by single-mindedness, and his tolerance was tempered by an implacable firmness when he felt that anything of real importance was at stake. If mysticism may he called the heart of religion, it was his function to enable the heart's blood to flow freely through the body, that is, the Islamic community, to its most outlying parts. This was the aim not only of his *Revival* but also of *The Saviour from Error*, his autobiographical treatise in which he affirms that Sufism is the highest way of life and the only sure antidote to scepticism.

But not withstanding his unqualified praise of Sufism, Ghazali knew that it is not merely useless but dangerous to offer men more than they can assimilate. Nor was he ignorant of the spiritual limitations of the majority of his contemporaries, and of the existence of many different spiritual levels. He addressed now one level, now another, speaking the language of each so well that his enemies sometimes accused him of duplicity. But although, like the philosophers of his day, he could make a wide distinction between the intellectual elite and the rest of the community, he was acutely conscious of the interpenetration between the different levels.

His insistence on the universal importance of observing outward forms is typical. An intellectual may know that the act of taking off his sandals before entering on the pilgrimage to Mecca symbolizes ultimately stripping himself of 'the two worlds' (heaven and earth), but his higher knowledge does not exempt him from actually taking off his sandals. 'One must pass to and fro,' he says, 'from the one to the other, from outward word (or act) to inward secret.'

Ghazali is generally classed as a 'moderate mystic' but this can be misleading. It must be remembered that in those works which he wrote especially for Sufis, such as *The Niche of Lights*, he was altogether uncompromising in his formulations, above all as regards the truth that God is the sole reality in the face of which all else is pure illusion; and he is perhaps the only Sufi to have actually used the term 'deification' in defining the end and aim of the mystic path.

Light on the Threshold

'Do you not see,' I reflected, 'that while asleep you assume your dreams to be indisputably real? Once awake, you recognise them for what they are – baseless chimeras. Who can assure you, then, of the reliability of notions which, when awake, you derive from the senses and from reason? In relation to your present state they may be real; but it is possible also that you may enter upon another state of being which will bear the same relation to your present state as this does to your condition when asleep. In that new sphere you will recognise that the conclusions of reason are only chimeras.'

This possible condition is perhaps that which the Sufis call 'ecstasy', that is to say, according to them, a state in which, absorbed in themselves and in the suspension of sense-perceptions, they have visions beyond the reach of intellect. Perhaps also Death is that state . . . Our present life in relation to the future is perhaps only a dream, and man, once dead, will see things in direct opposition to those now before his eyes . . .

Such thoughts as these threatened to shake my reason, and I sought to find an escape from them. But how? In order to disentangle the knot of this difficulty, a proof was necessary. Now a proof must be based on primary assumptions, and it was precisely these of which I was in doubt. This unhappy state lasted about two months, during which I was, not it is true explicitly or by profession, but morally and essentially a thorough-going sceptic.

God at last deigned to heal me of this mental malady; my mind recovered sanity and equilibrium, the primary assumptions of reason recovered with me all their stringency and force. I owed my deliverance, not to a concatenation of proofs and arguments, but to the light which God caused to penetrate into my heart – the light which illuminates the threshold of all knowledge. To suppose that certitude can be only based upon formal arguments is to limit the boundless mercy of God.

GHOST DANCE

TOWARDS THE END of the 19th century, a new religious movement sprang up among a group of North American Indian tribes. The name 'Ghost Dance' is derived from the term used for it among the Sioux and Arapaho and refers to one of the central doctrines of the movement, the imminent resurrection of the dead. It was first and foremost a messianic movement, but differed from similar movements elsewhere in that it looked towards the restoration of a past golden age rather than to an unknown salvation in the future.

Although it was virtually the last and most desperate attempt by the Indians to escape the effects of the white man's civilization, the Ghost Dance was foreshadowed by a number of similar movements which had flourished and died throughout the 19th century. Among its forerunners were the 'Good Message' movement founded by Handsome Lake among the Iroquois confederation in 1799, that started by Tenskwatawa among the Shawnee and their allies, the Dreamers founded among the Columbia River tribes west of the Rocky Mountains by Smohalla, and the Shakers (not related to the sect of English origin with the same name) founded among the Squaxin tribe in the early 1880s. All these movements had certain features in common. First and foremost, a rejection of the white man and his civilization including alcohol, weapons and technology; secondly, the preaching of brotherly love, honesty and unity among Indians, even between those who had for centuries been tribal enemies; and thirdly, a revival of Indian customs and religious traditions.

Despair and Nostalgia

To these general beliefs the Ghost Dance movement added at its height specific ingredients of despair and nostalgia that were the inevitable consequence of the reduced position of the Plains tribes. Only recently pacified, their nomadic life replaced by confinement to reservations where they were dependent on the goodwill and beef of the United States government, frequently hungry and unable to adapt to farming, they were largely in a state of sullen apathy in which the medicine-man and the visionary held out the sole hope for the future. Above all, by the end of the 1880s the last of the buffalo herds, the basis of their economy and much of their religious expression, had gone, slaughtered by white hide hunters.

It was not, however, among the warlike Plains tribes that the Ghost Dance originated. Its prophet or messiah was a member of the Paiute tribe, Wovoka (the Cutter). He was born on a reservation in Mason Valley, Nevada in 1856. His father, Tavibo, had been a prophet and leader of a minor Indian revivalist movement in the early

The Ghost Dance, painted on buckskin by a Ute Indian in 1891. The prostrate figures in the centre are in trance. The round object is a blanket, near which a medicine-man is hypnotizing a subject

Museum of American Indian (Heye Foundation)

1870s and Wovoka was also known as a medicine-man within the shamanistic tradition of his tribe. But it was not until 1886 during an eclipse of the sun, and while he was in a high fever, that he had the experience which was to inspire the Ghost Dance. In his own account he told how, 'When the sun died, I went up to heaven and saw God and all the people who had died a long time ago. God told me to come back and tell my people that they must be good and love one another and not fight or steal or lie. He gave me this dance to give to my people.'

The doctrine preached by Wovoka as a result of his vision embodied these basic beliefs: the white men would disappear from the earth after a general catastrophe from which the Indians would emerge renewed after three days; the buffalo would come back; the Indian dead would return bearing gifts and the old way of life would last for ever. To bring all this about Indians were not only to practise the precepts communicated by God to Wovoka, but were also to renounce alcohol and farming and abandon traditional mourning rites, because the resurrection was near at hand (it was promised for the spring of 1891). And they were to dance the Dance. This consisted of a slow shuffling movement quite unlike other Indian dance steps, in which the participants intertwined fingers and formed a circle or series of concentric circles and moved slowly following the course of the sun. It was to be performed four or five days running and accompanied by singing but no musical instruments. Both men and women were to take part.

The first dance was held on Wovoka's reservation in January 1889. Word of the ceremony spread quickly to other Rocky Mountain tribes, notably the Utes, Bannocks and Shoshone. By the autumn emissaries from the Sioux, Cheyenne and Arapaho had carried back Wovoka's teaching to the Plains reservations. As it travelled, Wovoka's peaceful message of hope became transformed, particularly by the Sioux, who numbered 26,000 and were the largest tribal group in the United States. Although each tribe added different elements from its own ritual traditions, it was the Sioux who added two specific elements not included in the messiah's original teaching. These were the deliberate use of hypnosis to induce trances and communication with the dead, and the 'ghost shirt' made of cloth or buckskin, which was believed to render the wearer immune to bullets.

Massacre at Wounded Knee

Foremost among the Sioux leaders who took up the Ghost Dance with enthusiasm was Sitting Bull, the medicine-man and war leader who had returned a few years previously from Canada, where he had fled after the massacre of General Custer and his troops. It was he who was largely responsible for encouraging trances, although he was reported to have been disappointed by his own failure to achieve a vision. As the Ghost Dance movement spread and increased in fervour towards the spring of the promised resurrection, the military and Indian Agency officials became alarmed. In December 1890, two months after he had presided at his first dance, Sitting Bull was killed by Indian troops while resisting arrest. His followers fled from Standing Rock reservation to the nearby Bad Lands to join the band of Big Foot and Kicking Bear, the medicine-man who had been among Wovoka's first visitors. Rounded up by white and Indian troops at Wounded Knee creek in freezing weather, the warriors resisted arrest, confident that their ghost shirts would protect them. The shirts proved powerless against the two-pound shells of four Hotchkiss guns. Approximately 300 men, women and children were killed.

Although the Ghost Dance continued to be danced among tribes further south, particularly the Kiowa, throughout the 1890s, it came to its real end at Wounded Knee. With it ended the last hopes of the Indians. Many of Wovoka's ideas were absorbed by the peyote cults which flourished in the 1920s and 30s and which still survive today.

Ironically Wovoka, the messiah who had once been identified with Christ, died in total obscurity in 1932, but not before he had allowed himself to be exhibited, during the 1890s, at the Mid-Winter Fair in San Francisco.

GHOSTS

Faceless women and lifelike apparitions, ghostly dogs and spectral trains, eerie lights and unnatural sounds: the wide range of ghostly manifestations makes it difficult to find an explanation which will account for them all

BELIEF IN GHOSTS means to many people an unequivocal acceptance of the souls of the dead in sheets and chains, squeaking and gibbering in Gothic ruins. This caricature has grown from second-rate horror stories, films and comic strips, and it remains current in spite of the impressive number of people who go on seeing much less melodramatic spectres.

For instance, a British family were rehoused by their local authority in 1966 because of the effect on their health of strange happenings in their two-year-old council house. The father saw a man's shadow on the stairs where no man was standing; the daughter saw weird lights moving in her room. Police, clergymen and others investigated and found nothing, but no one seemed to scoff; the council produced another house, the priest exorcized the first one, and the *Guardian* reported it all without any of the contempt that newspapers once reserved for such stories.

It may be that belief in ghosts grows out of, and is a response to, some basic and universal human need. The need, of course, is for some assurance of survival after death. In history and prehistory, ghosts were an integral part of religious belief. Religion carried the promise of immortality, which meant that the spirits of the dead had to be taken into consideration.

The Ancestral Spirits

Naturally the ghosts of a community's forebears would be the most prevalent. So ancestor worship can be said to be one of the first, perhaps the first, form of religious awareness that developed in man. Even the cave dwellers of the early Stone Age buried their dead with some ceremony, which

Though ghosts are reckoned to be very difficult to photograph, there are hundreds of alleged photographs of apparitions in existence, usually conforming to accepted ideas of what a ghost should look like: 'Yolande', photographed in 1890, wears a veil and drifting shroudlike garments

In all societies and from the earliest times men have feared the return of the dead. The spirits of the ancestors might be reverenced in Japan, but hostile ghosts *(right)* were still feared *Far right* A lean spectre peers over a victim's shoulder

suggests belief in an afterlife and also some kind of worship of the dead.

Where ancestors are worshipped, they have taken on the role of gods, gaining supernatural power as they enter the supernatural world. Often they are only minor gods, perhaps divine only to their own families. But equally often the forebears can be the major gods of the community. They then become the principal overseers of the tribe's ethical and spiritual welfare.

The ancestors are viewed as protectors, interposing their power between the living and various supernatural evils. More important is the negative view that if the goodwill of the ghosts is not maintained – if the offerings, praises and so on slacken off – the ghosts punish such laxity with calamities like disease, crop failure, accidents and death. If such disasters occur, the tribe concludes that someone has angered the ghosts, and a whole system of appeasement, or *propitiation*, goes into action.

The need to propitiate ghosts is just as important in those primitive societies which do not directly worship their forebears. Some of these societies, many South American jungle tribes for instance, see all spirits as basically vindictive and dangerous, and so requiring propitiation. It is as if the fact of death makes the spirit automatically hostile to the living, whatever its personality while alive. Sometimes the object is not appeasement so much as warding off the spirit: magic spells are set up in a house after a death in the family, to keep the ghost at a distance; or the body is buried in such a way that the ghost cannot find its way back. Ghosts are often believed to have a poor sense of direction: in fairly recent times the bodies of hanged criminals, executed witches and so on were buried at crossroads to confuse the ghosts.

Doomed to Walk the Earth

The more complex primitive societies and most civilizations developed the idea of a distinct spirit world – the happy hunting ground, Elysian Fields, Valhalla and the like. They saw ghosts as yearning for these places but being somehow balked. Thus arises the concept of the wandering ghost who infests this world while craving access to the next world and his eternal rest. Ghosts of murder victims remain to harass the living, like Hamlet's father, until vengeance

A Schoolmaster's Night Visitor

'We – McLeod and I – slept in a dormitory at right angles to the main building. Sampson slept in the main building on the first floor. There was a very bright full moon. At an hour which I can't tell exactly, but some time between one and two, I was woken up by somebody shaking me. It was McLeod; and a nice state of mind he seemed to be in. "Come," he said, –"come! there's a burglar getting in through Sampson's window." . . . Naturally I came and looked, and naturally there was no one there. I was cross enough, and should have called McLeod plenty of names: only – I couldn't tell why – it seemed to me that there *was* something wrong – something that made me very glad I wasn't alone to face it. We were still at the window looking out, and as soon as I could, I asked him what he had heard or seen. "I didn't *hear* anything at all," he said, "but about five minutes before I woke you, I found myself looking out of this window here, and there was a man sitting or kneeling on Sampson's window-sill, and looking in, and I thought he was beckoning." "What sort of man?" McLeod wriggled. "I don't know," he said, "but I can tell you one thing – he was beastly thin: and he looked as if he was wet all over: and," he said, looking round and whispering as if he hardly liked to hear himself, "I'm not at all sure that he was alive."'

Two early montages show spirits in *(left)* hostile and *(above)* more benevolent aspects *Right* Interference with a grave was strongly resented by the ghost of the person buried. An early 19th century engraving by George Cruikshank depicts an enraged ghost rising from the earth, a thighbone in each hand, to ward off a graverobber

is done. Ghosts remain also when their bodies have been improperly buried, or not buried at all, as with Odysseus's friend Elpenor. This idea remains strong today: Britain's famous ghost hunter, Harry Price, felt in the 1930s that the main 'haunt' of Borley Rectory would depart once Christian burial had been given to some old bones he found under the Rectory.

The association of ghosts with improper burial reveals another long-lived assumption: that there is a mystical connection after death between the corpse and the spirit. Many of the propitiations aimed at ghosts by primitives are in fact performed upon the corpse or the grave. Offerings are placed at the graveside, and all over the world the dead have been buried with food, ornaments, amulets and weapons for the spirit to have with him after death. Of course desecration of the grave or disturbance of the bones brought instant retaliation from the ghost.

In spite of the various links between corpse and spirit, the notion of a land of the dead became of vital importance, and the corollary idea began to arise that for a ghost to be operating in this world was a clear punishment. Shades of evil-doers remained among the living because they had earned no right to eternal rest. Others, not evil in life, were trapped here if they had been murdered or inadequately buried, or if they had left something important undone. No wonder so many ghosts are supposed to be malevolent; no wonder that moans and howls and shrieks are associated with them, as they bewail their inability to go to rest. There are very few tales, past or present, in which a ghost is willing and happy to stay in this world.

Many of the foregoing primitive attitudes to ghosts and the dead remain in folklore and legend. But the old beliefs about what ghosts look like, and their nature generally, have been added to a little. Primitive ghosts are often indistinguishable from devils, and so may appear as horned giants breathing fire or as unusually large and vicious animals. Such visions do indeed still figure in old wives' tales; but a great many ghosts seen by modern man apparently take remarkably human form. This tendency has been confirmed by various societies of psychical research, which try very hard to take a scientific, clear-eyed view of ghosts. They are at pains to show that most of the more reliable and straightforward accounts of apparitions describe the figures seen as quite ordinary-looking people – three-dimensional, solid and wholly human.

Apparitions of the Living

Many of these accounts are of apparitions of the living, which usually appear at some crisis in the life of the person who is seen. A well-known case illustrates the point: a young Englishwoman living in India in 1917 was startled to see her brother, a Royal Flying Corps pilot, standing in her living room one day. She thought he had come on a surprise visit; only when the brother disappeared did she realize she had seen an apparition. She later learned that it had materialized at the moment when her brother's aeroplane was being shot down over France. Apparitions of the dead (which are often of loved ones or close relatives) share this apparent realness; so do the many other apparitions that have been seen at the point of death of the person who appears.

Sometimes, indeed, the reality and solidity of the apparition is more than visual – as in the case of a bewhiskered ghost in a 19th century Bristol vicarage, who had a nasty habit of entering bedrooms and waking people up by shaking the bed. Or the affectionate 'haunt' of a British stately home, about 1885, who awoke a maiden lady sleeping in the haunted room by bestowing a ghostly kiss. But many other apparitions lack any other aspect of a physical presence than their appearance, and so are all the more frightening. Many accounts mention that the apparition seems to 'glide' soundlessly; few apparitions have left footprints where a flesh and blood person would have done; many have seemed to float well above the ground. Odd clothing is often abnormality enough: strange figures roaming the night become all the more eerie when they are wearing

Radio Times Hulton Picture Library

authentic 18th century dress. And terror would mount if they were also seen to walk through a wall or to be transparent.

One compiler of modern ghost stories tells of a company director driving through the British countryside at night, who saw what appeared to be an encampment of Roman soldiers in some woods. He assumed it was a film company on location, until he realized that he could see the trunks of trees through the soldiers' bodies. Nor was he the only person to have seen that ghostly camp. In another case, a tall clergyman was seen regularly to visit a London church to pray: quite unremarkable, thought the vicar of the church, until one day he accidentally bumped into the praying figure and walked right through it.

Apparitions often reveal their non-corporeal nature by suddenly disappearing for no obvious reason. They may also disappear if the living interfere with them. Ghosts may sometimes like to touch people or kiss them or shake their beds, but they seem to object when the living take the initiative. Try to grasp an apparition, to set traps for it, like hidden cameras or powder for possible footprints, and it will vanish. In fact, though there are hundreds of alleged photographs of apparitions, the creatures are notoriously camera-shy.

Some mention must be made of the ghostly occupants of 'haunted houses'. 'Haunts' are, above all, recurrent, walking regularly as clockwork – the same night, the same time, over the same distance. They often take little or no notice of the living (less, anyway, than most of the apparitions which appear only once), but they, too, will promptly disappear if the perceivers try to interfere with them. Haunts generally seem less lifelike than other apparitions; some authorities have described them as 'somnambulistic', even mindless. Patrolling the same area, performing the same actions, they are like a visual record stuck in one groove.

The Sheeted Dead

For every lifelike apparition in psychical research files or in folktale – lifelike even when the illusion slips a little, as when the ghost floats or is transparent – there are at least an equal number of stories of visitations that resemble rather the inventions of horror fiction. These include the female ghost in a Norfolk manor who had empty, fathomless hollows instead of eyes; the faceless woman who haunted a churchyard in Canewdon, Essex; and the bodiless head which in 1953 drove a series of residents from a house in Hamburg, in spite of a cruel housing shortage. Other outlandish horrors carry with them the signs of how they met their deaths, like the victim of drowning who was said to haunt a New Orleans bridge, and who was always seen dripping with spectral seaweed. Numerous cases exist of apparitions in the form of mouldering corpses, even skeletons; these are related to the appearances of ghosts in sheets (in other words the shroud or winding sheet from the grave), which provide further instances of the age-old connection of corpse with spirit.

Nor do all apparitions manifest themselves in human or even partly human form. Spectral animals are widely common, with Britain predictably leading the field; dogs figure most frequently in these tales. In many cases the animal ghosts are friendly, but more often they are semi-demonic, like the Manthe Dog that traditionally haunted a castle on the Isle of Man and the ghostly pack of hounds that made Cornwall's moors horrible with their baying. Horses occur in many ghost legends, often with a rider, just as often not; they also are seen pulling phantom coaches. So it seems legends allow inanimate objects a ghostly existence.

Prominent among such objects are various means of transport. Many are phantom ships, including the famous *Flying Dutchman* and the French ship *La Belle Rosalie*. Ghost trains also reappear to rumble through the night on their old runs, whether the railway lines still exist or not. One famous legend concerns the funeral train carrying the coffin of Abraham Lincoln, which is said to roll along a stretch of track in New York State every April, and to have on board a phantom military band playing busily, though its music cannot be heard by living ears.

Apparitions may take much less substantial and well-defined forms than the ones considered so far. For instance, a revenant (one who comes back from the dead) created by some violent death in the past may be

not a full-scale haunt but instead take the form of a mere bloodstain. A 19th century tavern keeper in Massachusetts murdered and robbed a traveller one night, but from then on was plagued by bloodstains in the victim's room which could not be removed. Several cases exist of ghostly manifestations in the form of clouds of mist: sometimes, though, the mist will form itself into a recognizable human shape, as happened in France in 1951 when a film writer believed he saw such a mist cloud take the form of the ghost of the actress Maria Montez.

An Eerie Moving Light

Ghostly lights frequently occur when other forms of apparition are absent, and often contribute to haunted-house legends, as with the flickering lights repeatedly seen round the notorious Borley Rectory during its several uninhabited periods. It is obvious that an empty house could easily have temporary tenants, such as tramps, exploring children or vandals, who might light their way with flickering candles or matches. Yet the legends go on, related to the notion that spirits sometimes glow in the dark. So, in America, the ghost of a North Carolina railway conductor haunts a particular trestle bridge in the form of an eerie moving light: he had been decapitated near that spot, and the light is said to be his head on an eternal and forlorn search for its body.

With phantoms formed of mist and light must be reckoned the phantoms associated with smoke. Even the smell of smoke can apparently breed ghost legends, as in the story of the 17th century American girl who was burned to death for no good reason, and whose ghostly presence is recognizable by its accompanying pungent odour of smoke. Visible smoke led to another ghost tale being added to the lore of the Tower of London. In 1954 a sentry left his post in pursuit of a smoke cloud that moved as if of its own volition, changed its shape, but did not seem to diffuse or drift like ordinary smoke – until it disappeared with alarming suddenness.

Lying Beside a Ghost

Setting aside apparitions, of whatever shape or form, there is an immense variety of non-visual ghostly happenings. Many of these must be ascribed to the poltergeist, seemingly the most widely occurring form of haunting in the present day. Poltergeists are those ghosts which tend to toss objects around, whatever their weight or danger to bystanders, and also (as the name implies, meaning 'noisy spirit') to produce various kinds of noises. Spiritualism first began by investigating the kind of poltergeist that announces itself by knocking, and much of its continued research is based on the kind of poltergeist that moves tables. Associated with poltergeists are all those uncanny occurrences of church bells ringing themselves, pianos or organs being played by invisible fingers, weird laughter or screams or footsteps echoing through empty corridors.

Less overtly poltergeist ghosts would include those invisible manifestations that lay their cold hands on people or touch them in other ways, like the kissing ghost mentioned earlier. In Sheffield in 1956 an invisible phantom made itself known to an elderly lady by lying down on the bed beside her, making the mattress sink and the springs creak. Somewhat closer to the traditional poltergeist, perhaps, is the invisible ghost of a former Bank of England cashier who now tends playfully to disarm the guards; and the Bavarian ghost first heard of in 1949 who gained the name 'Gus the Nazi' when he persecuted women who fraternized with Allied Occupation troops. He was said to have cropped the hair of one girl, with scissors held by his invisible hand, in full view of her parents.

A Sense of Evil

Last of all the categories of ghosts are the totally intangible phenomena which can loosely be described as 'eerie feelings'. In a large majority of cases of clearly seen or heard ghosts, those who have experienced such phenomena have reported a definite sensation of cold, a feature that occurs as often in well-attested psychical research files as in the annals of folklore. But sometimes this chill that has no physical cause can occur entirely on its own, or can occur before the apparition is seen, usually giving the percipient an almost instinctive feeling that something evil or fearful is present. Animals, particularly dogs, are believed by occultists to be specially attuned to supernatural manifestations; many sensible people have told psychical investigators of their pets' unexplained fear of something that apparently only the animal could see. Dogs, for instance, were often frightened round Borley Rectory, even in broad daylight; and Dennis Bardens relates the story of a modern visitor to Compton Castle near Torquay, whose pet greyhound was riveted to the spot in utter terror of something only it could perceive.

Sometimes such presences make themselves felt without the aid of chills or whatever special senses dogs may have. A 'creepy feeling' – a non-physical awareness of some presence – occurs to a great many people in quite ordinary circumstances. It often happens that someone enters unfamiliar but quite ordinary surroundings (like an empty house or flat visited during a house-hunting excursion) and has a definite feeling of oppression, depression or similar 'atmospheric' reaction from the place. Nor need this reaction be due to any perceptible physical factors, such as poor lighting, dank overshadowing trees, rising damp, atrocious wallpaper or bad smells. Many people have admitted their personal experience of this unpleasant sensation in an apparently ideal dwelling, as if there were some sort of 'psychic emanation' from the very walls of the place, reminiscent of past horrors that took place there.

The forms and habits of ghosts may be incredibly varied, but their reasons for returning, the basic purposes behind their presence among us, tend according

The death of the Duke of Buckingham was foretold by an armour-clad apparition of his father, which appeared several times to one of the Duke's servants. Ghosts are often harbingers of death

to folklore to be fairly limited. Many of the reasons for ghosts returning suggested by past and primitive societies can still be found in modern legend. So ghosts can return apparently out of sheer malevolence. Vampires, a special kind of revenant, return solely for evil purposes as, in many tales, do the ghosts of executed witches.

Return for a Purpose

Haunting ghosts seem to return to re-enact some crisis scene from their former lives – usually their death scene. Ghosts in modern lore, as in the past, have been said to return to seek vengeance on their slayers, to punish the living for crimes against them or against their descendants, to seek proper burial, to complete some task left undone or merely to continue one. The ghost of an American farmer returned for the specific purpose of informing his heirs where he had hidden his will; another American ghost returned to claim what it felt to be rightfully its own. This was the deceased wife of a thrifty New England farmer, whose husband had removed her rings before the funeral, eventually to pass them on to his next wife. But the second wife awoke in terror one night to find the apparition of her predecessor angrily pulling the rings off her fingers.

Quite a number of ghosts have appeared to announce their own deaths, in the 'point of death' form of apparition met so often in psychical research. But others are said to appear as harbingers of someone else's imminent death. The spirit of a deceased loved one might appear to a person, perhaps beckoning; Josephine's ghost apparently came to Napoleon in this way, some days before he died. Or some ancestral figure might appear to the title-holder of a noble family, heralding his death, as a spectral Black Friar was supposed to visit members of Lord Byron's family.

Some stories exist of ghosts appearing because the person has, before death, promised to return in order to indicate the continuance of life 'on the other side'. Dennis Bardens gives several accounts of such promises that were apparently kept, including that of the 19th century Lord Brougham, who materialized in the presence of a friend. Predictably, several people whose lives were devoted to psychical research are said to have returned, or at least to have sent messages back – like the 'spirit writings' transcribed by a medium that were asserted to be from the great pioneer of British psychical research, F. W. H. Myers (see CROSS CORRESPONDENCES).

Tricks of the Senses?

The foregoing must of course be taken as only a broad sample of what people have believed regarding ghosts, their nature and habits. To make some sense of it, we must now look at some of the answers that experts have given to the question of the reasons behind this universal belief.

The short answer that is often given is, obviously, that people who see ghosts experience nothing except a temporary derangement of their senses. It is true that our senses do often play tricks on us, when we are in an excitable or suggestible state, or when we are drunk, ill or half-asleep. Certainly quite a few accounts of ghosts can be dismissed on this account. The 'creepy feeling' mentioned before in connection with specific houses might be ascribable to a collection of possibly unconscious impressions – signs of decay or odours and the like, not consciously perceived but nonetheless affecting our reactions. At the very least, no occultist has yet come up with a convincing explanation of why certain tragedies in certain houses should breed these ghostly emanations, or should produce haunts, while others do not; yet there must be a great many houses quite happily occupied today that have tragic or horrific histories. In the same way, one tends to mistrust sightings of ghosts that are traditionally in residence in particular buildings. Too often people see what they expect to see.

Many psychologists tend instantly to dismiss accounts of ghost sightings as the 'product of a disturbed mind'. But for a few men in this field the easy answer does not satisfy. Freud searched for explanations among the repressed relics from our primitive past, the ancient ghost fears of primeval man now hidden within the unconscious mind, but sometimes slithering into conscious awareness. Jung looked for answers in his theory of the collective unconscious, the contents of which can in his view take on almost an autonomous life of their own, being projected or manifested as seemingly outer occurrences.

Both Freud and Jung made it clear that these views should not be taken as complete answers, but more as avenues of approach for psychoanalytic researchers. Other theorists depart from these standpoints, but still share with the two great psychological pioneers the idea that phenomena like ghosts are at least worth the time and effort of study. As the American psychologist William James put it, 'it is bad method to ignore them'. James himself produced one of the more interesting theories concerning apparitions, based on the idea of spontaneously produced hallucinations. Like other psychical researchers after him, he turned to extra-sensory perception – telepathy, clairvoyance and so on – as the possible cause of these hallucinations.

Phantom of a Living Wife

One of the best-known cases of the ghost of a living person concerns the wife of John Donne, the poet, Dean of St Paul's Cathedral . . . At the time of this happening, Donne and his wife were living in a house in Drury Lane with a friend, Sir Robert Drewry. King James decided to send a mission by Lord Hay to the court of the French King, Henry IV, and Sir Robert, who also had to go, asked Donne to go with him.

Mrs Donne was expecting a child, and when her husband told her of the plan she expressed the gravest misgivings. She begged him not to go, and he agreed to stay at home – but on Sir Robert's repeated insistence he changed his mind, and his wife, reluctantly, let him go.

Sir Robert and John Donne took about twenty days to reach Paris safely. Two days afterwards Sir Robert left Donne alone in a room where they had dined with some friends, and returned to find him in a kind of coma. 'I have seen a dreadful vision,' Donne told him, 'since I saw you; I have seen my dear wife pass twice through this room, with her hair hanging about her shoulders and a dead child in her arms; this I have seen since I saw you.'

Sir Robert tried to reassure Donne. 'Here Sir, you have slept since I saw you, and this is the result of some melancholy dream, which I desire you to forget, for you are now awake.' But Donne was adamant. 'I cannot be surer that I now live, than that I have not slept since I saw you; and I am as sure that, at her second appearing, she stopped and looked me in the face and vanished.'

The following day Donne's anxiety had not abated, nor his conviction as to what he had seen. Sir Robert, convinced now that his friend *had* seen something, despatched a special messenger to Drury House to discover how Mrs Donne was and what had been happening, if anything. In due course the messenger returned. Mrs Donne lay very ill at Drury House. After a long and dangerous labour she had delivered a stillborn child – at the very hour of the very day that her husband had seen the distressing vision.

Denis Bardens *Ghosts and Hauntings*

However, even after years of concentrated research into ESP very few conclusions about ghosts have been drawn or could have been, in spite of the mountains of statistics amassed from years of experimentation. So, to the layman at least, explaining ghosts in terms of telepathy is of only abstract interest. Nonetheless, it is interesting to find William James describing apparitions as products of our own unconscious minds when they are being stimulated by other minds. This telepathic contact, he says, produces an 'objective' hallucination (as opposed to the subjective kind that our minds can produce by themselves, without help from an outside agency). F. W. H. Myers had a comparable idea that the other minds did not stimulate our minds directly, but tinkered with part of the environment we were looking at to produce the hallucinatory apparition. Another great British student of the paranormal, G. N. M. Tyrrell, offered the idea that the other minds telepathically affect the sensory apparatus (like the optic nerve) of the percipient, so that the brain receives the message that a ghost is standing there.

Psychons and Astral Bodies

None of these theories accepts the possibility that something with objective reality might indeed be standing there. For these experts, apparitions are hallucinations, however caused. Other theories tend to grow a trifle more fanciful. Students of the occult who recall the many hundreds of accounts of 'astral travelling' – when a person's 'astral self' seems to detach itself from his body and move about, fully conscious and supernaturally mobile – often relate these astral selves to ghosts. An explanation of haunting has been offered on the basis of psychic emissions rather like the particles emitted in radioactivity, but of course non-physical, non-material; the particles are called 'psychons', and the theory suggests that they remain in a house, carrying an imprint of a particular scene, which becomes perceptible to certain minds in certain circumstances. Or there is the idea that every piece of matter – a person, a dog, a train – has an 'etheric' non-material counterpart that exists in 'psychic space', which sometimes cuts into physical space and becomes visible to a percipient.

Most of these theories, acceptable in terms of the frequently occurring 'phantasms of the living', raise difficulties when applied to apparitions of the dead. For if we accept the possibility of telepathically projected apparitions, or astral bodies, or etheric selves, we must accept that these transmissions can come from the dead; that, in short, a person's mind and psychic qualities can cross the barrier of death. That means that we must accept the idea of the survival of the individual personality after death. Or, if we balk at that, we must accept the idea of a striking time-lag in the case of post-mortem apparitions – that the telepathic or other emanation came from a living agent, perhaps at the point of death but no later, and did not reach a percipient's mind until some time after the agent's death.

None of these explanations is wholly satisfactory, for none seems applicable to the whole range of ghost lore. It seems likely that the question will remain open until, somehow, man is able to discover what, if anything, transpires after death. Meanwhile, for whatever reason or amalgam of reasons, people will go on seeing things or have experiences which tradition teaches them to call ghostly.

These experiences can apparently happen to anyone, however rationalistic, nerveless, phlegmatic or hard-headed he thinks he is. And hardly anyone has been able to hang on to his total disbelief in such phenomena after having had such an experience, in any form. There is a mystery, here, which man is no nearer solving than he was when he strung amulets round his hut to keep out the spirits.

Ghoul

From Arabic *ghul*, a demon which feeds on corpses or small children in Eastern stories; known throughout the Mohammedan world, it lives in the desert, in lonely places or in graveyards: more generally used of any vampire or cannibal spirit.

In general the giants of the past had a bad reputation. Greedy, boastful, brutish, with cannibalistic tendencies, their immense size and strength made them objects of terror

GIANTS

THE BELIEF in the former existence of a race of giants is world-wide. They feature in the mythologies of most peoples, in local legends and in folktales. The evidence relating to them is as complex as their appearance is ubiquitous, but from the collected mythologies of the world it is possible to trace their development. The evidence suggests that descending from their original status as 'sons of heaven', the giants finally came to feature as grisly monsters and demons.

The deepest and most ancient significance of the myth of giants lies in the cosmogonic cycles (cycles of creation myths) of many peoples. These allude to the existence of an immense primordial being who, in order to make possible the creation of the universe, and in particular of the earth, had to sacrifice himself. The first beings on this earth were creatures that manifested qualities and powers akin to those of this one mythical being.

Seen in relation to man, giants are personifications of the overwhelming manifestations of the natural universe. Similarly, on a psychological level, they may be seen to represent man collectively as a species asserting himself on this planet, or they may be regarded as symbolizing all those forces in man which he is unable to control.

In nearly all traditions the giants appear as miraculous and ominous manifestations, that is, they represent all that surpasses human stature and achievement. But often giants exhibit inferior qualities such as stupidity and helplessness, which render them subordinate to man. According to traditions preserved in mythology and folklore, giants died out because they came into conflict with either gods or heroes. Essentially, the giant is a symbol of dissatisfaction, in that he either aims at dethroning the gods or destroying the work of man. The hero's deed is to restore the equilibrium that had been upset by the giants' overturning of the universal order.

Goliath of Gath

Their mythological or early legendary character is clearly in evidence in the giants mentioned in the Old Testament. Biblical sources make only very scanty reference to what was probably a much larger body of current local folklore, which entered literature more extensively in the apocryphal writings. There is a passage in Genesis chapter 6, which speaks of a race of giants that sprang from a union of angels – called the 'sons of God', the 'Watchers' of the apocryphal writings – and women or the 'daughters of men' (see DEVIL). This passage appears to be a short fragment of a myth accounting to the Hebrew mind for those giants that were already known to common folklore. The contest of the giants with God appears first in the Apocrypha (Ecclesiasticus 16.7) and is developed greatly in later writings. In the other biblical references to giants the terms Nephilim and Rephaim, among others, are used to signify a race of giants who inhabited Palestine as the predecessors of the Canaanites. 'Rephaim', incidentally, is connected with the word meaning 'shade' or 'ghost' and thus fits the mythological references to the extinct races which were supposed to have inhabited the land. In general, Hebrew legend attributes long life and abnormal stature to prehistoric races. In these ancient myths, referred to in Genesis 6. 1–4, we find the origin of the idea of angels of high estate who fell from the grace of God. This idea was perpetuated through the millennia, finding its personification later in the figure of Satan in the New Testament, as well as in the figure of the dragon. It came to be widely expressed in Christian literature, as for example in Milton's poem *Paradise Lost*.

More realistic descriptions are found in relation to the giants Og and Goliath. In

A famous Indian epic poem, the *Ramayana*, tells how a virtuous Indian prince made war on the demons who lived in Ceylon: in this illustration of a scene from the epic, a sea demoness of gigantic size swallows soldiers of the invading Indian army. Wall painting on the inner wall of a courtyard in the temple of the Emerald Buddha in Thailand

William MacQuitty

Deuteronomy chapter 3 we are told of the former: 'For only Og the king of Bashan was left of the remnant of the Rephaim; behold, his bedstead was a bedstead of iron; is it not in Rabbah of the Ammonites? Nine cubits was its length, and four cubits its breadth, according to the common cubit.' Of Goliath of Gath, the champion of the Philistines who was slain by David, it is said that his bronze coat of mail weighed 5000 shekels, which is 208 pounds; about his weapon we are told 'the shaft of his spear was like a weaver's beam, and his spear's head weighed six hundred shekels of iron' (approximately 25 pounds).

In Greek mythology there are various accounts of the birth and the subsequent fate of giants; always they are closely related to the pantheon of gods. Hesiod speaks of their origin in his *Theogony*, written in about the 8th century BC. Uranus (sky) begot immense beings, the Titans and the Cyclopes, with Gaia (earth) and then shut his offspring in the depths of Tartarus. But Gaia in revenge incited the Titans to attack their father. This they did, led by Uranus's youngest son Cronus. Armed with a sickle Cronus castrated his father. The Titans then released the Cyclopes from Tartarus and awarded to Cronus the sovereignty over the earth; however, no sooner did Cronus find himself in supreme command than he confined the Cyclopes again to Tartarus.

Another account speaks of how certain tall and terrible giants, the Gigantes, with long locks and beards and serpents for feet, plotted an assault on heaven. They were enraged because Zeus, the successor of Cronus, had confined their brothers the Titans to Tartarus. Without warning they seized rocks and firebrands and hurled them upwards from the mountain tops against Olympus, disdaining the lightning of Zeus. An oracle had declared that the gods could not conquer them except with the assistance of a mortal. The hero Hercules was called to the aid of the gods and he slew the most formidable of the giants. The remainder perished by the hands of the gods or fled. Local legend explains those places noted for volcanic eruptions, as for instance the islands of Cos and Sicily, as being the spots where the giants were buried. The Gigantomachia, or War of the Giants, is also referred to by the Roman poet Ovid at the beginning of his *Metamorphoses*.

In revenge for the destruction of the giants, Gaia lay with Tartarus and brought forth her youngest child Typhon, the largest monster ever born. 'From the thighs downward he was nothing but coiled serpents, and his arms which, when he spread them out, reached a hundred leagues in either direction, had countless serpents' heads instead of hands. His brutish ass-head touched the stars, his vast wings darkened the sun, fire flashed from his eyes, and flaming rocks hurtled from his mouth. When he came rushing towards Olympus, the gods fled in terror to Egypt, where they disguised themselves as animals.'

The human hero in all mythologies takes part in the battle with the giants. In his *Odyssey* Homer related how Odysseus intoxicated and outwitted the one-eyed, human-eating giant Polyphemus who lived on Sicily. As forgers of thunderbolts the giants were assistants of Hephaestus, the smith of the gods.

Tradition holds universally that before the close of the mythical Golden Age people had been much taller and much stronger. Survivals of such beliefs are found in the mythologies of many peoples, and references to them are frequent, especially in Eskimo, North American Indian, Mexican and Persian legends and stories. All the Greek and Latin poets and historians shared the opinion that they and their contemporaries were dwarfs compared with their ancestors.

Immense Stone Figures

The fact that ancient peoples have possessed a belief in giants is further evinced hy the vast images of their gods and their colossal monuments in sculpture and architecture. Examples of such edifices and statues abound and survive from civilizations all over the world. The Colossus of Rhodes, one of the seven wonders of the world, exemplifies the ancient taste for the vast human figure. Grecian temples in general portray the gods and goddesses as being of superhuman size. In front of the portals of the palace at Karnak in Egypt are placed gigantic human statues, and in one of the courts there are erected 12 immense stone figures, each of a height of about 52 feet. Similarly, at the outer gate of the Temple of Longevity at Canton were four gigantic figures. Many more examples could be cited. The various ancient representations of huge human forms were the corporeal shapes of those gigantic mythical figures which existed in the imagination of our ancestors and which, having been perpetuated in stone, served to continue the early belief in giants.

Norse and Germanic mythology assign an important place to giants. Our knowledge of northern mythology is derived mostly from the *Prose Edda* of Snorri Sturluson, which he wrote in the 13th century. The Icelandic scholar relates in it that according to Norse mythology there were in the beginning two regions: the South, full of brightness and fire, and the North, a world of snow and ice. Between them there stretched a great void. When the heat and the cold met in the midst of this expanse, a living creature appeared in the melting ice: he was Ymir, a great giant. From under his left arm grew the first man and woman, while from his legs the clan of frost giants was begotten. Ymir was thus the ancestor of all the giants. When he was slain the earth formed under his body. There is also mention in Nordic creation legends of the giant Bergelmir who escaped in his boat from the flood caused by the blood of Ymir which overwhelmed the world. Having escaped he then founded a new race.

Subsequently the giants of the *Edda* feature either as companions of the gods or as their adversaries, as in tbe following account. One day the god Thor and Loki, a giant's son, set out to the land of giants. Towards evening they came to a huge building with an opening to one side. They groped their way in and spent the night there. But as there was a deafening noise coming from outside and as the building shook with a continuous earthquake, they sat up most of the night in terror. At daybreak they discovered that not far from this building there lay a giant. He was Skrymir, who when he rose picked up what Thor and Loki had taken for a building, but which was in fact his glove. The passage in which they had spent the night proved to be its thumb.

The giants slain by Thor are characterized by their enormous size, power and greed and by being particularly jealous of the possessions of the gods. Gods and giants intermarry. Born from such a union was Loki, who was handsome to look at but was evil in his ways. He was a cunning schemer who both helped and hindered the gods in their work. He was the father of the wolf Fenris, the World Serpent, and Hel, the ruler of death.

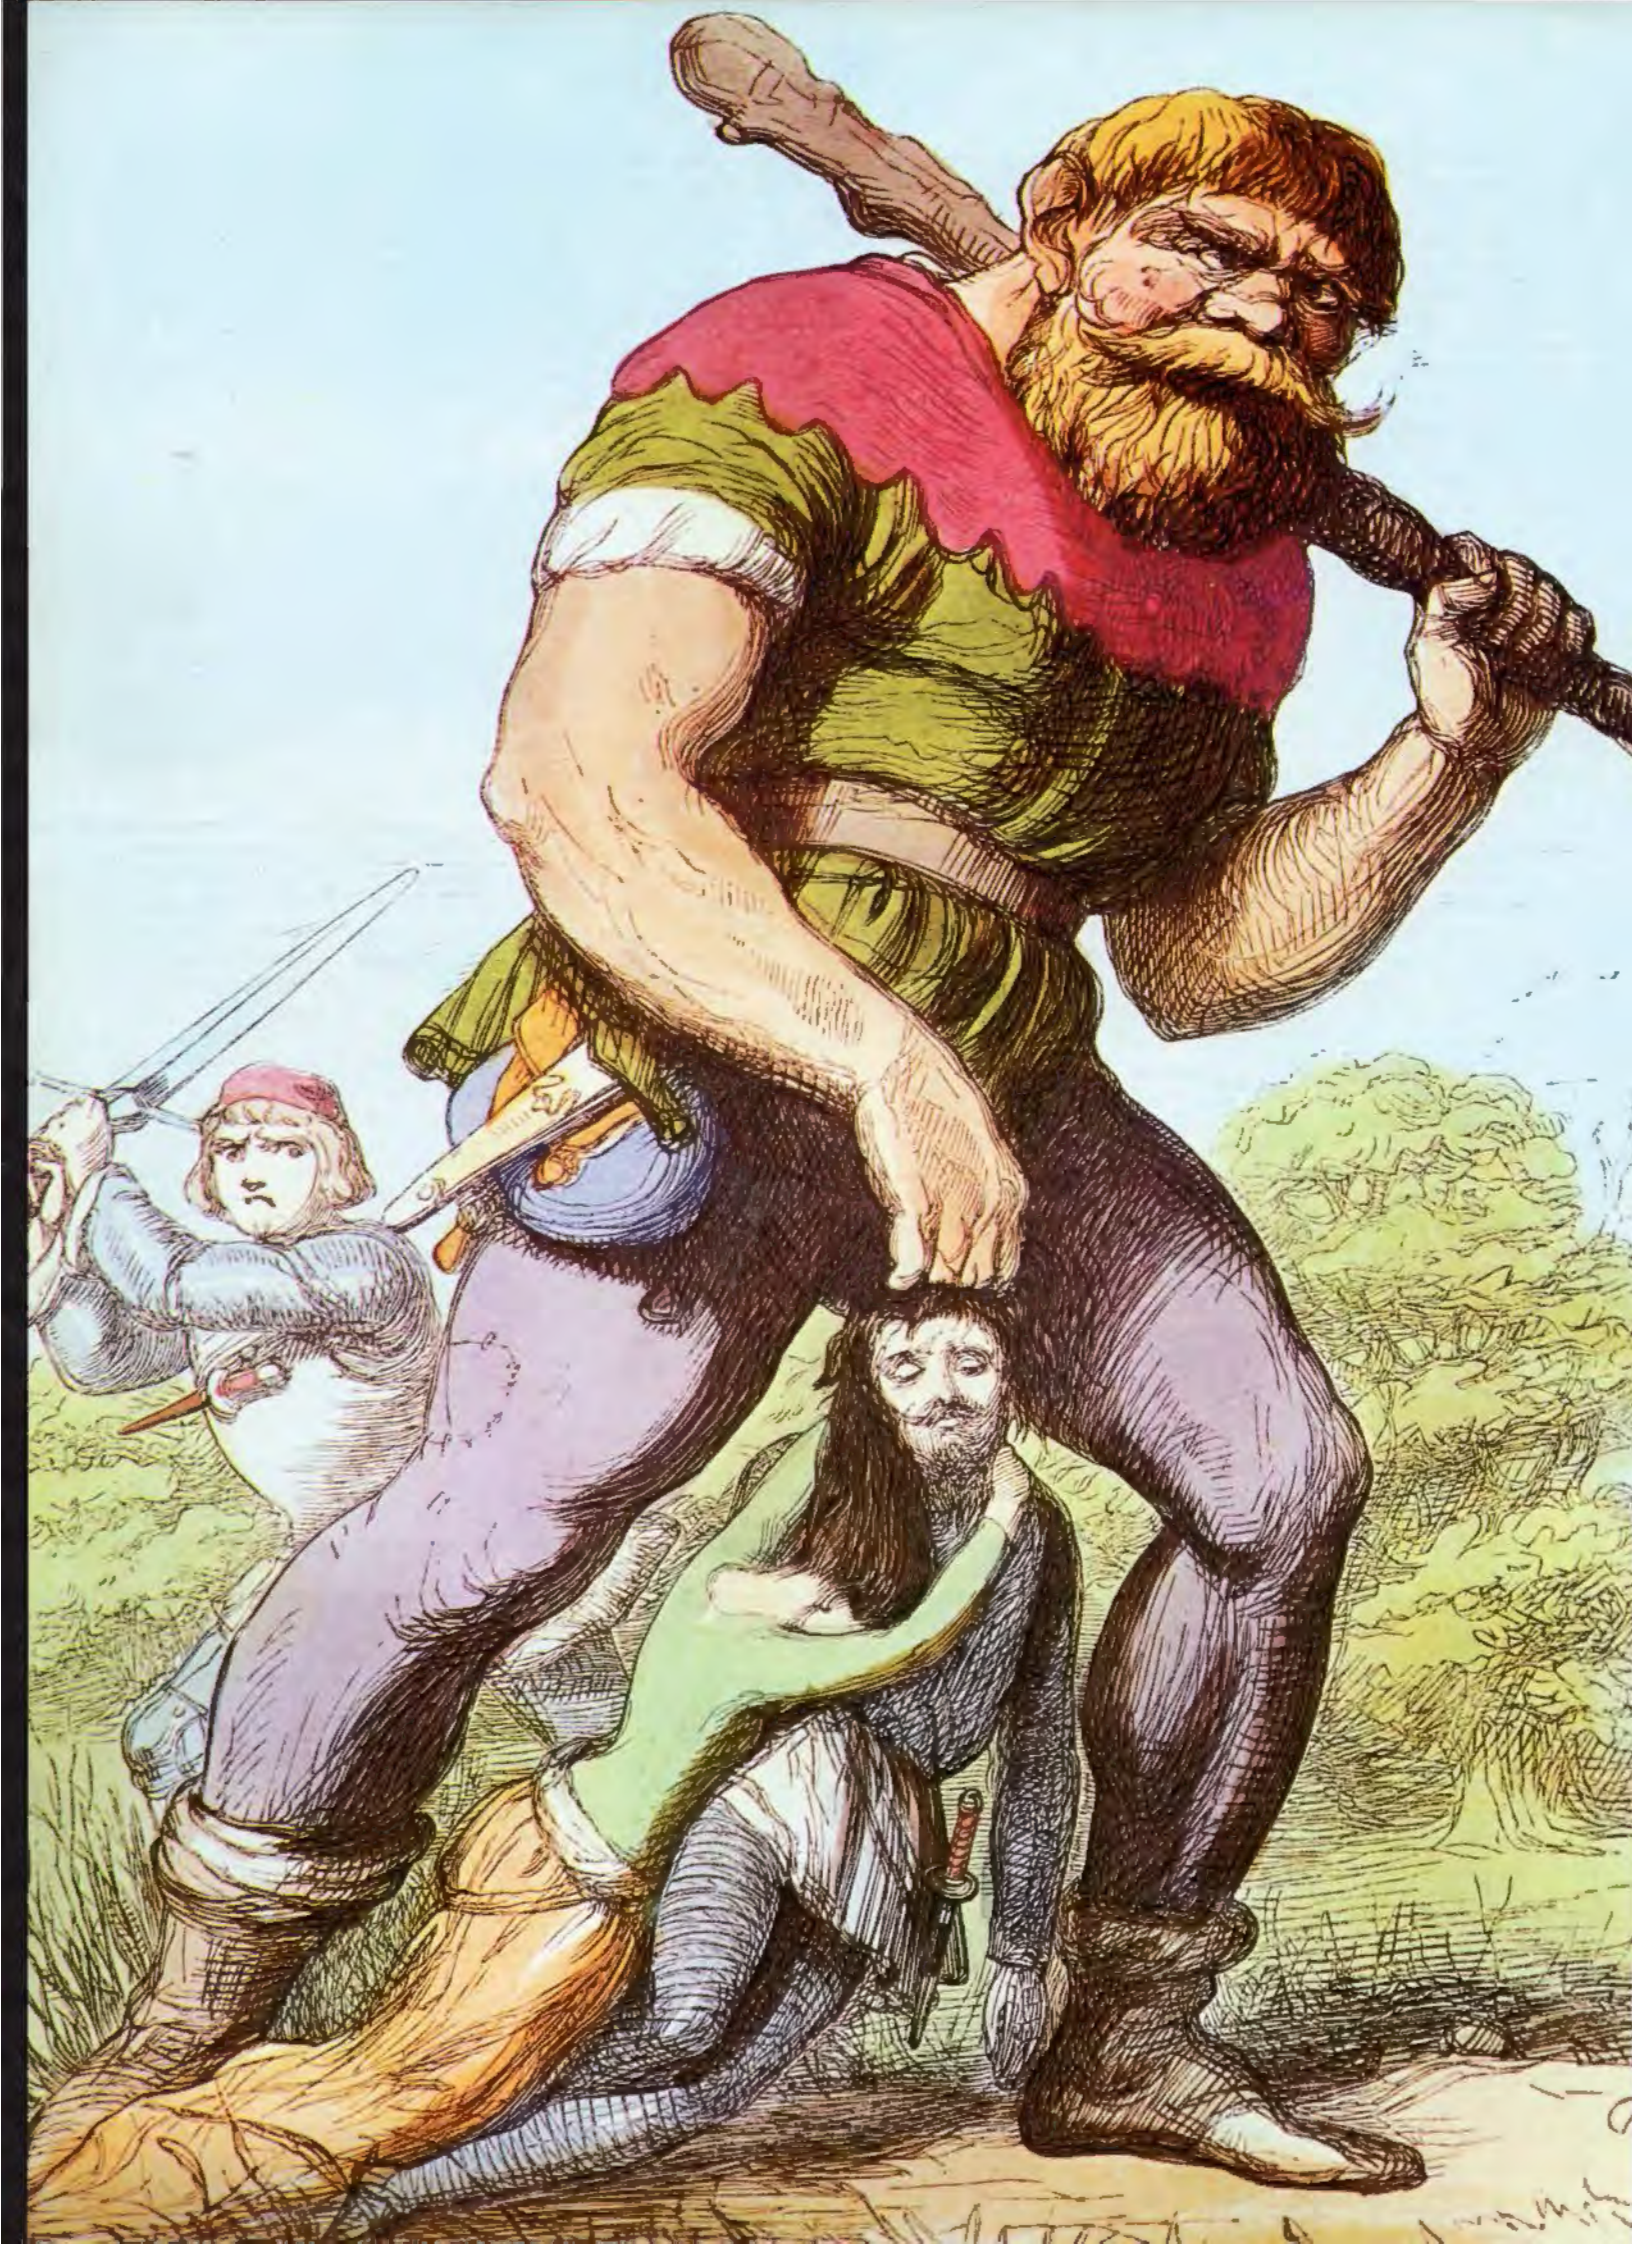
Legends universally ascribe the numerous stone structures of a former age to the work of giants. These stone structures are found particularly in Palestine, Greece and Central Europe, and are almost exclusively associated with buildings known as *cyclopean*. Apart from these edifices there are very numerous megalithic structures, both above and below ground. These *cairns*, heaps of stones akin to *dolmens*, known as *Riesengräber* in Germany, are found throughout Europe.

Local legend frequently pictures giants as throwing rocks about by way of trying each others' strength. According to a Dorsetshire legend, two giants once stood on a hill contending as to which of them could hurl a rock the longer distance across the valley to another hill. He whose stone fell short was so mortified by his failure that he died of vexation; he was buried beneath the mound which has since been known as the Giant's Grave. Similar legends are often attached to blocks of stone which occur naturally, and which appear strewn about, as it were, by some giants in an antediluvian game.

Gog and Magog

Giants are frequently counected with old mythic histories of the foundation of cities. Geoffrey of Monmouth in his *Historia Regum Britanniae* (c 1135) recounts the fate of Gog and Magog, the only survivors of a race of giants inhabiting Britain who had been slain by Brutus, legendary founder of the British race, and his companions. Gog and Magog were brought to the newly founded city of London, where they were compelled to officiate as porters at the gate of the royal palace.

Finds of huge skeletons and bones all over the world have frequently led to the belief in a former gigantic tribe of men. Pliny relates that in the time of Claudius Caesar there was a man named Gabbaras, brought by the emperor from Arabia to Rome, who was nine feet nine inches high, 'the tallest man that has been seen in our times'. The Emperor Maximus, so the story goes, was about eight or nine feet tall and of great bulk. He was in the habit of using his wife's bracelet for a thumb-ring. His



shoe was a foot longer than that of any other man and his strength was so great that he was able to draw a carriage which two oxen could not move. He could strike out a horse's teeth with one blow of his fist and break its thigh with a kick. He generally ate 40 pounds of meat every day and drank six gallons of wine.

Such gigantic people have been a great attraction in popular entertainment at all times. In the 1720s there appeared the following description of a human giantess in a London handbill: 'Advertisement. This is to give notice to all gentlemen and others, that there is lately arrived from Italy, a tall woman, being above seven foot high, and every way proportionable, weighing four hundred and twenty-five pounds weight. She has been shown before the Emperor of Germany, as also to the grand Czar of Muscovy, to the wonderful admiration and satisfaction of him, and the rest of the great princes of Christendom. She is to be seen every day from ten in the morning till seven at night (without any loss of time) at the Blue Boar and the Green Tree in Fleet Street, next door where the Great Elephant is to be seen. Vivat Rex.'

Folk tradition uses the term giant in connection with a supposed race of mortals of immense size who inhabited the world in early times. In most European folktales giants appear as cruel and stupid savages, often one-eyed and given to cannibalism; sometimes they are akin to monsters. The hero of the folktale, like the English Jack the Giant-killer and Grimm's Valiant Tailor, always emerges victorious from a battle with them. Kindly giants occur only in a few stories, as in the legends of Rübezahl, the giant of the Bohemian forest. The majority of them, however, were feared and hated, although marriage between their daughters and the hero of the story was not impossible. Jonathan Swift invented a race of benevolent giants in the second part of his satire *Gulliver's Travels*.

The figure of the superman in the ancient myths, legends and tales speaks of man's inherent tendency to magnify real occurrences, to idealize them and present them in the imagery of dreams. The human hero is a being of more than life-size ability and physique, who is presented as conquering giants, demons and dragons; thus the giants gradually come to embody almost exclusively negative qualities.

Man's love-hate relationship with the abnormal and the extraordinary, the violent idealization or rejection of the giant-hero, is apparent too in contemporary myth-making. The giant and the hero overlap. The negative giant, the master villain and the hero's enemy, embodies those qualities that are rejected by the current code of values or the ideology of a given community. The hero-giants may be cosmonauts, secret agents, political figures or other popular heroes always winning against odds and excelling in power and intelligence.

Conversely, human heroes have been represented in giant proportions to emphasize their superhuman qualities: at Tirumallaiyaval in India seven wise men keep guard in a temple courtyard

GILGAMESH

THE GREAT HERO of Sumerian and Babylonian mythology was Gilgamesh. His deeds are recorded in an epic poem no less adventurous than the *Odyssey*, put into its final written form not more than about a century after the Greek poem. The received text of the Gilgamesh epic was written down on a series of 12 clay tablets inscribed in the cuneiform script used by the Sumerians, the Babylonians and the peoples of Assyria. The fullest version that has come down to us was originally held in the great palace library of the king of Assyria, Ashurbanipal, who made a vast collection of contemporary and ancient texts in the course of three decades between about 660–630 BC.

This famous epic became a set book in the scribal schools and has been reconstituted from fragments found not only on many Mesopotamian sites, but also at places as far apart as Megiddo in Palestine and Ugarit in Syria. Evidence of the poem has been found at Sultantepe and Boghaz Koi, the great Hittite capital in Asia Minor. The Assyrian version ultimately derives from a much older Babylonian text which must have been composed before 1800 BC, for there is no mention of Marduk the god of Babylon, whose cult became the state religion in the reign of Hammurabi. But the earliest versions of all stem from Sumerian texts of the late third millennium BC, at which time this epic was perhaps not a continuous story, but consisted of a disconnected series of episodes in which Gilgamesh took a prominent place.

The epic itself is enthralling for the insight which it gives into the psychology of the Babylonians and their Sumerian forebears. We also become aware of the historical background and of a heroic age which, though associated with stories about the gods, may be authenticated by historical, or semi-historical, literature such as the Sumerian king lists, and by archeology. The historical position of Gilgamesh is firmly established by an episode in the Sumerian version of the story, which tells of a battle between Gilgamesh and Agga, King of Kish, a name already known from the Sumerian king lists. Indeed the name of Agga's father

John Webb

Michael Holford

has been identified on an alabaster bowl from the Diyala valley, dated about 2700 BC. Thus in the epic we can visualize a real king, Gilgamesh, as well as a world famous historical event, the Sumerian Deluge, the memory of which has been preserved in the book of Genesis.

From this poem we learn that Gilgamesh was a renowned and powerful king who had built the great walls of Erech, one of the most extensive cities of Sumer and Babylonia. Gilgamesh, however, was an arrogant, oppressive and philandering ruler who had exasperated his subjects. In consequence an appeal was made to the gods for a champion who would contend for their rights against the omniscient and headstrong oppressor within their city.

The Hairy Hunter

The champion elected to liberate Erech was a hairy hunter named Enkidu, a Sumerian wild man who lived with the animals and protected them. He was seduced by a courtesan, who tempted him with the delights of the city, and Enkidu who had never before partaken of bread developed a taste for strong drink also. On entering Erech he engaged in a wrestling match with Gilgamesh, but after honour was satisfied on both sides the two heroes became firm friends and decided to embark on an adventurous journey together.

In a mountain of cedars, perhaps the Amanus or the Lebanon, they sought out the demon Humbaba and slew him. In this episode we may see a relic of early dynastic Sumerian conquests in Syria recently attested by excavations at Mardikh and Chuera. The two friends returned in triumph to Erech, and the goddess Ishtar became enamoured of Gilgamesh. Unwisely he spurned her advances and accused her of having seduced men and beasts. The goddess, a woman scorned and enraged, induced the high god Anu to send down from heaven an avenging bull to trample on the city of Erech, but Enkidu killed it, thereby sealing his own doom and initiating a long drawn tragedy. After his death, which was foretold in a dream, there follows a lament for Enkidu, for whom an expensive funeral is arranged.

Gilgamesh, bereft of his friend, began to fear for his own life, and resolved to embark on a journey in search of the secret of immortality, although as we are reminded in the ninth tablet of the epic, 'two thirds of him is god, one third is man'. Between twin mountain peaks he penetrated the gate of sunrise which was guarded by the scorpion-man and his wife, and after a long journey through an immense and impenetrable darkness arrived in a garden where the trees bore carnelian and lapis lazuli. He was on his way to find Utnapishtim, the Sumerian Noah who, as he hoped, would reveal the secret of his immortality to him. The sun god warned Gilgamesh that he was on a vain quest and advised him to seek what pleasure he could in life:

> Day and night be thou merry
> Make every day a day of rejoicing.

This part of the narration in Tablet X concludes with a passage worthy of the book of Proverbs in which Gilgamesh reflects on the impermanence of life and its mutability.

The ensuing Tablet XI is the famous Deluge tablet, which breaks the thread of the narrative. This is thought by many authorities to reflect an identifiable event or events which, according to another Sumerian tablet, may be related to the reign of king Ziusudra who is thought to have lived not more than a century or two after 3000 BC.

Above **Gilgamesh and his friend Enkidu subduing wild beasts: plaster cast of an Akkadian seal** ***Below*** **Terracotta figure of Gilgamesh from Khorsabad, Iraq**

Michael Holford

Robbed by a Serpent

The conclusion of the eleventh tablet is that with the advice of a ferryman named Urshanabi, Gilgamesh, his feet weighted by stones, dived deep into the sea and discovered a plant like a thorn, the wondrous plant whose name was perpetual youth. His triumph was short lived, for on his way home, whilst refreshing himself in a pool, a serpent robbed him of his trophy and stole the secret of eternal life.

The last tablet of the series, Tablet XII, is an appendix to the whole, for in it Enkidu lives once more. It contains a Semitic version of a Sumerian story. Here we have a remarkable episode concerning a willow tree and its magical properties coveted by Inanna, queen of heaven. Enkidu, who has meddled dangerously on her behalf, goes to his death, and the story ends with an interview between Gilgamesh and Enkidu's ghost, who gives a woeful account of the underworld. Here we have an unrelieved picture of gloom which, with few exceptions, is typical of Sumerian and Babylonian thought.

GILLES DE RAIS

THE LIFE of Gilles de Rais, culminating in his trial and execution, presents an incredible study of a dual personality. To the outside world he was cultured and artistic, interested in drama and music and skilled at ornamenting manuscripts. Though he lived like an emperor surrounded by magnificent luxury, he was a brave soldier, and his worst failings appeared to be pride, hot temper and extravagance.

However, at the trial in 1440 a ghastly side of de Rais' character emerged. It seemed his inordinate public piety and liberal acts of charity had been zealously exercised to save him from damnation, while privately he practised the most diabolical and bloody rites. The charges of the ecclesiastical court and Inquisitor included heresy, apostasy, conjuration of demons, sodomy, sacrilege and reading forbidden works on magic. The civil court arraigned him for about 140 child murders. Evidence supporting these charges must be some of the most obscene and cruel on record. It describes monstrous sexual perversions using living and dead children, specially procured for their beauty. De Rais was said to have voluptuously kissed and gloated over the loveliest corpses, which were then burned or hurled into cesspits.

It is hardly surprising that the far older Breton legend of Bluebeard became interwoven in many minds with the deeds of Gilles de Rais, though there seems little foundation for assuming him to be the archetype of that character.

Born in 1404, Gilles de Laval, Baron de Rais (or Retz) was heir to riches and great estates in Brittany. During his solitary childhood he was treated as a prince. He grew up wild and headstrong, spending much time reading about the depravities of the Caesars in his vast library of Latin manuscripts. Unaccustomed to female company, his sensual appetites found outlet in homosexual pleasure.

Jean de Malestroit, Bishop of Nantes and the Inquisitor, Jean Blouyn hear evidence at the trial of Gilles de Rais in 1440: 15th century French manuscript

Bibliothèque Nationale Paris/Snark

The Baron's wealth was further increased by an early marriage to the great heiress Catherine de Thouars. This union was not happy, but it made him one of the greatest nobles in Europe. When he was only 16, his skill and courage during a campaign won him the particular interest of his overlord, the Duke of Brittany. Six years later de Rais entered the service of Charles VII, maintaining a large troop at his own expense. He fought courageously against the English and was entrusted with watching over Joan of Arc, fighting at her side outside Paris.

Profligate Spending

During Charles's coronation at Reims in 1429, Gilles de Rais, aged 25, was created a marshal of France. Abruptly in 1432 he retired from active life, and then commenced his grisly career. De Rais was surrounded by hangers-on, like Roger de Briqueville and Gilles de Sillé, who became his intimate confidants. Availing themselves of his munificent hospitality, these parasites inexpertly managed his affairs. Wherever he went excitement and envy were aroused. Ugly rumours began to circulate around his estates of Machecoul, Malemort, La Suze, Champtocé and Tiffauges: two women in the Baron's employ, Etiennette Blanchu and La Meffraye, were said to lure into his castles beautiful children who never returned. As de Rais was virtually omnipotent in his own domains, it was impossible to level any unconfirmed accusations at him.

In time his profligate spending forced de Rais to begin selling up his lands. In 1436 his alarmed relatives succeeded in getting the King to make an order preventing further disposal of the estates. The decree was observed everywhere except within Brittany, where Duke Jean and his chancellor, Malestroit, Bishop of Nantes, were busy purchasing the Marshal's lands, on which there was a redeemable period of six years.

To gain the wealth he needed for his projects, and also because alchemy was his serious interest, de Rais sought the Philosophers' Stone, which would transmute base metals into gold (see PHILOSOPHERS' STONE); to this end he lavished further money on all those who promised to help him. A Florentine priest, Francesco Prelati, joined the other magicians. De Rais evidently believed in and liked this utterly unscrupulous charlatan. Prelati claimed he invoked when alone a demon called Baron, who would grant gold if the right sacrifices were made. Numerous terrifying ceremonies took place. Once de Rais placed a child's heart, eyes, hand and blood in a glass container for Prelati to offer. The rite was a failure: 'Baron' refused the offering, which was then buried in consecrated ground. Though the Marshal acquired a reputation for using countless bodies of children to summon demons, this was the only real case cited at the trial.

Both duke and bishop were anxious to remove de Rais because of the redemption clause, and also to gain further land, but it was difficult to destroy a man in the Marshal's exalted position. However, the ungoverned temper of de Rais played into their waiting hands. One of his castles, St Etienne Malemort, was purchased in July 1440 by Geoffroi Le Ferron, the Duke's treasurer. His brother, a priest, Jean Le Ferron, went to collect the title deeds. A quarrel arose. Le Ferron was chased from a church and then beaten and imprisoned by de Rais. By so doing the Baron committed sacrilege and violated clerical immunity.

Brought to Trial

At the end of July Malestroit began collecting evidence against de Rais, concerning the disappearance of children and matters of a heretical nature. The case of Jean Le Ferron gave him the opportunity to bring the Marshal to trial, and the Inquisitor, Jean Blouyn, presented a charge of heresy. At the same time Duke Jean arranged for a civil trial in the ducal court under the presiding judge, Pierre de l'Hôpital, President of the Breton parliament, to hear evidence about the missing children.

If de Rais was declared a heretic, then duke, bishop and inquisitor stood to gain, for all his property would be legally forfeit. A fortnight before the trial opened Duke Jean sold his anticipated share in the estate, which strongly suggests that Gilles de Rais could not be allowed to go free. Rumours spread. De Briqueville and de Sillé fled.

On 19 September Gilles de Rais was summoned to appear in court. His servants and agents, including Prelati, were arrested and taken to Nantes. The remains of one body were discovered at Machecoul. The preliminary proceedings elicited little public outcry, but by the hearing on 8 October crowds of bereaved parents were clamouring for justice; popular opinion had been skilfully incensed.

The civil and ecclesiastical trials ran concurrently. After torture the Baron's associates, including the two women procurers, gave evidence against him and in minute detail Prelati described the attempts at necromancy. De Rais' two personal attendants, known as Henriet and Poitou, gave evidence before both courts. On 21 October de Rais was tortured until he promised to confess 'voluntarily and freely' before Pierre de l'Hôpital and the bishops. He admitted all the charges. Prelati was called; each confirmed the other's statements and the two men parted with tearful affection. On 22 October the proud Baron asked leave to confess publicly, adding further detail, piling horror upon horror, as if he believed this act of abject humiliation would help him obtain God's pardon. Then he begged forgiveness of the bereaved parents and commanded all those present to love and honour God and the Church. The Bishop embraced him and prayed he might be purged and redeemed.

On 25 October de Rais was brought for sentence before the ecclesiastical court. No sentence was passed but he was excommunicated for heresy, which grieved him deeply. The civil court condemned Henriet and Poitou to be hanged and burned. In return for not recanting his confession Gilles de Rais was granted the unusual mercy of complete strangulation before burning. In Nantes on 26 October, after prayer and penitence, the Marshal and his two servants went to their execution followed by a procession of clergy and populace singing and praying for Gilles de Rais' salvation.

Undoubtedly Gilles de Rais must have been guilty of some of the crimes. However, the many irregularities surrounding his trial suggest at best a mystery, at worst a conspiracy. Much of the evidence was hearsay. Only two accomplices were executed; other associates, whose testimonies against de Rais contained damning confessions of their own terrible guilt, were freed. Despite his acts of necromancy, which was regarded as a grave offence, even Prelati went unpunished.

GLASTONBURY

Nicholas Barrington

An island with a hill on it was well qualified to possess a sacred aura for the Celts. A Welsh legend preserves the belief that Glastonbury Tor was an entrance to the otherworld, and the chapel on top of the hill was dedicated to St Michael, the vanquisher of evil powers

Built on the site of the ancient Isle of Avalon, Glastonbury is reputed to be not only the first Christian foundation in Britain but the last resting place of King Arthur

THE SMALL TOWN of Glastonbury in Somerset, famed for its ruined Abbey, is dominated by the Tor, a hill rising about 500 feet above sea level and commanding a wide expanse of low-lying country. The abbey is the centre of a vast complex of legends as it is traditionally the oldest Christian foundation in Britain, and in some sense a repository of pre-Christian mysteries.

At the start of the Christian era, Glastonbury was virtually an island encircled by lagoons and rivers. To the British Celts it was a place of great religious awe, the enchanted Isle of Avalon, consecrated to the shades of the dead. An alternative name for it was Ynys-witrin, the Isle of Glass and 'Glastonbury' is a corrupt Anglo-Saxon rendering of this.

The legend recounts how in the 1st century AD Joseph of Arimathea, the rich man who buried Christ, brought the Holy Grail to Avalon. In obedience to a vision, he and his companions built a wattle chapel, the 'Old Church'; this was still standing in the early Middle Ages, dedicated to the Virgin and deeply venerated.

By the 5th century, Christian hermits were living on the spot and worshipping in the Old Church and St Patrick reorganized the little community and gave it a monastic rule. King Arthur, after receiving mortal wounds in his famous last battle, was reputedly buried in the Abbey graveyard.

When the Saxon conquerors took Glastonbury they were no longer heathens themselves: hence, this is the one place in Britain with Christian continuity stretching backward without a break to King Arthur, to the Romans, in fact to the apostolic age. It is a national shrine, with a spiritual character which has always set Britain apart from the rest of Christendom.

Philip Rahtz

Aerial view of Glastonbury, in legend and perhaps in reality the site of the oldest Christian foundation in Britain. To the Celts it was the enchanted Isle of Avalon, the home of the dead. It has been suggested that the corrugations round the Tor may be the remains of a ritual maze

Lake Isle of Avalon

The etymology of the place-names – 'Glastonbury' itself, 'Ynys-witrin,' and 'Avalon' – is confused. The 'glass' motif recalls the magical and otherworldly connotations of glass in Celtic myth, bot it is very probably a mistake. Ynys-witrin could mean 'island of glass,' but both this name and Glastonbury can be derived from Celtic words meaning 'woad'. A Celtic legendary figure named Glast has also been cited. It is sometimes claimed that Ynys-witrin is not the old British name at all, but a false translation of the Anglo-Saxon Glastonbury. Against this view there is the evidence of a charter – though a poorly authenticated one – that the area was already called Ynys-witrin in 601 AD, before the Saxon conquest of central Somerset and thus before the name Glastonbury came into use. The most that can be said safely is that both names go back to Celtic roots, although 'bury' is Anglo-Saxon.

As for Avalon, this is usually construed as the 'place of apples' like the Garden of Hesperides; the Irish Celts had a mythical Isle of the Blest which was so called. It suggests a hazy idea of pre-Christian Glastonbury as a pagan holy place in the midst of water and indeed most of the region used to be subject to flooding, with permanent lagoons. Massive drainage was carried out by the Abbey during the Middle Ages, but 17th century maps still show a fair-sized lake called Meare Pool. Somerset itself got its name, the 'Summer Land,' because it was a seasonal area. The dwellers on neighbouring high ground formerly drove their animals down to pasture when the summer sun made the meadows drier and more accessible. Geology indicates that before the drainage, and especially in the late Roman and Dark Age periods, Glastonbury Tor with its satellite hills must often have been nearly cut off.

In the light of Celtic mythical concepts, we can say that an island with a hill on it was well qualified to possess a special, sacred aura. The evidence that this one actually did is sketchy and conjectural. As no lake-village burials have ever been found, some archeologists have suggested that the burial site was on the island. The earthwork of Ponter's Ball, to the east, may be the boundary of a Celtic sanctuary containing Glastonbury Tor. A legend of the Welsh saint, Collen, preserves undatable folklore ideas about the Tor as an entrance to Annwn, the underworld, and as a home of Gwyn-ap-Nudd, lord of the fairy folk and leader of the Wild Hunt, in which the spirits of the dead were snatched away through the clouds. A chapel which the monks built on top of the Tor was dedicated to St Michael, vanquisher of the powers of evil.

Traces of inhabitants on the Abbey site in Roman times have been found but no indication of their religion. Recent excavations on the Tor revealed human settlement there also, notably around 500 AD, the Arthurian period. As for the monastery, it was certainly founded by British Christians, on the present site, before the Saxon conquest. Archeologically a date early in the 6th century appears likely. However, a study of the various 'Lives' of British saints of the Dark Ages discloses the interesting fact that while several of them – David, for instance – are said to have visited Glastonbury, there is no saint whose biography credits him with its actual foundation. The community is simply there, in some form, its origins unexplained and farther back still. Hence it remains arguable that the Old Church and a small group of hermits may have been present before the 6th century.

The West Saxons overran central Somerset in 658. Their Christian king, Cenwalh, maintained Glastonbury without a break. It became the first major institution in which Celt and Teuton co-existed and co-operated – the birthplace, in a sense, of the United Kingdom, and a point of convergence for different traditions, which were thus readily available in the medieval revival of Celtic legend. During the 10th century St Dunstan was abbot and under his enlightened and capable rule Glastonbury became the fountain head of the recovery of learning after the Danish wars. Its monks laid the foundations of medieval civilization in England,

'No other hands than those of the disciples of Christ erected the Church of Glastonbury'

and several of them later became archbishops of Canterbury. After a rich and magnificent career throughout the Middle Ages, the Abbey was one of the last to be dissolved, succumbing only in 1539; the Abbot, Richard Whiting, was then convicted of treason and hanged.

'Not Built by Art of Man'

Most of the legends of Glastonbury's Christian past seem to have grown round the Old Church. The British monks were unable to tell the Saxons any clear story of its foundation, which was already lost in antiquity. As a result, around the year 1000, the biographer of St Dunstan assures his readers that the Old Church was 'not built by art of man, but prepared by God himself.' This passage, coupled with one or two cryptic phrases elsewhere, may have inspired the notion that Christ himself came to Britain as a boy and lived at Glastonbury.

The first specific stories are in the work of William of Malmesbury, who carried out researches at Glastonbury Abbey between 1125 and 1130. By the standards of his time he was a good historian, unwilling to record what he judged to be mere legend. His book *On the Antiquity of the Church at Glastonbury* survives only in a later edition, heavily interpolated by a different hand, but much of his own text can be recovered from passages which he copied into another book. He says: 'There are documents of no small credit, which have been discovered in certain places to the following effect: "No other hands than those of the disciples of Christ erected the church of Glastonbury."'

Whatever William's informants told him about this 1st century advent, he names no names, and passes on rather hurriedly to a supposed restoration of the Old Church by two papal envoys toward the year 170. The interpolated edition, however, expands his brief remarks into an account of 12 missionaries coming to Britain in 63 led by Joseph of Arimathea. It stated that the British king, though unmoved by their preaching, granted them land on Ynyswitrin, where they settled as hermits and built the church.

This enlarged text of William's book was compiled at the Abbey about 1240. Hence the Joseph legend was established at Glastonbury by then – although the monks distrusted and omitted the Grail part of it. The problem of its origin turns on the question of what happened between William and his interpolator. Did this Arimathean story come in as literary fiction, or as monastic fraud, or as a genuine rediscovery of ancient tradition?

Some of the Grail romances narrow the search. Thus *Perlesvaus*, written about 1225, cites a Glastonbury Abbey source. Robert de Borron's unfinished *Joseph*, assigned to the 1190s, takes us a little farther back again. Here Joseph of Arimathea never reaches Britain himself, but his followers are commanded to take the Grail there, and seek out the 'Vales of Avalon'. That phrase, at that date, undoubtedly points to Somerset.

The Joseph legend was therefore current in some form toward the close of the 12th century. While there are good reasons for thinking that Robert de Borron took it from an earlier source, no one has traced it back any farther. The tale of Joseph's westward mission is connected somehow with the legend of the voyaging Maries, Mary, sister of the Virgin, Mary the mother of James and John and Mary Magdalene, who are said to have come to Provence, with the Arimathean saint in their company. An Anglo-Saxon Glastonbury missal shows that the Maries were venerated at the Abbey before the Norman Conquest. Unfortunately it does not name Joseph with them.

We are left, then, with suspicions that Joseph's mission was invented after William of Malmesbury. Too much has been made of William's failure to mention Joseph. He may have heard the story, but dismissed it, as he did dismiss various tales of Arthur which he heard but believed to be worthless fables. Or there may have been a Welsh legend of Joseph which was first publicized in England – as many others were – in the Arthurian vogue a few decades later, but was far earlier in its origins. The claim that the official version was a pure fabrication of 12th century romancers or monks raises the query: Why pick on Joseph of Arimathea? He was neither a likely apostle nor a particularly honourable one. There were ready-made legends that brought much more glorious Christians to Britain – St Paul, for instance. Yet neither monks nor romancers made use of them.

If we set aside the simple but overwishful theory that Joseph actually did come, we confront a number of proposed datings for the legend of Glastonbury's Christian beginnings, a number of guesses at the reason why Joseph was chosen as the hero. As the second point, most of the guesses postulate a misunderstanding (wilful or otherwise) of phrases in earlier texts, or of some inscription or ruin now vanished. Scholarly opinion favours an invention by Grail romancers, afterwards annexed by the Abbey. *Perlesvaus*, however, implies at least some degree of borrowing in the reverse direction and so perhaps does another romance, the *Grand Saint Graal*.

Whatever errors or falsehoods may have occurred, there is now a tendency to take the legend more seriously, not as literal truth but as an attempt to rationalize a cloudy historical tradition. Thus the late Professor Treharne, while totally ruling out Joseph himself, concluded that the legend might still reflect a fact – namely, that 'coming from the southwest, and along the south coast of the Bristol Channel, it was under Glastonbury Tor that Christianity found its first secure shelter and abiding-place in our remote land.'

The other stories of major Christian figures at Glastonbury are easier to explain and less interesting. Their growth was prompted by the monks' wish to increase the Abbey's prestige and attract pilgrims. Some of the Dark Age saints who are alleged to have come there – not only Patrick and David, but Bridget and others – may actually have come. What the monks manifestly did was to exaggerate their role.

Patrick was the most prominent, and the saint who received the most attention from document-fakers. It was claimed that after his long Irish ministry he returned to his native Britain, organized the hermits at Glastonbury into a more formal community, died among them and was buried. Before the 9th century his tomb being shown on the right of the altar in the Old Church, and a stream of Irish pilgrims prayed there. The fact that they accepted the tomb as genuine, despite the natural wish to have Patrick in their own country, suggests that its credentials were strong. The hypothesis of 'another man of the same name' is a dangerously easy way out, but in this case there is some early evidence to support it.

British Museum

Left King Arthur, from an early 14th century manuscript. In legend Arthur was taken to Avalon after being wounded in his last battle, and in 1190 the monks of Glastonbury announced the discovery of his grave
Facing page above Part of the Abbey ruins. Legends say that Joseph of Arimathea or his descendants, the keepers of the Grail, brought Christianity to Glastonbury. Archeological evidence suggests that there was a monastery there from at least the early 6th century
Below left The Holy Thorn, which blooms near Christmas time, may have been brought to the Abbey by a medieval pilgrim *Below right* The surrounding area is rich in Arthurian tradition: this stone near Slaughterbridge is known as 'King Arthur's stone', though the inscription does not name him

Legends of Arthur

The first known story that connects Arthur with Glastonbury is told by Caradoc of Llancarfan. About 1150 Caradoc wrote a Life of the 6th century British monk and historian Gildas. In this he says that Gildas lived for a time with the Glastonbury community. Meanwhile Arthur (portrayed by Caradoc as a somewhat dubious upstart) was trying to extend his power over Britain. Somerset was independent under its king Melwas, who had a stronghold close to the monastery. He carried off Arthur's wife 'Guennuvar' and kept her there. Arthur arrived with troops from Devon and Cornwall, but the marshes hindered his advance. Gildas and the Abbot mediated and, meeting under the sacred roof of the Old Church, the kings agreed on a pact and the lady was restored.

In the Round Table romances the story reappears, but the geography beeomes vaguer and the characters change. Melwas turns into 'Meleagant' and Lancelot takes Arthur's place as the rescuer. The abduction of the Queen looks like a Celtic fairy tale motif. However, the recent discovery of what may be interpreted as a Dark Age citadel on the Tor suggests that Melwas may have been a real local king, in which case a war and treaty involving Arthur become more plausible.

The better-known story of Arthur's grave is confused by the doubts over the name Avalon and its application to Glastonbury. The island of Avalon, the otherworldly apple orchard, may have been originally the island of Avallach, an unlocalized hero of Celtic legend. Geoffrey of Monmouth's *History of the Kings of Britain*, composed between 1135 and 1140, says that Arthur's sword was forged in the Isle of Avalon, and that he was taken there after his last battle for his wounds to be healed. However, Geoffrey's Avalon is no definite place, and in a later work he makes it a sort of Isle of the Blest in the Atlantic. Here again it is Arthur's last earthly destination.

Glastonbury may have been a pagan centre and a supposed gateway to Annwn, the realm of shades and fairy folk – which indeed is sometimes equated with Avalon in Welsh folklore. Its pagan aura may even account for the monastery, if the founders' motive was exorcism and purification. But all this is conjecture. If Arthur was buried there, the reason was simply that the monks' graveyard, with its relics of saints, was an honourable burial place. His alleged exhumation in 1190 pinned down the name Avalon on the map without proving much about it.

Several medieval authors describe the event and the account by Giraldus Cambrensis is valuable because he was a sceptic about King Arthur when most people were credulous. Ostensibly, the secret of Arthur's burial was betrayed to Henry II by a Welsh bard. The grave was between two 'pyramids' or memorial pillars in the cemetery of Glastonbury Abbey. King Henry had strong motives for discovering the remains on an 'English site: it would reinforce his own title to the Arthurian succession and also, by proving that Arthur was dead, it would undermine the Celtic hope of his Messianic return, a hope which was a political irritant in several parts of the Plantagenet domains. Henry indicated the direction of his thoughts to the abbot. For some years no action was taken. In 1184 most of the Abbey, including the Old Church, was burnt down, and in the course of rebuilding the monks who were digging at the site struck a stone slab and a lead cross, inscribed HIC IACET SEPULTUS INCLITUS REX ARTURIUS IN INSULA AVALONIA (here lies buried the renowned King Arthur in the Isle of Avalon) together with a coffin made out of a hollowed-out oak log containing the bones of a tall man with a damaged skull, and – according to some versions – some smaller bones, taken to be those of Guinevere.

These relics were placed in a casket and suitably enshrined. Edward I re-interred the casket before the high altar, but the contents were dispersed at the Abbey's dissolution.

The 12th century monks, like Henry himself, had powerful inducements to find what they were looking for, since Arthur's fame could help them in raising funds to rebuild their Abbey. Yet the theory of a total fraud is unsatisfactory. Despite the blow to Welsh hopes and pride, no Welshman seems to have challenged the find, or produced a rival Avalon. It is thus likely that the bardic tradition about the Glastonbury grave was at least an old and respected one, too firmly rooted to dismiss, once the secret was out.

The area was re-excavated by C. A. Ralegh Radford in 1962 and '63. He ascertained that the monks had indeed dug where they said. There were traces, not only of their spade-work and filling-in, but of the two memorial pillars, and the stone lining of an important grave at a great depth. By considering the stratification of the cemetery, the nature of Dark Age gravemarkers, and the style of lettering in old drawings of the leaden cross, which was preserved until the 18th century, Radford was able to reconstruct the history of the grave in a way which amounted to a case for its genuineness, though not conclusively.

Archeological findings at Cadbury Castle (see CAMELOT) have increased the likelihood of a link of some sort between Arthur and Glastonbury. The two places are ouly a dozen miles apart, and in sight of each other. But there are no certainties.

The Flowering Thorn

In the words of the Victorian historian E. A. Freeman, 'We need not believe that the Glastonbury legends are records of facts; but the existence of those legends is a very great fact.' The proofs of imaginative falsification, monastic and post-monastic, are beyond dispute, yet they are powerless to destroy the spell. This is partly due to Glastonbury's real age, genuine importance, and visual fascination, but partly to subtler causes arising from the nature of myth in general, and the peculiar concentration of themes which has occurred here.

The spell has gone on adding to the

Peter Cheze-Brown

Peter Cheze-Brown

Society of Antiquaries

Seal of the Abbey, 14th century, showing the Holy Thorn. The story that it grew from Joseph of Arimathea's staff, planted in the ground, has not been traced back before 1716

mythology. Thus, the famous Holy Thorn is a fairly late comer. On the eve of the Abbey's dissolution we find a few allusions to a thorn tree on Wearyall Hill which bloomed at Christmas. It was cut down by Puritans, but some of its descendants are still flourishing in the neighbourhood, and elsewhere. The tale that Joseph of Arimathea planted the staff in the ground, and that it came to life and grew, appears first in 1716. Owing to the change-over to the Gregorian calendar in 1752, the Thorn now blossoms in January. It does in fact resemble Syrian types of thorn; the parent plant might have been brought over by some medieval pilgrim.

Another focus of religious and antiquarian speculation is Chalice Well, in the valley between the Tor and the smaller hill beside it. This has been connected with Joseph and the Grail, and it plays a major part in John Cowper Powys's novel *A Glastonbury Romance*. However, there is no sign that any special notice was taken of it before the 18th century. Today it is preserved in a garden by the Chalice Well Trust, a society which has sponsored much of the archeological work of the 1960s.

Finally, mention must be made of two theories promoted in recent years. One of these asserts that Glastonbury is the centre of a huge zodiac. Ancient astrological symbols are said to be marked out over the surrounding district, and to be discernible from the air. The second theory is that a number of horizontal corrugations which run round the Tor are the remains of an early ritual maze. Both these ideas relate to the pagan past, to the presumed Avalonian aspect and insofar as any archeologists are disposed to accept either, they tend to prefer the maze theory.

Glossolalia

Technical term (from the Greek words for 'tongue' and 'talking') for speaking in tongues, the ability to speak in unknown and mysterious languages in a state of intense religious excitement: the speaker is believed to be the vehicle of, or in touch with, a supernatural power: Acts, chapter 2, describes the experience of the apostles when 'filled with the Holy Spirit': there has been a recent revival of glossolalia among some Protestant groups.

See SPEAKING IN TONGUES.

Gnomes

Name invented by Paracelsus for the elementals of the earth, dwarfish spirits which live underground and guard buried treasures: Paracelsus said that they move through the earth as easily as we move through the air.

See ELEMENTS; FAIRIES.

Now regarded as a religion in its own right, rather than as eccentric Greek philosophy or Christian heresy, Gnosticism was the religion of those who were convinced of the presence of a divine ingredient within themselves, the 'divine self'; this realization was the essential gnosis, the knowledge which brought salvation

GNOSTICISM

SOME EARLY CHRISTIAN WRITERS, including Irenaeus, Hippolytus and Epiphanius, tell us that there existed in their time certain sectarians or heretics who called themselves Gnostics ('those who know') because they claimed to possess *gnosis*, 'knowledge'. In modern times the label has been applied to a whole set of Christian heretics, from the early centuries AD onwards, who had some characteristics in common and of whom Valentinus in the 2nd century was the most important.

The fragments of Gnostic teachings transmitted to us by their early Christian opponents have been thoroughly studied, especially by German scholars. The gnosis that the Gnostics claimed was not scientific or philosophical knowledge, acquired by the use of reason, but knowledge acquired through a revelation given by the grace of God, a 'knowledge of the heart' as one Gnostic writing (the Gospel of Truth) calls it. It consisted of intuitive knowledge and esoteric lore, which was believed to carry with it the salvation of its possessor.

An Absurd Universe

It has also been established that Gnosticism was not specifically Christian. It has its counterparts in pagan Hellenism (in the collection of Greek-Egyptian occult writings called the *Corpus Hermeticum* – see HERMETICA) and even in Judaism. Professor Gershom Scholem has discovered a Jewish form of esoteric and ecstatic mysticism which he calls 'Jewish Gnosticism', though it lacks one of the beliefs generally characteristic of Gnostics: the distinction between the unknown supreme God and the demiurge, the lower spiritual power that created the world.

These findings led some scholars to consider Gnosticism as a religion of its own with its own characteristic features, by contrast with earlier views of it as a system of Greek religious philosophy, or as a Christian heresy, or as the descendant of Babylonian, Persian and Indian concepts. According to Hans Jonas (*Gnosis und Spätantiker Geist*, 1933) Gnosticism was neither Greek and philosophical nor a survival of oriental ideas but a new and revolutionary movement, rebelling against the structures of this world, which the Greeks venerated as a harmony and the Jews believed to have been created by God. Gnosis was an awareness of being a stranger in the world, of having been thrown into an absurd universe. The systems of the Gnostics should be read as an expression of such basic experiences as fear, anxiety, disgust and despair.

This picture is correct but one-sided. In my *Gnosis als Weltreligion* (1951) I suggested that Gnosticism expressed a specific religious experience, which was frequently turned into a myth. An example is the story that when Mani, the founder of the Manichean religion, was 12 years old God sent an angel to him, to inspire him. When he was 24, the angel came to him again and said, 'The time has now come to make your public appearance and to proclaim your own doctrine.' The name of the angel means 'twin' and he is the twin-brother or 'divine self' of Mani.

This Manichean myth expresses the encounter between the I, the ego, and the divine self. In the system of Valentinus we find the similar concept of the guardian angel, who accompanies a man throughout his life, who reveals the gnosis to him, forms a couple with him and is not allowed to enter eternal bliss without him. This encounter of the I and the Self, their distinction and yet their fundamental unity, was certainly a tenet of Valentinian Gnosticism and seems to reflect a personal experience. The Gospel of Truth, for instance, possibly written by Valentinus himself and certainly originating from his school, offers no explicit system but impressively describes the Gnostic's experiences, the nightmare of his life in this world, and his discovery of the self when he hears the call from above.

It seems clear that at least some of the major Gnostic systems were inspired by vivid emotions and personal experiences. And it is now generally accepted that Gnosticism was not a philosophy, or even a Christian heresy, but a religion with its own specific views about God, the world and man. God is the suffering God, the world is an error, man is a stranger whose inward self is of the same substance as God.

God and Demiurge

The discovery in the 1940s of Gnostic texts written in Coptic, at Nag Hammadi in Egypt has greatly enlarged our knowledge of Gnostic beliefs. These manuscripts also threw new light on the origins of Gnosticism. They show that Gnosticism had its roots, or some of its roots, in Judaism.

This new solution of an old problem was stubbornly opposed as long as Judaism was identified with the Pharisees and was regarded as a monolithic, monotheistic religion. After all, the early Gnostics rejected the Jewish god who created the world, relegating him to the position of demiurge, and rejecting the Old Testament. But at the beginning of our era Judaism embraced various different groups.

There were the adherents of Wisdom, of which the book of Proverbs speaks. According to their literature, Wisdom was a companion of God. She created the world, became the paramour of the wise man and, according to certain versions, left the earth and returned to her heavenly abode. It is in this perspective that we must see the doctrine of Simon Magus of Samaria, according to which the Idea of God, called Wisdom or Helen, springing forth from God and knowing his will, descended to the lower regions and brought forth the angels and powers (the rulers of the heavens) by whom this world was made. This is a gnostic development of the Samaritan and Jewish concepts that Wisdom was instrumental in creating the world.

There were also the Essenes (see DEAD SEA SCROLLS), who taught a dualism of light and darkness, and stressed the importance of knowledge of God. Much remains uncertain here, because the relationships between the Essenes, John the Baptist and Gnosticism are obscure.

The Fathers of the Church considered the Samaritans Dositheus, Simon Magus and Menander to be the first Gnostics. The books of the Samaritans, who were heterodox Jews, reveal a mythological imagery which could easily lead to Gnosticism, and it is

probable that Gnosticism did begin in Samaria, that is, on Palestinian soil.

It would be unwise to be too specific, however. In many cases we can find in Gnosticism certain elements derived from Judaism without being able to identify the exact channels through which these concepts were transmitted.

But how could the Gnostics, who distinguished between the high unknown God and an inferior creator, the Jewish god or demiurge, to whom they were violently hostile, be Jews or in sympathy with Jews? Some find here traces of antisemitism, which was by no means absent in Antioch and Alexandria, centres of early Gnosticism. Others point out that the Gnostics usually regarded the demiurge as an angel, and that there was a sect among the Jews who held a similar opinion. This was the pre-Christian sect of Magharians, who distinguished between God and an angel who is the creator of the world and is responsible for all the anthropomorphic descriptions of God in the Old Testament.

So it would seem that the Gnostic concept of the world-creator as an inferior angel was derived from Jewish sources, though from rebellious and heterodox ones. This is important for Gnostic origins in general. Some scholars distinguish between absolute dualism and relative dualism. The first is called 'Iranian', implying that it must be of Iranian origin, because Iranian religion is an absolute dualism of light and darkness, good and evil (see AHRIMAN). But the concept of the demiurge as an angel reflects a relative dualism, which seems to be the original concept. Absolute dualism is Gnosticism in a secondary and later development.

The Divine Spark

The Gnosticism of the 2nd century sects involved a coherent series of characteristics that can be summarized in the idea of a divine spark in man, deriving from the divine realm, fallen into this world of fate, birth and death, and needing to be awakened by the divine counterpart of the self in order to be finally reintegrated. This idea is based on the concept of a downward movement of the divine whose periphery (often called Sophia or Ennoia) had to submit to the fate of entering into a crisis and producing – even if only indirectly – this world, upon which it cannot turn its back, since it is necessary for it to recover the *pneuma* (literally 'breath', the fallen divine element).

Valentinus expressed these ideas in a myth which is not transmitted by any author of antiquity but which can be reconstructed. His followers split into an Occidental school led by Ptolomaeus and Heracleon who introduced some innovations and alterations, and an Oriental school which remained more faithful to its master. So the myth of Valentinus can be hypothetically reconstructed in the following way (and it may be added that the recently discovered Valentinian treatises of the Jung Codex have confirmed this hypothesis).

In invisible and ineffable heights Depth was pre-existent. With him was Silence. Together they generate the Pleroma (fullness of the spiritual world), consisting of 30 aeons (patterns of thought or archetypes). The very youngest of these, Wisdom (Sophia), led astray by pretended love, which was actually *hubris* (overweening pride), desired to understand the unfathomable depth of God and is expelled from the Pleroma. (The underlying idea is that philosophical reason cannot penetrate the mysteries of God and is the origin of the fall.)

In the empty space devoid of knowledge which she had created by her trespass, Sophia brought forth Jesus in remembrance of the higher world, but with a kind of shadow. And he purged the shadow of deficiency from himself and returned to the spiritual universe above. Left outside, alone, Sophia was subject to every sort of passion, sorrow, fear, despair, ignorance. (From these passions the elements of the world together with the world-soul and the demiurge were to be derived.)

At her request, Jesus asked the aeons to help Sophia. After the Holy Spirit had revealed the gnosis of God to them, the aeons together formed the Saviour, Christ, who is the perfect expression of the spiritual world. He was sent with his angels to Sophia, the world-spirit in exile, and delivered her from her passions, which became the world.

There are three layers of reality in this universe: the sublunar, material world, dominated by the Devil; the celestial, psychic world, dominated by the demiurge or Yahweh, who tends to be hostile; and the world above the planets, where Sophia and the spiritual beings are. Correspondingly, in man there is a material part, the body; a soul, the seat of ethical awareness and the power of reason; and a spirit, which dreams unconsciously in man and is the divine spark, of the same substance as Sophia and even God.

Not all men are spiritual. Some are materialistic, the pagans. Others, called 'psychics', have a soul and believe in the demiurge but have no awareness of the spiritual world above: these are the Jews and the ordinary Christian churchgoers. So history is a progress from materialism and paganism, by way of religion and ethics,

Left and facing page **Gnosticism was a religion but some of its ideas lent themselves readily to magic. The gnostic conviction that the world was made and is ruled by evil powers stimulated the use of amulets to ward off harm. Examples of the so-called 'Gnostic gems'**

The True Self

The very word *gnosis* shows that the Gnostic *knows*. He does not know because he has gradually learned; he knows because revelation has been given him. He does not believe, for faith is inferior to gnosis. And his gnosis, 'the knowledge of the ineffable greatness', is itself perfect redemption. Two famous definitions come from the Valentinians. The first explains that 'gnosis is redemption of the inner spiritual man', not of the body or the soul. The second tells what the questions are to which gnosis provides answers. Gnostics know 'who we were and what we have become; where we were or where we had been made to fall; whither we are hastening, whence we are being redeemed; what birth is and what rebirth is' . . . Gnostics know that they were originally spiritual beings who have come to live in souls and bodies; they once dwelt in the spiritual world above but have been made to fall into this world of sense and sin. Now, thanks to their self-knowledge, they are hastening back above, having been redeemed from this world below . . . The Gnostic is a Gnostic because he knows, by revelation, who his true self is. Other religions are in varying measure God-centred. The Gnostic is self-centred. He is concerned with mythological details about the origin of the universe and of mankind, but only because they express and illuminate his understanding of himself.

R. M. Grant *Gnosticism and Early Christianity*

to spiritual freedom and gnosis. All this is a necessary process. The world-spirit in exile must go through the Inferno of matter and the Purgatory of morals to arrive at the spiritual Paradise. The spirit in man is united with the soul so that it may be formed and educated in practical life, for it needs psychic and sense training.

Gnosticism and Christianity

In this system it is Christ who brings the decisive revelation of gnosis. He assumed or 'put on' Jesus at baptism, and thereby the whole of spiritual mankind, and saved it through the Resurrection. Since Christ, man can become aware of his spiritual self and can return to his origin above. When every spiritual being has received gnosis and has become aware of his divine being, the final consummation of the world-process will take place. Christ and Sophia, who have been waiting for the spiritual man at the entrance of the Pleroma, enter the bridal chamber to achieve their union. They are followed by the Gnostics and their guardian angels as higher Selves, who are bride and bridegroom also. In the Pleroma they perform 'the spiritual and eternal mystery of sacred marriage', which is the complete union of the I and the Self.

This doctrine of Valentinus should be compared with the Apocryphon of John, of which three copies were found at Nag Hammadi. In antiquity Irenaeus said that the doctrine of Valentinus was based on an earlier and more primitive system. This could be a system like that of the Apocryphon of John. There too we find an impressive description of the unknown God and his female counterpart, who together bring forth a spiritual world of aeons. The last of these, Sophia, falls through lust, brings forth a hostile demiurge and brings about the world-process, in which the spirit fights against evil and is delivered through gnosis. But in this system Christ has no part as Saviour. It would seem that this system (dating from c 100 AD) is non-Christian in origin.

The Christian influence on Valentinus now becomes clear. According to him, it is Christ who brings gnosis, or 'self-consciousness', to mankind. The philosophy of history which saw the delivery through Christ as the surpassing of paganism and Judaism, and as the central event in the evolution of the universe, appears as a new idea. Valentinus has hellenized and Christianized an existing gnostic myth which was essentially non-Christian.

His followers of the Occidental school went further. Valentinus taught that God was two, Depth and Silence: an adherent of the Occidental school, quoted by Irenaeus, declared that God is one. Valentinus described the demiurge as generally hostile: according to the Occidental school, the demiurge, though ignorant, was friendly and helpful. Valentinus thought that Christ had only a spiritual body. Ptolemaeus said that Christ also had a soul and a psychic body. This implied that not only the spiritual men but also the psychic men, if they behaved well, could be saved and would live eternally in the spiritual world at the entrance of the Pleroma.

These clumsy innovations, which made the Valentinian position so confused and bewildering, reveal the desire to compromise with the Church, which taught that God was one, that Christ was a real man, that the simple true believer would inherit eternal life. But these concessions could not disguise the fact that Gnosticism was a different religion from Christianity. Even if the demiurge is friendly, he is not the creator of heaven and earth who is the Father of Christ in Christianity. Even if Christ has a psychic body as well as a spiritual body, he is not a real man. Even if the ordinary churchgoer as well as the Gnostic could become spiritually immortal, this is far from the doctrine of the Church, which taught a bodily resurrection and a final ending of the material universe.

Free Fall

The Gnostic doctrine of the inferior demiurge, and their denial of the real body of Christ and of bodily resurrection, remained the principal targets of Christian authors like Irenaeus and Origen in the 2nd and 3rd centuries. But though Origen opposed Gnosticism, he accepted many Valentinian ideas and in a way continued the Christianizing process which Valentinus had begun and which had been carried further by Heracleon.

It seems probable that the Tractatus Tripartitus, one of the treatises of the Jung

British Museum

Codex, is due to Heracleon. In it we find several doctrines which come very near to the concepts of Origen. For example, the Tractatus Tripartitus stresses the freedom of the will, which is responsible for the fall of Sophia. Sophia fell through her free will. This is completely different from the original concept of Valentinus, in which the fall of Sophia is the outcome of a crisis in the Pleroma. This 'passion' first arose among the higher aeons and passed as if by contagion to Sophia, like an illness that starts in certain parts of the body and comes to an outbreak in others. The fall is the outcome of a necessary process within God, not the consequence of the free will of a spiritual being, as in the Tractatus Tripartitus.

According to Origen, the fall is due to the free decision of the spirits who lived in the spiritual world before our world was created. This emphasis on freedom is the main contention of his system, for he uses the belief in free will to attack the Gnostic view that only a few men, the spiritual men, will be saved. But the Tractatus Tripartitus shows that at least one Valentinian Gnostic had given a lead to Origen. In this perspective the theological system of Origen is the end of the process of the Christianization of Gnosticism.

It is more difficult to measure the influence of the Gnostics on the philosopher Plotinus (see PLOTINUS). He was a friend of Gnostics (Valentinians, as it transpires) and tolerated them for years in his school before he wrote a famous treatise against them. His system has much in common with Valentinus and Heracleon, and so Gnosticism served as a fertilizer of the two main streams of thought which were to dominate the future of the West, Christian theology and Neoplatonist philosophy.

Gnosticism did not disappear. Gnostic schools persisted in the Roman Empire for many centuries but they were no longer a deadly threat to the Christian Church and they do not have the historical importance of the schools of the 2nd century. Outside the Roman Empire, Gnosticism deeply influenced Mani and it was in the religion which he founded that Gnosticism became a world religion. Obscure eastern sects which were probably influenced by Gnosticism in turn influenced the medieval Bogomils and Cathars. The theosophical movement of this century has much in common with Gnosticism and rightly lists the Gnostics among its spiritual ancestors.

GOAT

THE GOAT is sometimes a symbol of agility and sometimes of an obstinate insistence on having one's own way (and so its Latin name is enshrined in the word 'caprice'). In popular traditional astrology those born under Capricorn are assigned the goatish characteristics of leaping over difficulties and butting away obstacles. But the goat is far better known for its proverbial lechery, its stench and its link with the Devil, all of which are connected in the reports of the witch trials in Europe.

Among the earliest surviving accounts are those of Anne-Marie de Georgel and Catherine Delort, accused at Toulouse in 1335 of copulating with the Devil in the shape of a goat (see FRENCH WITCHCRAFT). An attack on the witches of Arras in 1460 says that the Devil appeared to them as a goat, a dog or a monkey, but never in human form. They made offerings to him and worshipped him. 'Then with candles in their hands they kiss the hind parts of the goat that is the Devil . . .'

That the Devil never appeared in human form was contradicted all over Europe but that he was frequently an animal, especially a goat, was confirmed in many confessions extorted from suspects (though not in England and Scotland, where there is no trace of the Devil as a goat). A character in Martin le Franc's *Champion des Dames*, of the mid-15th century, says that at 'the obscene synagogue' the witches gazed upon the Devil in the form of a cat or a he-goat.

Some of the descriptions suggest a man dressed up as an animal. At Poitiers in 1574 the Devil was 'a great black goat who talked like a man'. At Avignon he was a man until the time came for him to mount a rock to be worshipped, when he turned into a goat, described in the sentence pronounced in 1582 as filthy, stinking and black.

Witches were sometimes accused of

Right **Witches were widely reputed to worship the Devil in the form of a goat: *Scène de Sorcellerie* by Goya**

Giraudon

riding to their sabbaths on demonic goats. The Italian witch judge Paulus Grillandus said that in 1525 a suspect told him that she went to witch meetings riding on a he-goat which would be waiting for her at her door when she wanted to set off.

Pan and Satyrs

To judge from some of the confessions and the pictures which artists based on them, the Devil often looked not unlike the Greek god Pan, who had a human body with the horns, ears, loins, legs and hooves of a goat. He was an amorous god and his function was to make flocks fertile. At an annual festival in February in Rome, the Lupercalia, goats and a dog were sacrificed to Faunus, who was identified by classical writers as Pan. Two young men, naked except for girdles made of the skins of the sacrificed animals, ran round the boundary of the old city of Rome on the Palatine hill. They struck at anyone they met with strips of goatskin. They themselves were popularly called 'he-goats' and a woman struck by them was supposed to be delivered from barrenness.

The name of the festival suggests warding off wolves or propitiating a wolf god. It is thought that the ceremony was a rustic ritual mingling purification and fertility magic with the beating of the bounds.

Some writers have assumed a connection between the Devil of the witches and Pan or the satyrs, the lustful goatish creatures who revelled in the train of Dionysus. Dionysus himself, also a god of fertility in some of his aspects, was sometimes connected with the goat (though more often with the bull). At the village of Eleutherai outside Athens he was called Melanaigis, 'he of the black goatskin', and the 'goat-song' in his honour eventually developed into the Greek tragedy (see DRAMA).

A Goat for Azazel

It is unlikely that the witch religion was a survival of the worship of Pan, Dionysus or any particular pagan deity, but the figure of the lustful man-goat may have influenced the linking of the goat with the lord of witches, who were renowned for their transports of animal lechery.

Another possible source of the goat's link with the Devil can be found in both classical

The Devil Rides Out

and Jewish traditions, and is again connected with one of the features of witchcraft which most obsessed the persecutors – the orgy in which the worshippers copulated with their master and sometimes with his subordinate demons. There were plenty of classical myths in which human beings had intercourse with gods – who to Christians were devils – and the belief that the powers of darkness desired the love of women also occurred in Jewish lore, especially in the legend of the Watchers, the fallen angels who sinned through their lust for the daughters of men (see DEVIL).

The leader of the Watchers (according to 1 *Enoch*, a Jewish apocryphal book) was Azazel, who was associated with Mars, the planet of war, and who, after his descent to earth, taught men evil by showing them how to make weapons of bloodshed. This same Azazel was connected with the Jewish scapegoat ritual. Down to 70 AD, a goat was selected each year 'for Azazel'. It was formally loaded with the sins of the people and sent away into the wilderness 'to Azazel' (Leviticus, chapter 16). The ritual was not forgotten and in the 13th century Rabbi Moses ben Nahmen explained that:

> God has commanded us, however, to send a goat on Yom Kippur to the ruler whose realm is in the places of desolation. From the emanation of his power come destruction and ruin; he ascends to the stars of the sword, of blood, of wars, quarrels, wounds, blows, disintegration and destruction. He is associated with the planet Mars. His portion among the peoples is Esau, a people who live by the sword; and his portion among the animals is the goat. The demons are part of his realm and are called in the Bible *seirim* (he-goats); he and his people are named Seir.

The scapegoat ritual tended to connect the goat with evil and, through the link with Azazel, with the fallen angels and the Devil. This association was hammered home by St Matthew's gospel (chapter 25) in which Jesus likens the righteous to sheep and the wicked to goats, and says that the goats will be condemned to 'the eternal fire prepared for the devil and his angels'.

The seirim or goat-demons assigned to Azazel by Rabbi Moses ben Nahmen are mentioned several times in the Old Testament. Azazel and the Watchers lusted for mortal women and it seems that the seirim may have done so too, for Leviticus 17.7 says, 'So they shall no more slay their sacrifices for satyrs *(seirim)*, after whom they play the harlot' (and, 'neither shall any woman give herself to a beast to lie with it' – 18.23). The translation 'satyrs' itself indicates the mingling in western Europe of classical and Jewish traditions about goatish beings which desire women.

The link between the scapegoat, Azazel, the Watchers or fallen angels, and the lecherous goat-demons may have influenced the medieval belief that witches adored the Devil by copulating with him in the form of a goat. The belief was probably strengthened by the passage in Exodus (chapter 22) which was so frequently cited as a justification for witch-hunting: 'Thou shalt not suffer a witch to live', followed immediately by, 'Whosoever lieth with a beast shall surely be put to death. He that sacrificeth unto any god save the Lord only, he shall be utterly destroyed' (Authorized Version).

The copulation of women with a divine goat is reported in antiquity from Egypt. In the 5th century BC, Herodotus (book 2) says that the people of Mendes in the Nile Delta venerate all goats, especially male ones. 'One of them is held in particular reverence, and when he dies the whole province goes into mourning . . . In this province not long ago a goat tupped a woman, in full view of everybody – a most surprising incident.'

Herodotus identified the divine he-goat as Pan. Much later, Plutarch (died c 120 AD) says that the most beautiful women were selected to lie with the divine goat of Mendes. Much later still, it turns up as Eliphas Levi's Goat of Mendes or Baphomet of Mendes (see BAPHOMET), which he believed to have been the Devil of the witches' sabbath.
(See also SABBATH; SCAPEGOAT.)

Devil with the head of a goat *(left)* from a recent film of Dennis Wheatley's novel *The Devil Rides Out*. Many of the witches' descriptions of the Devil suggest a man disguised as an animal: exhibit in the Witches' House Museum, Boscastle *(below left)*. A comparison is sometimes drawn between the goat-Devil of the witches and the lustful goatish creatures associated with the cult of Dionysus, the Greek god of wine and revelry: terracotta statuette of Dionysus on a goat *(below right)*

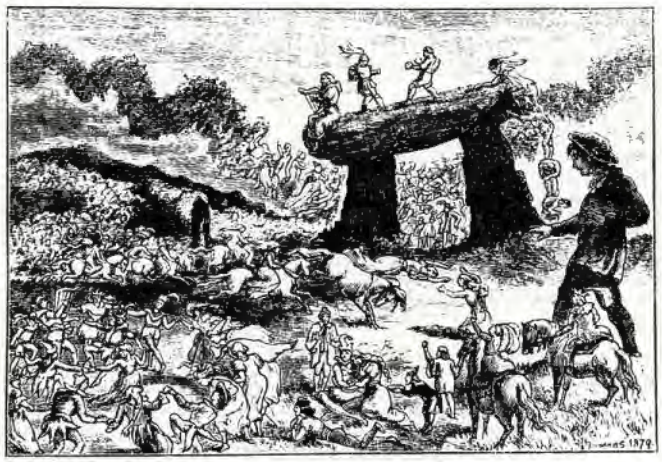
Goblins

Or hobgoblins, mischievous, and sometimes dangerous fairies or imps: descriptions of their behaviour in a house, rapping on walls, breaking crockery, clattering pots and pans, whisking bedclothes off sleepers, frequently resemble accounts of poltergeist phenomena: a way of getting rid of one is to sprinkle flax seed on the floor.
See FAIRIES.



GODIVA

ORIGINALLY KNOWN AS GODGIFU, Godiva was the wife of Earl Leofric of Mercia, one of the four powerful earls who ruled England under King Canute in the 11th century; Godiva herself owned extensive lands in six Midland counties. The most valuable of these estates was Coventry, consisting of more than 60 farms, and both she and her husband were buried in the Abbey there which they founded to replace an earlier religious house destroyed by the Danes. Godiva was warmly praised by ecclesiastical writers for her piety, wisdom and generous gifts to the Church, and is remembered with affection as the founder and benefactor of Coventry. The date of her death has recently been established as 10 September 1067.

Her fame rests chiefly on the story of her ride, naked, through the town in order to persuade her husband to free Coventry from a burdensome tax. The earliest versions of this are in two Latin Chronicles by monks of St Albans Abbey, one of the late 12th century by Roger of Wendover and the other of the early 13th by Matthew Paris. These tell how Leofric, angered by his wife's continual entreaties on the people's behalf, declared he would only do as she wished if she rode naked from one side of the marketplace to the other when all the people were assembled there. On a certain day she carried out this condition, covered only by her long fair hair, and returned rejoicing to her husband, who regarded it as a miracle that she was seen by none. He granted a charter to free Coventry as he had promised.

There are two brief references to this Godiva story from the 15th century, one in a window in Holy Trinity church (now lost), and the other in a rhyme pinned to the church door by rebels protesting against excessive taxes in 1495. A local version of the story from the 16th century by Richard Grafton, a printer and Member of Parliament for Coventry, explains the apparent miracle by the fact that Godiva first called on the leading men of Coventry to keep all the people off the streets with doors and windows shut as she rode past, and that because of the love and gratitude they felt for her they did as she asked.

Godiva as Lady of Coventry would herself be responsible for taxes, but the Earl of Mercia had the duty of collecting the much hated *heregeld*, a tax which in Canute's time paid for the king's Danish bodyguard. It was repealed in 1051, and before this the Earls could occasionally grant remission of it, so that there is nothing inherently improbable in this part of the tale. The incident of Peeping Tom, telling how a foolish man tried to see Godiva and was struck blind for his temerity, is not found before the late 17th century, and does not occur in the popular ballad on the ride of 1650. The claims of Robert Graves, Lewis Spence and others that the story preserves the memory of a pagan rite, where a naked woman representing a goddess appeared to the people, depend largely on the blinding of Peeping Tom, since this falls into line with various tales of the human who trespasses on the secrets of the supernatural world and is punished accordingly. These claims do not seem to be justified, either from the literary evidence or from what is known of the pre-Christian religion of north-western Europe in early times.

First Played by a Boy

There is little doubt, however, that the story of Godiva has been influenced by various types of folktale, such as those of the husband who imposes an ordeal on his wife when she wants to help the poor, the cunning maid who solves the riddle by fulfilling apparently impossible conditions, and the noble heroine miraculously saved from public shame. Christian folklore may have some influence also, and memories of the figure of Eve, who appeared at the Corpus Christi festival associated with the Coventry Miracle Plays before the Reformation, may have resulted in the demand for the introduction of Godiva into the later pageants.

The annual fair and procession at Coventry was revived after the Restoration, and Godiva first appeared represented by a boy in 1678. After this her part was played by a woman, usually a minor actress or dancer from outside Coventry, and her appearances caused much speculation and controversy beforehand and never failed to draw large crowds. Peeping Tom also appeared in the procession, and at one time was played by a man in a little house on a wagon, popping his head out with comic gestures to amuse the people. There is evidence also for the wooden figure still to be seen in the Leofric Hotel in Coventry being carried in the procession, decked out in a wig and cocked hat and regularly painted for the occasion. It is a wooden figure over six feet high, in armour of early Tudor times, and is probably the figure seen by a visitor to Coventry in 1679, who was told that a statue which he saw there represented the man struck blind for trying to see Godiva. This sounds like a local joke, perhaps based on the anguished expression and blank eyes of the wooden figure. The Coventry Peeping Tom was so popular that several copies of him still survive.

Godiva last appeared in the pageant of 1692, and in 1967, on the anniversary of her death, there was a service in the Cathedral and various ceremonies to mark the occasion. Study of the evidence suggests that the story of her ride is a genuine local tradition going back to Anglo-Saxon times, based on some historical incident which has developed under the influence of folktales, and been kept alive by the regular processions at the Coventry Fair. It may be that Godiva performed some act of penance on her husband's behalf and appeared bereft of the usual marks of rank as a sign of humility and penitence. It is known that Leofric was hostile towards the Church in early life, but later reconciled with it under the influence of his wife and their confessor, the Prior of Worcester. Such an act may have been exaggerated into an account of her riding naked, and become popularly associated with her efforts to free them from a grievous tax. It is difficult now to establish the exact nature of her service to her people, but the traditional story of her deed, of great interest to folklorists as well as to historians, has also proved an inspiration to poets, novelists, playwrights, painters and sculptors, who have treated it sometimes romantically and sometimes satirically.

At the age of 81 Goethe said that he had at last discovered the only sect to which he could wish to belong: the Hypsisterions of the 4th century who revered the best in all religions

GOETHE

FEW POETS can have had more practical repercussions than Johann Wolfgang von Goethe (1749–1832), not just in the sense of effects upon the private or public conduct of individuals (the testimony of Albert Schweitzer is but one among many) but also in the sense of organizations or institutions inspired by his thought. One has only to recall the foundation of a world-wide Anthroposophical Society by Rudolf Steiner (distinguished mathematician and editor of Goethe's writings on natural science – see STEINER), or of the Institute of Botany in the University of Mainz directed by Wilhelm Troll on Goethean principles, or of the many acknowledgements to Goethe by adherents of Gestalt psychology. No wonder T. S. Eliot could incline to the view that Goethe was more of a thinker than a poet!

Which was more responsible for his influence is still a matter of debate. There are those who argue that but for his prestige as a poet no one today would be interested in his thought. Others treat the whole canon of his work, poetry no less than prose, as a kind of lay Bible from which to cull snippets of life-wisdom. Yet others explain the power of his scientific as well as his poetic works by reducing them to some few powerful insights gleaned from his youthful dabblings in alchemy, astrology and other occult 'sciences'.

The case of Goethe the Scientist is altogether a very strange one. Why has he not been relegated to an object for dispassionate scrutiny by historians of science? How is it that he can still provoke impassioned and even acrimonious attack, or sympathetic interest, where not outright defence, from many who are by no means to be dismissed as cranks (the physicists Max Planck and Werner Heisenberg, for example)? Presumably because his probing, if undismayed, gaze was turned upon an issue which has become urgent in our own day: the double-facedness of man's inventive curiosity, the seemingly inextricable involvement of his impulse to make and to know with his impulse to power and the control of Nature.

It is an insight which informs the whole of Goethe's dramatic treatment of the Faust legend (see FAUST), achieving its most poignant symbolization in the tragic events consequent upon his hero's otherwise admirable technological project for the reclamation of land from the sea. For Faust's splendid vision of a community of

Goethe's *Faust* presents 'the tensions inherent in the whole history of Western man's endeavours' but this 19th century German illustrator was evidently more interested in romantic horrors: Faust drinking the witch's potion *(above)*, Mephistopheles and Faust pursuing a Will-o-the-Wisp *(below)*

free people, earning their freedom each day anew on this hard-won land – a vision quoted so often out of context and in support of such disparate political ends – is made to follow, not only upon his abjuration of magic in the shape of Mephisto's help, but upon his own blinding by Dame Care, an evident projection of his guilty conscience.

Is this an ironic acknowledgement of man's inveterate tendency to gloss even his most disreputable motives with the veneer of respectability? Or is it a sober recognition that even his highest endeavours are prompted by mixed motives, some of them worse, but some also better, than he knows at the time? Probably both. The general tenor at any rate coincides with Goethe's maxim that 'whatever emancipates the mind without giving us control over ourselves is dangerous'. Such a warning could, and probably did, have reference to dangers contingent upon the control over the universe which man has acquired through the predictive power of Newtonian science. But it is by no means confined to these. For all his polemic against Newton (which by no means precluded recognition of his genius), it is only by a prejudicial selection of evidence that Goethe could ever be accommodated to such anti-Newtonians as, say, William Blake. Or to any romantic Jeremiahs, old or new, whose proposals for 'an alternative society' are confined to such products of the creative imagination as poetry, art and myth.

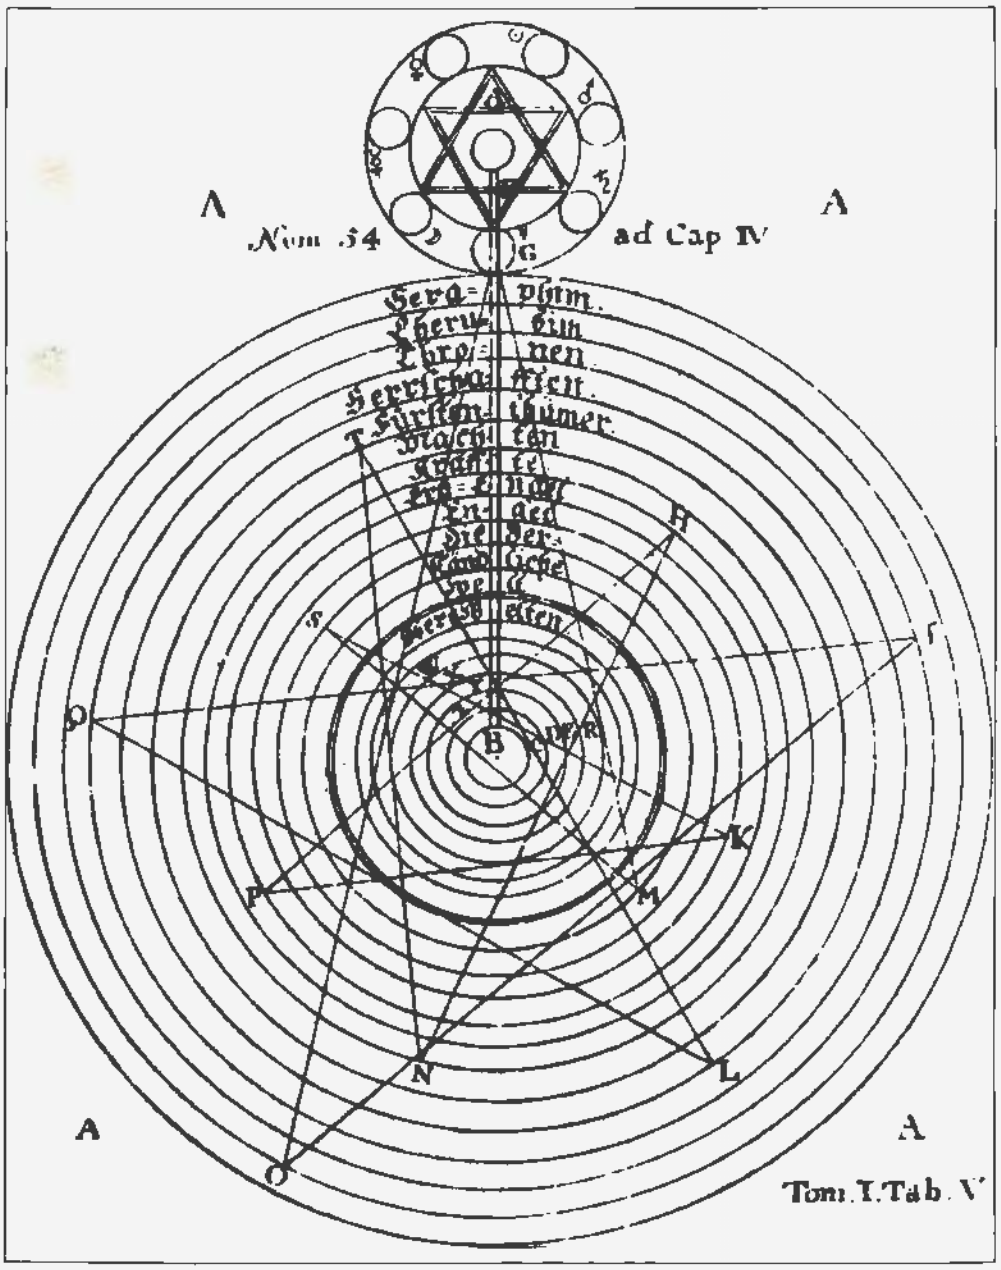
For Goethe, science too, whether pure or applied, was no less a product of man's Promethean reach. He may have said in a much-quoted aphorism that man's appropriate stance before the unknowable is to explore the explorable and quietly revere the inexplorable. But he offset this by another in which he insisted that man must persist in his belief that the incomprehensible may yet be susceptible of comprehension, for otherwise he would cease to explore.

The Whole Man

Clearly no single factor is adequate to account for the manifold influence of anyone so complex. One reason for it must obviously be his power to transmute an immensely wide range of thought, as well as feeling, into an astonishing variety of matchless verse and prose: it is this which puts him into the select company of the world's greatest poets. Yet another is his openness to an immense variety of cultural traditions, of the East as well as of the West – theological, philosophic, scientific, mythological, alchemical, cabalistic – and his power to 'condense' their perennial truths into symbols of inexhaustible potency. It is this which has attracted the attention of C. G. Jung and his followers, enabling them on the one hand to enlist him in support of their notion of a 'collective unconscious', on the other to shed new light, out of their therapeutic experience, on the more esoteric aspects of works such as *Faust* (the circularity of the procedure has not gone unremarked).

A third reason for Goethe's continuing influence must undoubtedly be the time through which he lived. Born just before the meridian of the 18th century into the heyday of European Enlightenment, he was not to die until the various phases of Romanticism had come and gone, the political face of Europe been completely changed by revolution and reaction, and Western man was clearly headed for the technological era in which we now live. To all these changes he responded, not without misgivings, but with an unfailing curiosity and an essentially forward-looking commitment. What, rising 80, would he have most liked to live to see? The completion of such great technological projects as the Suez and Panama canals. And what was the humane ideal proposed in his great two-part novel about education and self-education, *Wilhelm Meister*? Not the Renaissance ideal of the many-sided man according to which he himself had been raised, but one more attuned to the modern world; how to educate 'whole men' in an age committed to one-sided specialization. Goethe has been called 'the last universal man'. But Oscar Wilde was right too in calling him 'the first of the Moderns'.

The world into which he was born marks a decisive phase in the long transition from the God-centred world of medieval times to the man-centred universe of our own. It was then that Western man, putting his trust in the knowledge which his own reasoning can furnish, decided to stand on his own feet and work out his salvation for himself. A decision asserted not with that sense of sinful pride which haunted the Great Renaissance figures, and found dramatic embodiment in Marlowe's *Dr Faustus*. Rather with a modest confidence which trusted that the progressive enlightenment of men's minds would bring about a decrease in man's inhumanity to man.



The pattern of the universe, from Georg von Welling's *Opus Mago-Cabbalisticum et Theosophicum*, a popular 18th century work which influenced Goethe in his treatment of the famous *Faust* legend. At the top of the diagram is the throne of the Splendour of God, surrounded by the seven planets. Below is the 'middle world' consisting of the 12 circles or choruses of innumerable spirits and angelic hosts. At the centre are the seven circles of the inner world, with Satan (at point B) in the middle

Flight to the South

The only period in his life when Goethe was tempted to take older modes of thought literally, was brief. It lasted at most from the autumn of 1768 to the summer of 1770. Returned from the 'rationalistic' University of Leipzig with a severe physical complaint (from which he was apparently cured through the secret, and alchemically derived, salt of a Pietistic doctor) he remained throughout that winter confined to his room in a state of psychosomatic depression. And open by both temperament and environment to supernatural experiences – his maternal grandfather claimed the gift of second sight, and passed on to him his interest in the interpretation of dreams, while he himself as a boy had erected in his room an altar to 'The Unknown God' – the disillusioned and despairing youth felt drawn to such possibly mind-enlarging experiences as alchemy, astrology, and the mystical rites and rituals proffered by a Pietistic relative, Fräulein von Klettenberg. To a revolutionary and cynically minded young man the central gospel of Pietism, with its reassertion of Luther's claim that every human soul has the right to direct communication with God without benefit of clergy, could not fail to appeal.

Three stages may be distinguished in Goethe's emancipation from any desire to take literally either the procedures of the occult sciences or the doctrines of any religion. The first and most decisive was his encounter with J. G. Herder in Strasbourg, where he went to resume his studies in 1770. Rightly regarded as one of the progenitors of European Romanticism, Herder was nevertheless a man of the Enlightenment: a stickler for distinctions in both thought and language, rigorously schooled in classical rhetoric as well as in theology, a pioneer in comparative religion as well as in the origins of language and the history of ideas. Among the many lessons he taught Goethe, the most unforgettable were the need to inspect his own mental processes, as both man and artist, and the danger of confusing contexts of thought and modes of discourse.

The second stage was Goethe's lifelong and patient devotion to a number of observational and experimental sciences, which he somehow managed to pursue alongside both his literary activities and the manifold ministerial duties which devolved upon him as friend and general factotum of the Duke of Weimar: mineralogy and geology, botany and zoology, optics and theory of colour, meteorology and theory of clouds. And the third stage was his flight from the ten-year long burden of administrative duties, and from an increasingly frustrating love-affair, to the clear skies of the Mediterranean, cradle of our Western civilization. This flight he repeatedly described as a process of rebirth and self-discovery. It brought not only the completion or promotion of poetic works which had long been hanging fire, but the precipitation of scientific discoveries he had long been on the verge of making. It brought above all an understanding of the archetypal, whether in Nature or in man. And hence, a new attitude to myth.

The clearest evidence of this is in his essentially 'modern' treatment of Greek myth in his verse drama *Iphigenia*, portraying as it does man's power to free himself from the tyranny of his myths by recognizing them as projections of his unconscious needs, fears and insights. In Goethe's version the curse laid upon the race of Tantalus – the seemingly inexorable chain of violence and vengeance, 'an eye for an eye, a tooth for a tooth' and worse – is lifted, not by the intervention of any deity, but by the painfully acquired power of human beings to 'read' the oracle aright, and to put their faith in truth and trust between man and man.

Alchemy and Astrology

All this is not to say that Goethe henceforth lost interest in myth and magic, in religion or occultism. Far from it. Whenever the need arose – whether for his poetic works, his autobiography, or that historical prelude to his *Theory of Colours* which some have claimed as the first history of science – he again had recourse to the whole body of Pansophic knowledge, most of it familiar to him from his youth: Paracelsus, Boehme, Bruno, Pico, Ficino, Kepler, Swedenborg, the anonymous *Aurea catena Homeri*, not

Mary Evans Picture Library

Portrait of Goethe: he once said that man should explore the explorable and quietly revere the inexplorable, but he also insisted that man must persist in trying to understand the incomprehensible, for otherwise he would cease to explore

to mention such widely read 18th century works as Georg von Welling's *Opus Mago-Cabbalisticum et Theosophicum* or Gottfried Arnold's *Unbiassed History of the Church and its Heretics* and *History of Mystical and Symbolic Theology*. But there was no longer any question of his writing, as he did to a friend in January 1769: 'The Saviour has got me at last!'. Or in the next year to Fräulein von Klettenberg 'Chemistry is still my secret passion'.

Chemistry is, after all, itself a kind of 'magic', destroying as it does the familiar perceptual world in order to reveal a world of relations hitherto unsuspected. Alchemy, by contrast, unless interpreted symbolically, is essentially superstition: a misuse of the genuine and the true, a mendacious flattering of man's hopes and desires.

Astrology likewise. Its mumbo-jumbo, satirized by Mephisto in *Faust* was in Goethe's view one of many examples of the false application of mathematics; and his attempt at casting his own horoscope at the beginning of his autobiography is distinctly ironical in tone. On the other hand, the possibility of scientific validation of the age-old belief in the connection between all living things and the subtle rhythms of cosmic origin is never ruled out: it received poetic tribute in the opening verse of his *Orphic Utterances* and in the figure of the wise woman, Makarie, in *Wilhelm Meister*, scrutinizing the heavens from her astronomer's tower.

Altogether this was the older Goethe's way: not to deny early experiences, but to put them in perspective. It is a temper which informs the whole of his autobiography, and accounts for its title *Poetry and Truth*. The hesitant gropings of his youth are recalled with a tender regard for the reality of all genuinely felt experience, but also with the 'physical distance' won through the ever widening experiences of a long life. He never indulges in irony for its own sake. What he does do is to strip away the attachment to the letter found in fundamentalists of whatever persuasion in order to get to the kernel of a sacramental view of life wherever it is to be found. It is this essentially syncretic endeavour – the desire to find what is common without obliterating differences – that inspires all Goethe's utterances about religion: his great Eastern ballads, *The God and the Bayadère* and *Pariah*; that most mystical lyric of his cycle *The West-Eastern Divan*, 'Ecstatic Yearning'; and his unfinished poem *The Mysteries*. It is this that inspires his treatment of comparative religion, whether in *Wilhelm Meister*, or in the Fourth Book of his autobiography. It is this that could make him say at the age of 81 that he had at last discovered the only sect to which he could wish to belong: the 4th century Hypsisterians, whose whole endeavour was to revere the best in all religions, whether Christian, Jewish or heathen.

These Serious Jests

The poetic use Goethe made of the diverse cultural materials he inherited varied from work to work. And if we concentrate too much on the materials themselves, or on their sources, we run the risk of missing the new import he intended to convey through the artistic form he devised. It is above all with *Faust* that the inadequacy of any single key becomes most apparent. Goethe's characterization of the Second Part, in the last letter of his life, as 'these profoundly serious jests' applies to the whole of the work. And the whole of it lights up in a new way once we are aware of the immense variety of historical traditions that have gone to its making: theological and philosophical, scientific and literary, as well as mythological, mythical or mystagogical. Much can indeed be revealed about the psycho-symbolic significance of certain figures by bringing alchemical knowledge to bear. But we do well not to overlook Goethe's historical allusions: to the scientific controversies of his day between Neptunists and Vulcanists about the origins of life; or to the great sinners of the New Testament, the three Marys, who also play their part among the many who intercede for the salvation of Faust's soul. Or miss the anticipatory power of his symbols – whether it be our knowledge that during its nine months in the womb the human embryo 'condenses' all the stages of evolution; or that scientists themselves are now plnnging into the oceanic depths in order to discover more about man's own humble origins; or that the trend towards 'unisex' may betoken a new readiness towards reciprocal exchange of the masculine and feminine principles of the psyche.

For what Goethe was attempting in *Faust* was neither a rival to that of his greatest predecessor, Marlowe, nor the creation of a new myth. It was rather the dramatic presentation of the tensions inherent in the whole history of Western man's endeavours: his triumphs and his failures, and the constant threat that he may destroy himself. And if he decided to 'save' the soul of his constantly erring anti-hero, it was not as a reward for either his 'innate virtue' or his 'ceaseless striving', though both played their part. But rather the redeeming grace of 'love from above', under which complex notion Goethe comprised all the manifold symbols the human mind has conceived in order to give expression to the hope that, for all his transgressions, man may yet be enabled to survive.

Goethe summed up his outlook to a reviewer of his *Theory of Colour* in a letter of November, 1812: that since men are all too prone to have recourse to the magical, the unfathomable, the inexpressible, he himself had determined in all his work – poetic, artistic or scientific – to give prominence to the clear rather than the opaque, to the rational rather than the vaguely intuitive, so that in giving form to the outward the inward might be tacitly revered.

Gog and Magog

The names of two mythical giants, statues of which now stand in the Guildhall, London: according to legend, Gog and Magog were the last survivors of a race of British giants overcome by Brutus, who had them taken to London where they were compelled to work as porters at the gates of the royal palace: in the Bible, Gog is described as a terrible ruler living in the north, and in the Apocalypse the terms Gog and Magog stand for all the enemies of the kingdom of God.

See GIANTS.

GOLD

CONSISTENTLY THROUGHOUT human history, from the earliest of the known civilizations, gold has been treasured and valued in its physical substance and also as a symbol of something of equivalent value and rarity in the mental and spiritual life of man.

The following description by Pliny the Elder (23–79 AD) of the properties of this metal can be read equally easily both in the sense of the material metal and as an analogy for the qualities of the intangible equivalent buried in the hearts of men:

> It alone of all substances loses nothing on heating and survives even conflagrations and the funeral pyre. In fact, the oftener it is heated the better . . . the best proof of purity is a high melting point. It is strange, too, that a substance subdued by charcoal, made from the most fiercely-burning wood, is swiftly heated by the chaff, and that is fused with lead to purify it . . . . Another reason for holding gold in esteem is that it is least worn away by use . . . Again, nothing can be beaten into thinner leaves, nor divided more finely . . . Above all, it alone is found in nuggets of fine dust . . .
>
> Finally, neither rust nor verdigris can waste its excellence or diminish its weight. Again, brine and vinegar, the conquerors of matter, make no impression on it.

From this passage, it is plain to see why gold in its physical form is used, through all known cultures in human history to represent light, riches, wisdom, excellence, the essence and elixir of life, and stands for what has been called the 'irreducible minimum in the human spirit'. One can see, too, why it stands as a central symbol in the religious traditions – as the golden sun stands at the centre of our physical universe, giving life and light. In the magical system of correspondences, gold is indeed linked with the sun (see CORRESPONDENCES).

The Greek writer Hesiod relates that at the beginning of time the Olympian gods first created the men of Gold, who lived like gods in unalloyed happiness. In the Christian nativity story the Magi brought gold as one of the offerings to the infant Jesus and in Christian symbolism gold represents the divine spirit, glory, joy and love.

In our own culture, and not necessarily linked to any form of religion, gold stands for perfection in such phrases as: 'the golden age', 'the golden mean', 'the golden rule'.

The Perfect Metal

In the folklore of all cultures there are stories in which gold is the lure and prize, as in the recurring tale of the remote city – be it El Dorado, Timbuktu, or many others – where the streets are paved with gold, and in which there is wealth beyond dreams.

Nothing, of course, is consistently lucky and good – it depends who you are and what are your motives. So it is not surprising to find that on the other side of the coin, gold can symbolize greed, temptation, corruptibility, waste and treason. The tale of King Midas, who was punished for his greed by everything he touched turning into gold, is an example of what can happen if the user's intentions are baser than the precious metal.

Eric Cross

As well as standing for perfection and riches, both earthly and spiritual, gold also symbolizes greed and temptation *Left* A miser is dispossessed of his gold by the skeletal figure of Death: from the *Dance of Death*, a series of woodcuts by Holbein *Above* Sarcophagus made of 22 carat gold, which contained the mummified body of the Egyptian pharaoh Tutankhamen

Naturally there is much day-to-day folklore associated with gold as well. Even today, it is thought by many people that a gold bead worn round the neck will prevent or cure a host of ailments – anything from a sore throat to scrofula. It was also believed to protect the wearer from drowning; in the past, British sailors often wore plain gold ear-rings as amulets. In connection with this use of gold for magical reasons, it is significant that the magician reserves gold for the highest and most ceremonial magics.

The vast literature of alchemy is concerned with the transmutation of baser metals into gold, both in the literal sense and as a symbol of the development of the alchemist himself. Alchemy as practised since the 8th century bears the stamp of Jabir ibn Hayyan, surnamed El-Sufi (known in the West as Geber), who propounded the theory that all metals are composed of two principles resembling sulphur and mercury. He accounted for the existence of different varieties of metals by assuming that these two principles are not always pure and that they do not always combine in the same proportion; when this is the case, the result is silver, lead, tin, iron or copper. When, however, the sulphurous and mercurial principles are perfectly pure and combine in perfect balance, the result is gold.

The idea that in both a scientific and a metaphorical sense gold represents the sum of perfection occurs also in a 13th century work *Speculum Alchemae* (Mirror of Alchemy) which is attributed to Roger Bacon, the English philosopher and scientist: 'I must tell you that Nature always intends and strives to the perfection of Gold: but many accidents, coming between, change the metals.'

PAT WILLIAMS

ORDER OF THE

GOLDEN DAWN

The chance discovery of a coded manuscript in 1880 led to the founding of a secret society, said to be 'the only repository of magical knowledge' in the West in modern times, and to which many famous people belonged

THE HERMETIC SOCIETY of the Golden Dawn or Stella Matutina was formed in 1887 by three members of the Rosicrucian Society in England, which had been founded in 1866. The Order had 11 grades or degrees, subdivided into three groups: the Golden Dawn in the Outer, with five degrees, and the Stella Matutina comprising the Rosea Rubiae and Aurea Crucis, each of three degrees. In addition the Silver Star, or Argenteum Astrum (three degrees) was said to consist of 'Secret Chiefs'.

René Guénon in *Le Théosophisme* (1921) wrote: 'The English secret society of the Order of the Golden Dawn in the Outer is a society of occultists studying the highest practical magic, somewhat akin to Rosicrucianism. Men and women are admitted on equal terms. There are three principal officers, Imperator, Praemonstrator and Cancellarius'. The grades, besides that of Neophyte, were four (corresponding to the four letters of the Tetragrammaton or personal name of Yahweh in the Old Testament): Zelator, Theoreticus, Practicus and Philosophus; also a sub-grade, the Portal, leading from the Golden Dawn to the Rosea Rubiae and Aurea Crucis, the Inner Order.

The story of the founding of the Order follows the mysterious pattern characteristic of the Rosicrucians. In 1880 an Anglican clergyman, the Rev. A. F. A. Woodford, bought some cipher manuscripts from a bookstall in Farringdon Street in London which he showed to two Masonic and Rosicrucian colleagues, Dr Woodman and Dr Wynn Westcott, an antiquarian, scholar and London coroner; both Masons of high standing and learned in the Cabala. Accompanying the manuscripts was a letter in German, saying that whoever cared to decipher the text should communicate with Sapiens Donabitur Astris (S.D.A.) through a Fräulein Anna Sprengel, and would receive further information. The manuscripts were duly deciphered; they were found to consist of notes and rough diagrams for the five rituals of the Outer Order (grades 0 = 0 to 4 = 7) together with certain lectures on elementary occult and cabalistic knowledge.

S.D.A. then instructed Westcott and Woodman to elaborate the rituals. This was done by another Freemason, a Scot, Samuel Liddell Mathers (who later, under the influence of the Celtic movement, called himself MacGregor, and later le Comte de Glenstrae), assisted by Dr Westcott. The poet W. B. Yeats, who was initiated into the Order 'in a Charlotte Street studio' in 'May or June 1887', had met Mathers while both were working in the British Museum Reading Room: 'a man of thirty-six or thirty-seven, in a brown velveteen coat, with a gaunt resolute face, and who seemed, before I heard his name, or knew the nature of his studies, a figure of romance'. Yeats, who became a prominent member of the Order, and Imperator of the London lodge in 1901, helped Mathers in the writing of the rituals. These were published in America by Dr Israel Regardie, a member of the Order in its later days. The main body of the ritual consists, according to Regardie, of 'the sonorous and resonant versicles of the Chaldean Oracles – the translation, I believe, of Dr Westcott.' There is also a strong influence, especially in the rituals of the Outer, of the Egyptian Book of the Dead, and – doubtless through Yeats, who was editing the works of Blake at the time – marked traces of Blake's 'Prophetic Books'.

Apart from the cipher manuscripts and other Hermetic literature found in libraries both in England and on the Continent by Mathers, most of the early teaching was received by Mrs Mathers clairaudiently.

The authors were presently told that they would be permitted to form an elementary branch of the Rosicrucian Order in England; and finally S.D.A. wrote to Dr Westcott authorizing him to sign his (or her – S.D.A. may have been Fräulein Sprengel herself) name to any warrant or document necessary for the constitution of the Order, and promising further rituals and advanced teachings should the preliminary Order prove successful. On 1 March 1888, a warrant was drawn up according to a design given in the manuscripts and was signed by Dr Woodman, MacGregor Mathers and, for S.D.A., by Dr Westcott. In 1889 a letter was published by Mathers announcing that 'this society studies Western traditions . . . the Theosophical Society is in friendly relations with them.'

In 1891 Dr Woodman died, leaving the management of the Order to Westcott and Mathers, who for some years seem to have worked together in harmony. In 1897 Westcott withdrew from his office and Mathers reigned supreme until 1900.

A. E. Waite, an early member of the Order, recapitulates in his *Brotherhood of the Rosy Cross* (1924) much of the above information about 'the Isis-Urania Temple of the Hermetic Students of the Golden Dawn.' He concludes that the cipher manuscripts were post-1880, and were probably part of the reorganization of Westhaupt's Illuminati in 1880. According to another view, the French magician Eliphas Levi (whose *Magical Ritual of the Sanctum Regnum* interpreted by the Tarot Trumps was translated by Wynn Westcott) was one of the continental originators. Evidence for this is a cipher note of more recent date

'Greek Cross of the Zodiac', drawn from a Golden Dawn manuscript: the zodiac signs converge on the wheel of the sun and the year, and are linked by the coils of the snake biting its own tail, the ourobouros, a symbol that 'All is One'

Light of Occult Knowledge

Initiation of Aleister Crowley into the Order of the Golden Dawn

He was waiting without the portal under the care of a sentinel while the Hierophant (Mathers), between the pillars and before the altar, addressed his chief officers and the assembled members. Crowley was clothed in a strange, feminine-looking robe with a hood over his head so that he couldn't see a thing, for the light of the natural world is but darkness compared with the radiance of Divine Light. And he was held by a triple cord, a token of nature's tie which bound him. A voice cried from within the Hall of Neophytes . . .

'Child of Earth! wherefore hast thou come to request admission to this Order?'

A voice answered for him. 'My soul is wandering in the Darkness seeking for the light of Occult Knowledge, and I believe that in this Order the Knowledge of that Light may be obtained.'

John Symonds *The Great Beast*

The Angel Axir

From a ceremony of evoking the angel Axir by means of his magical signature (Sigil), painted on a talisman (Pentacle) and carried by the Magus:

Bind and veil Sigil with white cord and black cloth. Place it without the Circle at the West, and say: Hail unto ye, Lords of the Land of Life, hear ye these my words for I am made as ye are, who are the formers of the soul. With the divine aid, I now purpose to call for this day and hour from the dark depths of my sphere of sensation the Angel Axir of the Lesser Earthy Angle of the Northern Quadrangle, whose magical seal I now bind with this triple cord of bondage, and shroud in the black darkness of concealment. Even as I have bound about this Sigil this cord so let Axir be bound in his abode and habitation that he move not therefore save to manifest unto the Light before me. Even as with this veil of black I shroud the Light of Day from this Sigil, so do I render him in this place, blind and dumb, that he may in no wise move except into manifestation and appearance before me. And the reason of this working is to obtain from that Angel the true knowledge of Earth, how I may securely fix within my being the secret philosophical stone of creation whereupon is a hidden name inscribed. To this end I implore the divine assistance in the names of Adonai ha-Aretz, Auriel, Phorlach, Emor Dial Hectega, and Ic Zod Heh Chal.

Draw the Pentacle into the circle with the front of the Sword.

Creature of Sigils, enter thou within this sacred Circle that the Angel Axir may pass from concealment into manifestation.

Consecrate immediately with Fire and with Water at the West of the Circle.

Creature of Sigils, purified and made consecrate, enter thou the Pathway of Evil.

Israel Regardie *The Golden Dawn*

The original intention of the Order was 'to prosecute the Great Work: which is to obtain control of the nature and power of my own being'

added to the original instruction on 'the Tarot Trumps and their attribution to the Hebrew Alphabet' signed A. L. C. – Alphonse Louis Constant, or Eliphas Levi. All that seems certain is that somewhere on the continent there existed a Society, possibly Rosicrucian, from which Rudolf Steiner and the Golden Dawn, as well as the Theosophical Society, ultimately derived.

Astral Meetings

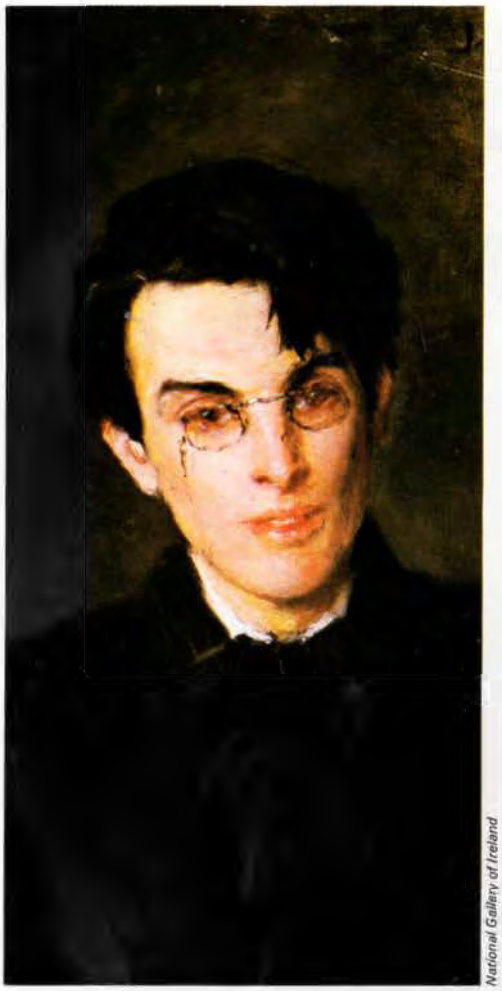
For the first few years all went well and the Order flourished. Among its early members were A. E. Waite, Florence Farr the actress, the writer Arthur Machen, and Allan Bennett, later famous as the Buddhist Bikku Ananda Mattaya. Besides the mother-lodge in London (Isis-Urania) there were formed new temples or lodges in Paris (the Ahathoor) Horus in Bradford, Osiris in Weston-super-Mare, Amen-Ra in Edinburgh. Algernon Blackwood was a member of the Edinburgh lodge.

However, the Order soon ran into difficulties. MacGregor, now living in Paris, became increasingly autocratic, presently claiming that he alone was in communication with the 'Hidden and Secret Chiefs of the Third Order', by whom, he said, those parts of the rituals received clairaudiently by Mrs Mathers were 'dictated'. Communications from these Masters gave him the only true interpretation of existing manuscripts. In a fantastic manifesto dated 29 October 1896 Mathers claimed initiation by those 'secret and unknown Magi' into the Third Order. 'I have but very rarely seen them in the physical body,' he wrote, 'and on such rare occasions *the rendezvous was made astrally by them*. They have met me in the *flesh* at the time and the place which had been astrally appointed beforehand. For my part I believe them to be human and living upon this earth; but possessing terrible superhuman powers. When such a *rendezvous* has been in a much frequented place, there has been nothing in their personal appearance or dress to mark them out as differing in any way from ordinary people except the appearance and sensation of transcendent health and physical vigour (whether they seem persons in youth or age) which was their invariable accompaniment: in other words, the physical appearance which the possession of the Elixir of Life has been traditionally supposed to confer. On the other hand, when the *rendezvous* has been in a place free from easy access by the Outer World they have usually been in symbolic robes and insignia.'

Mathers had become increasingly preoccupied with black magic; and the last straw was when in 1900 he sent the notorious Aleister Crowley to take over the London lodge. 'This person,' Yeats wrote in a letter to Lady Gregory, 'seized the rooms and on being ejected attempted to take possession wearing black mask and in full Highland costume and with a gilt dagger at his side. Having failed in this he has taken out a summons on the ground that he is Mathers' 'envoy', and that there is nothing in the constitution of the Society enabling us to depose Mathers.' However, that is just what the Isis-Urania Lodge did in the summer of 1900.

But that was only the beginning of the end. In 1901 Yeats, then Imperator of Isis-Urania, wrote a pamphlet entitled *Is the Order of the Golden Dawn to Remain a Magical Order?* in which he refers to the break with Mathers. A. E. Waite was now objecting to the system of examinations by which candidates passed from one grade to the next, and also calling in question the reality of the Third Order. Yeats defends the examination system and, without committing himself to any opinion of their nature, the reality 'whether in the body or out of the body' of the 'secret and unknown Magi'. Waite and his following broke away, however, in 1903, objecting to occult work and saying that they must work on purely mystical lines. Waite and those who seceded with him retained the name of the Golden Dawn and still used the same magical rituals, somewhat modified to suit Waite's mystical ideals. He ceased to be chief of the Order in 1915, and soon after it went into abeyance.

The remainder of the Order, under a Dr Felkin, continued until 1905 when Yeats, Arthur Machen and Wynn Westcott resigned. Dr Felkin founded a second offshoot, the Stella Matutina, or 'Order of the Companions of the Rising Light in the Morning', with a temple called Amoun in London. Dr Felkin founded a second but smaller temple in London, whose membership was restricted to members of the Rosicrucian Society in England, and he also



National Gallery of Ireland

Radio Times Hulton Picture Library

The Golden Dawn's rituals were written by W. B. Yeats *(left)* and MacGregor Mathers *(right)*. Yeats became Imperator of the London lodge after the expulsion of Mathers, who is seen here celebrating a Mass of Isis, and who claimed to be in touch with 'Secret Chiefs' who met him on the astral plane

founded the Hermes in Bristol. In 1917 he resurrected the Isis-Urania temple as the Merlin temple of the Stella Matutina. Dr Felkin then retired to New Zealand where he started yet another temple; all but the Amoun were short-lived.

Subversive Powers

Meanwhile Mathers had trouble with his 'black' *enfant terrible*, Crowley, who in 1905 broke away to found his own Order, the Argenteum Astrum (A.·. A.·.) or Silver Star. The Golden Dawn had at no time practised any form of sexual magic but Crowley identifying himself with the Antichrist under the sign of the Great Beast 666 of the Apocalypse, made sexual rituals central to his Order. Mathers died in 1917, broken, some say, by Crowley, whose stronger personality proved too much for him and who stole many of the rituals which were in fact Mathers's work. After the death of Mathers the Ahathoor lodge was closed. According to an article on the Golden Dawn by Gerald Yorke, 'the A.·. A.·. survives in New York, the Stella Matutina though dormant is not quite defunct, and the Golden Dawn in its original form is no more'. A member of the Golden Dawn, 'Dion Fortune', whose real name was Violet Firth, founded the Society of the Inner Light, which is still in existence (see FORTUNE).

A Miss Stoddart, at one time an ardent follower of Dr Felkin, wrote an anonymously published 'exposure' of the Order entitled *Light-Bearers of Darkness* (1930). She believed that, in common with all magical societies, the Golden Dawn was controlled by Secret Chiefs, subversive powers whose aim is the direction of the destinies of the earth; the Thule group said to have been behind Hitler is a more recent instance of this kind. It is well known that under cover of the Freemasons subversive groups were at work before the French Revolution; and according to Miss Stoddart, Mathers was 'doing political work under the Secret Chiefs and was mixed up in war and military matters.' Miss Stoddart expressed violently antisemitic opinions, and disapproved of Mrs Besant's work towards the overthrow of British rule in India (see BESANT). Her evidence seems to be largely imaginary, so far as the Golden Dawn is concerned.

A more plausible criticism comes in Gerald Yorke's article, quoted earlier; he writes of magic as 'an anachronistic survival of pre-Christian thought. It is both simpler and safer to put your trust in Christ and his Church.' According to this writer, 'To be successful a magus must become conscious of all the elements of his soul without exception. This is often represented as a descent into Hell, since it is precisely these unknown parts of the soul — of the subconscious — that are the abodes of demons. Many who are rash enough to rouse these demons by evocation end by succumbing to them.' It is nevertheless true that modern psychology claims to carry out a comparable process of enlargement and integration of consciousness; and the Golden Dawn may be seen as one among a number of manifestations of a process to which, in one form or another, this generation is committed; what Yeats calls 'the revolt of soul against intellect now beginning in the world'.

The Great Work

Gerald Yorke says that, 'In the main the brethren fell by the wayside.' Dr Israel Regardie, on the other hand, considers that, 'there can be little or no doubt that the Golden Dawn is, or rather was until very recently, the sole repository of magical knowledge, the only Order of real worth that the West of our time has known.'

Magic was indeed only one aspect of the work of the Golden Dawn. The original intention of the Order was 'to prosecute the Great Work: which is to obtain control of the nature and power of my own being.' According to some of the texts the purpose was even more specifically Christian: 'To establish closer and more personal relations with the Lord Jesus, the Master of Masters, is and ever must be the ultimate object of all the teaching of our Order'. There was at one time in the Society a strongly Anglo-Catholic bias; besides the scholar Charles Williams, a number of members of

Kenneth Grant

Drawing of a wand used in Golden Dawn rituals. The central rites were a dramatic portrayal of 'the spiritual rebirth or redemption of the candidate, his resurrection from the dark tomb of mortality through the power of the Holy Spirit'

the Anglican Society of the Resurrection were members, and even, briefly, Evelyn Underhill, the writer on mysticism. Lectures and papers were circulated expounding the Catholic doctrines of the Apostolic Succession, the seven Sacraments, the Assumption and the Immaculate Conception of the Blessed Virgin, or teaching the three grades of prayer. None of these papers is included in Israel Regardie's four volume publication of the rituals; which gives in this respect, a one-sided impression.

The studies and practices of the Adepti centred round the cabalistic Tree of the ten Sefiroth (see CABALA); especially as taught by the Christian cabalist tradition. Mathers, quoting from Eliphas Levi's *Histoire de Magie* wrote that, 'the absolute hieroglyphic science had for its basis an alphabet of which all the gods were letters, and all the letters ideas, all the ideas numbers, and all the numbers perfect signs'. Astrology and geomancy, scrying and travel on the astral planes were taught, besides the theory of alchemy. Every adept had to prepare his own magical apparatus: cup, wand, dagger and pentacle, together with an elaborate symbolic Rosy Cross. He must also consecrate a sword. Ceremonies were performed in robes whose colour varied according to grade and the nature of the work.

Three varieties of magic were taught: the Clavicula of Solomon the King, the Sacred Magic of Abramelin the Mage, and the Enochian system with its peculiar alphabet and language as revealed to Dr John Dee, Queen Elizabeth's astrologer (see DEE). Mathers was industrious in translating cabalistic literature into English; *The Key of Solomon the King* (1889), *The Kabbalah Unveiled* (1889) and *Abra-Melin the Mage* (1898).

The central rituals are based upon the description, in the Rosicrucian *Fama Fraternitatis*, of the Vault of the Adepti; translated by A. E. Waite in his *Real History of the Rosicrucians*. This consists of a symbolic enactment of the uncorrupted body of 'our father Christian Rosencreuz', symbolic of the buried sleeping higher Self. In the words of Dr Regardie, 'the whole concatenation of symbols is an elaborate and dramatic portrayal of the central theme of the Great Work. In a few words, it depicts the spiritual rebirth or redemption of the candidate, his resurrection from the dark tomb of mortality through the power of the Holy Spirit.'

Golden Fleece

In Greek mythology, the object of the voyage of Jason and the Argonauts, who, helped by the enchantress Medea, stole it from Colchis on the Black Sea, where it hung on a tree guarded by a dragon: it was the fleece of a ram which could think, speak and fly, sent by Hermes to save two children whose lives were threatened by their cruel stepmother.

Gong

Principal musical instrument of Asia, with religious and magical uses similar to those of bells in the West: sounded to accompany religious ceremonies, to drive away evil spirits or to expel the demons of disease: drinking from one after taking an oath gives the oath a binding significance: gongs are male or female according to tone, and are sometimes given individual names.

Head of the golem, from a famous film, *The Golem*. The story of the artificially created human being which turns on its master became associated with Rabbi Judah Loew, of Prague in the 16th century, but without historical foundation

Jewish legend has its own Frankenstein's monster, a human being created by magical means who threatened to destroy his master

GOLEM

A GOLEM is a creature, especially a human being, created artificially by magic. In the late Jewish form of the legend, as told by Jakob Grimm in his *Journal for Hermits* (1808), the golem is the figure of a man, made of clay or mud, and brought to life when the miraculous name of God is pronounced over it. The golem is dumb (though other versions of the legend do credit it with the power of speech) but it can understand orders and is used as a servant to do the housework. It must never be allowed to leave the house. On its forehead is written the word *emeth* (truth). With every day that goes by, the golem gains weight and it gradually becomes bigger and stronger than anyone in the house, until they become afraid of it. They then rub out the first letter of the word on its forehead, altering it to *meth* (he is dead). The golem immediately collapses and turns back into clay again.

One man's golem, according to Grimm, grew so tall that its forehead was too high to reach. Its owner ordered the golem to take off its boots, so that when it bent down he would be able to reach its forehead. The golem did as it was told, and the owner succeeded in erasing the first letter but the mass of dead clay fell on top of him and crushed him.

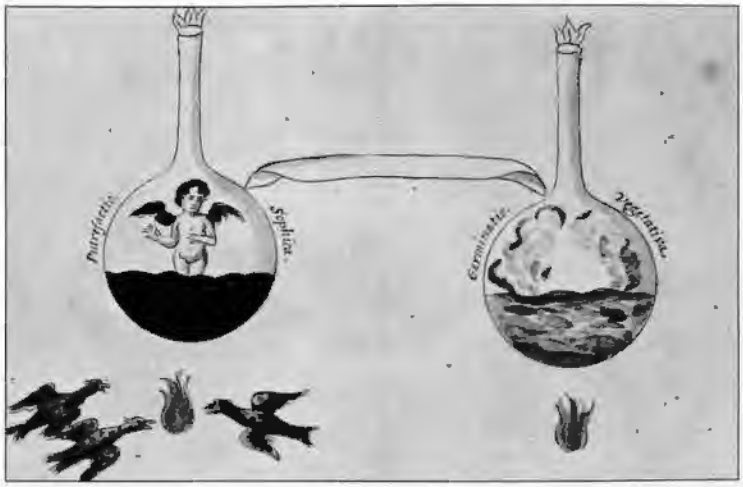
The Hebrew word *golem* occurs once in the Old Testament (Psalm 139. 16), where it means a human being which is not yet fully formed, an embryo. In the Talmud (the oldest extant code of Jewish law) the word is used once for Adam's body during the first hours of its existence but before it was fully endowed with life and consciousness. Elsewhere in the Talmud the word is used to denote an uncultured, boorish man. In medieval Hebrew the word was used as a technical philosophical term equivalent to the Greek *hyle*, that is, hylic matter, matter without form. Only at a much later stage was the word golem associated with magical traditions about the possibility of creating human and other beings by means of formulae, divine names, and permutations and combinations of Hebrew letters.

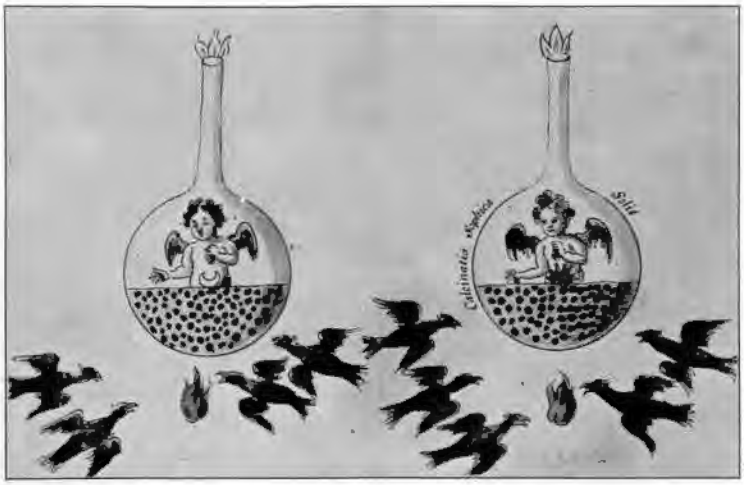
Act of Creation

The idea that it is possible to create living beings or to endow lifeless images or statues with life by magical means is widespread. In classical antiquity it was frequently associated with the alleged imparting of the power of speech to idols and statues. The Talmud too contains evidence that legends about such magical feats were current among Jews. One rabbi is said to have 'created a man' and sent him to a colleague. When the latter spoke to the messenger but received no reply, he recognized his true character and commanded him, 'Return to your dust'. Two other rabbis are reported to 'have made a calf for themselves' on the eve of every Sabbath and to have eaten it. They produced this calf by busying themselves with the book *Yetsirah*.

The reference to the *Sefer Yetsirah* (the Book of Creation) indicates the range of ideas and concepts underlying the theory of the magical creation of living beings. There is no way of knowing whether the *Sefer Yetsirah* (or *Hilkhoth Yetsirah*) of the Talmudic legend is or is not identical with, or similar to, the extant book bearing that name (see ALPHABET; CABALA). According to this book which came to be highly regarded in later Jewish mysticism, the world is derived from 32 elements which are the first ten numbers and the 22 letters of the Hebrew alphabet. All reality is a reality of the letters, the elements of which the cosmos is formed.

These ideas, which go back in part to Talmudic notions concerning the creative power of the letters of the name of God or of the Hebrew letters in general (because all combinations of these were held to be mystical names of God), obviously lent themselves to magical interpretation and application. Whereas the idea of creating living beings by magical means was associated in Greek and Arab magic with astrology, the emphasis in the Jewish tradition is on letter mysticism. These concepts were developed in the commentaries on the *Sefer Yetsirah* that





British Museum

The idea of the golem was linked with the belief that artificial human beings could be created by alchemy, a belief stimulated by symbolic pictures like these, showing the creation of a spirit in the vessel. 'Let two or at the most three parts of our mercury liquefy, one part of silver or gold of the vulgar, subtiliated, and they will become one body, spongious and inseparable, which is called our silver or gold, and not of the vulgar . . .' from *Cabala Mineralis*, an alchemical manuscript in the British Museum

were composed from the 12th century onwards. In these commentaries the word golem also begins to appear as a technical term for a being artificially created by applying the mysteries of the *Sefer Yetsirah*.

In the circle of Jewish mystics of the 12th–13th centuries known as the 'Hasidim of Germany' these conceptions gave rise to a mystical rite of creating a golem. There is little doubt that this ritual, in spite of its magical character, did not serve any materialist purpose (such as creating a robot servant) but was essentially a spiritual experience fraught with symbolic meaning. At the conclusion of their studies of the *Sefer Yetsirah* and similar texts, these mystics would perform a ritual 'act of creation' symbolizing their level of spiritual achievement. In this ritual the participants would take earth from virgin soil and shape it into a golem, or, according to another version, bury a golem made from clay in the earth, and bring it to life by walking round it and using the appropriate combination of letters and mystical 'names of God'. By the act of walking in the opposite direction and reciting the magic formulae in reverse order, the golem would again become lifeless.

Rebellious Servant

What was essentially a mystic-symbolic ritual in the circles of the German Hasidim soon became a subject for popular folklore and legend. Concurrently the golem too became an actual creature serving his master and fulfilling menial and other tasks laid upon him. Legends of this kind were fairly widespread among German Jews after the 15th century and came also to be known among non-Jews; Goethe's *Sorcerer's Apprentice* is indebted to the golem legend.

Earlier legends implying the possibility of resurrecting the dead by putting a piece of parchment with the name of God into the mouth or on the arm, were transferred to the golem, which it was believed could be made lifeless again by removing or inverting the mystical formula. The idea of a golem also linked up with the alchemists' notion of an artificial man produced by alchemical means (the homunculus of Paracelsus). As in the *Sorcerer's Apprentice*, the idea that the golem could get out of hand and his creator might no longer control or master him became a major feature of popular legend. The golem would grow to giant size, and become a serious threat to others, even to his master or members of his household. To reduce this Frankenstein's monster to dust again it would be necessary to remove the parchment with the mystic formula from his forehead. The golem's giant size made such an attempt very hazardous.

The best known form of the golem legend is associated with Rabbi Judah Loew of Prague (16th century) but without any historical foundation whatever. As a result of this association, which seems to date from the end of the 18th century, most current forms and versions of the golem legend, popular as well as literary are connected with the history of the ghetto and the old synagogues of Prague. The first legendary biography describing a rabbi as the creator and master of a golem servant appeared in connection with Rabbi Elijah of Chelm (died 1583), and its substance was later transferred to Rabbi Judah Loew of Prague. In the later versions the golem is credited not only with enormous strength but also with uncanny instincts which enabled him to serve the Rabbi and the Jews of Prague by discovering plots against the Jews – especially accusations of ritual murder – and preventing their execution. Many stories relating to Rabbi Judah Loew and the golem are meant to 'explain' special liturgical practices of the congregation of Prague.

In the 19th century the golem legend became a favourite literary subject both with Jews and non-Jews. First in German literature, and later in Hebrew and Yiddish, the legends were expanded and interpreted in diverse ways. The verses emphasizing the golem's function in preventing libellous accusations and their consequent dangers to the Jewish community were probably composed after the resurgence of accusations of ritual murder in the 1890s. Among the best known works inspired by the legend are the mystic-occultist novel *Der Golem* (1915) by Gustav Meyrink, published in an English translation as *The Golem* (1964) and the Yiddish drama *Der Golem* by H. Leivick.

R. J. ZWI WERBLOWSKY

The Golem of Prague

It must have been . . . toward the middle of the 18th century that the Polish legend about the rabbi of Chelm moved to Prague and attached itself to a far more famous figure, the 'Great Rabbi' Loew of Prague (*c* 1520–1609). Of course the Prague legend may have grown up independently, but this strikes me as very unlikely. In the Prague tradition of the early 19th century, the legend was associated with certain special features of the Sabbath Eve liturgy. The story is that Rabbi Loew fashioned a golem who did all manner of work for his master during the week. But because all creatures rest on the Sabbath, Rabbi Loew turned his golem back into clay every Friday evening, by taking away the name of God. Once, however, the rabbi forgot to remove the *shem* (from the *Shem Hameforash*, the ineffable name of God). The congregation was assembled for services in the synagogue and had already recited the 92nd Psalm, when the mighty golem ran amuck, shaking houses, and threatening to destroy everything. Rabbi Loew was summoned; it was still dusk, and the Sabbath had not already begun. He rushed at the raging golem and tore away the *shem*, whereupon the golem crumbled into dust. The rabbi then ordered that the Sabbath Psalm should be sung a second time, a custom which has been maintained ever since in that synagogue, the Altner Schul, but buried his remains in the attic of the ancient synagogue, where they lie to this day. Once, after much fasting, Rabbi Ezekiel Lander, one of Rabbi Loew's most prominent successors, is said to have gone up to look at the golem. On his return he gave an order, binding on all future generations, that no mortal must ever go up to that attic . . .

Hirmer

GOOD SHEPHERD

THE FIGURE of a shepherd bearing a sheep upon his shoulders frequently appears in early Christian art, either as a statue or carved on the sides of sarcophagi, or painted on the walls and ceilings of catacombs. The figure depicted is sometimes bearded and wearing a short tunic. In these various forms, it was used as a decorative symbol by Christians from c 200 to 400 AD. It has been customary to identify such figures as representations of Christ as the Good Shepherd, and in support of the identification good evidence could be cited. In the gospel of St John (chapter 10) Jesus is recorded as saying: 'I am the good shepherd. The good shepherd lays down his life for the sheep'; and the gospel of Luke (chapter 15) contains the parable of the Lost Sheep, which the shepherd seeks and, finding, lays upon his shoulders with rejoicing. The image appeared to be an easily intelligible one, and its popularity is further attested by its use on cups or bowls, on terracotta lamps, and even on knife handles.

More recent research, however, has questioned both the identification of this 'shepherd figure' with Jesus, and also whether it was originally a Christian symbol. It has now been shown that the figure of a man bearing a sheep or goat has a very long ancestry in the art of the ancient Near East. It appears in Mesopotamian art as early as the 3rd millenium BC, in the form of a man carrying a kid in his arms, for sacrifice to a deity. Hittite art of the late 2nd millenium BC provides an even closer prototype of the Christian 'Good Shepherd' in depictions of a man bearing a goat upon his shoulder as an offering to the gods: in either hand he holds a pair of the victim's legs. These figures doubtless constituted a familiar symbol of the pious service of the devotees of the gods concerned. Greek art introduces another phase of the tradition with the statue of Hermes *kriophoros*, 'ram-bearing', made about 450 BC for the ancient city of Tanagra in Boeotia. This represented the god Hermes as the divine patron of shepherds, bearing across his shoulders a ram. The god is shown in heroic nudity and initiates a form of presentation found later, that of nude shepherds carrying sheep which appear on sculptured sarcophagi of the Roman Imperial period (c 300–400 AD). The dying god Adonis is depicted in a similar state, bearing a ram and accompanied by the female figure of a Nature goddess, on the ceiling of a 2nd century Roman tomb.

However, a tradition gradually developed of portraying these sheep or goat-bearing figures simply dressed in shepherd's costume without specifying identity with a particular deity. This transformation coincided with the craving for an idealized pastoral life that characterized sophisticated Graeco-Roman society, and is reflected in the poetry of Theocritus and Virgil, and other contemporary poets and philosophers. The image of the shepherd, and his tender care for his sheep, came thus to symbolize the newly appreciated virtue of *philanthropia* or *humanitas* and was used, significantly, on the sculptured sarcophagi that became fashionable, for the burial of the wealthy, together with other imagery of pagan origin, expressive of virtues and hopes related to the afterlife.

It would, accordingly, appear that the 'shepherd figure' was adopted into Christian art from contemporary pagan art, and careful examination of its use on Christian sarcophagi of the period indicates that, with two possible exceptions, it denoted the virtue of *philanthropia* or, in Christian terminology, love of one's neighbour.

Analysis of the use of the 'shepherd figure' in catacomb art, however, suggests that an identification was made here with Christ in a very significant context. It was the practice to cover the *arcosolium*, the cavity in the catacomb wall in which the corpse was placed, with a marble slab which was decorated with various religious symbols and an inscription. The 'shepherd figure' was often depicted here as a representation of Christ in the role of the *psychopompos*, or guide of the departed soul on its perilous way to the next world. Hermes had this office in pagan religion; but it is more likely that Christ's role in this connection was inspired by Psalm 23, 'The Lord is my Shepherd'. However, Christ was regarded as the *psychopompos* for a short while only, and the office was soon attributed to the Archangel Michael (see JUDGEMENT OF THE DEAD).

The 'Good Shepherd' figure disappears from Christian iconography after the year 400. But the idea of Christ as the Good Shepherd, enthroned among his sheep, is magnificently portrayed in a 5th century mosaic in the Mausoleum of Galla Placidia, Ravenna.

Michael Holford

The impressive spectacle of huge flocks of geese flying overhead with the return of spring, anciently gave rise to goose myths and ceremonies, usually associated with fertility; strangest of all bird beliefs, is that of the barnacle goose: 'they are not flesh, nor born of flesh'

GOOSE

IN MANY PARTS of Europe and Asia the goose has played an important role in local folklore, custom and mythology, and in the British Isles it is one of the few birds still involved in ritual observances. The preservation of such folk rites in a sophisticated society usually indicates the very great antiquity of the beliefs originally associated with them.

The principal goose ritual in England is a goose dinner which is eaten at Michaelmas (29 September), a custom which persists in the Yorkshire Dales and used to be much more widespread; a similar feast is held in Denmark on or near Martinmas (11 November). It might at first seem absurd to regard having goose for dinner as anything more than enjoying a good meal but customs which are observed at specific seasons of the year often have an interesting history and there is plenty of documentary evidence to attest to the great age of the Michaelmas goose feast.

A record dating from the time of Edward IV states that: 'John de la Hay was bound to render to William Barneby, Lord of Lastres, in the county of Hereford, for a parcel of the demesne lands, one goose fit for the Lord's dinner on the fast of St Michael the Archangel.' George Gascoigne wrote in 1575:

> And when the tenants come to pay their quarter's rent
> They bring some fowl at Midsummer, a dish of fish in Lent
> At Christmas a capon, at Michaelmas a goose;
> And somewhat else at New Year's tide for fear their lease flies loose.

By the 16th century, therefore, the Michaelmas goose was believed to be a propitiatory gift to keep landlords in good humour. It was also believed that eating goose at Michaelmas brought good luck: 'If you eat goose on Michaelmas Day you will never want for money all the year round.' A cookery book of 1709 informs the housewife:

> So stubble geese at Michaelmas are seen upon the spit; next May produces green.

'Green geese', mentioned by Shakespeare in 'Love's Labour's Lost' were birds fed on green pastures and the rhyme obviously implies fertility, increase and good fortune.

Bird of the Sun

Beliefs and ceremonies associated with the goose used to be characteristic of most northern countries. In pagan Sweden the goose figured as a grave offering; in Germany geese were sacrificed to Odin at the autumnal equinox and there was apparently a goose goddess at Cologne. During the 13th century the inhabitants of Friesland were accused of a form of witchcraft in which a goose was involved.

Goose beliefs and cults were not confined to Europe. Among Siberian tribes the bird figured in various ceremonies. One tribe sacrificed it to the river or sky god while another made a 'nest' for the goose god of skin, fur and cloth. Further south, in India, the wild goose is considered of great significance and the god Brahma is frequently depicted riding on a gander. Aphrodite, the Greek goddess of love, was also shown being borne through the air by a goose. In China a goose was carried at the head of processions and a pair of geese or duck might be presented to a newly married couple; the mandarin duck is a symbol of marital fidelity.

All these beliefs and rituals appear to have originated in an association between the goose and the sun, and consequently with fertility. In early times people were greatly impressed by the spectacle of huge flocks passing overhead in spring and they connected the birds with the lengthening of the days, greater warmth, growth or vegetation and the mating of birds and beasts. Wild geese thus came to represent the power

The flight of the wild geese has always moved and impressed mankind, and deities are often shown riding on them. *Above* 18th century Japanese calendar print, in which the girl is representing the goddess Kosenko *Right* Drawing from southern India of the god Brahma, riding on a cosmic gander

which wrought these changes – the sun or sun god.

Goose feasts may be a dying tradition in the British Isles but another ritual, derived from goose beliefs, is still widely observed though without realization of its origin – the custom of 'breaking the wishbone' when a chicken is served for dinner. A Bavarian physician, writing in 1455, describes the procedure by which the weather might be forecast by examining the breastbone of the Martinmas goose. He adds that the Teutonic knights in Prussia 'waged all their wars by the goose-bone'; that is, they judged by this kind of oracle whether the weather would be propitious for their campaigns. In Yorkshire it was believed that the breast-bone of a goose appeared dark in colour before a severe winter and much lighter if the winter were to be mild. It is a natural corollary to belief in the supernatural powers of the goose to attribute oracular significance to its remains.

The Barnacle Goose

The remarkable Irish belief that geese hatch from shellfish relates in particular to the barnacle goose which still winters around the coast of Britain in great numbers. It is now known that barnacle geese only breed north of the Arctic Circle, and in the past the breeding of this noisy, conspicuous species of goose was a mystery, because no nest had ever been found or reported even by those who sailed up to Iceland. After a severe storm, the bodies of birds might be found drifting among flotsam on the beach, covered with barnacles, and so it could be believed that it was the shells themselves which generated the geese.

A 10th century Arab diplomat writing of a country called 'Shasin', probably Ireland, reported: 'There is something marvellous there, such as is nowhere else in the world. On the sea-shore grow trees, and from time to time the bank gives way and a tree falls into the sea. The waves toss it up and down so much that a white jelly is formed on it. This goes on until the jelly increases in size and assumes the shape of an egg. Then the egg is moulded in the form of a bird with nothing but both feet and the bill attached to the wood. When Allah wills, the wind that blows on it produces feathers and it detaches

Chris Barker

British Museum

Michael Holford

the feet and bill from the wood. So it becomes a bird which scuttles into the sea about the surface of the water. It is never found alive, but when the sea rises it is thrown by the water on the shore, where it is found dead. It is a black bird similar to the bird that is called the Diver.'

In 1186 the Welsh writer Giraldus Cambrensis, returning from his travels in Ireland, lectured on his experiences to members of Oxford University: 'There are in this place many birds which are called Bernacae,' he said. 'Nature produces them against Nature in the most extraordinary way. They are like marsh geese but somewhat smaller. They are produced from fir timber tossed along the sea and are at first like gum. Afterwards they hang down by their beaks as if they were seaweed attached to timber, and are surrounded by shells in order to grow more freely . . . They do not breed and lay eggs like other birds, nor do they hatch any eggs, nor do they seem to build nests in any corner of the earth. Hence Bishops and religious men do not scruple to dine off these birds at the time of fasting, because they are not flesh nor born of flesh.'

The tradition was given wide currency by John Gerard in his *Herball* of 1597. He was unscrupulous in his borrowing and often careless in regard to facts. As he and others copied and improved on the illustrations of barnacle geese hatching, these became increasingly realistic, showing birds issuing from barnacle-like fruit growing on a tree by the waterside.

A contributory factor to the survival of this type of myth, lay in the supporting evidence of travellers' tales of fabulous creatures, which gained wide currency and were popularly believed. A Friar Odoric, who made a journey to the Far East in 1313, noted in his journal that he had heard of a tree reputed to bear melons containing 'a little beast like a young lamb' – probably a garbled description of a cotton plant. He added 'I myself have heard reported that there stand certain trees upon the shore of the Irish Sea, bearing fruit like a melon which, at certain times of the year do fall into the water and become birds.'

The barnacle goose legend, as Giraldus had realized, several hundreds of years earlier, provided an excellent excuse for eating goose on fast days. The Irish sense of humour has often come to their rescue, when living was hard and food scarce, so they clung to the belief in the generation of the barnacle goose from shellfish and thus were able to conform to the requirements of church discipline without offending their consciences.

Anyone rash enough to gaze on the Gorgons was petrified, literally and metaphorically, for their gaze was so terrible that it turned the onlooker to stone

GORGONS

THE GREEKS APPLIED the name Gorgo or, less commonly, Gorgon to female monsters which are a favourite subject in their extant art, sometimes terrifying but sometimes, to all appearances, humorous. In mythology, the Gorgons figure chiefly in the story of Perseus. The ancient lore concerning them is most fully summed up in Apollodorus's *Library of Mythology*, in Ovid's *Metamorphoses* and in Lucan's *Pharsalia*. These accounts written between the 2nd century BC and the 1st century AD, are all late versions of the myth of Perseus, and depend on much older poetry, which has been lost. It is not known that there was ever a complete epic that described the adventures of Perseus in his quest for Medusa.

The scattered references to the Gorgon or Gorgons in earlier poetry and poetical fragments known to us are usually to the terrifying aspect of the Gorgon's head, as for instance in the *Odyssey* (book II) where Odysseus fears that Persephone may send up the Gorgon's head to confront him if he stays longer by the entrance of Hades. In Hesiod's poem *Shield of Hercules* the Gorgons are said to be represented on the shield pursuing Perseus as he flies away carrying the head of Medusa, which is so large that it covers all his back. After him rush Medusa's sisters, the other Gorgons, 'not to be approached and not to be described, eager to seize him. The shield rang sharp and shrill with a loud din as they trod on the pale adamant, on their belts were two serpents writhing and arching their necks and darting out their tongues and furiously gnashing their teeth as they savagely glared. And over the terrible heads of the Gorgons a great Dread quivered.'

The Three Sisters

This is the earliest continuous piece of poetry dealing with the Gorgons (except for the summary account of their origin and dwelling in Hesiod's *Theogony*). In the common versions of the myth of Perseus, at least in those which became accepted by such writers as Apollodorus, there were three Gorgon sisters, daughters of the ancient sea gods, Phorcys and Ceto, namely Stheno and Euryale, who were immortal, and Medusa who was mortal. According to most writers, they lived on the Atlantic shores of Africa, which seems to link them with the underworld, which was likewise placed in the far west. According to the philologists, the name Gorgons should once have denoted a terrible roaring or bellowing. But in Greek usage the name always suggests their glaring eyes.

Perseus, son of Zeus and Danae, grew up on the island of Seriphos, whose king Polydectes conceived a passion for Danae, while Perseus protected her. To get Perseus out of the way, Polydectes sent him to fetch the Gorgon's head, an enterprise which would, he hoped, lead him to his death. But Perseus was helped by Hermes and Athena. The nymphs gave Perseus the winged sandals of Hermes, the *kibisis*, apparently a large sack or wallet, and the cap of Hades which made its wearer invisible. Hermes also gave him the sickle (*harpe*), a special curved sword with which he was able to cut off the head of Medusa.

Once Famous for her Beauty

Perseus flew to the home of the monsters where he found the three Gorgons asleep, their heads covered with snakes instead of hair, and their mouths armed with great tusks like those of boars. Their gaze turned to stone all who beheld them. As they slept, Perseus stood over them, Athena guiding his hand, and looked away at a polished shield while he cut off the head of Medusa. From her as she died sprang forth the winged horse Pegasus. Perseus put the head into the sack and set off homeward, pursued by the other two Gorgons, who could not see him but tracked him by smell. They failed to catch him. On his way back he made use of the Gorgon's head against his enemies, and when he arrived at Seriphos he turned Polydectes and his followers to

'And over the terrible heads of the Gorgons, a great Dread quivered'; it seems likely that such fearsome creatures had a special connection with the underworld: Greek head of a Gorgon, from Syracuse in Sicily

C. M. Dixon

stone. He returned the sandals and other gifts to the nymphs and finally gave the head of Medusa to Athena to adorn her goatskin shield.

Though in Ovid and other writers Medusa is said to have been once famous for her beauty, she was grotesquely ugly when she had taken on the nature of a Gorgon. In art, particularly on vases and architectural ornaments, the Gorgons are shown in human form but with wings and very wide faces to contain their immense tusked mouths and thick lolling tongues. Their great eyes glare in an inhuman manner, sometimes like those of wild beasts and sometimes those of cuttlefish. Their pursuit of Perseus, as described in Hesiod, is often shown with the details that he gives. The *gorgoneion*, or gorgon-face, was one of many demon-faces that existed in archaic Greek art. One of its purposes as a magical object was to frighten away evil beings. It seems likely that the Gorgons have a special connection with the underworld because they are so lethal. If so, the expedition of Perseus might fall within the class called 'the harrowing of hell' (see HELL) to which the similar expedition of Hercules to Hades to fetch up Cerberus certainly belongs.

If the origins of the Gorgons are sought outside Greece, the most likely source is the Near East, Anatolia, Phoenicia or Mesopotamia, where religious art abounds in monsters. It has been plausibly suggested that the origin of the Gorgon face is in the Anatolian and Syrian sculptures of open-mouthed lions with lolling tongues which were attendant on the gods. Perseus has a connection with Joppa in Phoenicia, where he delivers Andromeda from the sea monster. His sickle-shaped sword, like that used by Cronus to castrate Uranus, is of Near Eastern origin.

Gospel
Literally 'good news', the doctrines preached by Christ and his apostles: the news of Christ's life and work in the accounts by Matthew, Mark, Luke and John, the evangelists (from a Greek word meaning 'good news'); all four gospels were probably composed before 100 AD, with Mark's the oldest, but the dates are disputed; the first three, which share a common view of Christ and his teaching are called 'synoptic'; the traditional symbols of the evangelists are respectively the man, lion, ox, and eagle.

For reasons which we can only speculate about today, a respectable Scottish farmer's wife spontaneously denounced herself as a witch in 1662. Her confession included stories of intercourse with the Devil and rides to fairyland

ISABEL GOWDIE

Radio Times Hulton Picture Library

THE NAME of Isabel Gowdie continually crops up in surveys of British witchcraft. The completeness of her case ensures that a reference to her is in place over a wide range of topics – magic murder, wind-raising, 'shape-shifting', flying, sterility rites, coven membership, spirits, excursions to fairyland – the Gowdie case has them all, and more. For some writers she seems to represent a sort of ideal witch, a prototype, the product of the final wave of witch persecution, when the popular and legal image of the witch had been clearly defined and everyone, including the witch herself, knew just what was expected of her.

This is not, however, to suggest that Isabel Gowdie herself was a victim of one of those classic trials in which the weapons of intimidation, circumstantial evidence and the primary assumption of guilt combined to carry an innocent woman to her death. On the contrary, Gowdie's confession is famous, though not unique, for being totally spontaneous. Before she made it to the surprised and discomforted elders of Auldearne kirk in Morayshire in 1662, no one, not even her husband apparently, had suspected her of illicit practices. She made no attempt to dissemble or excuse herself but, like Agnes Sampson, another famous Scottish witch, had apparently decided to 'tell all'.

Mischief for Idle Hands

Isabel Gowdie was an attractive, red-headed girl, married to a farmer living on the edge of Lochloy near Auldearne. She seems to have married young, and quickly grew bored on the lonely farm: she was childless and it was said that her husband was a boorish man, her social inferior, lacking her wits and education. Nowadays we might say that Gowdie was neurotic because of the unsatisfying conditions of her life; in her own era it was believed, more literally, that Satan found mischief for idle hands to do. By her own account the 'man in grey' who in 1647 accosted her one day on the downs found her ready and even eager to follow him. He baptized her that same evening in Auldearne kirk, giving her the name of 'Janet', a typical non-Christian nickname. She dedicated herself to him, and he put a witch's mark upon her, sucking her blood.

This ceremony and its site, suggesting as it does a parody of the Christian ceremony, provides classic evidence for supporters of Dr Margaret Murray's view that the witchcraft cult was quite real and coherent, and that the similarities between it and Christian ritual date back jointly to one common primeval source of cult and myth. On this hypothesis, it is entirely possible that what Gowdie said on this and other subjects was substantially true, that she was indeed approached by a man who may or may not have been already known to her, and who was presumably the Devil-god of a local coven. Her acquiescence to his invitation would suggest that, whether the kirk elders knew of it or not, there was already a thriving organization of several covens in the neighbourhood, to which a number of local women belonged or were soon to belong.

'Each one of us has a Spirit to wait upon us, when we please to call upon him.' If they were real at all, these spirits may have been male members of the witch organization, dressed up. A witch with demonic spirits, by Ryckaert

In evidence, Gowdie was eventually to give their names (13 to a coven) and also the

names of the personal spirits or fairies who attended upon each:

> Ilk one of us has a Spirit to wait upon us, when we please to call upon him. I remember not all the Spirits' names; but there is one called Swein, which waits upon the said Margaret Wilson, in Auldearne; he is still (always) clothed in grass-green; and the said Margaret Wilson has a nickname called Pikle nearest the Wind. The next Spirit is called Rorie, who waits upon Bessie Wilson, in Auldearne; he is still clothed in yellow; and her nickname is Throw the Corn Yard . . . Jean Marten is Maid to the Coven that I am of; and her nickname is Over the Dyke with It, because the Devil always takes the Maiden in his hand next him, when we dance Gillatrypes; and when we would leap . . . he and she will say 'Over the Dyke with it!'

Her own Spirit, she added, was called the Read Riever and habitually wore black. She seems to have regarded these beings as supernaturals, but the 'spirits' were presumably, like the Devil himself, male members of the organization dressed up. The gay dances suggest the traditional rituals, such as 'follow-my-leader', and the circles 'widdershins', against the course of the sun. The meetings were apparently held regularly, with a grand meeting at the end of each quarter. They ended in the traditional phallic orgy, which has led some modern commentators to suppose that the whole business was the product of the disordered imaginations of frustrated women, but which equally supports the suggestion that the meetings represented a degenerate version of an ancient fertility cult.

Gowdie and her friends copulated with their spirits and also with the Devil himself. Her comments on the Devil's person suggests that some sort of artificial phallus of horn or leather may have been used: 'His members are exceeding great and long; no man's members are so long and big as they are . . . (he is) a meikle, black, rough man, very cold; and I found his nature as cold within me as spring-well water . . . He is abler for us that way than any man can be, only he is heavy like a malt-sack; a huge nature, very cold, as ice.'

Other activities on these occasions included eating, drinking, mischief-making and romping through the countryside. Once they entered a dye-works at Auldearne, and bewitched the vat so that ever afterwards it would only dye black, the Devil's colour. Isabel Gowdie claimed that she and other witches had the power to turn themselves into hares or cats, and said that once when she was a hare she was chased by dogs and only just escaped by running through her own house and out into another one.

She had a little horse on which she rode to meetings, crying to it 'Horse and Hattock in the Devil's name!' Or rather, she seems to have flown, though whether through the air like the traditional witch on a broomstick or simply skimming along the ground, 'even as straws would fly upon a highway', is not quite clear from her evidence. The impression given of covering great distances in an unorthodox manner with dreamlike ease is typical of witches' accounts of their travelling, and supports equally the theories that they were victims of total delusion or that the various toxic ointments with which they rubbed themselves, and the ceremonies in which they indulged, created in them a state of light-headedness; so that actual long journeys on foot or horseback did indeed pass for them in an effortless, timeless manner.

Visit to Fairyland

She described a visit to fairyland undertaken in this manner, a claim which would have appeared credible at that period, when respectable and sensible people in Scotland believed that fairies led a real existence, similar to and alongside man's own, though hidden away for the most part in fairy mounds and little-frequented uplands. It may be that there were actual, remote communities living in such places, hill-tribes who had been driven into retreat many centuries before by more advanced invaders (see FAIRIES). More probably, all such communities had died out long before the 17th century, but their legend survived and perhaps was applied to bands of outlaws. It is quite possible that Gowdie really did, as she said, visit their abode, since an understanding between local outlaws and local criminals is at least as likely, on a practical plane, as the supernatural connection between witches and fairies in which Gowdie herself believed. Although some contemporary commentators were inclined to believe that fairies were neither angels nor devils but 'of a middle nature', wanderers on the face of the earth – Isabel Gowdie was apparently in no doubt that fairy tribes were hosts of hell, and identifiable with the demonic spirits at coven meetings, one of whom was actually called Thomas a Faerie.

'I was in the downie hills . . . the hills opened, and we came to a fair and large braw room in the day time . . . and I got meat there from the Queen of Faerie, more than I could eat. The Queen of Faerie is brawly clothed in white linen, and in white and brown clothes; and the King of Faerie is a braw man, well favoured, and broad faced. There were elf-bulls, routing and skoyling up and down there, and affrighted me.' Here she saw the Devil making elf-bolts, those famous and lethal weapons which sound, from their description, like prehistoric flint arrowheads – another pointer to the fairies' ethnic origins: 'The Devil sharps them with his own hand, and delivers them to Elf-boys, who whittles and dights them with a sharp thing like a packing needle.' Later she herself was taught how to use them: 'We have no bow to shoot with, but span them from the nails of our thumbs.' The Devil took her and the others on what sounds like a coven outing; they shot and killed a ploughman and then Gowdie herself brought down a woman.

Murder by Magic

The Auldearne witches also achieved murder by the more devious traditional method of a clay image, the essential 'magic murder' which was a capital offence in Britain long before other witchcraft practices came into this category. The company in this case wished to destroy the Laird of Park's male children:

> John Taylor brought home the clay, his wife brake it very small, like meal, and sifted it with a sieve, and poured water among it, in the Devil's name, and wrought it very sore, like a rye-bowl (a rye-pudding); and made of it a picture of the Laird's sons. It had all the parts and marks of a child, such as head, eyes, nose, hands, feet, mouth, and little lips. It wanted no mark of a child; and the hands of it folded down by its sides . . . We laid the face of it to the fire till it strakened (shrank in the heat); and a clear fire round about it till it was red like a coal. After that we would roast it now and then; each other day there would be a piece of it well roasten. The Laird of Park's whole male children by it are to suffer, if it be not gotten and broken, as well as those that are born and dead already . . .

On another occasion Gowdie and several intimate friends dug up an unchristened child in the graveyard; the object seems to have been to use it in spells rather than to offer it to the Devil in direct sacrifice. They shared the body with another coven, as a generous folk doctor might share a rare herb he had collected. Their own piece they buried in the middens of a neighbouring farmer, as a means of magically 'taking' his crops. By other long-distance charms they similarly 'took' milk from cows, but they do not seem to have had the milk or crops for themselves, or to have derived any personal benefit from their spells other than the pleasure of seeing the farmers discomforted.

Apart from the vandalism of these acts there is an alternative aspect: what was sterile and 'wasted' to the victim of the witches' attentions could fairly be said to be 'fertile' to the Devil-god who was supposed to be the mystic recipient of the goods thus wasted. In much of the behaviour of the Auldearne covens there seems to be an element of mysticism, however debased, a concept of serving the master with a logic in it beyond mere evil-doing, a hint of ritual sacrifice. Such ideas seem to be behind Gowdie's miniature ploughing session, a famous example of 'sterility magic', when she and her cronies used toads as oxen, couch-grass as the traces and the horn of a castrated ram as the ploughshare. All the accessories are carefully chosen to suggest sterility but the action of ploughing itself is clearly an imitative fertility-bringing ritual. Presumably the witches were 'taking' the land they ploughed for the Devil to sow his own harvest there.

Sacrificial Victim?

Some fifteen years after the 'man in grey' first appeared to her, Isabel Gowdie appears to have tired of her occult activities; or perhaps it was some secret squabble which led her to dramatic revelations, in which she inculpated herself and a number of others. 'Alas,' she was to tell the court at the trial in 1662, 'I deserve not to be sitting here, for I have done so many evil deeds, especially killing of men . . . I deserve to be riven upon iron harrows, and worse if it could be devised.' Was this mere histrionics, the self-dramatization of a personality who,

Isabel Gowdie said she flew to the witches' gatherings on a horse, though whether they flew through the air or skimmed over the surface of the ground is not clear. A famous picture of witches flying, by Goya

Mansell Collection

for years, had fed on the heady ideal of its own evil power?

Psychologically she is a most interesting puzzle. If we are to believe that, even in her confession, she was still serving the ends of her Satanic master, it is arguable that she *wanted* at this point to die, and that she may even have been elected by her coven as the sacrificial victim in a decadent version of the immemorial pagan rite – the killing of a god-substitute in order to ensure the reigning 'god's' continuity.

Seeker of Limelight

An alternative explanation of her behaviour is that something caused a complete change of heart in her, and that her words of repentance were genuine. A number of the women arraigned before the court were obviously confused or senile but this does not seem to have been the case with Gowdie, who impressed everyone with her apparent sanity and coherence. There is no sign of her 'confession' being a tale that grew and altered with the telling; in the course of four separate examinations she never once contradicted herself.

The most likely answer is that she was emotionally abnormal, a seeker of limelight with only a theoretical grasp either of the reality of other people's lives or of the punishments that might be meted out to her, but certainly not mad by the criteria of her own society, or perhaps, ours. Her tale obviously contains elements of fantasy, possibly drug-induced – the flying, the shape-shifting – but probably also a strong basis of fact. Most witches, and Gowdie is no exception, commonly confessed to forms of witchery that were already well-recognized. It was as if they were bent, in practice as well as in 'make-belief', on fulfilling a legend already there for them.

Grace

In Christian theology, the undeserved favour of God which grants a man salvation; in the New Testament usually translates the Greek *charis* (see GRACES): views of it have differed considerably in different Christian denominations; St Paul says, 'For by grace you have been saved by faith, and this is not your own doing, it is the gift of God' (Ephesians 2.8): a 'state of grace' is the condition of being free of sin and inspired by the strengthening goodwill of God.

Graces

The three *Charites* (plural of *charis*) of Greek mythology, Aglaia (the radiant), Thalia (the flowering) and Euphrosyne (joy), personifications of grace and charm, companions of the love goddess; originally there were more than three of them and they stood for the joy and beauty of fertile Nature; associated with flowers, especially the rose and the myrtle; later, they conferred on human beings not only beauty and charm but also wisdom, intellectual power and artistic ability.

GRAIL

The knights of the Round Table rode out in search of the Grail, the precious relic of Christ which was guarded in a mysterious castle. But in the end the winning of the Grail brought the end of their fellowship

FULL OF ADVENTURE and excitement, of wonders and enchantments, the stories of the Grail are particularly enthralling for their air of mystery, of some tremendous secret that is hinted at but not revealed. We are not told exactly what the Grail means. It is unimaginably sacred, unimaginably precious. It is the fruit of blessedness, the essence of all sweetness, the perfection of paradise, the centre of high secrets and mysteries, but essentially its secrets are 'those things that the heart of mortal man cannot conceive nor tongue relate'.

The origins of the Grail have been searched for in Christianity, in paganism, in Byzantine, Persian, Jewish and Mohammedan traditions. Traces of gnostic ideas have been revealed, and hints of possible Templar and Cathar influences. For the different stories that have come down to us vary very considerably, and the great American authority R. S. Loomis plaintively observed that 'the authors of the Grail texts seem to delight in contradicting each other on the most important points.'

The stories contradict each other because there is no single Grail legend but a number of variants embroidering on not one but several themes. They tend to be rambling and inconsistent because they were originally told, not written. They are part of the larger mass of Arthurian legends, with their remote origins in Celtic paganism, spread through western Europe by travelling story-tellers who altered the stories, forgetting or misunderstanding parts of them, inventing other parts, and giving the tales a new emphasis and a new significance (see ARTHUR).

Shorn for the moment of most of their enticing details, the Grail legends are basically about a knight who comes to an eerie and magnificent castle which is the home of a crippled king, the Fisher King or Maimed King. In the castle the hero sees a magic sword and a lance which is dripping blood. During a lavish feast he

Vision of the Holy Grail, detail from a tapestry by William Morris, to the design of Burne-Jones. The Grail is shown as the cup of the Last Supper. An angel holds two other sacred objects of the legends, the dish and the lance. Galahad kneels at the door of the chapel while Bors and Perceval, who were less spiritually perfect, are further off

sees the Grail itself, variously described as a dish, a cup, a ciborium (the vessel in which the sacred host is kept, a cup with an arched cover surmounted by a cross), or even as a stone. The Grail is carried in procession during the feast, or sometimes itself serves the feast. The hero is supposed to ask a question. If he fails to ask it, he has failed in his quest and calamities follow. If he asks the right question, the Fisher King is healed and, in some versions, the Waste Land which he rules is once again restored to fertility.

The Otherworld Quest

Looming dimly in the background behind the medieval legends are older Irish and Welsh stories in which a hero visits the otherworld, sees its marvels and mysteries, and sometimes seizes one of its treasures. The close connection between the Grail and feasting is one of the clues to its origins in Celtic mythology, which is rich in 'vessels of plenty', magic vessels which provide limitless quantities of food and drink. Feasting was one of the great Celtic pleasures and naturally the feasting in the otherworld was beyond anything to be found in this one. The smith god Goibniu, for instance, brewed beer in a cauldron for an otherworld feast which made everyone who took part in it immortal (see CAULDRON). In many mythologies it is the food and drink of the otherworld which keeps its inhabitants forever young.

The magic vessel of plenty is not always a cauldron. It may be a dish, like the platter of Rhydderch the Generous which instantly provided the food anyone wanted, according to a 16th century list of the Thirteen Treasures of the Island of Britain. In *Culhwch and Olwen* (one of the stories in the Welsh collection called the *Mabinogion*) four magic vessels have to be obtained for Culhwch's wedding feast: a

Entry of the Grail

And then the king and all estates went home unto Camelot, and so went to evensong to the great minster, and so after upon that to supper, and every knight sat in his own place as they were toforehand. Then anon they heard cracking and crying of thunder, that them thought the place should all to-drive. In the midst of this blast entered a sunbeam more clearer by seven times than ever they saw day, and all they were alighted of the grace of the Holy Ghost. Then began every knight to behold other, and either saw other, by their seeming, fairer than ever they saw afore. Not for then there was no knight might speak one word a great while, and so they looked every man on other as they had been dumb. Then there entered into the hall the Holy Grail covered with white samite, but there was none might see it, nor who bare it. And there was all the hall fulfilled with good odours, and every knight had such meats and drinks as he best loved in this world. And when the Holy Grail had been borne through the hall, then the holy vessel departed suddenly, that they wist not where it became: then had they all breath to speak. And then the king yielded thankings to God, of His good grace that he had sent them. Certes, said the king, we ought to thank our Lord Jesu greatly for that he hath shewed us this day, at the reverence of this high feast of Pentecost.

Sir Thomas Malory *Le Morte D'Arthur*

cup in which is the best of all drink; a platter or table on which everyone would find the meat that he wanted; a horn for pouring out the drink; and the cauldron of Diwrnach the Irishman, for boiling the meat. The variety of Celtic vessels of plenty may be one reason for the later variations in the shape of the Grail.

The cauldron of Diwrnach was stolen from Ireland by Arthur and his men. It was probably an otherworld cauldron originally, for the same list of the Thirteen Treasures includes the Cauldron of Tyrnoc (or Dyrnawg) the Giant, which would boil food for a brave man but not for a coward. A similar otherworld cauldron was seized by Arthur in a Welsh poem called *The Spoils of Annwn*. 'The cauldron of the Chief of Annwn, what is its nature? Blue round its rim and pearls; it will not boil the food of a coward. . . .'

Another celebrated cauldron is the one which belonged to Bran the Blessed (see BRAN). According to the story of *Branwen* (also in the *Mabinogion*) this cauldron restored the dead to life: 'a man of thine slain today, cast him into the cauldron, and by tomorrow he will be as well as he was at the best, save only that he will not have power of speech.' This cauldron's failure to restore speech may have something to do with the failure of some of the Grail heroes to speak at the crucial moment of the quest.

Bran was probably the prototype of the Fisher King, whose name in some of the medieval romances is Bron. The son of a sea god, he died from a poisoned spear wound in the foot, which might be the origin of the Fisher King's crippling wound in the thighs. His head was cut off and taken by his companions to a great hall, where they passed a joyous 80 years in its company, never seeming to grow any older. This scene seems to reappear in the French romance *Perlesvaus*, written c 1225, in which Gawain sits down to feast in the Fisher King's hall with 12 knights, each of whom was 100 years old but none of them looked more than 40.

The Grail's close connection with eating and drinking probably stems from its remote origins among pagan magic vessels of plenty. Christianized as the container of the body or blood of Christ *Above* Joseph of Arimathea, the first custodian of the Grail, bearing the Christ-child (the sacred host); before him is the Holy Lance which pierced Christ's side on the cross, described in the legends as ceaselessly dripping blood *Below* The Grail appears to the knights of the Round Table and provides each man with the food he most desires: it is shown in this 14th century French MS as a ciborium, the container of the consecrated host

At the Grail Castle

The oldest surviving romance of the Grail is the unfinished *Conte del Graal* (or *Roman de Perceval*), written c 1180 by the French poet Chrétien de Troyes, who says that he based it on a book his noble patron had given him. The principal hero is Perceval, an uncouth young man who was brought up in seclusion by his widowed mother in the remote wilds of Wales, from which he made his way to Arthur's court. He knew nothing of the ways of the world but was advised by an older knight not to talk too much or pester people with questions.

Trying to find his way home again, worried by the fact that his mother had fainted when he left her, Perceval came to a river and saw a man fishing from a boat. The fisherman invited Perceval to his castle nearby. At the castle, a squire came in, carrying a white lance which dripped blood from its point. Curious but mindful of advice, Perceval asked no questions. Next a beautiful girl came in, carrying in her hands 'a grail', made of gold, set with jewels and giving off an intensely brilliant light. The company sat down to eat and with each course the Grail passed before them but Perceval reigned in his curiosity and 'did not ask concerning the grail, whom one served with it.'

Perceval was shown politely to bed but next morning the castle was completely deserted. He rode out over the drawbridge, which was promptly raised behind him. He shouted to whoever had raised it but there was no answer. Riding away into the forest, he met a maiden who told him that the castle belonged to the rich Fisher King, who had been wounded in battle by a javelin which pierced both his thighs. He was now crippled and fishing was his only pastime. Perceval had done ill by not asking about the lance, and worse by not asking about the Grail, for his questions would have cured the Fisher King 'and much good would have come of it'. What held his tongue was his sin against his mother, who had died of grief for him.

Perceval returned to Arthur's court, where a hideously ugly damsel – 'never was there creature so loathly save in hell' – rode in on a mule to reproach him. 'Fortune is bald behind, but has a forelock in front . . . you did not seize Fortune when you met her.' He should have asked why the lance bled and who was 'the rich man whom one served with the grail.' If the Fisher King is not healed, 'Ladies will lose their husbands, lands will be laid waste . . . and many knights will die.'

Perceval was determined to discover the answers to the two questions. For five years he rode out, proving his mettle in many a strange adventure, but in all this time he never went into a church or worshipped God. One Good Friday he met a knight who reproached him for bearing arms on the day Christ died. Perceval went to a holy hermit to confess his sins. The hermit told him that the one who was served with the Grail was the father of the Fisher King. What it served him with, and all that he lived on, was the sacred host. On this diet he had lived 15 years without ever quitting his room. The hermit told Perceval to 'believe in God, love God, worship God', to go to church and to serve his fellow men. At this point the story breaks off.

The Question

Partly because it is unfinished, the story raises more difficulties than it solves. The lance is not explained, nor why the question should heal the Fisher King. Confusingly, there are two kings in the castle (as in many of the later romances). There are three different explanations of Perceval's silence. The Grail is described at the end as a large dish on which the sacred host is served to the Fisher King's father, but most uncanonically by a woman instead of a priest. All the same, it is a hauntingly powerful story.

Some authorities doubt whether Chrétien himself wrote the last part of the tale but as we have it, at any rate, it is clearly not a pagan story, even though it uses motifs which were originally pagan. This is driven home by the sound Christian advice which the hermit gives Perceval at the end.

In the legends the Grail and the Lance are both connected with the body and blood of Christ, torn and spilled to save men from death and the Devil, and also the sacramental food and drink of the Mass, in which Christ himself was present, the sustenance which a Christian should most desire. Angels collecting the crucified Christ's blood in cups, as Joseph of Arimathea was said to have collected it in the Grail

One of the pagan motifs is the question Perceval should have asked, 'Who is served with the Grail?' A similar question is asked in an Irish story known as *The Phantom's Frenzy*, existing only in a 16th century manuscript but possibly dating from the 11th. The hero, Conn of the Hundred Battles, goes to the hall of the sun god Lug, where he sees a vessel of gold, a vat of silver and a golden cup. A girl in a golden crown serves Conn with food but before giving him ale she asks, 'To whom shall this cup be given?' Lug answers, 'Serve it to Conn of the Hundred Battles'. As she keeps repeating the question, Lug names each of Conn's descendants who will rule Ireland after him. At the end Lug and his hall vanish.

The Blood of God

After Chrétien's death, other authors turned their attention to the Grail legends and the old pagan themes were increasingly Christianized. Chrétien's *Conte* itself was continued in four different sequels. In the First Continuation (probably before 1200) Gawain sees the 'rich grail', which moves about by itself at the feast, serving each course and filling the wine-cups. The lord of the castle explains that the lance which bleeds is the Holy Lance with which a Roman soldier pierced Christ on the cross, 'and at once there came out blood and water' (John 19.34).

Gawain is also told that the broken sword he had earlier seen in the castle is the one which destroyed the whole realm of Logres (Britain). At this point Gawain, most irritatingly, falls asleep and the rest of the explanation is lost, but an interpolation by another author brings in Joseph of Arimathea, the rich Jew who took Christ's body from the cross for burial (see also GLASTONBURY). Joseph caused the Grail to be made and took it to Calvary, where he caught in it the blood that flowed down over the feet of the crucified Jesus. After Joseph's death the precious vessel passed on to his descendants, down to the Rich Fisher.

Joseph D'Arimathie, c 1200, by the Burgundian poet Robert de Borron, says Joseph used the Grail to collect the blood of Christ crucified and that it was the same chalice which Jesus used at the Last Supper, when he took a cup and the apostles drank of it and he said, 'This is my blood of the covenant, which is poured out for many'

Kunst und Museums Bibliothek der Stadt, Köln

Ronald Sheridan

'This is my blood of the covenant, which is poured out for many.' The belief that the cup of the Last Supper was guarded somewhere in secret was an immensely exciting one in an age which believed in the miraculous power of sacred relics. The Last Supper vessel in the unusual form of a two-handled jug, from St Clement's at Ohrid, Yugoslavia, 13th century

(Mark 14.24). With his brother-in-law, Hebron or Bron, Joseph left Palestine for foreign lands. He founded the table and service of the Grail, which only those who believe in the Trinity and lead clean lives may attend, and there they have everything their hearts desire. An empty seat at the table, corresponding to the seat of Judas at the Last Supper, is reserved for a descendant of Bron (this is the Siege Perilous which Galahad would later fill). On the Grail table is a fish, the symbol of Christ, placed there by Bron, who in consequence is called the Rich Fisher.

Fruit of Blessedness

Both the Lance and the Grail have now been connected with the blood of Jesus, the blood which was spilled to save men from death and the Devil. The Grail itself has been identified as the cup of the first Mass, containing the wine which was not merely figuratively but in all reality the life-blood of God. Most of the great relics of the life and death of Jesus had been found, or at least it was believed they had been found, and the idea that the cup of the Last Supper was still in existence and was guarded somewhere in secret was an immensely exciting one in an age which believed in the miraculous power of relics. What had been long before a magic vessel of plenty, which in giving food gave immortal life in the otherworld, was now the Christian vessel which gave immortality, the heavenly life after death of the faithful Christian.

Not that all the remaining romances identified the Grail as a cup, far from it. In another variation on Perceval's adventures, *Parzival* by the Bavarian poet Wolfram von Eschenbach, written c 1200–1212, the hero comes to the Maimed King's hall and sees the Grail, 'which surpasses all earthly perfection'. The company sit down to feast and 'whatsoever one reached his hand for, he found it ready, in front of the Grail, food warm or food cold, dishes new or old, meat tame or game . . . for the Grail was the fruit of blessedness, such abundance of the sweetness of the world that its delights were very like what we are told of the kingdom of heaven.'

Parzival refrains from asking questions 'for courtesy's sake', because it would be impolite, but later he is reproached for callousness towards his crippled host. 'You should have felt pity for your host, on whom God has wrought such terrible wonders, and have asked the cause of his suffering.'

The Grail, it turns out, is a stone. 'There never was a human so ill but that, if he one day sees that stone, he cannot die within the week that follows. And in looks he will not fade. His appearance will stay the same . . . the same as when the best years of his life began, and though he should see the stone for 200 years, it will never change, save that his hair might perhaps turn grey. Such power does the stone give a man that flesh and blood are at once made young again.' From the stone 'derives whatever good fragrances of food and drink there are on the earth, like to the perfection of Paradise. I mean all things the earth may bear. And further the stone provides whatever game lives beneath the heavens, whether it flies or runs or swims.'

The parallel with the pagan vessels of plenty is very clear and the Grail castle recalls the pagan otherworld, where there is no aging and no disease, and where the immortals feast on whatever they like best. But the Grail is now a stone, which resembles the Philosophers' Stone of the alchemists. It too surpassed all earthly perfection, cured disease, and kept its possessor forever young. It is likely that Wolfram was also indebted to the stone in a legend of Alexander the Great, the stone which was heavier than any quantity of gold but, when a little dust was sprinkled on it, was lighter than a feather, and which was an object-lesson in the renunciation of worldly pride and ambition (see ALEXANDER THE GREAT).

The Waste Land

In a brilliant book, *From Ritual to Romance* (1920) which was influenced by Frazer's *Golden Bough* and which in turn influenced T. S. Eliot's poem 'The Waste Land', Jessie L. Weston argued that the central themes of the Grail legends were connected with pagan fertility ritual, the restoration to vigorous life of the dying god of vegetation; that the Fisher King was so named because the fish is a symbol of swarming life; and that beneath the surface of the legends can be discerned the rites and symbols of a secret cult, which had transmuted primitive fertility ritual into an 'initiation into the secret of Life, physical and spiritual'. The sacred objects of the legends were the sacred symbols of the cult: the dish from which the worshipper ate the communal meal, the lance and cup together as symbols of male and female, the sources of physical life, and the Holy Grail itself as the source of spiritual life.

The majority of scholars have rejected this theory, for lack of adequate evidence of the existence of any such cult. What is generally accepted, however, is that the theme of the Waste Land preserves the ancient belief that the fertility of the land depended on the life, vigour and sexual potency of the ruler. In Chrétien the Fisher King is wounded in both thighs, which is thought to be a euphemism for the genitals.

So long as the king was maimed, no crops were sown, no child was born, no meadow turned green, no beast or bird bore young

In Wolfram's *Parzival* there is no euphemism: the Maimed King was pierced through the testicles by a poisoned spear.

In a comparatively late romance, *Sone de Nansai*, dating from after 1250, the Fisher King – usually said to be a descendant of Joseph of Arimathea – is identified with Joseph himself. When God wounded him in the loins, to punish him for marrying a heathen princess of Norway, the land of Logres fell under an enchantment. So long as the king was maimed, no crops were sown, no child was born, no meadow turned green, no beast or bird bore young.

In the *Suite du Merlin*, of c 1230, it is the lance of the Grail castle which deals what Malory later called 'the dolorous stroke'. The hero Balaain (Balin in Malory) came to the castle of King Pellehan. Attacked by the king and searching hurriedly for a weapon with which to defend himself, he found a lance standing point downwards in a vessel of silver and gold. He snatched up the lance and drove it through Pellehan's thighs. Instantly the walls of the castle collapsed. Outside, Balaain found that the trees had fallen, the crops were destroyed and the inhabitants were all dead. From that time on the land came to be called the Waste Land.

Logically, the all-important question which the hero must ask at the Grail castle ought to heal the Fisher King and restore the Waste Land to bloom. In some of the romances it does, but in by no means all (and there is no suggestion of the question restoring an arid land to fertility in the Irish story of *The Phantom's Frenzy*). In Chrétien, the Waste Land is not mentioned at all or, at most, is only hinted at. We are told that if the Fisher King is not healed, 'lands will be laid waste,' but this seems to be seen as the result of coming wars, not of infertility.

In the First Continuation Gawain succeeds in restoring the fertility of the Waste Land by asking about the lance. But even so, he has not fully achieved the quest for if he had stayed awake long enough to ask about the Grail, 'no one could tell the great joy that would have come of asking.'

The more determinedly Christian the intentions of the author, the more the Waste Land theme is thrust into the background, presumably because of its obvious pagan connotations. The *Queste del Saint Graal* says that the father of the Maimed King was killed by the blow of a sword, which unleashed such wrack and ruin that 'never again did the land requite the ploughman's toil, for no corn sprouted there, nor any other crop, nor did the trees bear fruit, and there was a dearth of fish in pond and stream.' Later, the Maimed King himself tried to draw the same sword from its sheath and was instantly transfixed through the thighs by a flying lance. But though the Grail-winner, Galahad, heals the Maimed King nothing is said of restoring the Waste Land. On the contrary, the Grail itself is taken away from the land altogether.

End of the Fellowship

In the *Queste* the Grail is the dish from which Christ ate the Passover lamb with his disciples. It was brought to Britain by Joseph of Arimathea and was guarded by his descendants at their castle of Corbenic. It retains some of its earlier functions, for the sight of it heals the sick and when it appears at King Arthur's court it provides each person with the food he desires. But Arthur and his knights are told that the quest of the Grail 'is no search for earthly things but a seeking out of the mysteries and hidden sweets of our Lord, the divine secrets which the most high Master will disclose . . .'

The *Queste* is part of the compilation called the Prose *Lancelot* (1215–1230), which deals with the adventures of Lancelot and his love affair with Guinevere. There are warnings in the *Lancelot* that his adultery with Guinevere will debar him from achieving the Grail, and the author of the *Queste* invented a new character as the Grail-winner, Galahad, who was 'so grounded in the love of Christ that no adventure could tempt him into sin.'

When his knights swore the quest of the Grail, King Arthur lamented that this meant the end of the fellowship of the Round Table. He was right, for the *Queste*'s author intended Galahad's success to be a demonstration of the superiority of Christian ideals and the inadequacy of the worldly ideals of romantic chivalry. The one knight who is utterly dedicated to God and entirely free from any contamination of worldliness is the only one who fully achieves the quest.

Galahad, Perceval and Bors receive Mass from the Grail at the hands of the crucified Christ himself and 'it seemed as though the essence of all sweetness was housed within their bodies.' But only to Galahad was revealed at that moment 'those things that the heart of mortal man cannot conceive nor tongue relate, my heart was ravished with such joy and bliss . . . for so great a host of angels was before me and such a multitude of heavenly beings, that I was translated in that moment from the earthly plane to the celestial . . .'

Here the supreme experience of the Grail is the vision of union with God, the discovery of the 'secret and hidden wisdom of God' which St Paul had preached: 'what no eye has seen, nor ear heard, nor the heart of man conceived, what God has prepared for those who love him' (1 Corinthians, chapter 2). The Grail has translated Galahad from the barren Waste Land of life in this temporal and imperfect world to the eternal rapture of heaven.

Malory took the bulk of his Grail material for the *Morte D'Arthur* from the *Queste*. The Grail is taken away from Britain because of the sinfulness of the inhabitants. Galahad dies and the Grail is carried up into heaven. This is immediately followed by Lancelot's return to Guinevere and the public denunciation of the lovers. The knights divide into warring factions, the fellowship of the Round Table is destroyed and Arthur's reign comes to its bitter close.

A philandering priest, a web of political intrigue and the unhealthy atmosphere of a French convent formed an explosive combination which manifested itself in outbreaks of alleged demonic possession

URBAIN GRANDIER

BORN IN 1590 at Bouère near Le Mans, Urbain Grandier was educated by the Jesuits at Bordeaux. He entered the priesthood and in 1617 was appointed parish priest of St Pierre de Marché in Loudun, Vienne. Grandier was a handsome, attractive man of cultivated tastes who despite his calling had an eye for young women: a worldly type of priest, not uncommon in 17th century France. Unfortunately he lacked discretion in the conduct of his affairs, while his unguarded tongue made him many enemies.

In time his affairs became so notorious that they attracted attention in high places; matters came to a head in 1630 when he not only carried on a scandalous relationship with Madeleine de Brou, one of his young penitents, but was accused of being the father of an illegitimate child born to Philippa Trincant, daughter of the public prosecutor of Loudun. Trincant lodged a complaint against Grandier and persuaded La Rocheposay, Bishop of Poitiers, who disliked Grandier, to arrest him. On 2 June 1630 Grandier was charged with immorality and found guilty, but succeeded in persuading Archbishop Sourdis of Bordeaux to free him and lift his suspension from clerical duties.

Grandier returned to Loudun to find that his opponents had joined forces with Father Mignon, a priest who held the post of confessor to the nuns of a small Ursuline convent at Loudun and who was an old enemy of his. A conspiracy was apparently hatched to damage Grandier further by persuading some of the sisters that they were possessed by demons and to confess under exorcism that Father Grandier had bewitched them. Sister Jeanne des Anges, the Mother Superior, co-operated willingly and soon she and several other nuns gave bizarre signs of demonic possession, going into convulsions,

National Film Archive

adopting erotic postures, holding their breaths and distorting their faces and voices. One of the nuns at the height of an attack mentioned Grandier's name and soon several others began saying that Grandier was the cause of their possession. They claimed that the demons tormenting them had whispered the name of the parish priest of Saint Pierre, and Sister Jeanne herself confirmed his guilt, saying that her nuns were possessed by two devils, Asmodeus and Zabulon, at the bidding of Father Grandier. Gradually the story grew and became elaborated. The motive commonly imputed to Grandier for the alleged possession was thwarted ambition, a desire to revenge himself on the nuns because Jeanne des Anges was known to be opposing his advancement.

Alarmed at the growing scandal, in 1633 Monsignor Sourdis stepped in and again came to Grandier's rescue. He sent his own doctor to Loudun who pronounced that the nuns were not possessed and forbade Father Mignon to practise any further exorcism, 'as well as everybody else to interfere in exorcism under pain of losing their rights'. These sensible measures put a stop, as if by magic, to the nuns' convulsions.

Bewitched by a Bunch of Roses

Although peace was apparently restored at the convent, the conspiracy continued to fester. A relative of Sister Jeanne des Anges named Jean de Laubardemont, an agent of the Crown and a close supporter of Cardinal Richelieu, was sent to Loudun on government business. Learning that Grandier had published a satire which had infuriated the Cardinal and also that one of the nuns in the now notorious convent was related to his master, he reported back for orders to Richelieu.

For purely political motives, Richelieu wished to revive the institution of the Inquisition; he wanted to stage great public exorcisms which would impress the Protestants and clear the way for revoking the Edict of Nantes, under which freedom of worship was permitted to all demoninations. Seeing in Father Grandier's case an opportunity to instigate such a trial at Loudun – and at the same time to pay off an old personal score – he gave orders to Laubardemont to form a handpicked commission to arrest and convict Grandier.

To gain witnesses to support the original case against him, the Crown agent appointed three priests to exorcize the nuns publicly; under the ministrations of Father Surin, a Jesuit, Father Lactance, a Franciscan, and the Capuchin Father Tranquille, the women repeated their accusations of possession, displaying renewed symptoms of even greater intensity than in the previous outbreak. Grandier himself was coerced into exorcising the nuns, since it was alleged that it was he who was responsible for their condition. Besides the original charge of causing the nuns' possession, Grandier was accused of committing incest, sacrilege and other crimes, even in the church precincts, and some sixty witnesses were found to attest to these crimes. The Mother Superior herself swore that the nuns had been bewitched by Father Grandier tossing a bouquet of roses over the convent walls.

Even at this stage, Grandier appears to have totally underestimated the power of the forces ranged against him and to have considered that he had little to fear since the offences with which he was charged were imaginary. On 30 November 1633 he was suddenly thrown into prison in the castle of Angers. Proof of his guilt was immediately sought in the form of 'Devil's Marks' – spots on the body that were insensitive to pain, and found on four areas of his body; a not surprising result in the light of a later account by Nicholas Aubin who maintained that the method employed was to stab the priest with a lancet in one place causing a sharp pain, and then immediately after, using the blunt end of the instrument, touch him lightly elsewhere, predictably causing no reaction.

At the trial, in 1634, Richelieu's calculated choice of an investigating committee to handle the case, in place of the normal secular court procedure, denied Grandier his legal right to appeal to the Paris *parlement* and led to a complete travesty of justice. When the Bailli of Loudun led a public protest against the very irregular procedure, the movement was quashed by Laubardemont who represented it as a criticism of the King, and hence treasonable. All evidence in support of the priest's innocence of the charges was disregarded and pressure was brought to bear on a number of would-be witnesses for the defence, to induce them to keep silent on pain of incriminating themselves as witches. Several of the nuns had a change of heart and attempted to recant their previous statements, but the court refused to allow them to be heard. Jeanne des Anges herself was refused a hearing when it became evident that she wished to disclaim her previous evidence.

Radio Times Hulton Picture Library

Left **After a frenzy of demonic possession, Jeanne des Anges and her nuns lie prostrate in submission while prayers are offered for their release from the grip of devils; from *Mother Joan of the Angels*, a film about the Loudun case *Right* Urbain Grandier was burned alive in 1634 for bewitching the nuns of Loudun**

Proof of Grandier's guilt in the form of an alleged pact with the Devil, signed by Satan, Lucifer, Beelzebub, Leviathan and Astaroth, was produced by the prosecution, who asserted in all seriousness that the document had been stolen by the demon Asmodeus from the Devil's own files. When it was shown in Court, the words were found to be written from right to left, in 'mirror writing', following the widely held belief that devils performed most actions in reverse to show their hostility to Christianity.

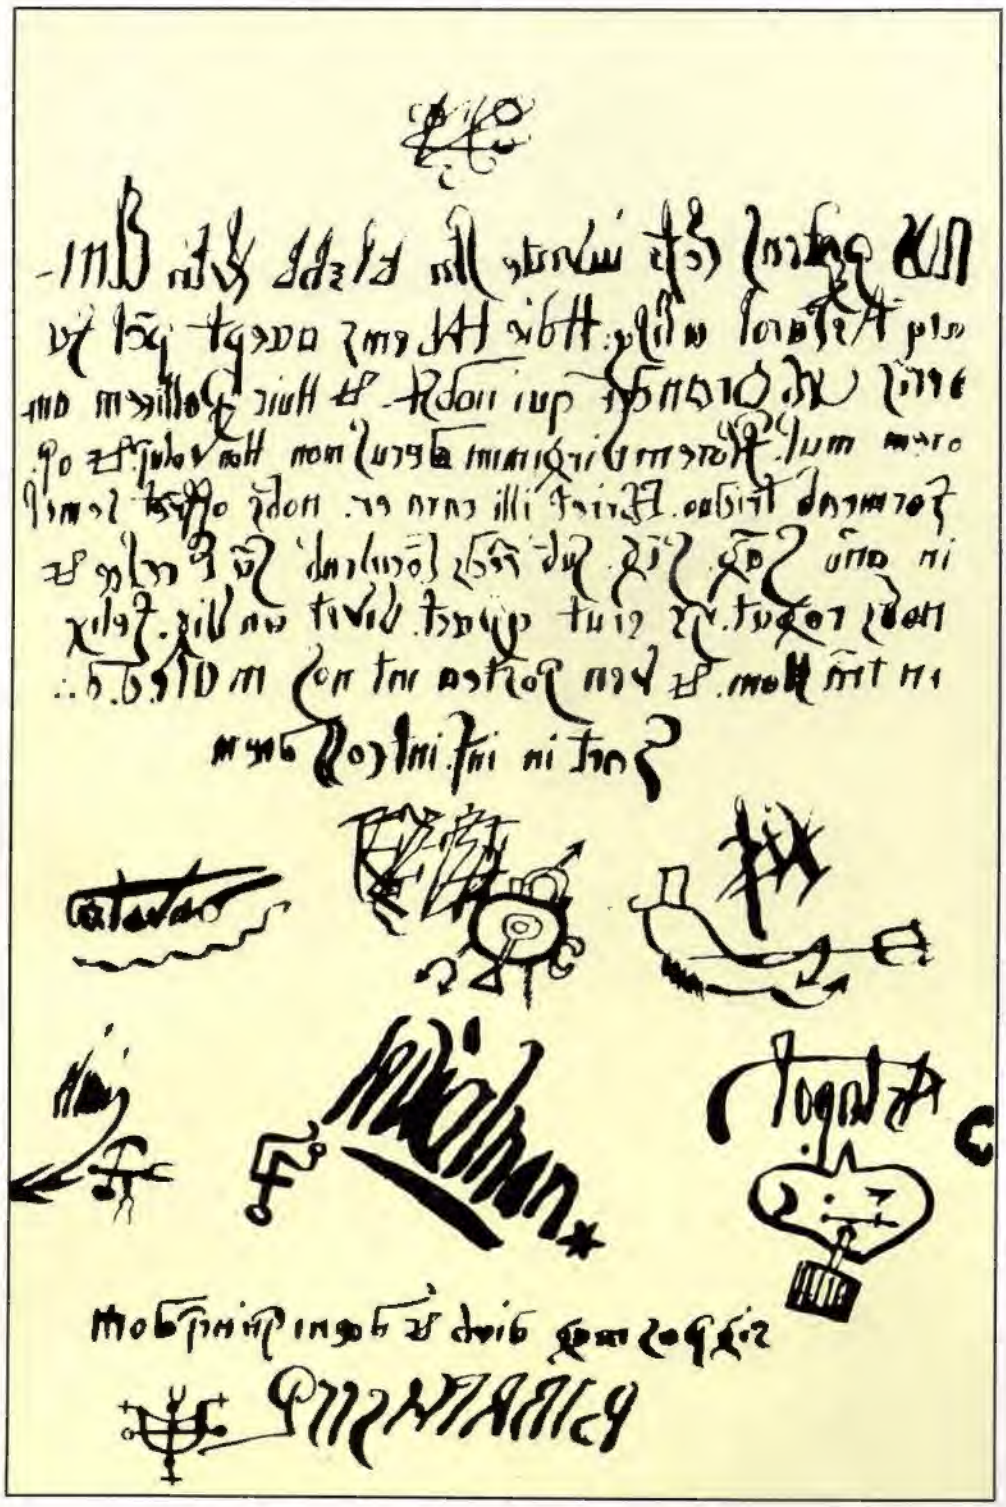
Judgement was pronounced on 18 August and Grandier was found guilty of the crimes of magic, maleficia (attempting to do harm by witchcraft) and causing several nuns to be possessed by demons. Sentence was passed, the priest being condemned to be tortured according to the 'first and last degrees', with the purpose of forcing him to incriminate others. After this, on the day of his execution, he was to ask God's pardon before the door of St Pierre, and then be taken to the public square of St Croix and burned alive.

Grandier's extraordinary dignity and courage under torture – a contemporary writer records that this was so extreme that the marrow oozed out of his broken bones – served merely to infuriate his persecutors, in particular the Capuchin friars. Grandier refused to gain remission by naming imaginary accomplices and although he had been assured that he would be strangled before reaching the fire, the rope was knotted in such a way by the friars that it could not be drawn tight enough: he was burned alive.

Today Grandier's innocence is no longer in doubt, even among Roman Catholic authorities who accept that there were several authentic cases of possession. Even before the publication in 1880 of Dr Legne's *Urbain Grandier*, containing contemporary documents, the case had been summed up 20 years earlier by Abbe Lécanu, who wrote: 'it must be admitted . . . that apart from the evidence of the possessed, who never described a single act capable of being proved, there cannot be found in the enormous dossiers on this affair any proof, any indication that he ever entered into any traffic with Satan' (*Histoire de Satan*, 1861). Indeed among Grandier's own contemporaries many theologians were shocked by the contradiction of the evidence which led to his sentence; according to all Christian tradition Satan is an eternal liar, yet in the eyes of the committee which tried Grandier, Satan became an essential witness.

A Demon Named Zabulon

After Urbain Grandier's death the authorities were faced with the embarrassing situation that not only did the possessions continue, affecting indeed the Mother Superior herself, but the agitation had spread beyond Loudun. The government was being lampooned and scurrilous songs were being sung about the Cardinal. If only to justify Grandier's execution, it became imperative to exorcize Jeanne des Anges. An intelligent and saintly man, Father Jean Joseph Surin, was appointed her spiritual adviser; his memoirs taken together with Jeanne's autobiography, throw some light on her personality and the extraordinary events at Loudun. 'I was more determined than ever,' wrote Father Surin, 'to follow the path of penitence and prayer in making these nuns serve God with more fervour than before'. He offered himself to God 'to be burdened with Jeanne des Anges' evil and to feel all the sensations so far as being possessed by the Devil, provided it pleases his divine goodness'. This close association, in which the exorcist and victim, as it were, exchanged roles, went some way to healing Jeanne's soul. She began to have mystical visions of God and not all of these appear to have been invented, although undoubtedly some were embellished.



Formal agreement, signed by the demons Satanas, Beelzebub, Lucifer, Elimi and Astaroth, promising Grandier the love of women, wealth and worldly honours in return for his allegiance. Written backwards and from right to left because demons do everything in reverse, this document was produced in evidence at Grandier's trial

Under the Jesuit Father's spiritual direction, considerable success was also achieved in exorcizing the nuns who were still possessed. The withdrawal of the 'pension' which Richelieu had granted to the possessed nuns for testifying against Grandier, when the Cardinal lost interest in the case, brought about further improvement. Unfortunately, Father Surin was recalled by the Jesuits before Jeanne's demons were completely exorcized. A demon named Zabulon whispered to her that he would never leave her except at the tomb of St Francis de Sales. After Jeanne made a visit to Italy to visit the tomb, the demon duly departed and by 1638, four years after Grandier's death, the possession had been won over.

A number of explanations, in the light of modern knowledge, could account for the extraordinary behaviour of Jeanne des Anges and her nuns. It is still debated whether she was really possessed, a fraud, a hysteric, or possibly an epileptic.

Undoubtedly there was a strong exhibitionist streak in her nature. 'The Devil', she wrote, 'often tricked me with a little pact that I had gyrations and other peculiar things he did with my body. I took tremendous pleasure in hearing people talk about it and I easily appeared worse than others'. In rare moments of honesty she confessed: 'Very often I realized very clearly that I was the prime cause of my troubles and that the demon only acted according to the cues I gave him'.

The events in her life which led up to and followed her involvement in the Grandier trial illumine, if they do not explain, her part in this extraordinary drama.

Born Jeanne de Belcier, of moderately wealthy parents living in the western province of Saintonge in 1602, as a child she was physically handicapped with one shoulder higher than the other. It could perhaps be argued that her desire to compensate for this personal defect led to the exhibitionist tendencies and disturbed fantasies which became apparent in later life. The Abbey of Saintes where she went to school from the age of ten to fifteen, and where one of her aunts was prioress, asked her to leave before she had completed her studies. At 18 she entered the Ursuline convent at Poitiers and apparently proved an indifferent novice, fretting against the discipline and bored with prayer. 'I was looking,' she said later in her autobiography, 'in so far as my condition allowed, for pleasure – although I found it in nothing.' She discovered the art of shamming sanctity, claimed to experience visions and generally counterfeited an image of saintliness. Her conduct impressed her superiors and in 1627, at the age of 25, she was nominated prioress of the Ursuline convent at Loudun. She was unpopular with the nuns and there was bitter opposition to the appointment.

To her convent parlour came gossiping friends from the outside world and it was here that she first heard the name of Urbain

Grandier, the parish priest whose affairs were the talk of the town. The nuns and in particular their dissatisfied and embittered Mother Superior became obsessed with the thought of Grandier, who had come to epitomize the forbidden pleasures off the flesh. There are indications that the motive put about by Jeanne for Grandier's alleged possession of the nuns – that it was ao act of revenge because she had stood in his way when he applied to be appointed confessor to her convent – was the distorted projection of a neurotic personality and that the opposite was nearer the truth. It seems far more likely that Jeanne, fascinated by Grandier's reputation as a womanizer, attempted to persuade the priest to accept the appointment and was rejected. Plain and lacking in affection, Jeanne des Anges needed above all to draw attention to herself and it was in this situation that the advantage of simulating possession probably occurred to her, either consciously or unconsciously. Better to be possessed, she may have reasoned, than to remain unnoticed and distinguished.

After the pilgrimage to the tomb of St Francis and the expulsion of the last of the demons, a new life began to her; no less spectacular and self-absorbed than before, it encompassed visions, prophetic utterances and alleged healings. The climax occurred when her left hand was said to have developed stigmata in the shape of the names of Jesus, Mary, Joseph and Francis de Sales. She attracted even greater notoriety than before and received the ultimate accolade of being received at Court and being granted an audience with Richelieu, who found her stigmata 'admirable'. Apart from her autobiography, there is little contemporary evidence either for the stigmata or for the miracles which she claimed.

In time the events at Loudun, a psychological drama intermingled with politics which ended in tragedy for Urbain, faded into oblivion. Jeanne died at Loudun on 29 January 1665, shortly before Father Surin.

GREAT BEAST

Bodleian Library Colour Filmstrip

The mouth of hell, from a manuscript in the Bodleian Library, probably influenced by the Great Beast of the Apocalypse, which was like a leopard and to which the Devil gave his power and throne and great authority on earth

'AND I SAW a beast rising out of the sea, with ten horns and seven heads, with ten diadems upon its horns and a blasphemous name upon its heads.' This creature is the Great Beast of the Apocalypse, whose identity is concealed behind hints, symbols and a numerological puzzle.

In chapter 11 of the book of Revelation an angel announces that the kingdom of the world has become the kingdom of God. This proclamation is immediately followed by the titanic rebellion of the powers of evil and the coming of Antichrist. Satan appears as the great red dragon, there is war in heaven, and the dragon is hurled down to earth and his angels with him. A voice in heaven prophesies, 'woe to you, O earth and sea, for the devil has come down to you in great wrath, because he knows that his time is short.'

In chapter 13 this 'woe' takes the form of the beast which rose from the sea. It was like a leopard, with the feet of a bear and the mouth of a lion. 'And to it the dragon gave his power and his throne and great authority.' One of its heads 'seemed to have a mortal wound, but its mortal wound was healed.' The whole earth followed the beast with wonder and worshipped it, saying, 'Who is like the beast, and who can fight against it?'

The beast held sway for $3\frac{1}{2}$ years, during which it made war on the saints and conquered them, it had power over every tribe and people, every tongue and nation, and everyone on earth worshipped it except only those whose names were written before the foundation of the world in the book of life of the crucified Christ.

'Then I saw another beast which rose out of the earth.' This was the first beast's lieutenant, which worked great signs and wonders, and which ordered the people to make an image of the first beast and worship it. It caused everyone to be marked on the right hand or the forehead with the mark of the first beast, which was its name or its number. 'This calls for wisdom: let him who has understanding reckon the number of the beast, for it is a human number, its number is 666.'

From the Sea

The early Christians believed in a coming struggle between God and a great opponent, an evil counterpart of Christ, who would claim to be God, work delusive miracles in parody of Christ, and deceive people into worshipping him (see ANTICHRIST; BELIAL). Some commentators identified the second beast, the one which rose from the earth, as Antichrist because it worked signs and wonders. But it is more likely that for the author of Revelation the Great Beast 666 was Antichrist, though he does not use the term Antichrist itself. The second beast is called 'the false prophet', a reference to the 'false Christs and false prophets' of whom Jesus spoke, who will show signs and wonders to lead the elect astray (Mark, chapter 13). Its ancestry goes back further, to Deuteronomy (chapter 13) where the people are warned against a prophet and dreamer of dreams who will show a sign or a wonder and try to persuade them to worship false gods. The passage in Mark suggests that as the second beast is the false prophet, it is likely that the first beast is the false Christ.

The first beast unites the characteristics of the four beasts seen in a vision in the book of Daniel (chapter 7), which stand for four empires which in turn oppressed the Jews – Babylon, Media, Persia, and the Greek empire of Alexander the Great. The $3\frac{1}{2}$ years of the beast's rule also come from Daniel (chapter 12), the 'time, two times and half a time' after which the power of the persecutor will come to an end, the persecutor being Antiochus Epiphanes, the first human model for the figure of Antichrist.

The beast comes up from the sea, which in Revelation is the home of the forces which oppose God. This harks back to Mesopotamian, Canaanite and Jewish myths in which to create the ordered universe, or keep it in being, it is necessary for the monster of the deep, the chief of the powers of chaos, to be defeated (see CREATION MYTHS; DRAGON). When Revelation comes to the creation of the new heaven and the new earth, we are told that 'the sea was no more'.

It is generally accepted that if the Great Beast is Antichrist in the spiritual sphere, on earth it is Rome, the empire which now oppressed Jews and Christians. The worship it insists on is the cult of the deified emperors, and the false prophet probably stands for the local authorities responsible for the imperial cult. The fact that the Great Beast comes from the sea (from abroad) and the false prophet from the earth (from at home) may reflect this. In chapter 17 the whore of Babylon (the city of Rome) is seen riding on a scarlet beast, which is probably identical with the Great Beast. The seven heads of this beast stand for hills (the seven hills of Rome) and also for seven kings (Roman emperors).

The head that was mortally wounded but healed looks like an allusion to the persistent rumours that Nero, the persecutor of Christians, who committed suicide in 68 AD, was not really dead but would return with an army to conquer Rome. The image of the beast recalls Caligula's orders, issued in 30 AD but never carried out, that his statue be placed in the Holy of Holies at Jerusalem, an intended sacrilege which horrified the Jews.

In chapters 19 and 20 the beast and the kings of the earth with their armies do battle with the forces of God, led by the rider on a white horse, the Word of God. They are decisively defeated and then

Michael Halford

Tapestry showing the Great Beast which rose from the sea, with seven heads and ten horns, and which represented Antichrist in the spiritual sphere and on earth the Roman Empire and the cult of emperor-worship

slaughtered. The beast and the false prophet are thrown alive into 'the lake of fire that burns with brimstone', where they will be 'tormented day and night for ever and ever'. The Devil himself is shut away in the bottomless pit for 1000 years.

Number of the Beast

The number riddle which has produced so many solutions, some of them singularly eccentric, is an example of gematria (see GEMATRIA). Evidently the Great Beast's name or title will add to 666 if its letters are turned into numbers. The obvious candidate for the honour is Nero but Revelation was written in Greek and his name in Greek, Neron, adds to 1,005. However, if his Greek title Neron Kaisar is turned into Hebrew letters, the total is 666 (nun – 50, resh – 200, waw – 6, nun – 50, qoph – 100, samech – 60, resh – 200). Nero also has the advantage of explaining the western tradition that the number was really 616, for if the Latin Nero Caesar is turned into Hebrew letters, it adds to 616.

Austin Farrer pointed out the interesting connection between 666 and the number of Jesus, which is 888 (see EIGHT). Eight is the number of rebirth and resurrection, and 888 shows that Jesus rose from the dead on the *third* day, which was a Sunday, the *eighth* day from the beginning of Passion week. The Friday on which Jesus was crucified, and on which the powers of darkness apparently triumphed, was the *sixth* day from the beginning of that week. So if 888 is the number of Jesus, it is fitting that 666 should be the number of Antichrist. In addition, 8 and 666 are connected because $8+7+6+5+4+3+2+1 = 36$, and if the same process is applied to 36, the total is 666.

GREAT CHAIN OF BEING

IN MODERN TIMES the phrase 'great chain of being' is often applied to a way of looking at reality, developed from the thought of Plato and Aristotle, which became predominant in the ancient world during the first centuries AD. In it the universe, 'all things visible and invisible', is thought of as proceeding from a transcendent first principle in a continuous series of ordered stages, a great chain of being which descends from God through the ranks of spiritual beings and the visible heavens, to end with the material bodies of the world below the moon. Man's position in this static, hierarchical world is in the middle. He is an embodied soul, a spiritual being of the lowest rank of the frontier of the spiritual and material worlds: sometimes he is by no means the highest kind even of embodied spiritual being if the sun, moon and stars are thought of as alive and divine, or if angels and spirits are thought of as having some sort of ethereal or aerial bodies. He has to control the material beings below him and his own bodily life by his reason, but he is only able to do so because he can look upwards in contemplation and travel up in spirit through the hierarchy of beings above him to its transcendent source.

Often man is thought of as a microcosm, a little universe, containing within himself in his own mind, life and body all the ordered levels of being (and responsible for effectively keeping them in proper order). This view of the universe, with important variations but very little essential modification, continued to dominate European and much Moslem and Jewish thought throughout the Middle Ages and Renaissance. When medieval Aristotelianism was challenged and to some extent superseded by Renaissance Platonism the influence of 'great chain of being' thinking on men's minds was strengthened rather than weakened. Like the various kinds of Christian Platonism in the earlier Middle Ages, the Aristotelianism of the great medieval scholastics was a derivative of Neoplatonism, which already in its earlier forms had a large Aristotelian element in it, which had contributed a great deal to the formation of its 'great chain of being' school of thought. The Platonism of the Renaissance looked back directly to Neoplatonism and produced a more literary, less logically rigorous, more passionate and imaginative understanding of the 'great chain of being' which was very powerful for a time. It was only well on in the 17th century that it was generally superseded by more modern ways of thinking.

The One and the Many

In this way of thinking about the universe, especially in its earliest pagan Platonic form, the transcendence of the First Principle from which the great chain of being proceeds is very much stressed. It absolutely surpasses everything which it produces, and it does so especially by being absolutely single and simple. For those who thought like this, the seed in its concentrated unity was far superior to the evolved structure of the tree with its complex of separate parts. This first One from which the Many proceed in order is absolutely self-sufficient in its infinite perfect simplicity. It gains nothing by producing, needs nothing of what it produces, and remains unchanged and undiminished by its production. There is therefore some difficulty in seeing why and how it produces anything at all.

Sometimes it was maintained that, just as the First Principle itself in its infinite simplicity is beyond the reach of our thought, so no explanation can be given of how or why the unthinkable Absolute creates. In Christian versions of this way of looking at the universe, creation depends on the free will of God, and his freedom to create or not to create is very much stressed, sometimes in a way which suggests an arbitrary whimisicality at the fount of everything. Generally some attempt is made to explain the how and the why, to bridge the gulf between the One and the Many, to hook the great chain of being firmly onto the Absolute.

In pagan Platonism intermediaries are sometimes multiplied, and in some forms of early Christian theology the Logos, the Word and the Son of God, is the intermediary link between the Father and creation. The 'why' is most effectively explained in this way of thinking by appealing to the principle that good naturally diffuses or imparts itself. In Platonic thought this is an important part of the meaning of 'good'. Being good means doing and producing good; so the Absolute One, being absolutely and supremely good, is supremely productive and creative. This can be maintained without denying its freedom.

The principle that good naturally imparts itself carries with it in this way of thinking what is known as the 'principle of plenitude'. The Absolute Good must expand the creativity which is an essential part of its goodness to its furthest limits. It must bring into being all that can possibly exist, from highest to lowest. Everything is good in its own order and degree, though some good things are very inferior to others. But it is better that even the most inferior should exist, for the sake of the completion of the whole. Material reality is not sharply separated from spiritual, or living from non-living: the great chain of being goes down unbroken through all its degrees. In fact an important feature of this type of thought is that the material universe is thought of as an organism, not as a machine, a great complex living being containing innumerable living beings. Life and soul are prior to and produce mechanical movement, not the other way round. Everything is thought of as being an image of the First Principle in its own way and on its own level, and the material world is generally thought of as an image of the spiritual world.

The view of man's function in the universe which goes with this conception of it is the ancient contemplative one of Greek thought. Man is to contemplate it, rather than master it by his technological powers. He has to know his place in the world and fulfil his active functions, but his main object is to rise through the levels of being to contemplation of and union with the Supreme. Attitudes to the world of non-human nature can vary in this way of thinking. The natural world can be despised in comparison with the spiritual, or it can be greatly valued as a universe of signs in which God makes himself present to our spirit. But it is never thought of primarily as raw material for human exploitation.

Knowing His Place

In social and political thinking the 'great chain of being' obviously goes well with the sort of hierarchical society in which this kind of thought developed. It makes a hierarchy of more or less fixed social classes and ranks, each with their own function to perform, culminating in an absolute monarchy ruling by divine right, seem an appropriate way of organizing human society, and is liable to lead to the emphasis on the importance of everyone 'knowing his place' and keeping it. But there are, after all, a number of different ways of ranking human beings, and this mode of thought should not be assumed to involve inevitably the unquestioning acceptance of the claims of the absolute monarchy or of a social pecking order based on hereditary status. The philosophers who originated this kind of thought considered that only virtue and wisdom entitled a man to rank high among his fellows, and this ideal of goodness and wisdom as the only things which ought really to matter in human society never entirely lost its power. And among Christians, not only was holiness supposed to confer the highest possible human status, but the position was further complicated by the existence of the Church hierarchy, which in theory was wholly independent of the worldly hierarchy of birth, rank and wealth. An ordinary Christian during the period when 'great chain of being' thinking was prevalent would have considered a poor and low-born holy man, especially if he also happened to be a bishop, superior to a king or even a high-born pope of notoriously evil life. And everyone would have agreed in despising a very rich man without high birth, virtue and wisdom. Of course, there was always a tendency towards the pompous fiction that those holding high rank in Church or State were automatically virtuous and wise.

The influence of the 'great chain of being', not only on philosophy and theology but on European art and literature throughout the Middle Ages and Renaissance was immense. In art, the idea of the hierarchical universe under the transcendent God found expression in the architecture and decoration of Byzantine churches, and in literature 'great chain of being' thinking is particularly apparent in English literature of the 16th and 17th centuries. Its last great champions in England were the Cambridge Platonists who fought a determined, though in the end unsuccessful, battle against the newer view of the universe, practical, mechanical and non-hierarchical, which accompanied the scientific developments of the 17th century and eventually superseded the older way of looking at reality.

Great Plains Indians

Eric Cross

In Great Plains Indian mythology, the buffalo were believed to have once been a race of savage, horned human beings, the predecessors and hunters of man *Left* The Mandan buffalo dance, commemorates the emergence of man from beneath the earth by the sacred tree and the subsequent period of man-hunting, before the buffalo were metamorphosed into animals: 19th century painting by Karl Bodman *Right* The Sioux conception of the happy hunting ground was of a place where warriors were borne through the sky on magnificent steeds; birds were believed to carry messages to heaven: the *Sky People*, a modern Indian painting

Central to the American Plains Indians' view of life were the twin ideals of unflinching bravery and union with the supernatural through visions. In their most important ceremony these aims were united; a fearful heroism was required to endure the tortures of the mystical Sun Dance

LONG BEFORE the white man reached North America, tribes of Indians roamed the great plains: primitive and poor, they struggled to survive the hardships of prairie life. Then, in the later part of the 18th century, they briefly achieved wealth and power, both materially and culturally. This change was due to their acquisition of horses, from the wild herds that were offspring of horses brought to Mexico by the Spaniards. Mounted, the Plains Indian became a master buffalo hunter and a fierce, dangerous warrior and this has remained the popular image of him, in spite of the fact that by the mid-19th century his rule of the Plains had been destroyed by the white man's rifle, which decimated the buffalo and (with whisky, disease and other adjuncts of civilization) killed Indians. But the Plains Indians have become a modern legend, for the glorious futility of their wars against the whites, their ferocity in battle – they were perhaps the finest light cavalry in history – and their embodiment of many traditionally heroic traits.

Although the Indians reached a fairly high level of culture in their brief heyday, their social and cultural structures remain comparatively simple, with none of the complexities of the Pacific Northwest tribes, or of African peoples with deep-rooted and ancient traditions. The major cultural changes wrought on the Plains tribes by the advent of the horse tended to iron out the major cultural differences among the individual tribes. The Comanche of the south-west, the Cheyenne and Pawnee who fought over the central plains, the Sioux and Blackfoot who ruled the grasslands near the Canadian border – these tribes and the others, in spite of language barriers and continual wars, had much in common.

The gods of the Plains Indians were rarely conceived of as a clearly structured, hierarchical pantheon. The gods or spirits were a more or less vague grouping of powers, seldom ranked as lesser or greater, not always with specifically defined attributes or supernatural roles. Some of the tribes did have a definite idea of a supreme deity, who appears in their creation or origin myths. The Dakota Sioux and the Blackfoot tend to give pride of place to the sun, but the Blackfoot complicate matters by ascribing creation to a fairly explicit 'trickster' figure, a god or spirit in temporary animal form. The Pawnee possess myths of the great god Tirawa, meaning father or 'Power Above'; but even in this case the supreme god is little more than a rather cloudy abstraction. He may or may not be identified at times with the sun or some other obtrusive natural phenomenon like thunder or the morning star. But predominantly he tends to be a character in mythological tales rather than an omnipresent god with whom man can come in contact.

The Trickster Spirit

Environment plays an important role in Plains myth and most Plains Indians ascribe godhead to the sky, the stars, the moon, the wind and so on. The Pawnee, with a sound if embryonic astronomy, were especially devoted to star gods, and share with other tribes a high regard for the hero-god of the morning star. Water gods are important to the Sioux and others; fire and thunder, constant companions to the people of the level, dry plains, appear in many tales of mighty spirits. Sometimes the fertility goddess known the world over as the Great Mother or Earth Mother, plays a role in the old tales – probably carried over from the days before the horse, when maize was as economically important as buffalo.

Animal gods occur frequently in the Indian myths, sometimes as one of the great gods temporarily in animal form, more usually as a generalized spirit or power in that form appearing for a specific purpose, and it is in these explicit guises that the Indians make contact with the supernatural in their prayers and worship. In the myths and tales, however, one such animal spirit takes definite precedence: the trickster figure, one of the most complex but fascinating concepts in all mythology.

This god, or hero, is a lesser deity but at the same time he is one of the first gods, who existed before creation. His actions are often heroic, fighting great battles, righting wrongs and punishing evil-doers, and sometimes his role expands into that of the creator of the world or of mankind. Yet many of the trickster stories involve him in the most farcical mischief-making, showing him to be a clever but small-minded practical joker.

The trickster goes by many names among North American tribes: in the Pacific Northwest he is the hero Raven; on the Plains, he is Coyote to the Pawnee. The Cheyenne call him 'Wihio', translatable sometimes as 'white man', sometimes as 'spider'. The Blackfoot trickster is Napi, and has much in common with the Cheyenne's: his name can mean 'white old man' but is often rendered as just 'old man', especially when his role of creator is implied.

The myths of the trickster as creator often show him bringing about the origin of some natural phenomenon more or less by accident, or as the casual side effect of some

Hamlyn Group Library

Camera Press London

joke or piece of mischief. Often the joke is on the gods: the trickster fools and bedevils them into some action that will directly or indirectly benefit the earth and man.

There seems to be little contact, in the sense of direct worship, between the trickster and his believers. He figures in myths that explain Nature and in comic tales, and the Indians seem content to leave it at that. When they wish to make representations to the supernatural world, they direct their prayers and supplications to animal gods or Nature spirits, which can be seen as concentrations of spirit power that have become focused in animal form. So it is not to the buffalo god or the eagle god that the Indian prays – but to the buffalo or eagle power, one area of supernatural power that flows to man through certain animals or natural phenomena, such as thunder power or wind power. These animal or natural powers serve to a great extent as guardian spirits. Tribal spirits are dictated by tradition and the old tales; but individuals can acquire their own direct contact with a specific spirit or power. Some individuals acquired deeper knowledge of the tribal spirits and closer contact with the supernatural, and these became shamans, or medicine-men.

Role of the Medicine-Man

The medicine-man had certain prescribed functions within the tribe. He often looked after the community's major religious relics and paraphernalia, and led the religious ceremonies. He made the broad appeals to the gods or powers on the tribe's behalf, and was often the source of vital prophecies about matters such as the location of the buffalo or projected success in war. Quite often the medicine-man and the tribal chief were the same person, religious and secular leadership in one.

Semi-nomadic peoples like the Plains Indians see their shamans differently from more settled, agricultural tribes. The hunter, it seems, places more value on individualism. Any man can make contact with the supernatural, so to some extent every man is his own shaman. The medicine-men are not a separate priestly caste, as occurs in other primitive organizations, with priests jealously guarding their rights as the sole repositories of power, monopolizing the links between men and gods. Plains Indian medicine-men may have extra-sharp 'antennae' for godly matters, an extra capacity for religious ecstasy or magical power. But the ordinary Indian has these abilities too. In terms of curing the sick, for instance, the ordinary tribesman knows enough rites and prayers for purposes of first aid, while the medicine-man's more extensive spirit contacts provide specialist help.

Indian ceremonials primarily involved special dancing, accompanied by songs and prayer chants, backed by music from drums, rattles and whistles. Often the dancing took on magical overtones: a Blackfoot war dance required the dancers in full battle regalia to gallop their horses round the fire and then to dance on foot in a manner representing the proud dancing step of horses. Most tribes had special magic rites to 'call' the buffalo, often similarly involving mime of a buffalo herd. Tribes like the Pawnee who combined agriculture with hunting had special planting and harvesting rituals with magical protection for the fields and insurance of good crops. At one time the Pawnee sacrificed a captured girl from an enemy tribe as part of their planting rite, possibly a remnant of Aztec influence.

Many Plains tribes engaged in semi-religious and semi-social ceremonials, including one called the Grass Dance in which specially costumed celebrants enjoyed a feast, gave away possessions as a form of self-denial and imposed temporary celibacy on themselves. Scalp dances, in honour of victorious warriors, can also be seen as both social and religious celebrations. And celebration was the undercurrent beneath the ritual that became not only the highest expression of the Plains Indians' religious individualism, but also the greatest single religious event of the year. It was the terrible and exalting Sun Dance, the core of Plains Indian religious and magical belief.

Agony of the Sun Dance

The Indian warrior's personal path to the gods, the supernatural powers, was by way of the Sun Dance. It was basically a 'vision quest', the most sacred and crucial of all the ways in which visions could be obtained. The whole superstructure of the religion depended on the vision, in which the supernatural became manifest to the individual man; without it he would have no guardian spirit, no 'good luck' magic, no supernatural

Hamlyn Group Library

The Indians owed to the buffalo their food, clothing, livelihood and wealth, and something of the animal entered into every ceremony

assurance of survival and success. Visions might come through ordinary dreams, or could be induced by fasting, by magical means such as sleeping near the grave of a once-powerful shaman, even by drugs. Peyote, derived from the mescal cactus that is Nature's own hallucination-producing drug, became popular in the late 19th century as a quick route to visions (see PEYOTE CULTS). But always the most memorable and most admirable visions sprang from the awful tortures of the Sun Dance, still practised as late as the 1940s. The Indians knew as well as any early Christian ascetic the value of mortification of the flesh as an open door to hallucinations; they also saw the Sun Dance as a splendid test of their courage and endurance.

The ceremony had only little to do with the sun itself, in the sense of active worship of that god. The Sioux name for it is more specific, 'Sun Gaze Dance', for the dancer's suffering was magnified by his being required to perform the ritual while under the brazen midsummer sun, shining through the open-roofed medicine lodge. The effect of the sun was in turn increased by the purifying preparations of the sufferer before the dance, when he went without food and water, often for several days. Perhaps he would also have spent time in the 'sweat house', a primitive sauna bath consisting of a closed hut with steam rising from water thrown over hot stones.

Once purification was completed, the medicine-man or some other appointed elder of the tribe would bring the dancer to the appointed place and make the final preparations. He would be ritually painted, complete with simulated tears on his cheeks to anticipate the real ones that would flow. Then two sets of vertical incisions would be made in the dancer's pectoral muscles, and sometimes also in the upper muscles, and back. The incisions were arranged so that wooden skewers could be thrust through the muscle, looking like the pins put into cloth by a seamstress to mark her line. Rawhide ropes would then be tied to the skewers, their other ends attached to a high 'sun pole'.

The dancer had to lean his full weight on the ropes, that is on the skewers, and dance round the pole under the cruel sun until the skewers were torn free from his flesh. Sometimes heavy shields would be hung from the back skewers, or other means used to wrench them free in the same way. Sometimes, too, the dancer would be lifted off the ground by the ropes, to hang until his flesh gave way. And throughout the agony he would sing ritual songs, and appeal to the powers for a special vision.

When release from the skewers came, the terrible wounds would be treated by the medicine-man, and the dancer would go alone to his lodge to await a vision out of the pain-drenched and delirious sleep that might follow – unless, of course, he had been lucky enough to experience hallucinations while on the ropes. Because his whole culture had prepared his mind with a firm belief in visions and their necessity in a warrior's life, visions usually came – most often in the accepted form, where a particular god or power assumed animal shape, or that of some natural phenomenon. If the supernatural visitor came as a hawk, then the dancer's guardian spirit would from then on be the hawk, and his whole life would be overseen by the special power that the hawk represented.

The Sun Dance had a central role, with only the most trivial tribal variations, in the religious practice of all Plains tribes. In the later years of their decline another religious ceremony grew up, similarly common to most of the tribes, and nearly rivalling the Sun Dance in its short-lived importance. The Ghost Dance, which was performed towards the end of the 19th century in a final attempt to get rid of the white man, with the help of the ghosts of the Indian dead, and return to the old way of life, was inspired by a vision experienced by a Paiute Indian (see GHOST DANCE).

The Indian gods can be seen as a grouping of rather abstract supernatural powers, less explicity conceived of in human terms than, say, Greek or Norse divinities. When a

vision, engendered by the Sun Dance or other means, illumines an Indian's individual guardian spirit for him it also provides him with some personal magic. Many of the common amulets and talismans in use among Plains Indians were introduced through such visions – for instance, the 'thunder bow', an ornamented bow with a lance-head on one end, partaking of 'thunder power', or what we could call the power of the thunder god. It was a general talisman to bring good luck but also gave protection against lightning and against being wounded in battle.

Magic Bundles

But no amulet, no other container of magical power, protective or otherwise, could rival in importance the tribesman's personal 'medicine bundle'. The bundles were collections of odd objects and artefacts, most of which were related in some way to the form taken by the god or power in the Sun Dance vision. The objects would be wrapped in some special way, and the whole bundle would never be far from its owner – especially when some major undertaking was planned, when the bundle's power and protection would be invoked by the songs and prayers that might also have been dictated by the individual's vision.

Special taboos often went along with a medicine bundle, relating to the shape taken by the visiting spirit who conveyed its contents to the visionary. If an Indian's vision had concerned a beaver, so that he owned a beaver bundle (probably wrapped in the fur of that animal), he could never show fear of water – his guardian's favourite element. A man owning a snake bundle could never break any bone within his house. Ordinarily, though, Plains Indian beliefs were by no means as taboo-ridden as those of other primitive peoples. Such proscriptions occurred mainly in areas of life directly connected with the vision quests and the medicine bundles – such as the obvious taboo against freeing a Sun Dancer from his agony before the final tearing of his flesh, or the taboo when the tribe was on the march against anyone passing in front of the man carrying a tribal medicine bundle.

Tribal bundles were immensely powerful and venerated objects, handed down over many generations from their legendary origin – some distant divine visitation. One or more medicine pipes served as tribal bundles for the Arapaho, Blackfoot, Dakota and some others; they were never smoked but their spiritual power remained accessible. Special individuals – often medicine-men but not always – took charge of the pipes by inheritance, and through them led the tribe in prayer for prosperity, cures for the sick, victory in battle and so on. The Cheyenne put their tribal belief in a handful of ancient and sacred arrows and, among the northern branch of the tribe, a sacred hat made of buffalo skin topped with horns.

Such community bundles served active purposes as well as the passive function of tribal protection and the bringing of luck. The Pawnee used a special bundle called a 'storm eagle' – a dead eagle stuffed with magical objects – to raise storms over enemies. The Cheyenne performed spell-casting gestures with the sacred arrows before a battle, in a mime of the foe's defeat. So the general idea of magic working, like the general idea of amulets and taboos, never gets far away from the focus of the vision and the medicine bundle. The Plains Indians had no really rich store of spells and incantations for historians of magic to plunder. The Blackfoot and Cree had a few gentle love charms, involving birch bark images. Comanche medicine-men might work evil sorcery against rivals, or a forsaken maiden might throw a spell on her erstwhile lover (by burying a segment of her own flesh on a mountain peak and praying that the lover would decompose along with the piece of herself). But such elements in Plains Indians lore are comparatively rare. Certainly the men were too proud of indulge in magic: the anthropologist Ralph Linton records that among the Comanche, 'malevolent magic was never used between rivals of war age.'

So to a large extent magic, like religion, was kept firmly in its place by the Plains Indians. They were hunters and warriors, first and always – restless, wide-ranging, individualistic and proud. Life for an Indian before the white man came was usually short, always hard, often cruel; afterwards life was shorter, harder and even more cruel. So it might be said that the Plains Indians had little time or energy to spend on working out involved and sophisticated pantheons of gods with neatly arranged aspects and attributes – nor could they concern themselves with too extended and detailed approaches to the craft of magic. Perhaps they obtained most of the magic they needed from their ecstatic and agonized vision quests. And perhaps they found most of the religion they needed in their awareness of their awesome environment – the interminable prairie grasslands and the immense prairie sky.

MAN, MYTH & MAGIC

VOLUME 5

Gree – Init

Michael Holford

GREECE

Sonia Halliday

In the religion of classical Greece elements from Crete blended with elements from the Greek mainland: 'the most dramatic form of this lengthy process was a struggle, never quite to be resolved, between the concept of a mother goddess and the newer concept of a dominating male god, Zeus'

THE HISTORY OF GREEK RELIGION reflects an uneven, halting but recognizable development from magic to officially sponsored religion; from an epoch when men had not clearly separated themselves from Nature and natural forces to a time when gods and goddesses were worshipped in human shape. However, the uniformity of this process should not be overestimated. For magic continued to be inseparably associated with religion, especially in the realms of popular cult, just as birds, beasts and flowers continued to be identified with particular gods and goddesses.

The traditional polytheistic religion of classical times incorporated, in varying forms and with varying emphasis, many survivals from earlier periods, including the Minoan and Mycenean periods of the Bronze Age, especially in Nature-religion and fertility cults. Broadly speaking, the Greek religion of classical antiquity was an amalgamation of early Aegean with later Indo-European elements, the latter having been contributed by people who spoke Greek as one of the Indo-European family of languages.

However, realization of this is comparatively recent. A hundred years ago there were no accepted objective criteria, in the form of buildings, pottery, jewellery and armour, which were relied upon to form an independent witness of the realities of the world which emerges in the Homeric poems. The history of Greece was thought to have begun with the first Olympiad in 776 BC, and

everything that went before including the Homeric Age, was legend or myth.

Now, however, what is sometimes described as the Aegean civilization has been discovered by archeologists. In consequence, the objective criteria of Greek pre-history reach back to the beginning of the Iron Age (roughly 1000 BC), and through the two millennia of the preceding Bronze Age into the earlier Neolithic period.

This vast change in outlook is mainly the result of the work of two men, Heinrich Schliemann and Sir Arthur Evans. Schliemann's excavations at Troy, Mycene and Tiryns proved that there was some historical reality behind the Homeric epics. Sir Arthur Evans began to excavate the Bronze Age palace of Minos at Cnossus 70 years ago. One of the many consequences of his factual discovery of the Bronze Age civilization of Crete is that no student of Greek and Near Eastern religion in antiquity can afford to ignore the Cretan (or Minoan) background.

This background, complex though it may be, is shown by a variety of evidence collected from many different sites that date from the earliest periods to the later Bronze Age, when the Minoan and mainland Mycenean traditions became increasingly interfused.

There is now a mass of symbols, representations on seals and frescoes, cult paraphernalia, and idols and statues collected from tombs, cemeteries, cult-rooms, altars, shrines, sanctuaries and temples, which have to be set beside the mythology, poetry and general literature of the period. There are also numerous inscribed documents which, although they are often fragmentary, sometimes throw light upon religious beliefs and practices.

The abiding mystical concepts derived from Cretan religion are significantly marked by the influence of a mother goddess and a dying god, associated with the bull, who later became worshipped as 'Cretan-born Zeus'. This Zeus, who died and was born again, was different from the Olympian Zeus of the familiar Greek pantheon. He was much more comparable with the Greek Dionysus, also a bull god and a dying god. These two different concepts help us to establish distinctions between the Minoan and the Mycenean phases of earlier Greek religion.

The historian Herodotus records that the poets Homer and Hesiod were the first to compose theogonies, poems dealing with the origin of the gods, and gave the deities their epithets, allotted them their offices and occupations, and described their forms. It is probable that these traditional Greek theogonies derived from the Greek epics which were rooted in the Mycenean period of the late Bronze Age.

Traditional mythology recorded legends about conditions before the Mycenean pantheon of the Olympic gods became paramount. Before this time, the Titans, the children of Uranus and Gaia (Heaven and Earth) held sway. To prevent Cronus, the youngest Titan, from swallowing his baby son Zeus, his wife Rhea bore him secretly in Crete and substituted a stone wrapped in swaddling clothes for the infant, who was reared in hiding (see CRONUS). The legends about the birth of Zeus in Crete were responsible for the specific epithet of the supreme god as 'Cretan-born'. This epithet and the oriental connections of his mother Rhea, indicate that he was an old Minoan god, involved in the same basic pattern of oriental ritual which prompted the myths of Ishtar and Tammuz, Isis and Osiris, Venus and Adonis. It is probable that Greek-speaking people who arrived in Crete gave the name of their sky god to an old Minoan deity whose ritual and character can be guessed from the evidence of later times.

The Olympian Zeus was the leader of the traditional Greek pantheon. There is reason to suppose that the hierarchical organization of the gods and goddesses as portrayed in the Homeric epics reflects the actual social conditions of the Mycenean period. The Homeric Greeks (the Achaeans), burst the bonds of their own ancestral tribal organization and adapted their control of Bronze Age techniques to warfare. The martial character of the Myceneans of the later Bronze Age is exemplified in their fortification of their urban centres, in marked contrast with the unfortified cities of Minoan Crete. Similarly, the Achaean chieftains of the Homeric poems dominate the battlefield.

The heroic age of ancient Greece, as it is portrayed in Homer, represents the violent and ruthless conquest of an older, sophisticated, peaceful and refined civilization by warlike adventurers. Its richest and most important centres were away from the mainland, especially on the island of Crete; so the greatest prizes were out of reach until the Achaeans became sailors.

Syndics of Fitzwilliam Museum, Cambridge

The Supreme God of All

Of course, Zeus is far more than a blend of these two elements only, Indo-European sky-god and Cretan babe or Kuros or bull (that is, Cretan fertility-spirit). To the Greeks he is throughout their history the supreme god of all . . . There is scarcely a department of nature or of human life with which he was not connected by his worshippers. This is reflected by the titles and epithets which they heaped upon him, and which include almost everything that a Greek held sacred. In a dozen different names they call him king and lord. He is Zeus of the clan and of the ancestors, Zeus who guards the home, who minds the storehouse, the protector of suppliants, the god of hospitality to strangers, of the sanctity of the oath, the bringer of justice, guardian of the city – and there are countless others, too well known to need enumeration. Let us only note before we leave him that the Greeks carried the notion of a universal god considerably further than anyone had ever done before, and very nearly as far as anyone has carried it since. So firmly were his supremacy and universality established that his name came to be used by poets and philosophers almost as the name of God might be used by a Christian or that of Allah by a Moslem. Aeschylus felt no incongruity in applying it to the great moral power which was his conception of God, and in the second century AD, in the deeply philosophical writings of a Marcus Aurelius, we find that the sublime Stoic belief in the brotherhood of man can be fitly expressed by calling the world the City of Zeus.

W. K. C. Guthrie *The Greeks and their Gods*

After 1400 BC the leadership of the Aegean world passed to mainland Mycene; and the Mycenean pantheon presumably spread its influence as the Mycenean social and economic system penetrated widely from its mainland centres. The ensuing social conflict, and fusion of peoples and customs, was paralleled by increasing complexity in cults and in mythology, and in the composition and organization of the pantheon. The most dramatic form of this process was a struggle, never quite resolved, between the old concept of a mother goddess and the newer concept of a dominating male god, Zeus.

Under the monarchical leadership of Olympian Zeus, the gods and goddesses were gathered together in a single heavenly stronghold. Their dwelling-places, built by Hephaestus, surrounded the central palace of Zeus. Although the authority of the supreme male god had become fairly stable, it was not unchallenged. In fact Hera, wife of Zeus, was amongst those who intrigued against his authority.

This Homeric picture of the Olympian hierarchy is paralleled by the Homeric picture of earthly conditions. Even in the midst of war, Agamemnon, the leader of the Greek expedition to Troy, could claim only a loose kind of authority: his control was often disputed by his fellow-chieftains. This instability has its analogy in the inability of the Achaeans to establish a centralized, enduring Bronze Age economy similar to the older oriental type.

There is, too, a lack of uniformity in the Homeric accounts of the Olympian system. In two passages of the *Iliad* Zeus is living alone on Olympus. In one passage he hurls a thunderbolt, in the other he sends a storm. It is highly probable that Olympus itself was a kind of generic term for 'mountain'. However, in a well-known evocative passage of the *Odyssey*, the heavenly Olympus is described in a way that is more appropriate to the Minoan Fields of the Blest than to a lofty, mountainous seat of storms, rain and lightning.

The growth of the Olympian pantheon was a process of tribal federation which led to military kingship. The mortal prototype of the weather god who was lord of storms, rain, lightning and thunder, and reigned in a mountain fortress, was the Mycenean overlord. The companions of the god, with their differing functions, at first lived apart from him but eventually, although they kept their traditional functions, they went to live with the Olympian overlord in his stronghold and were subject to his will.

Dying God from Crete

The traditional function, or privileges, or spheres of influence of the gods were the outcome of heavenly tribal warfare. Legend tells how Zeus made a promise to his supporters before he went to war against the old order represented by Cronus and the Titans. He swore that if he won he would guarantee the rights they already had, and would apportion rights to those who had none; when the conflict was over he became the supreme overlord and bestowed the honours. The traditional province of Hephaestus, for instance, was fire; Atlas held up the skies; Apollo was concerned with music and dancing; Hades with lamentation; the nymphs cared for mortals in the time of their youth, and so on.

The Twelve Gods who were early united into a sort of official Olympian society were normally Zeus, Hera, Poseidon, Demeter, Apollo, Artemis, Ares, Aphrodite, Hermes, Athene, Hephaestus and Hestia. There were sometimes modifications to the list, as when Dionysus replaced Hestia in the representation of the Twelve on the east frieze of the Parthenon in Athens.

Dionysus has a place of special importance in Greek religion, essentially popular and non-Olympian. However, the cults which he personified and which played such a major role in historical times, had their counterparts elsewhere in much earlier times. Explaining why the cult of Dionysus was conspicuously absent in Crete, M.P. Nilsson observed in *Minoan-Mycenaean Religion*: 'The reason why Dionysus does not appear in Crete can only be that he was not needed there, the religious ideas of which he was the herald having already been applied to the Cretan Zeus.'

The copious amount of legendary material regarding the birth of Zeus in Crete emphasizes its pre-eminence compared with other birth-stories of Zeus. However, the very existence of such a remarkable birth-story, and the cults associated with it, inevitably meant that places other than Crete were also credited with being the site of Zeus's birth. These included Messenia where Zeus was reputed to have been reared by nymphs on Mount Ithome; Arcadia which, apart from Crete, made the strongest claims, with a legend that Cronus had swallowed the stone on Mount Thaumasius and that Zeus was born and reared on Mount Lycaeus; and Olympia, which was said to be Zeus's birthplace in a legend of the founding of the Olympic Games.

It was quite consistent that the dying god, Zeus of Crete, should not only have had his sacred marriage to Hera commemorated in an annual ceremony during which sacrifices were offered with traditional wedding rites but that his death also should have been mourned. This explains why the legend of Zeus's tomb, supposedly located at various places in Crete including Cnossus, Mount Ida and Mount Dicte, has endured from ancient to recent times.

There are a number of versions of the inscription on this legendary tomb, which suggests that 'Zan', the old name for Zeus, was certainly well known in Crete, and also that the cult of Cretan Zeus was involved with, if it did not actually develop from, an earlier cult of Minos. A common link was an annual festival celebrating a god like Adonis or Tammuz, at which this god was eaten in the form of a bull. The evidence for the tomb, relatively late though it may be, indicates that Cretan Zeus was looked upon as a dying god, with the implication that he died annually and was born again.

Initiation, which may well have originated in the Bronze Age, continued to play a major part in various Greek cults and in social life generally. The death and rebirth of an initiate tended to be dramatically represented, often with a contest and some kind of ordeal. It was not only the god, or his animal symbol, who continually died and was born again. A similar pattern persisted in the training of the youth of the Greek city-states in classical times.

The late appearance and subordinate status of a male Minoan deity served to emphasize the over-riding importance of the Minoan goddess. In Neolithic times there seems to have been no concept of a male

The hero Hercules, renowned for his gigantic strength, captures the Cretan bull in the seventh of his 12 labours. The mainland Greeks 'captured the Cretan bull' in a sense, when they conquered the rich and peaceful civilization of Crete

The Twelve Gods of Olympus, with their own functions or spheres of influence, lived with Zeus in his stronghold and sometimes challenged his authority. *Above, left to right* Demeter was concerned with agriculture and the fruits of the earth (relief at Eleusis). Apollo, god of music, prophecy and healing, and as god of oracles 'the ambiguous one', was identified with the sun and inspired much Greek art and literature (statue in the National Museum, Naples). Artemis, goddess of the chase and of wild animals, was probably descended from the Cretan Lady of Wild Beasts (statue in the National Museum, Naples). Hera was the wife of Zeus and presided over all phases of the life of women (relief in the National Museum, Palermo). *Below left* Poseidon, whose dominion was the sea: bronze statue, c 460 BC *Below right* Hermes, god of travellers and the messenger of Zeus, was also responsible for guiding souls on their way to the underworld

The Greek's Demeter, who was divine protectress of agriculture and the fruits of the earth, perpetuated the role of the old Minoan mother goddess

divinity in human form. He emerged later, as a secondary deity, but the tendency to raise him to a superior status was clear by the end of Minoan times. With the decline of the mother goddess, the bull became associated with the Minoan kingship, which perhaps had important functions in relation to the governing of the calendar. Hence the bull became a symbol of the sun, and both were fertility symbols. Bull-worship and snake-worship remained associated with traditions of the prehistoric Bronze Age kingship.

The Minoan goddess is a central feature of Minoan religion, just as the palace was a central feature of Minoan social life. In surviving monuments and artefacts she is shown in association with animals, birds and snakes; with the sacred pillar and the sacred tree; with poppies and with lilies; with the sword and the double axe. She appears to have been huntress and goddess of sports, she was armed and also presided over ritual dances; she had male and female attendants, and she held sway over mountain, earth, sky and sea, over life and death. She was household goddess, vegetation goddess, Mother and also Maid.

There are many examples of figurines from Minoan Crete, including votive images from sanctuaries, cult idols from shrines, and statuettes which have been recovered from graves and tombs. The various attitudes assumed by these figurines, which include the 'gesture of benediction' familiar in portrayals of the mother goddess, sometimes recall the postures of a sacred dance. The sitting or squatting position of early specimens could well represent the attitude actually assumed for childbirth. Hence the differing gestures depicted by later statuettes could also have been supposed to have had a beneficial influence on childbirth and on the growth of crops.

As puppets, the images had clear associations with birth and with death, accounting for their presence in graves and tombs. As votive offerings, they represented worshippers appealing for the protection of the goddess in sickness or childbirth, an initiation, marriage or bereavement; or the statuettes could represent the goddess herself. Figurines dating from the earliest times onward have been discovered in Greece, showing that the ancestral idols of magic did not easily yield to the deities of religion.

By Minoan times the bull, the dove and the snake had already acquired special prominence. Large numbers of votive offerings included figurines of oxen, goats, rams, swine and dogs. There is no doubt that the birds that are so often portrayed in Minoan religious contexts, perched upon double axes, columns, trees or idols represent divine manifestations. In fact, the birds of the domestic shrines are not mere votive offerings but real representations of deity; and the idea of birds as manifest forms of the spirits of the dead was persistent in later Greek religion.

The mother goddess of Crete held sway over mountain and earth, sea and sky, life and death: figurine of the goddess, her hands in a gesture of blessing

Mansell Collection

The most conspicuous Minoan domestic cult was that of the snake, especially in connection with the so-called snake goddess. Snake cults are world-wide, and are associated with the belief that snakes are incarnations of the dead. They also signify immortality because they cast their skins and renew themselves, personifying the ability to be reborn. Both dreaded and revered, snakes became beneficent, guardians of the house. Snake-worship was common in later Greek religion and indeed plays a part in modern Greek folklore.

All these powerful traditions seem to have played their part in the formulation of the mother goddess as an abstract and unifying principle, both one and many. It was perhaps in the Cretan palaces of the Bronze Age that the Neolithic figurine developed most rapidly into a female deity in human form, still attended by magical and totemistic symbols, in the form of trees and stones, animals, birds and flowers. The most sacred Minoan flower was the lily.

Hero and God of Health

Some goddesses of the later conventional pantheon markedly perpetuate the role of the old Minoan mother goddess. Demeter was said to have reached Greece from Crete; she was regarded as divine protectress of agriculture and the fruits of the earth. The myth of Demeter and Persephone recalls the Minoan concept of the mother goddess as both Mother and Maid. The famous Eleusinian Mysteries performed at Eleusis near Athens (see ELEUSIS), were in their honour. These mysteries may have originated in the East, but there is little doubt that they were brought to Greece from Crete.

The cult of Apollo and his mother Leto originated in Asia Minor. Their association with Crete has long been recognized, together with evidence that the cult of this goddess survived more markedly in Crete than in mainland Greece, where her cults are few and of uncertain age. Other deities and semi-divine heroes were loosely connected with the official Greek pantheon and with traditional Greek mythology. They include Eros ('Love'), Selene ('the Moon'), Hercules, and Asclepius.

The hero of physicians, elevated to divine status, Asclepius had a cult and temple at Lebena in Crete in historical times (see HEALING GODS). The snake, his constant

The so-called mask of Agamemnon, leader of the Greeks in the siege of Troy according to Homer: gold funeral mask of a prince of Mycene, the great fortress-city of pre-classical Greece. The organization of the gods and goddesses portrayed in Homer reflects the social conditions of the Mycenean period

companion and symbol, indicates his association with earlier phases of religion, recalling the prominence of the snake cult in Minoan belief. He did not really become a god until the end of the 6th century BC; excavations at Epidaurus, the most famous centre of his cult, revealed that the buildings dedicated to him cannot be dated earlier. But the cult, with its combination of superstition, miracle cures and genuine medical lore, enjoyed an increasing respect in the Greek world in later antiquity, which has rightly been contrasted with the growth of scepticism towards the traditional Olympian hierarchy.

By the Christian era the worship of Asclepius had spread widely and was a potent force while other cults had lost ground. In fact, Asclepius was looked upon as the chief opponent of Christ in the late pagan period: he was firmly entrenched in his position as one of the great, and one of the most popular, ancient gods when the final struggle between Christianity and paganism ensued. The Christians did not deny that he possessed real power, just as they had to acknowledge the reality and strength of the other heathen deities. They admitted that he was able to heal but as with other gods and goddesses whom they opposed, they believed that Asclepius was weaker than their own Lord.

As the colour of vegetation, green was prominent in spring celebrations throughout Europe; it is also, traditionally, the colour of envy

GREEN

THE GREEN MAN of British inn signs commemorates an important figure of the old springtime festivities. In England he was called Jack in the Green or Jack in the Bush. On May Day in 1894 at Lewisham the Jack was a man encased in a tall framework shaped like a bottle, covered with ivy leaves and crowned with paper roses. The May Queen and her maidens danced round him while he revolved solemnly on his axis. In 18th century London the black-faced chimney-sweeps danced on May Day, led by a Jack in the Green. He was hidden inside a framework which might be as much as ten feet high, to which green boughs of holly and ivy were fastened, with flowers and ribbons at the top.

All over Europe, green as the colour of vegetation, the reviving life of plants and trees, was prominent in the celebration of spring. The maypole was garlanded with greenery, and children paraded about with green branches. In Britain May Day was connected with Robin Hood, not unsuitably, since that great outlaw lived in the greenwood and dressed his men in Lincoln green. One May Day in the 16th century Henry VIII and his courtiers rode a-Maying to Shooter's Hill, where they found 200 archers, dressed all in green with green hoods. Their leader, who was called Robin Hood, insisted that the king stay to watch them shoot. (See also ROBIN HOOD.)

Green George

In parts of Russia and the Balkans the equivalent of Jack in the Green was Green George, also a man masquerading as a tree. One custom on St George's Day (23 April) was to fell a tree, decorate it with flowers and carry it in a procession led by Green George, who was covered from head to foot in branches of birch. He was ducked in a stream or a pond to make sure that enough rain would fall to keep the fields green in summer. In Switzerland the Whitsuntide Lout was a boy enmeshed in leafy branches who carried a green bough. He was ducked in the village well, which gave him the right to sprinkle water on everyone else. In Germany the May King might be concealed in a wooden frame, with a bell inside it, covered with birch boughs and flowers. People had to guess who was hidden inside. At a wrong guess the May King shook his head, which made the bell ring, and the unsuccessful guesser had to pay a forfeit.

In *The Golden Bough* Frazer treated these customs as relics of tree worship. It seems clear that the Green Man was the spirit of the reviving vegetation, immersed in water as imitative magic to ensure rain for the fields and crops. Many old European customs involving holly, ivy and other evergreens mark, or look forward to, the renewal of life in the spring (see HOLLY AND IVY; MAY DAY).

The evergreen plants which stay green all through the winter inspired the Christian symbolism of green as the colour of 'hope for eternal life', and the 'green pastures' are the eternal meadows of heaven. The connection with water, as the bringer of life, appears again in the story of the man who drank the water of life and promptly turned green, which crept into the legends of Alexander the Great (see ALEXANDER THE GREAT). In popular Mohammedan belief 'the green one' is Khidr or Khisr, who long ago drank from the Fountain of Life and has lived on ever since, travelling the seas and protecting sailors. Interestingly enough, he was identified with St George, who was himself connected with the Green George in eastern Europe.

Green is also frequently worn by fairies and, for some unknown reason, it is the colour of envy. This seems to lie behind an old Scottish rule that if a girl was married before her older sisters, she gave them green stockings. In Fife knitted green garters were secretly fastened to the clothes of an older unmarried sister or brother of the bride, and in the west of England an elder sister should dance in green stockings at her younger sister's wedding.

But the prevailing symbolism of green is as the colour of the beauty and harmony of Nature. It does in fact seem to have a peaceful and soothing influence on people, and is often lavishly used in the decoration of hospitals, for this reason.

Gremlin
Mischievous air spirit believed to cause mishaps to airplanes; the name is said to have been coined by a British bomber squadron in India, not long before the Second World War, by amalgamating Grimm's Fairy Tales with Fremlin's Elephant Ales; the gremlin has now largely disappeared from British and American airmen's lore.

JEAN GRENIER

THE BELIEF THAT a human being could transform himself into a wolf at will appears frequently in medieval European stories and indeed much later. Generally those accused of this offence were brought to justice, if they were not killed by terrified peasants. A typical case was that of Jean Grenier, a 13-year-old youth, who was tried in 1603 by the court of Bordeaux.

Neglected by his parents, the boy lived by begging and minding cattle, and it was the accusation of another child similarly employed which led to his arrest. The girl's story was that she had been attacked by a wolf-like beast and that afterwards she had realized that her attacker was Jean Grenier.

Even before his arrest Grenier had boasted of his exploits, claiming that he was able to become a wolf and that he had killed and eaten dogs. He even said that he had eaten a girl 'apart from her arms and legs'.

During his trial Grenier agreed with the statements of several peasants whose children had been attacked or eaten by a werewolf. He confessed to meeting a 'Gentleman of the Forest' who rode a black horse and had brought him a wolf's skin and given him a special cream which he rubbed on himself; and he told the court how, when he wore the skin, he was transformed into a wolf or any other animal he wished.

Jean was later described as being rather small for his age with a vacant expression, haggard eyes, large fang-like teeth and long dirty finger nails.

Although there was enough evidence to send the boy to the stake, the court was presided over by an understanding and humane magistrate, who took into consideration the age and situation of this 'stupid and ill-nourished child . . . whom wicked seduction and despair had corrupted . . .' He preferred, he said, 'to save a soul for God rather than consider it lost'.

The verdict was that Jean Grenier should be confined to a Bordeaux convent for the rest of his life, where he died 'a good Christian', some seven years after his trial.

Generations of children have been fascinated by the folktales of the Grimm brothers, who were not only distinguished linguistic scholars but also the founders of scientific folklore

GRIMM

ENTHUSIASTIC COLLECTORS and antiquarians, with a deep and lasting interest in folklore and mythology, Jacob and Wilhelm Grimm are best known today for their collaboration on *Kinder-und Hausmärchen*, popularly known as *Grimm's Fairy Tales*. In fact, they also published many other works, separately and in collaboration.

The combination of rare talent and early recognition of their merits and the extent of their contribution to scholarship, made them not only the most distinguished scholars of the German Romantic period, but also favoured their reputation abroad. Both Jacob (1785–1863) and Wilhelm (1786–1859) carried out most of their work together after obtaining law degrees from the University of Marburg. Jacob subsequently visited Paris where he was appointed first librarian, then auditor to Jerome Bonaparte, King of Westphalia. Later he became secretary of the legation to the minister for Hesse at Paris and the Congress of Vienna. Wilhelm was appointed librarian at Kassel, where Jacob joined him in 1816.

In 1829 they both became members of the staff of Gottingen University, as professor and librarian respectively; but Jacob supported the protest of seven professors against the *coup d'état* of the elector of Hanover, and was exiled in 1837. In 1838 both brothers moved to Kassel, and in 1841 they were given chairs at the University of Berlin where, by appointment of Friedrich Wilhelm IV of Prussia, they were elected to the Berlin Academy of Sciences.

Of the two, Jacob was the grammarian and historian, specializing in the science of language, and Wilhelm was primarily the literary scholar. Jacob contributed greatly to the advance of linguistic studies and published a number of important books on these and other related subjects; in collaboration with Wilhelm he produced an inventory of the entire German language. His *Deutsche Mythologie* was published in 1835. Wilhelm's principal independent work is the *Deutsche Heldensage* (1829), which he wrote as a result of his studies of German heroic myths. These he placed historically between history and mythology.

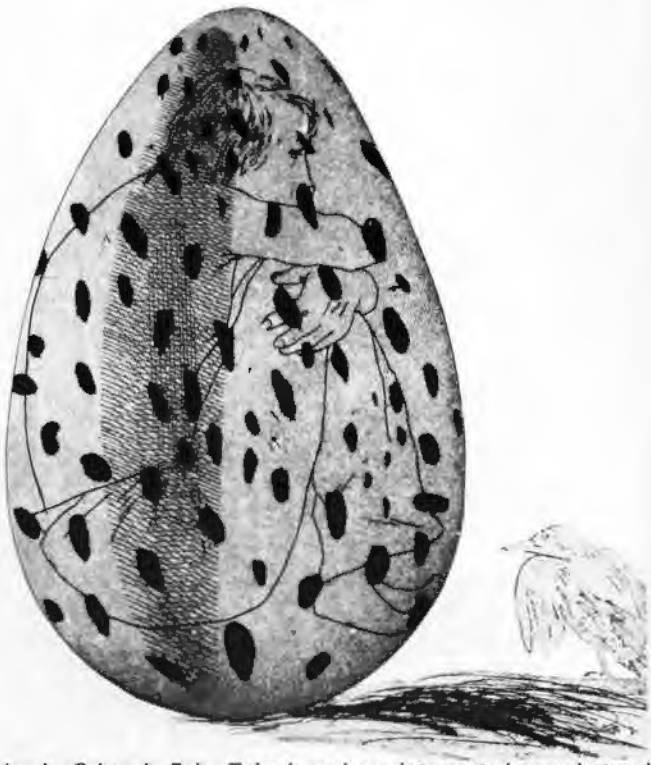
From the very beginning of their researches the brothers Grimm devoted much time to seeking out and deciphering medieval manuscripts, and to collecting and studying the so-called Folk Books of the 16th century. Their aim was to discover all sources of German antiquities which might possibly throw light on the origin and connection between heroic sagas, mythology and folktales. Gradually this became their chief occupation and provided the impetus for all their researches. Either separately or together, they brought out their editions of various German medieval texts, and of the *Edda* (1815), a major source of information about early Scandinavian beliefs and culture. They also interested themselves in the manner in which medieval songs were performed.

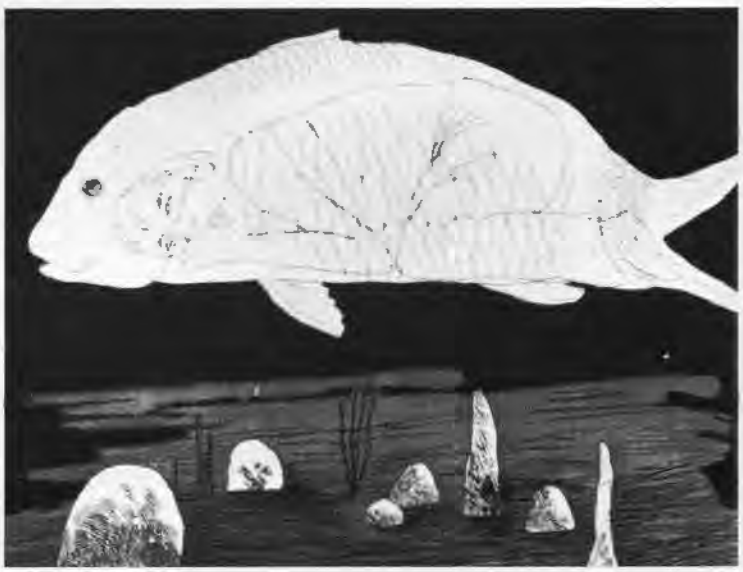
A stimulus and great encouragement to their collecting of tales had been their aquaintance with the so-called Heidelberg group of Romanticists, especially with the writers Clemens Brentano and Joachim von Arnim, who at this time were collecting folk songs, legends and fairy tales. Encouraged by the success of their collected folk songs *Des Knaben Wunderhorn* published in 1805, the Grimm brothers also began to collect tales with a view to publishing them. In this they showed a scholarly regard for the sources, and respect for the creation of the people that was unusual at this time.

The tales that were known and published before the brothers' collection in 1811 were not folktales as the term is understood today. They were mostly satirical, didactic or moralistic stories, often told with supercilious contempt; or they had been neglected by scholars and the public alike, or treated at best as mere curiosities. Partly as a reaction to this unjustified attitude to the creations of the common people, and

Belief in magic and miracles pervades the folktales collected by the Grimm brothers; in 'The Jew in the Bush', a dwarf gives the hero a fiddle that sets everyone who hears it dancing: illustration by Arthur Rackham to *Grimm's Fairy Tales*, 1900. In the Victoria & Albert Museum

Grimms Fairy Tales





Petersburg Press

The stories in *Grimm's Fairy Tales* have been interpreted as archetypal dreams; the life force animates all levels of existence, and the hero has the unique task of mediating between them. He liberates enchanted beings, and is transformed and perfected in the course of his travels: a selection of David Hockney's illustrations to the folktales

partly inspired by a wave of nationalistic feeling, the brothers' own treatment of the material was to see it as the source of popular beliefs and wisdom.

The idea of the unity of the nation, a new ideology that arose as a result of the Napoleonic armies having overrun Europe, was a matter very close to the hearts of both brothers. They were convinced that they could find in the past material that would lead to the answers that were needed in the present. For this reason they both tended to idealize the past, as is evident in Jacob's *Deutsche Mythologie* which was written from an idealistic conviction that the time of German antiquity was a time of freedom, a kind of Golden Age. The historical view presented in this work is that the pagan period of the Germans was followed by the strict and rigid Middle Ages which led to a period of despotic, absolute government.

In *Deutsche Mythologie* Jacob substituted deductive reasoning, partially based on his own ideas of a somewhat glorified Germanic past, for scientific observation. As in most countries where Christianity superseded the pagan religions, there are few reliable records of early times, and the data cannot always be established with certainty. Jacob therefore sought to obtain supplementary material for his thesis wherever it might be found and with this aim in view he used the collection of tales that had grown up over the years; he exploited the material he found in them for his *Deutsche Mythologie*, and supplemented the German data with material from Nordic countries for the same reason. He made comparisons with Hellenic, Slavonic, Celtic, Ugric and Oriental material. Consequently it is not really possible to extract from his account of Germanic mythology a factual history of Germanic religion.

Jacob presented the pagan religion of the Germans as an animistic Nature religion characterized by an abundance of spirits, good and evil, which are part of Nature, such as giants and gnomes. The gods have human characteristics and are similar to man in that they display his virtues and weaknesses. The pantheon of gods is engaged in a constant struggle with the dark demons and giants, but their magical powers combined with the assistance of wise

gnomes may keep the giants, the Midgard snake and the Fenris wolf in check. But above them is the relentless power of Fate which turns against them with the murder of Balder. The central theme of the old Germanic myths is the struggle of the divine gods against the powers of darkness that want to destroy Valhalla, their home. Only a few gods survive, but there is another myth which speaks of a resurrection of the old destroyed world. It mentions the coming of a new and better world in which the divine powers triumph over the demons of darkness (see GERMANIC MYTHOLOGY).

The publication, between 1812 and 1814, of the three volumes of the *Kinder- und Hausmärchen*, familiar to English readers as *Grimm's Fairy Tales*, was perhaps the most outstanding single event in their career as scholars. This work represents the most universally known aspect of their work and was to have the most lasting international influence. From the point of view of scholarship and the development of the study of folklore as a science, their collection proved to be the most important of all collections of folktales. The stories enjoyed immediate success. They were available in their English translation from 1823, and gained immense popularity throughout the English-speaking world, while their effect in scholarly circles was to transform attitudes towards creations of the common people. The folklorist's evolution from antiquarian and amateur collector and enthusiast dates from this event.

The Grimm brothers spent 13 years collecting their stories. The story-tellers were mainly simple folk from farms and villages, but they also received many stories from friends. The brothers searched for material everywhere, and were eager to include any story they could find in their collection, even if it came from literary sources. Because earlier collectors had manipulated the folk material, and had endeavoured to make it acceptable reading for the sophisticated, the Grimms were concerned that the stories should be printed in the idiom in which they had been related.

A little earlier, before the brothers published their tales, the German Romantic poet Novalis had pronounced the folktale to be the primary and highest creation of man. The brothers told how they endeavoured to preserve the tales in the way they had found them: 'Our first aim in collecting these stories has been exactness and truth. We have added nothing of our own, have embellished no incident or feature of the story, but have given its substance as we ourselves received it . . . Whenever we found that varying stories completed each other, and that no contradictory parts had to be cut out before they could be joined together, we have given them as one, but when they differed, we have given the preference to that which was the better, and have kept the other for the notes.'

Although both brothers agreed that tales should not be merged, they nevertheless combined them, added material from other tales, or left out recurring episodes. Wilhelm was responsible for the greater part of the work on the tales; he gave them their literary form. Gradually he began to work on them alone, and Jacob later used the material for his *Deutsche Mythologie*. Wilhelm aimed to keep the sentence construction simple and he took special care to retain the imagery, and some of the folk phrases, which gave the tales their freshness. He therefore kept to the repetitions which usually occur in a threefold sequence, and the stylistic formulas that are repeated between the episodes relating the action. But in spite of the attempt to preserve much of the folk-style and the idiom, the version of the tales available to the public is the product of men of great literary talent.

Fragments of Myths

For their material the Grimms were greatly indebted to their principal story-teller Katharina Viehmann (1755–1815) who was in her middle fifties when they met her. In the preface to the first edition of the second volume of the *Kinder-und Hausmärchen* Wilhelm describes her as having 'a strong and pleasant face and a clear sharp look in her eyes; in her youth she must have been beautiful. She retains fast in mind these old sagas – which talent, as she says, is not granted to everyone; for there be many that cannot keep in their heads anything at all. She recounts her stories thoughtfully, accurately, with uncommon vividness and evident delight . . .'

The brothers published a volume of commentary and a comparative study of the tales in 1822. More ideas on their content and significance may also be fonnd in Wilhelm's essay in the second edition of tales in 1819. His main ideas on the content and meaning of the tales were that those stories which most resemble each other were undoubtedly derived from a common Indo-European ancestry. He was convinced, as was his brother, that the tales were fragments of old myths and heroic tales. He expresses a similar idea in the *Kleinere Schriften* (Minor Works). 'All tales have this in common that they express ancient beliefs which are reflected in their imagery, and embody supra-sensual phenomena.' His conviction that conditions existed which were so natural and basic that the tales could appear everywhere, and that peoples borrowed folklore materials from one another, was later taken up and developed further by a number of scholars.

The brothers Grimm did not retell the tales exactly as they had heard them. On the contrary, they prepared them very carefully, simplifying or embellishing them according to their poetic taste and to make them suitable for children: they chose their material from among the narratives that seemed to them to be poetically most striking, and in their choice they were not independent of the taste of their time. But their version of the tales is still universally read today, proving that their work has not dated in any way. Jacob would have preferred to have had the tales published in their folk-idiom but their widespread popularity is chiefly due to Wilhelm's talent in giving them their literary form.

Subsequent collecting of folktales revealed that their plots and themes were largely identical with those in the stories and myths of other peoples, suggesting that folktales and myths were once one. In the tales folk-belief and the fanciful came to dominate over the profound *Weltanschauung*, or philosophy of life, which is embodied in them. In their collection the Grimms included literary tales that were recorded in the 16th century, some stories translated from Latin, sagas, legends, riddles, incantations, games, rhymes and anecdotes in keeping with the diverse character of folk art.

In this way their collection is similar to the story books of the East. Many of the folktale elements can be found in surviving written sources, such as the Babylonian *Epic of Gilgamesh* or the Egyptian tales. Similar or identical features that reflect the unity of the oral tradition and mythology may also be found in the narratives of ancient India, the Old Testament, the epics of Homer, the oriental collection of *A Thousand and One Nights*, in Germanic mythology or in the *Edda*.

Many of the Grimm brothers' tales embody a perennial philosophy shown in the stories which portray the hero's journey in search of the Elixir of Life, in the form of the water of life or the princess of the distant kingdom. These he obtains only after many obstacles have been overcome which is synonymous with having proved himself to be the true hero. Christian elements have found their way into the tales which feature God, Christ or the Devil as actors involved in the fate of man. Pre-Christian figures such as giants and gnomes, once part of pagan mythology, appear and so do magicians and witches. The principal fignres such as kings, princesses and artisans are generally borrowed from the medieval social scene. Animals in the role of helpers or enemies abound, while transformation from man to animal, from plant to mineral, or the other way round, is a central theme. The life-force, as envisaged in the tales, is all-pervading and animates all levels of existence. It is the unique deed of the hero to mediate between these levels, to liberate enchanted beings, to transform and perfect himself in the process of his travels and to return to the world with gifts to bestow on his fellow men.

The belief in magic and miracles is a distinctive feature of the tales. There are countless examples of transfornnation through imitative and sympathetic magic, or through pronouncing a wish or speaking a thought in the form of a magic formula, which results in instantaneous action. This folktale magic is characteristic of the philosophy that any aspect of the whole may fulfil the function of the whole. For instance, the ring given by the supernatural helper to the hero carries his qualities and helps the hero in a difficult situation. The themes of the power of love that can break the spell that binds and imprisons the heroine, of wakefulness in face of danger and in relation to the execution of a task, and of the disguised hero under the mask of a fool are basic folktale motifs.

Characteristics of all types of folk art may be found in the folktales edited by the brothers Grimm: they are a mixture of the

Victoria & Albert Museum/C. Barker

Illustration to 'The Frog Prince', by Walter Crane, c 1870: transformation from man to animal, or the other way round, is a central theme in the tales

Magical possessions, such as the sword that cuts off heads when its owner cries 'Heads off!' *(above)* and the blue light with which a soldier summons his supernatural servant *(below)* abound in the folktales, as do beings like the giant in 'The Young Giant and the Tailor' *(below right)* and the dwarf who helps e soldier whose nose grows enormously long *(above right)* when he eats a magical apple: illustrations by Cruikshank

religious and the profane, of 'high seriousness' and burlesque. Novel and ancient features have been assimilated in the course of their long existence; but in spite of all these diverse elements the tales have retained a fundamental unity of theme, structure and style, transcending any given period of time by embodying the timeless qualities expressed in the overall theme of the search for 'paradise lost'.

The folktale as an artistic creation is a mixture of the most diverse elements. It contains survivals of an ancient view of the world based on a fundamental dualism, separating it into sacred and profane, upper and lower, good and evil: all folktale figures are exponents of one force or the other united through the hero's deeds. The tales mirror beliefs in the supernatural and in magical practices, they embody ethical principles and display a belief in survival beyond death. They incorporate dream-motifs, they attempt to resolve the fear of death, the overcoming of which is the central aspect of the hero's battles. All these elements are united and given form through the fanciful imaginations of the bearers of tradition.

It is not possible to assess in detail the influence exerted by the tales in the field of scholarship. Scholars set out to find the 'archetype' or original story which gave rise to all others, and attempted to trace its evolution, its place of origin, its significance in the religious, historical and social life of a given people. More recently the tales have been interpreted as projections of man's psychological structure, as 'archetypal' dreams and so on. All the many and varied interpretations arose from a realization that these stories often embody a race's entire heritage, and from an attempt to elucidate the universal similarity of themes, and the stories' perennial relevance to man. No doubt, the brothers Grimm would have been delighted to see the extent to which their work has initiated collecting, editing and classifying of folktales all over the world.

GRIMOIRE

AN ATMOSPHERE of Christian piety is perhaps the most surprising quality of the grimoires, the textbooks of the European tradition of magic. They contain instructions for summoning up spirits or demons, constantly calling on God for assistance, and they give directions for making powerful talismans and performing other magical operations. Most of them date from the 16th to the 18th centuries, though they preserve older material.

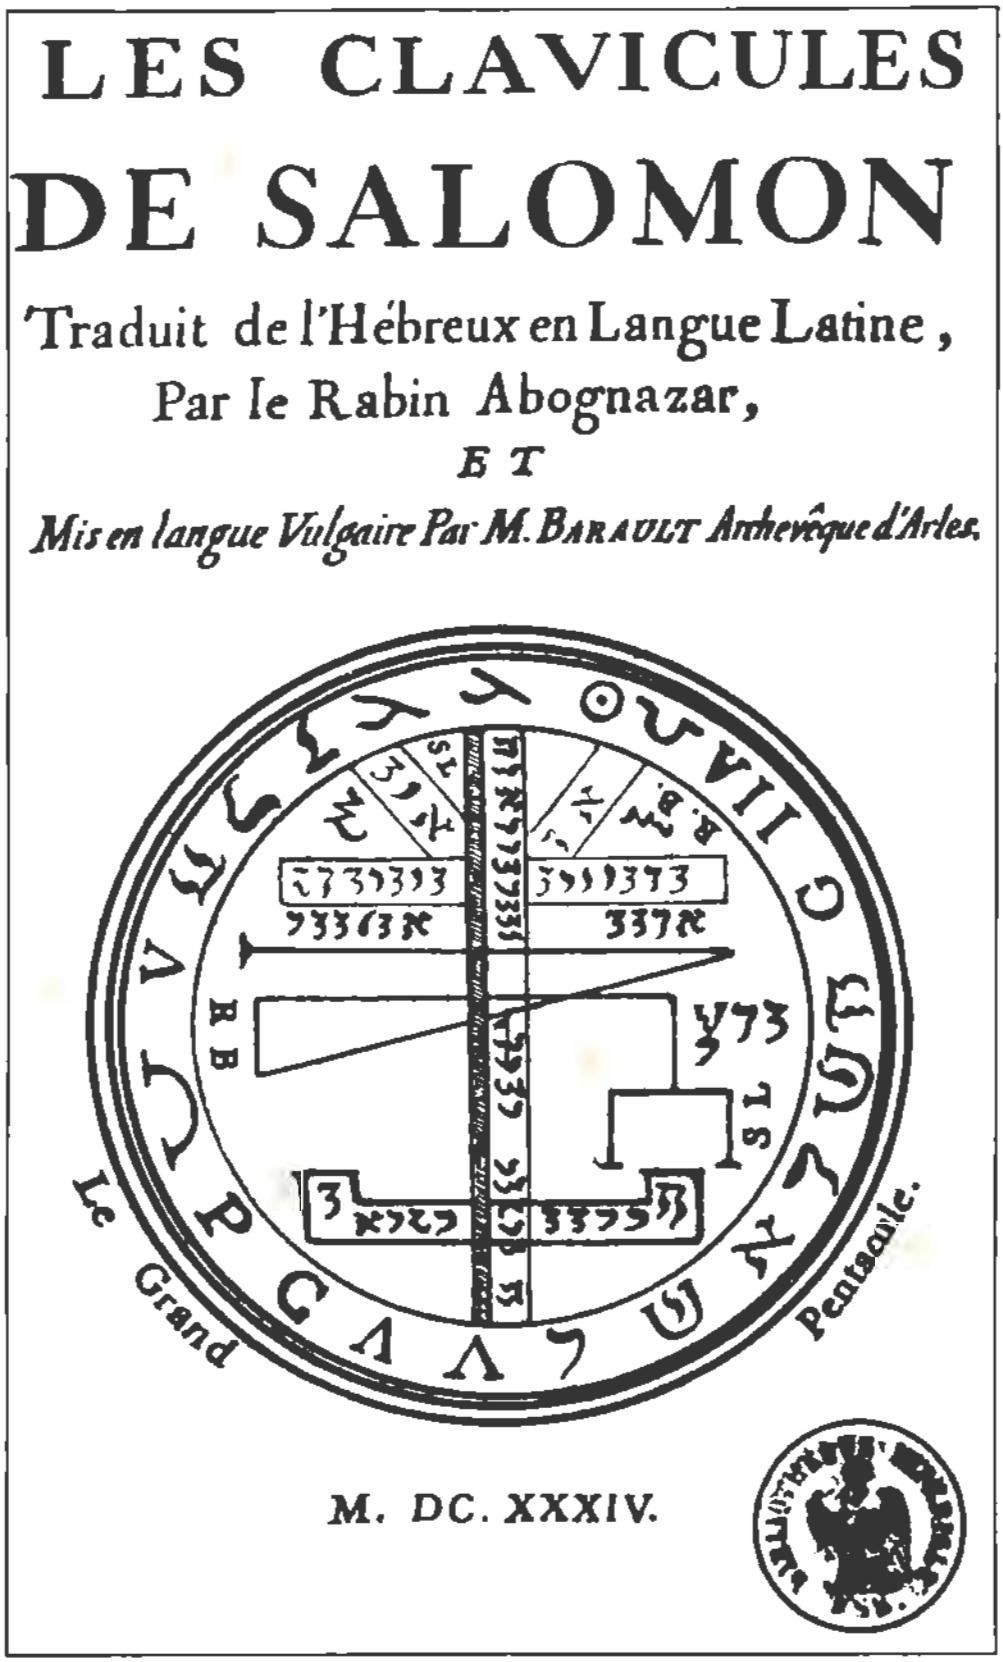
'Grimoire' is basically the same word as 'grammar' (and 'gramarye' is an old term for magic and enchantment) and the implication that language is supremely important in magic is fully born out by the grimoires themselves. The most influential of them is the celebrated *Key of Solomon*, on which many of the others are based. Strongly influenced by cabalistic and astrological magic, the *Key* sets out the lengthy preliminaries, the choosing of a suitable time and place, the weapons, robes and 'pentacles' or diagrams which the magician will need, the drawing of the magic circle, the incantations for summoning spirits and for compelling their obedience. As usual in the grimoires, the processes are complicated, elaborate and difficult. E. M. Butler commented that they 'read like the worst sort of obstacle race' and 'are certainly calculated to deal the death-blow to any notions harboured by intending practitioners that magic is a short cut to their desires.'

Infernal Devices

Printed copies of the *Key* are extremely rare (the edition which MacGregor Mathers published in 1889 is heavily expurgated) but it exists in numerous manuscripts in various languages. Most of these date from the 16th century or later but a Greek version in the British Museum may date from the 12th or 13th century. Solomon enjoyed a great legendary reputation as a powerful magician and a worshipper of strange gods, and as far back as the 1st century AD the Jewish historian Josephus referred to a book of incantations for conjuring up demons, supposedly written by Solomon. The *Testament of Solomon* (not the same as the *Key*) dating from c 100 to 400 AD, lists the names and powers of demons which Solomon had subdued with his magic ring. In the 13th century Roger Bacon, himself a reputed magician, knew of magical works attributed to Solomon and c 1350 *Le Livre de Salomon*, containing methods of evoking demons, was burned by order of Pope Innocent VI.

The key of the title is the instrument which unlocks the doors of hidden power and wisdom, a symbolism strengthened by the words of Jesus to St Peter which magicians took as a kind of warrant or charter. 'I will give you the keys of the kingdom of heaven, and whatever you bind on earth shall be bound in heaven . . .' (Matthew 16.19).

Also attributed to Solomon is the *Lemegeton* or *Lesser Key of Solomon*, divided into four sections and dating from the 16th century or earlier. The first section lists 72 chief demons, with their names and powers,



Above **Frontispiece of a 17th century version of the *Key of Solomon*. The most influential grimoire, the *Key* is strongly influenced by astrological and cabalistic magic. It sets out the preparations that must be made in order to summon spirits and compel their obedience, advice on choosing a suitable time and place for the ceremony, what kind of weapons, robes and pentacles are necessary, and instructions on drawing a magic circle *Right* Sigil or linear representation of the archangel Gabriel; 'He is to be invoked on a Thursday before daybreak. His power is very Great and he can do you great good, in which he will instruct you': from the *Grimoire of Armadel*, translated by MacGregor Mathers**

Gerald Yorke Collection/Michael Halford

and the directions for summoning them.

Three famous French grimoires were based on the *Key* and the *Lemegeton*. The *Grand Grimoire* first printed in the 17th century, contains 'the Infernal Devices of the Great Agrippa for the Discovery of all Hidden Treasures and the Subjugation of every Denomination of Spirits, together with an Abridgement of all the Magical Arts.' Also known as the *Red Dragon*, it explains how to make a pact with the Devil and how to use 'the dreadful Blasting Rod, which causes the spirits to tremble.' *True Black Magic* or 'The Secret of Secrets', published at Rome in 1750, includes a collection of magical symbols and talismans. The *Grimorium Verum* also belongs to the 18th century though characteristically claiming to have been published by Alibeck the Egyptian at Memphis in 1517.

The French *Grimoire of Honorius the Great* probably dates from the late 16th century and is the most laborious and most paradoxically Christian of all. Its array of prayers, psalms and pious sayings of Mass, harneased to the calling up of the Devil, have given it a particularly black reputation.

Among many other grimoires are the *Arbatel of Magic*, allegedly published at Basle in 1575 and mainly concerned with the summoning of the seven Olympic Spirits which rule the planets. Typically, its aims range from acquiring the supreme knowledge of God to making money and prolonging life. The Fourth Book, added to Agrippa's *Occult Philosophy* but probably not written by him, provides methods of invoking the planetary spirits. The *Heptameron, or Magical Elements* is a sequel to the Fourth Book and gives procedures for summoning the Spirits of the Air and for controlling supernatural beings which will find hidden treasures, cause wars and hatred, nose out secrets, open locked doors and procure the love of women.

Guardian Spirits

The belief that human beings have spirits which help and protect them is very widespread: 'cults of affliction' in two African societies throw light on the different social roles which this belief can play

TO APPEAL FOR HEALTH, personal welfare, or release from suffering and affliction, men serve guardian spirits. If some religious beliefs are pure and simple, the belief that human beings have personal protectors among the spirits is not. It is grasped through diverse modes of symbolic action which are an integral part, and therefore less than the sum total, of ritual appealing to the gods or the shades of the dead to allow men to live well, both morally and materially.

The guardian spirits of the Kalanga of Botswana in southern Africa and the Ndembu of Zambia will be discussed here, because there is almost a polar contrast between their cults. Moreover, the evidence for the Ndembu cults is rich, perhaps the richest in recent anthropological studies.

When the Kalanga of Botswana appeal, in domestic ritual, for the well-being of their children and themselves, the ritual makes them recognize a dangerous likeness: a likeness to non-human virtue. Where they have failed their kin, they have acted as becomes creatures of other orders, not men. They must face, and even seek, blame for sins and moral faults. What they desire is relief from personal suffering, and they come to appease afflicting demons, *mazenge*. The Kalanga beg to be freed from a wide variety of afflictions, from minor ills and aches to chronic diseases, severe pain during pregnancy, and childlessness. Their concern is the failure of kin to act with humanity and meet their family obligations.

The epithets of mazenge demons condense meanings which are expanded in the acts, metaphors and stylized clichés of ritual. The epithets are:

> Crushers of Meat,
> They of the Great River,
> They prey at the Tall Grass,
> Of snatching without shortcoming,
> They came from far, far,
> They should mock cramping.

These epithets convey remoteness, contrariness and a paradoxical purpose of the demons. From a distant grassland near plentiful water, where the guardian demons prey, the demons came in order that they should deceive or mock 'cramping, oppression, pinching'.

Mazenge are capricious demons that possess women. An initiate of the cult may sing of herself as 'carrying an evil'. For these afflicting demons, unlike mankind, are not bound to act according to specific ethical rules. Their demonic order represents disproportion, rapacity, and chaos for mankind. It is in their nature to act according to *lunya*, 'peevishness, spite, antipathy to children'. Their viciousness and contrariness is like human contradiction, it represents the derangement of human morality. Through the cult, congregations catch a glimpse of the kind of world they could expect when evil triumphs.

During the ritual, a woman acts as cult initiate or host. The guardian demon 'come from far, far' is believed to be performing her ritual acts. No longer herself, she becomes a 'lion' and wears a mane of white and black beads on her head; about her body, a mantle of red and black cloth, or of blue printed on white, sometimes with geometric patterns, and usually with lions or cocks and a surrounding design. About her legs are strings of rattles made from the cocoons of winged ants. With a gourd rattle symbolic of the staff of an elder or chief, she regulates the rhythm while dancing or leading a song.

In this role of host she is told of the affliction and pollution, the 'dirt' and 'rubbish' which concerns members of the congregation. She is asked what faults bring on affliction and treats her patients, her kin, with herbs which she digs up while she is possessed. She is expected to be overcome by awe and to enact human vice. Through her symbolic acts she grapples ritually with the sins and faults which are thought to have caused mazenge demons to send affliction: the denial to relatives of the share which they are entitled to 'eat', for example, the cattle of inheritance, bridewealth or slaughter at a feast; the failure to feed relatives and give them their dues from one's earnings; favouring some kin at the expense of others; or the stealing of a kinsman's wife through adultery – exacting the lion's share. In her role as host she grapples with selfishness and rapacity which cheats and dispossesses close relatives of what should be theirs.

The Song of Creeping

During the dance of a ritual, plaints are chanted about suffering from neglect, from old age and from the meanness of relatives, their mocking, and ingratitude. The plaints are addressed to a high place, 'a knoll that has in it mazenge demons', a ritual phrase for the possessed woman. This is the text of a song sung by an old woman, a childless widow, during a ritual on behalf of a sick elder. The chorus is the first two lines, and is repeated after each succeeding line:

> *Oh knoll,*
> *Oh knoll, having within it mazenge demons.*
> Let us stamp.
> Where we have danced.
> Let us stamp.
> I tire, I cannot cope.
> Where we have danced.
> The chief of the black string of bast.
> Oh lions, you defecate dung.
> Awe, the creeping, creeping.
> The spirit of others falls.
> Mine is like the stamping block's.
> About to be stamped upon, it lies outside.
> Most have ended, long ago.
> My children died, long ago.
> If only I should die myself.
> If only I should die myself . . .
> My child remained outside.
> Let us offer for the spirit of the father.
> The spirit of (the sick elder).
> How is it mine is so hard?
> Mine is like the stamping block's,
> About to be stamped upon, it remains outside.
> A lullaby stolen in, its owners not here.
> Let us offer for the spirit of the father.

The soloist sings of a basic activity of domestic life, an activity on which it depends and which is the special preserve of women: the provision of meal. The singer calls on another cult member, who is reluctant to join her in possession, and compares this woman to a stamping block. The singer urges that this reluctance, and remaining outside in neglect, should be compared to a block about to be used and thus left around in the cooking compound. Her step pounds on the floor of her kitchen in the rhythm of the pole on the block, and she sings of her dancing as stamping: the rhythm of the household economy is the rhythm of the ritual. She alludes to her childlessness – the children she bore died – and she comments on the conduct of her kinswoman

who is, in the cult, her 'child'. In the ritual, too, she is 'childless' for her 'child' is hard, with the hardness of the block to be beaten, and denies a father (the sick elder of this hamlet) the ritual services which he requires to be healed.

The soloist's plaint has its force through a coalescence of meanings, characterizing her personal lot in life and the events of the immediate performance. Three lines show this most clearly: The chief of the black string of bast; Oh lions, you defecate dung; Awe, the creeping, creeping.

The first of these lines represents her as the 'chief of black grief'. She wears an emblem of seniority, the black string of bast. This is an emblem of affliction, for 'string' and 'cry' are one word and symbol in Kalanga. It is a symbol of black grief. In the next line, she sings of defecating. A host feeds on special food, for she should defecate distinctively and ritually. Doing so is an act symbolic of a host's role and its part in pollution: she must 'make the occult patent'. In this song, the soloist's use of the image of lions defecating sets in relief, by juxtaposition, her chiefship.

Next, she sings of 'the creeps', the awesome feeling, which Kalanga say is a sensation of the hair standing on end. A host ought to feel this at the onset of possession, when she must act as though overcome by the urge to dance and fall possessed. The singer threatens that the reluctant host is to be the prey of the demons and is to feel the creeps. The singer represents herself as being like a tracker of animals, finding them before seeing them, by their dung and its location. The phrase 'creeping, creeping' used for awe, *manyawi nyawi*, plays on that for 'you defecate', *manya*. It conveys what is unseen yet known to the tracker: the frenzy, the excitement, the terror, the exaggerated self-confidence of the prey. The chiefship of black grief, dung, awe, thus follow together, belong in one single image and, within a unity, represent primary aspects of the role being ritualized.

Through such metaphors and acts of the cult, close relatives declare symbolically their shared anticipation, their mutual dependence, and their subjection to commandment within a realm of domesticity. They carry on a dialogue about animal virtue which

The singer threatens that the reluctant host is to be the prey of demons and is to feel the creeps

Belief in supernatural guardians is found in many parts of the world; they may take the form of protective spirits who accompany and care for men during their lives, or they may guard temples or other places of worship ***Left*** **At the Wat Po temple in Bangkok the figure of a Dutch sea-captain, evidently regarded as a peculiarly formidable guardian, keeps evil spirits at bay** ***Right*** **The cherubs of European art are sentimentalized descendants of fierce spirits which guarded Assyrian temples. In the Old Testament cherubim guarded the garden of Eden and the Ark of Yahweh**

compels them to share a universe of meanings about human sins and faults. A realm of experience is enhanced and given its special location in a symbolic order through the Kalanga cult of affliction.

Close relatives are coerced, ritually. However, they are not involved in a widening circle of outsiders or disinterested persons. The congregation at a Kalanga ritual of affliction is, at its widest, a body of kin and neighbours. It is not a casual assembly but a congregation of persons brought together because of their specific interests in one another. Highly exclusive events are confined to the closest relatives.

Competition for Status

The Ndembu have many cults of affliction in which they placate their guardian spirits, the shades of the dead. These Ndembu cults are a luxurious growth and each one is lush in symbols and secrets. Elaborate and distinct regalia blazon one and all. They are thick with special privileges and duties: no one need lack a place. Taken together, they represent a vast splendour of all-absorbing emblems and ritual qualifications.

Almost any Ndembu, through their cults, can convey secret notions to some, and exclude from a universe of meanings others of his close relatives, fellow villagers neighbours and friends. In these cults the closest kin continually promote symbolic disharmony. They do so through symbols that are intelligible to unrelated persons but not to all the congregation of close kin. Indeed, some kin in the congregation are mystified in their ignorance. Each of the multitude of cults may be understood by some of the kin, but not by all.

Embarrassment and shame at ignorance are necessary features of the Ndembu cults of affliction. A man, driven to overcome his shame, can never succeed. Once he gains understanding as a novice there is yet another cult beyond his comprehension, there is yet a further elaboration of esoterica to grasp. Secret associations multiply. It is fitting to speak of a 'ritual man' among the Ndembu; for the more a man invests in cults, the more he extends his wealth of symbols and the range of persons with whom he is bound through shared secrets. But he must continually participate in the exclusion of others, including some who have lived or still live in the greatest intimacy with him; and he is compelled by his increasing investment in cults, to sustain greater and greater symbolic disharmony.

V. W. Turner points out that the impact of these rituals is important for linking inter-village and internal village relations. The rituals' consequences are not confined to a distinct body of relatives, to one village or smaller area within the wider Ndembu region. According to Turner, the Ndembu invoke 'the participation of the wider society, represented by adepts drawn from all over the Ndembu region, in the conflicts of the narrower unit of the village.' He considers that in some of their rituals the Ndembu urge one another to come to terms in quarrels. However, they do not act in rituals of affliction in order to seal off strife between relatives, and contain the struggles within an arena of their immediate village or kinship relationships. Turner suggests that such rituals 'may have the subordinate function of reintegrating the ritual subject's village.' He observes that they 'dominantly emphasize the unity of all Ndembu'.

Both the Kalanga and the Ndembu compete for status through their cults. The Kalanga do so, however, without upsetting the seniority between generations and so re-ordering other relationships between kin. As a Kalanga host ages, her seniority increases. Her status is the highest in the cult, because her authority is extended through the great number of hosts whom she has initiated and who are her juniors. By contrast, among the Ndembu, there is a multiplication of ritual privileges, duties and claims against others, irrespective of their kinship or residence. Most Ndembu join several cults. Some begin with one, others with another and they advance their status in each at varying rates and at irregular intervals during their lives. The standing of kin in a cult may be the reverse of their standing as senior and junior kin and as this varies from cult to cult the multiplicity of cults intricately complicates the relationships between kin. Each performance promotes the differential advancement in status of particular kin and associates. A member's status becomes higher the more he or she takes part in rituals and invests in payments to acquire knowledge of the cult's medicines and techniques.

A Universe of Meanings

Any series of economic transactions may add up as relative gains or losses in status. However, goods offered in a cult of affliction are links in a chain of symbolic statements which, among the Kalanga at least, fix the meaning of domesticity and of close kinship and neighbourliness. Among the Kalanga close relatives are compelled to recognize and make manifest the occult, not merely affirm its existence. The paradoxes of their interdependence are made the subject of concurrence in a symbolic idiom. They tell one another home truths through the cult. But they must do so within an idiom which is symbolic and cryptic in the sense that all its statements speak of the occult, of what is hidden and unknowable. The secrets of a group of kin are grasped, ritually, within prescribed metaphors, cliches, take-offs, jokes and puns. Mockery and humour too, is ritualized in the cult, and kin must meet to share it among themselves, with a subtlety of innuendo which they alone can fully appreciate.

To understand their deployment of the symbols, in any of its subtlety, one must be an intimate or a kinsman and conversely, being an intimate, one is required to deploy these symbols in expression of one's relationships of intimacy and domesticity. The symbols advance the relationships, and the relationships sustain and carry forward the symbols. Close relatives compete and struggle with one another through and about their ritual investments, for it is through investment in symbols that they invest in each other.

Those present in the congregation are required to pledge themselves to carry forward relationships and to reconstitute, in

C. M. Dixon

Left **Guardian spirit from a Chinese tomb. The belief that human beings have personal protectors in the spirit world occurs in various forms in many societies** ***Far right*** **For the ritual through which the Kalanga of Botswana appeal to their guardian spirits, the 'host' women wear rattles made from cocoons of winged ants around their legs; their black and blue garments symbolize rain, and coloured beads are worn to please the sky god** ***Right*** **A woman of the tribe performs a ritual dance in her kitchen; the food cooking in the pot symbolizes the closest relationships of kin**

agreement, a universe of meanings, symbolically representing what must ultimately be unknowable – the occult. At any performance, some kin can be (indeed, they must be) excluded from the congregation, while being included in the dialogue of the occasion. They are not excluded from the knowledge of the symbolic discourse that is pursued although they cannot and must not attend. Most of the significance of the discourse, in their absence, and about them, depends on the expectation of the congregation that, in the future, some of the excluded relatives will become aware of what has transpired and will have to modify their conduct accordingly.

R. P. WERBNER

Guardian Genius

Belief in guardian spirits is found in many other parts of the world besides Africa, in various forms. A man may be believed to have a protective spirit which accompanies him all his life, and which he acquires at birth or at puberty; sometimes it is the spirit of an ancestor, sometimes not; it may cease to exist when its human companion dies, or it may live on. The guardian is particularly important in the lore of American Indian peoples, where it usually shows itself to a man in a vision and in animal form. Supernatural beings may guard places as well as people, like the spirits which ward off evil from oriental temples or the dragon that guards the treasure-hoard.

In modern English we have turned what was originally a guardian spirit into the characteristic intellectual or artistic endowment of each person. This is the 'genius', which was the Latin word for each man's spirit protector (the guardian spirit of each woman was called a Juno). The word means 'the begetter' and the genius seems to have been the procreative force in a man, principally occupied in helping him to satisfy his natural appetites. The genius was honoured in Roman birthday celebrations. The Greek equivalent was the personal daemon, mentioned by some writers as accompanying a man throughout his life, and it may be that growing belief in the existence of this personal guardian was responsible for the increasing attention given to celebrating people's birthdays in classical times.

The Romans also believed in the *genius*

Richard Werbner

Richard Werbner

accompanying a man throughout his life, and it may be that growing belief in the existence of this personal guardian was responsible for the increasing attention given to celebrating people's birthdays in classical times.

The Romans also believed in the *genius loci*, which guarded a particular place. It had its Greek counterparts in the nymphs and animistic spirits attached to streams, trees, mountains and other natural features.

In the Old Testament the book of Daniel (chapters 10, 12) mentions angels who watch over different kingdoms and peoples. The garden of Eden was guarded by cherubim (Genesis 3.24), winged creatures descended from Mesopotamian spirits believed to intercede for men with the gods and placed at the entrances of temples and palaces to guard them. Two cherubim with wings outstretched guarded the Ark of Yahweh (Exodus 25.18).

Jesus advised his disciples not to despise children, 'for I tell you that in heaven their angels always behold the face of my Father' (Matthew 18.10). This was taken to mean that each child has a protecting angel and influenced the belief, accepted by medieval theologians, that every Christian has a guardian angel. The early Christian *Shepherd of Hermas* says that each man is accompanied by an angel of righteousness who inspires his good actions and an evil spirit which inspires his bad ones.

In Mohammedan belief, each man is guarded by two angels during the day and another two during the night. They protect him from harm and record all his actions, in preparation for judgement day. Sunset and sunrise, when these angelic sentries change guard, are particularly dangerous moments in which a man may fall into the clutches of demons.

Guinevere

In the Arthurian legends, the wife of Arthur and mistress of Lancelot; in early Welsh stories she was Gwenhwyfar, and there were said to be three of her; there was an old theme of her abduction and rescue; in the later legends, she brought Arthur the Round Table as her dowry, and the traitor Mordred seized her, or tried to, when he usurped Arthur's crown; the monks of Glastonbury said that she was buried there, with Arthur.

See ARTHUR; LANCELOT.

British Museum

Guisers

People dressed up, a general term, used particularly in Scotland, for the dancers and masqueraders who appear in curious costumes, disguises and masks at folk dances and ceremonies; the masked dancers and children in grotesque costumes at Hallowe'en are examples.

Michael Busselle

A modern mystic who believed that man could develop spiritually only by consciously labouring and suffering, Gurdjieff's teachings brought not so much peace as 'a special kind of inner warfare'

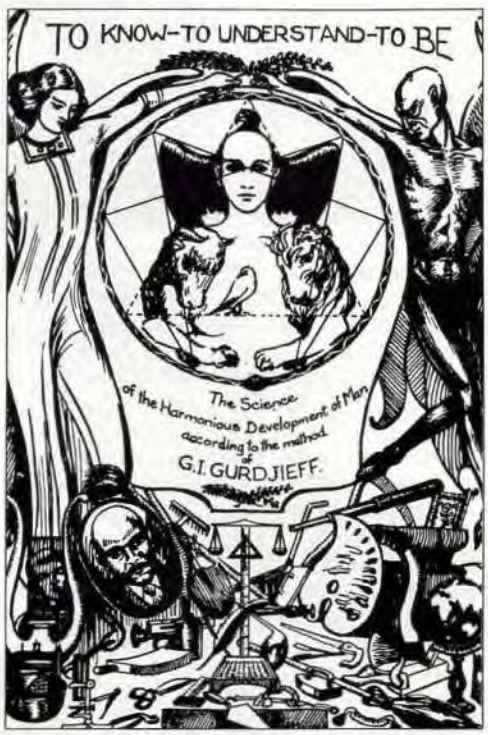
GURDJIEFF

BORN IN ALEXANDROPOL, near the Persian frontier of Russia in about 1877, of a Greek father and an Armenian mother, George Ivanovitch Gurdjieff was brought up in an antique, patriarchal world where children were put to sleep at night with the story of Gilgamesh, the great hero of Sumerian and Babylonian epic poetry. While he was still a very young man, Gurdjieff 'disappeared' into that cauldron of history, tradition and ideas that we know as the Middle East. Indeed, in his second book, *Meetings with Remarkable Men*, he describes an even wider orbit, taking in the Gobi Desert, Mecca and Tibet; but in this case the names may stand either for places or for symbols in his unremitting search for a 'real and universal knowledge'. 'I was not alone,' his disciple, the Russian writer P. D. Ouspensky quotes him as saying. 'There were all sorts of specialists among us. We called ourselves "The Seekers of Truth"'. Ouspensky recorded his first meeting with Gurdjieff as having taken place in the autumn of 1914. 'I realized,' he wrote, 'that I had met with a completely new system of thought surpassing all I had known before. This system threw quite a new light on psychology and explained what I could not understand before in esoteric ideas.'

During the first two years of the First World War Gurdjieff elaborated his teachings to groups in St Petersburg and Moscow but with the onset of the Russian Revolution, flight was inevitable. His journey with his followers through Russia to the Caucasus, then to Constantinople and at last to the West has all the elements of a modern thriller. But it is given an epic quality and an extra dimension by the fact that Gurdjieff used the hardships and dangers – always for him the true stuff of existence – to exemplify his teaching, and required of his pupils that they should escape not merely with their lives but with their Life. It was not until 1922 that he succeeded in bringing to the West what he had found in the East, by establishing his pilgrim band at the Chateau du Prieure, near Fontainebleau, where he founded his *Institute for the Harmonious Development of Man*.

Gurdjieff never openly disclosed the source of his teaching. By examining his writings and the numerous commentaries upon them it might be possible to discover parallels in various traditions but the fundamental features of his method cannot be traced to any one source. Ouspensky quotes him as admitting 'I will say that, if you like, this is esoteric Christianity.' In fact, there seems to be no reason to reject this when one remembers that Christianity, as Gurdjieff knew it, was the heir to centuries of religious tradition and must have drawn into itself early pre-Christian Hittite, Assyrian, Phrygian and Persian elements; and that there is nothing so explosive as old ideas restated in contemporary terms – as the Western world was to discover when Gurdjieff burst upon it.

Design for the programme of Gurdjieff's Institute for the Harmonious Development of Man, 1923. Gurdjieff insisted that man is asleep: only when he wakes, to both consciousness and conscience, does his true evolution begin. The guardian angel and attendant demon support the symbols of the four evangelists in a pentagram, symbol of man as the potential god



Intentional Suffering

His impact was tremendous. It was clear that he had come not to bring peace but a special kind of inner warfare, and that his mission in life was to destroy men's complacency and make them aware of their limitations. Only by such means, by what he called 'Conscious labours and intentional suffering', was it possible to bring about man's inner development. It very soon appeared that the Work, as his method came to be called, had been only too accurately named. Writers, artists, and men and women from all kinds of professions found themselves digging wells, chopping down trees and breaking stones by day, while at night they were required to take part in sacred dances or 'Movements', or to assist at one of Gurdjieff's great feasts where, under the influence of good food, vodka and the watchful eye of the Master, opportunities were provided for those who had the courage to come face to face with themselves.

By 1924 the Work was sufficiently well established for Gurdjieff to set out on the first of his visits to the United States where in January, in New York, a group of 40 pupils gave demonstrations of his Movements. Two thirds of these evenings were devoted to the sacred dances, and the remainder to what was described as 'Trick, Semi-Trick and Real Supernatural Phenomena'. The audience was invited to distinguish between them and reminded that 'the study of the first two was held to be indispensable to the study of the third, since to understand the last a perfectly impartial attitude and a judgment not burdened by pre-established beliefs were necessary'.

It is clear from Gurdjieff's writings that hypnotism, mesmerism and various arcane methods of expanding consciousness must have played a large part in the studies of the Seekers of Truth. But none of these processes had any bearing on black magic, which according to Gurdjieff 'has always one definite characteristic. It is the tendency to use people for some, even the best of aims, without their knowledge and understanding, either by producing in them faith and infatuation or by acting upon them

through fear. There is, in fact, neither red, green nor yellow magic. There is "doing". Only "doing" is magic.' Properly to realize the scale of what Gurdjieff meant by magic, one has to remember his continually repeated aphorism, 'Ouly he who can *be* can do'; and its corollary that, without 'being' nothing is 'done', things simply 'happen'.

The American tour hrought a new influx of pupils to the Prieure and, as usual, Gurdjieff, by deliberate indirection, set them to find directions out. 'The teaching', wrote one pupil, 'was given in fragments – often in unexpected ways – and we had to learn to put the pieces together and connect them up through our observations and experiences.' It was in the late summer of 1924, that Gurdjieff, slowly re-assembling his forces after a near-fatal car accident, hegan to put those separated fragments together in the form of a book.

While helping the pupils who remained, Gurdjieff wrote incessantly at Fontainebleau, on his frequent motoring trips, or seated at a table in the Café de la Paix in Paris where he had long heen a familiar figure.

Called *All and Everything*, the book attempts to cover every aspect of the life of man. Into it Gurdjieff gathered the fundamentals of his teaching. Man, we are told, has a unique function in the cosmological scheme and enters into obligation by the very fact of being horn. But the awareness of this is not a gift of Nature; and neither are individuality, consciousness, free will and an immortal soul. These attributes, which man mistakenly believes he already possesses, have to be acquired by his own special efforts. Above all, the book repeatedly insists that man is asleep. It is only at the moment when he wakes, not merely to consciousness but also to conscience – indeed, for Gurdjieff, the words were synonymous – that his true evolution can begin.

Monsieur Bonbon

The manuscript, constantly revised, now became the focal point of the teaching, not only in France but also in New York during his two visits to America in 1929 and 1933. In the latter year the Prieure was sold and his life entered another phase. Gurdjieff never stood still but was always growing, always experimenting, always searching. After enjoying his fame for nine years, he seems to have retired into the shadows, clearly for reasons of his own. 'He is no longer teaching,' said his older pupils when new people wanted to make direct contact with him. But one of his pet tenets was that the Work was designed not to discover something new but to recover that which is lost, and an intrepid few set out to do just that. If Gurdjieff accepted them as pupils, they were put into small intimate groups, each member depending upon the others, like mountain climbers upon a rope, no group having any connection with the others. Gurdjieff's teaching was essentially intimate and personal, and his insistence that by the very nature of the Work he could not have many pupils appears valid and inevitable.

The published reminiscences of various members of these small groups bear witness to the fact that he was, indeed, teaching in the '30s; but quietly, as though it were a question of holding his powers in reserve. Those who knew Gurdjieff as a teacher could gather only by rumour and hearsay that there were other Gurdjieffs: the healer of psychic illnesses, the curer of alcoholism, the business man and the Gurdjieff known as 'Monsieur Bonbon', an old eccentric gentleman whose sole mission in life, it appeared, was to dispense candy to local cronies and children.

In 1939 Gurdjieff again visited America, a country that he held in affectionate regard because of its 'brotherliness'. On his return to Paris, war was close and when it hroke out Gurdjieff disappeared from the sight of all but his French pupils until the Liberation. It is said that he sustained himself during those lean years by putting about the rumour that he was heir to a Texan oil well. Nobody was more surprised than the French shopkeepers to find, when his British and American pupils streamed back and paid the bills, that the story was essentially true.

The year 1946 marked the beginning of the last phase of his teaching, a period that, for those who had known him earlier, was richer than any that had gone before. For a little over three years new adherents and old pupils who brought their own pupils and children, flocked to his small room to listen to a reading from one of his manuscripts, *All and Everything; Meetings with Remarkable Men; Life is Real Only When I Am;* to hear him play on his small hand accordion the music he had composed for the different chapters; or to receive the bounty of his teaching in whatever form it might be given. 'If take, then take, no sipping, no trifling', was one of his favourite aphorisms and for many the special nourishment that was offered in addition to the delicious edibles was indigestible, hard to stomach.

The exotic flavours and the vodka in which the famous 'Toasts to the Idiots' were drunk ('idiot' in this case having its original Greek meaning of private person, that which in myself I am) did not make things easier. But easiness was not the aim. The patriarchal host, massive of presence, radiating a serene power at once formidable and reassuring, dispensed this 'food' in various ways, always unexpected; sometimes in thunderclaps of rage, sometimes telling a story that only one of all the table would know was meant for himself, sometimes merely by look or gesture thrusting home the truth. Masks were mercilessly stripped off. Beneath the exacting henevolence of Gurdjieff's gaze everyone was naked.

But occasionally for those who could face their own situations, he would fleetingly let fall his own mask. It was possible then to see that behind the apparent mercilessness was sorrow and compassion. At such moments his 'humanity-ness' (a key word in his odd English vocabulary) would radiantly declare itself. If his aim was to teach men how to rise to the possihility of saying 'I am', he never forgot that 'thou art' and 'he is' complete the conjugation.

The Desire to Awake

Gurdjieff describes his concept of good and evil:

'A permanent idea of good and evil can be formed in man only in connection with a permanent aim and permanent understanding. If a man understands that he is asleep and if he wishes to awake, then everything that helps him to awake will be *good* and everything that hinders him, everything that prolongs his sleep, will be *evil*. Exactly in the same way will he understand what is good and evil for other people. What helps them to awake is good, what hinders them is evil. But this is only so for those who want to awake . . . Those who do not understand that they are asleep . . . cannot have understanding of good and evil.'

P. D. Ouspensky, *In Search of the Miraculous*

'Man Must Live Till He Dies'

In addition to the activities in his own apartment, Gurdjieff now instituted at the Salle Pleyel daily practices of the Movements that were so essential a part of his teaching. But it was not only in Paris that the Work progressed so vigorously year by year. There were groups in England and the United States and others were now established in Holland. Sweden, Germany and South America. During what was to be his last visit to America, on 13 January 1949 Gurdjieff announced that he was ready to publish *All and Everything*. At the same time, those English disciples who had joined the Paris groups after Ouspensky's death in 1947, arranged for the publication of *In Search of the Miraculous*, Ouspensky's long withheld account of his early years with Gurdjieff.

These two books, the first giving an added dimension to the second, and the second clarifying the first, opened up the teaching. Gurdjieff's health was now faltering but such was his powerhouse of inner strength that few could believe it. Throughout the summer, after his return from New York, the Work went on with added intensity. While serenely putting his own house in order, Gurdjieff used every moment as a moment of teaching, and every aspect of his fading strength as a reminder to his pupils that 'Man must live till he dies'. In Gurdjieff's sense, to 'live' was consciously to labour and voluntarily to suffer. This he himself did, with constancy and deliberation, until 29 October, 1949.

Since his death his chosen pupils have carried on his work, and groups are to be found everywhere in the Western world. The Movements have been accurately documented in a series of films; his second book, *Meetings with Remarkable Men*, has been published and the third is in preparation. The siftings of time are likely to prove that these records are his proper monument. In them the man and his myth are one.

EDMUND GURNEY

J. H. Cartan

Portrait of Edmund Gurney, completed shortly before he died in June 1888; he was one of the first scientific investigators of paranormal phenomena

A FOUNDER of the Society for Psychical Research and one of the most important pioneers in the scientific investigation of ostensibly paranormal phenomena, Edmund Gurney was born on 23 March 1847. After being privately educated he entered Trinity College, Cambridge in 1866 as a Minor Scholar in Classics. His undergraduate career was unusually prolonged, owing to spells of ill-health, but he succeeded in being elected to a Trinity Fellowship in 1872.

Gurney was more interested in music than in classics, but after years of dogged application, he had to admit that he could never have been more than a moderately competent performer. However, he continued to reflect on the theory of music, and in 1880 published *The Power of Sound*; the great American psychologist William James considered that when it appeared it was 'the most important work on aesthetics in the English language'.

Gurney decided to become a doctor and studied medicine partly in London and partly in Cambridge, from 1877 to 1881. But throughout his life he was intimately aware of, and unusually sensitive to, the sufferings of men and animals, and early in 1881 he abandoned medicine. In May 1881 he became a student at Lincoln's Inn in London, but within a year had abandoned his law studies. In 1877 he married Kate Sara Sibley. They had one child, a daughter, born in 1881.

The foundation of the Society for Psychical Research in February 1882 supplied the occasion and the motive for the astonishing output of first-class work which he achieved in the few years that remained to him. He was Honorary Secretary of the Society from October 1883 until his death in June 1888.

Gurney's main achievements, after the publication of the *Power of Sound*, were concerned with philosophical and ethical reflections, and with psychical research. The former are mostly collected in the first volume of his two-volume book *Tertium Quid*, containing an essay on 'The Nature of Evidence in Matters Extraordinary' which is directly relevant to psychical research and it is probably still the best critical treatment of this fundamental topic. The main subjects in the other essays in this volume are Gurney's doctrine of pain in general, and the ethics of vivisection in particular; his contempt for the idealization of natural science and its practitioners, and for the optimism associated with it; and his grounds for thinking that survival of bodily death is at any rate abstractly possible.

Gurney's position may be summarized roughly as follows. He held that the notion of survival is not inconceivable, and that it is not so improbable as to be unworthy of further consideration. He himself had little if any desire to survive. He realized that even if survival was a fact, things might possibly be as bad as, or even worse than, they would be if no one survived. But he felt certain that if no one survives, and there is therefore no possibility of the evils and injustices inevitable in this life being redressed, then the world is so predominantly bad that a reasonable man in a cool hour would desire the early and complete cessation of the human race.

Gurney's work in psychical research deals mainly with hypnotism and phantasms of the living. His research into hypnotism falls into two main divisions. The first is a study, theoretical and practical, of the purely psychological features of hypnotism, without regard to any paranormal phenomena which may be associated with it. The second is an experimental study of ostensibly paranormal features in connection with some cases of hypnosis, for example, in the telepathic induction of the hypnotic state, in community of sensation between operator and subject, and in some of the feats performed by subjects under hypnosis.

Overdose of Chloroform

Most of Gurney's experiments were done in Brighton, with a Mr. G. A. Smith as hypnotiser, and with subjects chosen by him. Smith had been a stage hypnotist, and he subsequently became Gurney's secretary and trusted assistant. There can be no doubt that he produced genuine deep hypnosis in certain subjects. But he had formerly been associated with a man called Blackburn who, very much later when he mistakenly believed Smith to be dead, alleged publicly that they had at one time been co-operating in the production of fraudulent (non-hypnotic) phenomena, and this has cast a certain shadow on all experiments in which Smith played an essential part.

A book called *Phantasms of the Living* was published under the auspices of the Society for Psychical Research in 1886. The authors were given as Edmund Gurney, F. W. H. Myers, and F. Podmore. Myers contributed the introduction and an important note in the second of the two volumes, and Podmore gave invaluable help in collating and examining the evidence. All the rest of the book is due to Gurney.

The essential factual basis of the work is the reports of 357 spontaneous cases, for all of which the evidence is first-hand and is regarded by the authors as being of first-rate authority. Some idea of the labour involved in producing the book can be judged from the following facts. Gurney often spent eight or nine hours a day writing 50 to 60 letters in his own hand, and almost every living person who gave evidence concerning the 'phantasms' was personally interviewed by at least one of the three authors. The chief part of this delicate work fell on Gurney.

A 'phantasm of the living' is experienced if, and only if, a person has a hallucinatory apparent perception as of seeing, hearing, or touching someone else, who is at the time out of range of the first person's actual sense-perception, and if the latter is alive in the flesh at the time, or was alive very shortly before. Such an experience is classed as 'veridical' (that is, coinciding with realities) if, and only if, the actual state and situation at the time of the person appearing corresponds in considerable detail with the hallucination. Otherwise it is 'delusive'.

Stories of such experiences, alleged to have been veridical, have been common in all ages and places. Many of these are no doubt false. Others, which may well be true, may reasonably be ascribed to mere chance-coincidence, or explained by a combination of normal causes and unusual circumstances. The question is whether or not there are nevertheless a substantial number of cases which fall under neither of these heads; and, if so, what is the most plausible kind of paranormal explanation of them.

The authors of *Phantasms of the Living* concluded that there was, in the cases which they investigated, a substantial residuum of well-attested veridical experiences of the kind in question, the veridicality of which cannot reasonably be assigned to mere chance-coincidence, and cannot plausibly be explained by any combination of generally acknowledged normal causes. The most probable explanation of the veridicality of these is in terms of telepathic communication of experiences between the two people concerned.

The book gave, for the first time, a clear formulation of the questions at issue and an extremely acute and fair-minded discussion of each of them against a background of relevant experimental work, and of a large number of carefully scrutinized reports of spontaneous cases.

Edmund Gurney died in June 1889 at the age of 43 at the Royal Albion Hotel, Brighton, where he had taken a room for the night. Next day he was found dead, with a sponge-bag pressed over his nose and mouth. At the subsequent inquest the jury returned the verdict that death had been accidental, and that it had been the result of an overdose of chloroform inhaled to relieve pain. Very naturally, from that day to this, there has been some suspicion that he committed suicide. There is no good reason to doubt the evidence on which the jury reached their verdict; and there is no positive evidence for the view that Gurney had some special reason for committing suicide. Nevertheless in view of his known temperament and his published opinions, suicide seems by no means unplausible.

C. D. BROAD

British Museum

Guy of Warwick
Hero of a popular early 14th century English prose romance, named after him; his legendary feats included the slaughter of a destructive dragon in Northumberland; he went on pilgrimage to the Holy Land where, among other adventures, he killed a Saracen giant; he came back to England to rescue King Athelstan from the Danes by killing another giant who was the Danish champion.

MADAME GUYON

Believing that God had entrusted her with an evangelical mission, Madame Guyon left her family and travelled through France and Italy, teaching her philosophy

THE FRENCH WRITER and mystic Madame Guyon has been described as 'the most enlightened person of the 17th century' but during her lifetime she was harshly condemned by the Church, and was imprisoned for several years in the Bastille because of her quietist writings. Quietism was a religious movement that swept through France, Italy and Spain during the 17th century; it was based on a blind reliance on God's charity, one of its doctrinal keystones being passive prayer and the relinquishing of the active war against evil (see QUIETISM).

Born in 1648, the daughter of a wealthy and aristocratic French family, Jeanne Marie Bouvier de la Mothe early became fired with religious fervour. By the time she was 16, this had become so intense that she was terrified of losing her soul and prayed constantly to the Virgin Mary to save her.

In an attempt to calm these fears and anxieties, her father married her to Jacques Guyon du Chesnoy Champoulet, a rich invalid 22 years her senior. But the marriage was unhappy, and the young woman soon regretted that she had not become a nun. Even the births of her four children failed to console her, and she took refuge in stubborn silence, retreating into a secret inner life, channelling all her energy into good works and tending the sick with an almost masochistic fervour.

When she was 19 a priest pointed out to her that it is only in the innermost recesses of oneself, in total prostration, that the voice of God is revealed. It was a dazzling revelation for her. 'I was suddenly so changed,' she wrote, 'that I was no longer recognizable either to myself or to other people . . . Everything seemed to be consumed like straw in a fierce fire'.

This inner fire burned within her from that time on. The writings of mystical saints became her everyday reading, and she felt that she was about to find the way to ecstasy. Two paths were open to her: the sacrifice of her body and senses through pitiless asceticism; and intense prayer and meditation. She wore a hair shirt that scratched her skin, a horsehair belt that constricted her stomach and kidneys, and she put stones in her shoes so that she could not walk without pain. Attempting to achieve union with God, she spent nights praying and meditating.

When one of her daughters died in 1672 Madame Guyon saw in this the hand of God; and when her husband died four years later she decided to renounce her family and the world. She felt herself destined for an apostolic task, a belief that was strengthened by the advice of her spiritual director, Father Lacombe, a Barnabite monk who predicted that God would entrust her with an evangelical mission.

In 1681 she set out with Father Lacombe on travels that were to take them through Savoy and south-eastern France. During the five years that they journeyed together spreading their mystical ideas, they acquired an immense vogue.

Both were exceptional people and both were credited with powers of healing. In Rome Father Lacombe had been friendly with mystics who were interested in the occult; and many people believed that he could perform miracles. On one occasion, when he was crossing Lake Geneva in a small boat, a storm had blown up which he was said to have stilled by placing his hands on the waves; and it was claimed that he had cured Madame Guyon of a fever simply by laying his hands on her forehead.

Madame Guyon was believed to have the ability to communicate telepathically, and to foretell the future. She was also an automatic writer, sometimes covering page after page, believing that she was the instrument of divine inspiration.

Dedicated to Misery

Many people believed her to be a saint, a belief that Father Lacombe strongly affirmed. He distributed two short works she had written, *Spiritual Torrents* and *Middle Way*. These were widely read, but the Church was angered by Madame Guyon's behaviour and eventually both she and Father Lacombe were ordered to return to Paris. When they arrived there in July 1686 the priest was put under surveillance; he was finally condemned to life imprisonment and died in prison, insane. Madame Guyon was arrested in 1688 but released in 1689.

During that same year she became part of the court circle at Versailles presided over by Madame de Maintenon, the secret wife of Louis XIV, where she met the Abbé de Fénelon. He was moved and impressed by her religious fervour, considering her to be an emissary of God, and believed that this strange, pious person, who was dedicated to misery, was able to make disturbing mystical paths clear to him.

Doubts about Madame Guyon's orthodoxy caused Madame de Maintenon to call upon Bossuet, the influential Bishop of Meaux, and several other clerics, including Fénelon, to draw up a formulary of articles describing the proper doctrine of the love of God, in which the extravagances of the type of quietism practised by Madame Guyon were condemned. On account of his championing the cause and character of Madame Guyon, however, Fénelon, now Archbishop of Cambrai, quarrelled with Bossuet and as a result was condemned by Rome and had to retire from the court.

Madame Guyon was again imprisoned, being finally released in 1702. After her liberation she retired to her son's estate near Blois and spent the rest of her life in charitable and pious work, until her death on 9 June, 1717.

An ancient Celtic divinity who has affinities with the gods of Germany and Gaul, Gwydion is a poet and magician, prophet and astronomer; he embodies the virtues and skills that the Celts revered in both their gods and their heroes

GWYDION

A SURPRISING AMOUNT of genuine pagan tradition is contained in medieval Irish and Welsh literature. In both Irish and Welsh mythology there seems to have been the concept of a hierarchy of deities, headed by the mother of the gods and her three sons. In Welsh literature these beings are the central characters of the tales in the 'Four Branches' of the *Mabinogion*, stories which are concerned with gods, not with men, and in which fragments of ancient cult legends are fused and confused with folklore motifs and Christian allusions (see MABINOGION).

One of these characters is Gwydion, a powerful sorcerer and skilled craftsman, whose name possibly means 'the prophetic one' or 'the inspired one', and who was the son of the Welsh divine mother, Don (the equivalent of Danu or Anu in Ireland). By an incestuous union with his sister, the goddess Aranrhod, Gwydion was the father of Lleu Llaw Gyffes, who as Lugus in Gaul and Lugh in Ireland was one of the most widely invoked deities of the pagan Celtic world (see LLEU).

Gwydion is mentioned frequently in early Welsh literature and is one of the principal characters in the story of *Math, son of Mathonwy* in the *Mabinogion*. Gwydion and his brother Gilfaethwy are nephews of Math, a renowned magician who has instructed Gwydion in enchantment and sorcery. Math was forbidden to be without a virgin in whose lap his feet were held, except in time of war. This virgin is Goewin, a girl of exceptional beauty and virtue. Gilfaethwy falls in love with her and Gwydion, detecting this, determines to help him. Extreme care is necessary, for as Gilfaethwy says to his brother: 'Thou knowest the peculiarity of Math son of Mathonwy; whatever the whispering, however low, there be between men, once the wind has met it he will know of it.' But Gwydion uses his powers of sorcery to outwit his uncle.

Otherworld Swine

The next motif is important because it connects Gwydion with swine and gives him the role of culture hero, the bringer of benefit and improvement to his people. He promises to fetch the wonderful otherworld pigs which belonged to Pryderi, ruler of Dyfed. With 11 others disguised as bards, he goes to Pryderi's court and is made welcome there, for Gwydion is 'the best teller of tales in the world' – an essential requisite for a Celtic deity. In exchange for the swine he gives Pryderi 12 stallions, 12 greyhounds and 12 golden shields. These he has made by magic but the spell will last only for a day, and Gwydion and his men hurry away with the swine. Pryderi and his men overtake them, and Math joins in the battle. This leaves the virgin Goewin on her own: Gwydion and his brother return to Math's court where both rape the girl in Math's own bed. Then they return to the battle.

Gwydion finally defeats Pryderi in single combat. When Math discovers what has happened to Goewin, he marries her and transforms his nephews into wild animals. Gwydion becomes a stag and Gilfaethwy a hind, and they go forth for a year, returning at the end of it with a fawn which Math turns into a fine boy, whom he then sends to be fostered. He strikes the men again, turning Gilfaethwy into a boar and Gwydion into a wild sow. At the end of a year they return, accompanied by a young animal which, when touched by Math's wand, becomes a handsome auburn-haired boy. Next, Math turns the two brothers into a wolf and a she-wolf. They return at the end of the year, accompanied by a wolf-cub which Math transforms into a boy in the same way. He then restores the men to their own shapes, and tells them that the punishment is over.

Flowers of the Oak

The episodes concerning Lleu Llaw Gyffes begin here. Aranrhod, Gwydion's sister, is proved not to be a virgin when she undergoes Math's chastity test. When she runs from the room she drops a boy-child, and also a 'small something else'. Gwydion snatches this up before anyone has seen it properly, and hides it in a chest. It is another boy, clearly the result of his incestuous union with his sister. Gwydion looks after the boy himself.

One day Gwydion and his son set out for Caer Aranrhod, his sister's home. She welcomes him but refuses to give the boy a name, and Gwydion vows she will do this in spite of herself. Next day he walks with his son along the sea-shore where he forms a magical ship. 'And they began to fashion shoes, and to stitch them.' When they are seen from the fortress, 'he took away their own semblance, and put another semblance upon them, so that they would not be recognized'. Aranrhod asks for a pair of golden shoes, but Gwydion will not make a pair of the correct size until she comes to have her foot measured. This she does, and a wren alights upon the ship while she is there.

Her son aims at it and hits it perfectly. 'Faith,' says she, 'with a deft hand has the fair one hit it.' Gwydion says: 'He has now got a name and good enough is his name. Lleu Llaw Gyffes is he from now on.' (*Lleu* means 'fair', *llaw* 'hand' and *gyffes* 'deft, skilful'.) Everything magical now vanishes and the son is changed back into his own shape. Gwydion's sister swears a destiny on her son, that he will never bear arms until she herself equips him with them.

In due course, Gwydion and Lleu, who is now a young man, go once again to Aranrhod's dwelling in the guise of two youths, claiming to be bards. They are welcomed, for 'Gwydion was a good teller of tales'. They go to bed and 'at early cock-crow Gwydion arose. And then he summoned to him his magic and his power'.

By daylight the countryside was in a state of uproar and Aranrhod bursts into the room crying, 'We cannot see the colour of the deep for all the ships thronging together.' She goes to get arms for the two men and Gwydion tricks her into arming her son completely herself. All the turmoil then ceases and she realizes that Gwydion has got the better of her yet again. She swears Lleu shall never have a wife 'of the race now on earth'. Gwydion goes to get Math's aid, and together they make a wife for Lleu from the flowers of the oak and of the broom, and of meadowsweet.

Lleu is given land by Math and settles down to rule prosperously. However, on one occasion when he is away from home, his wife Blodeuwedd is unfaithful to him; she and her lover, Gronw Bebyr, plot his death. Although Lleu is practically invincible, his wife persuades him to tell her the one way in which he can be killed, and the lovers make their preparations. Lleu is struck by Gronw with the fatal, poisoned spear in the manner which he has divulged. He screams and flies away in the form of an eagle.

Math and Gwydion are deeply distressed when the news reaches them; and Gwydion sets out to find his son. Eventually he comes to an oak tree, to which he has been led by a sow which has been feeding on Lleu's rotting flesh and maggots, and sees him emaciated in the tree. He persuades him to come down to his lap and turns him back into human form. Lleu is only skin and bone but skilful physicians nurse him back to health in less than a year. Gwydion finds Blodeuwedd and says to her: 'I will not slay thee. I will do to thee that which is worse; that is' said he, 'I will let thee go in the form of a bird.' He turns her into an owl and she flies away. Lleu then slays Gronw with his spear; and rules his territory in peace and prosperity once more.

Sorcerer and Hero

In this tale, as in other fragments from medieval Welsh literature, we get glimpses of a much more archaic world than the one which the story-teller describes, a world which is fully familiar in terms of Celtic mythology. Gwydion is clearly an ancient deity who has affinities with Lugus himself, with Odin of Germanic tradition, and with Mercury. His cunning and magical skills are matched by his brilliant craftsmanship.

He fights as an armed hero and as a sorcerer, combining both powers in order to attain invariable success. He is a poet, a splendid story-teller, a prophet and an astronomer. Animals and birds are closely linked with his legend. The frequency with which pigs figure in the tale may indicate an earlier and more specific association with these and other animals, as may the transformations practised upon him and his brother by Math. In origin Gwydion must have been a god of the most sophisticated type, according to Celtic preference. His virtues and his many skills are those that were most deeply revered by the Celts in their gods and in their heroes alike.

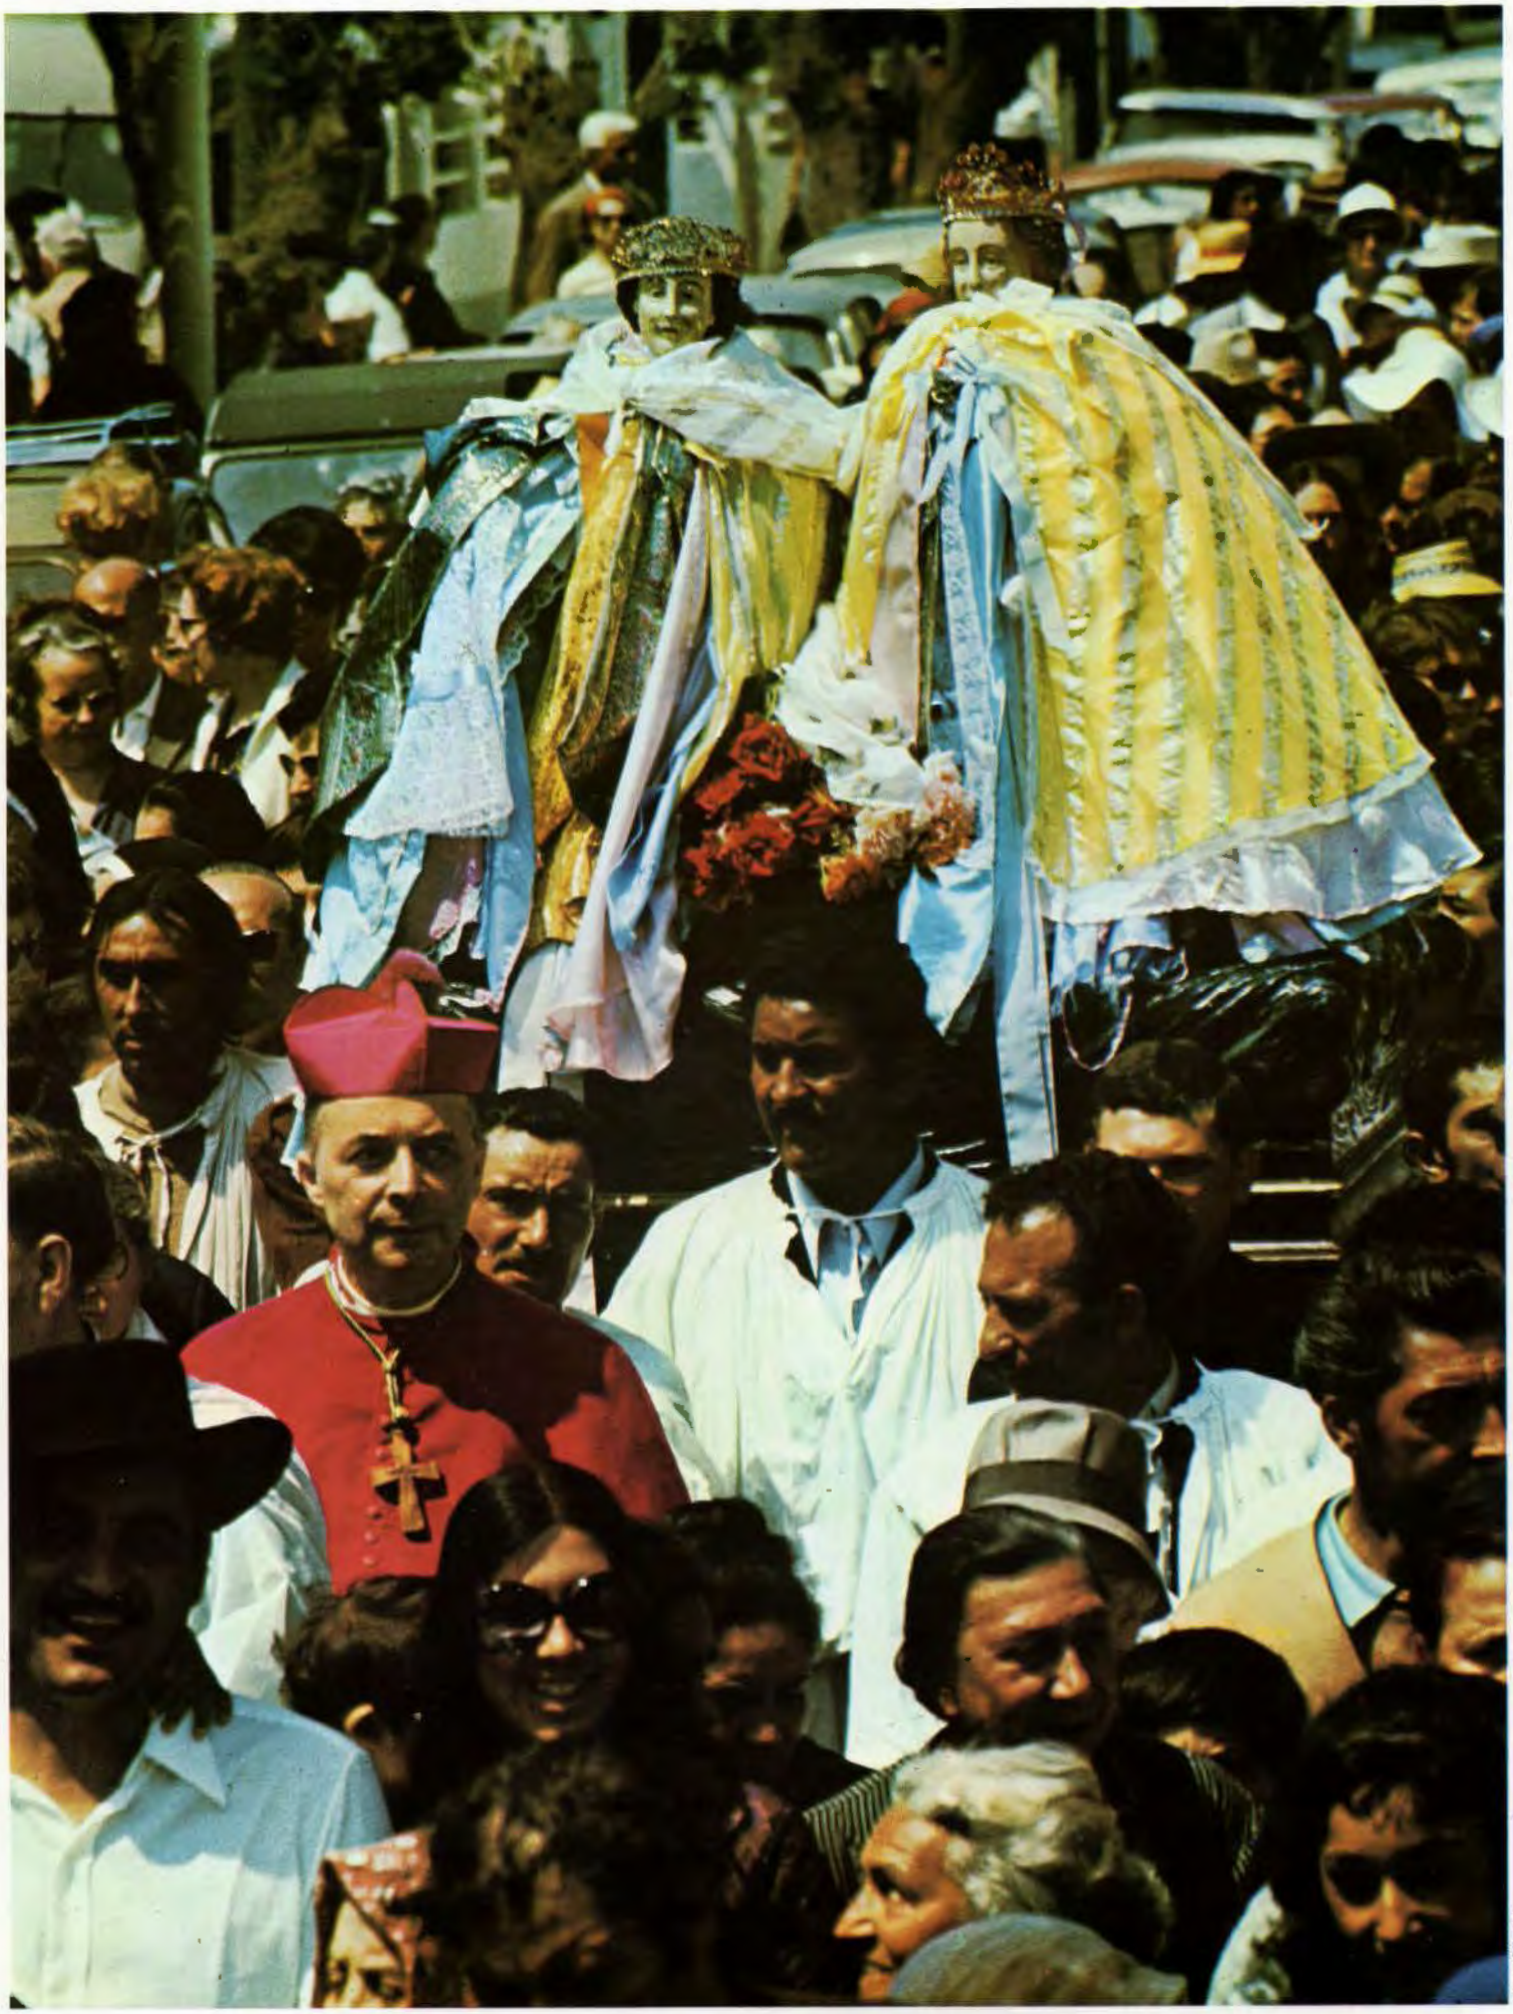
Gypsies



Hans Silvester

There is a legend that the gypsies are the descendants of Cain, cursed and doomed to be fugitives and vagabonds

Fortune telling and the provision of charms, love potions and herbal remedies are part of the gypsies' stock in trade. Distinctive myths, beliefs and ceremonies preserved through their wandering existence help to set them apart from the rest of society

MOST PEOPLE fear gypsies. Their manners are strange, their customs outlandish, their nomadic way of life at odds with the conventions of settled societies. But fear is often tinged with a kind of fascination. Countless painters, musicians and writers have had their imagination stirred – and some of their public have had their heads turned – by romantic notions about gypsy weddings and blood brotherhood, scenes of passion to the sound of violins, moonlight, mystery and magic, fortune telling, divination and secret powers.

Somewhere between the extremes projected by this romantic image and by the disenchanted view of landowners and gamewardens who find their coverts raided and their land fouled and littered (often by non-gypsy travellers) lies the truth about the gypsies: that they are indeed an outlandish people, who in the course of their history have preserved and sometimes perhaps acquired beliefs, customs and traditions which are paralleled in many cultures. Some of these probably date far back into antiquity, others have certainly been modified during the gypsies' centuries of wandering.

One of the difficulties in reconstructing these wanderings is that the gypsies are virtually an illiterate people. A degree of literacy has been forced upon them in recent times as a condition, for instance, of obtaining the licences for the cars which nowadays often tow their caravans, but their society is essentially an oral rather than a literate one. And being nomadic the gypsies have not left behind archeological evidence of settlement, cultivation, artefacts and gravegoods.

In May each year gypsies gather from all over Europe at the Mediterranean fishing village of Les-Saintes-Maries-de-la-Mer, where according to legend the 'Three Marys' of Christian tradition took refuge with their servant Sara la Kali (the Black), patroness of gypsies. Their images are carried in procession (*previous page*) and are dressed in bright robes for the occasion (*left*): on the left is Sara la Kali, on the right Mary Magdalene

Apart from a few documentary references in European archives from the 14th century onwards, their history is preserved in their own oral traditions and legends, not in written records; legends and traditions which are often seemingly at variance with one another. The same is true of their customs and beliefs, whose systematic investigation and study is a comparatively recent, and as yet uncompleted, exercise. Investigators find that gypsies are as likely to be reticent, or deliberately misleading, about these subjects as they are about their past journeys or future movements. But enough headway has been made for a general account to be given of gypsy life, customs and beliefs though these vary from group to group and family to family.

There are four main groups of gypsies in Europe: the Kalderash, mainly coppersmiths and tinsmiths based in eastern and central Europe; the Gitanos, centred in the Iberian peninsula, North Africa and the south of France; the Manush or Sinti in France, Germany and northern Italy; and the British gypsies who are probably of mixed Kalderash and Sinti stock. Great numbers of gypsies are also found in Asia, as well as in New Zealand, Australia and America.

Most American gypsies are of Kalderash or Sinti families. Early large-scale immigrations came from Britain. In later years gypsies have drifted to America from all over Europe; many hundreds of Serbian and Balkan families came at the time of the First World War. In the 1920s the author Irving Brown estimated some 50,000 gypsies in the United States. A more recent estimate, in 1962, placed nearly 5000 gypsies in New York, nearly 10,000 in Los Angeles – cities where the gypsies tend to congregate during the winter.

The word 'gypsies' derives from the self-bestowed title of 'Dukes' or 'Lords' of Egypt (sometimes Little Egypt) by which they were known when they appeared in Europe. Advance bands had no doubt infiltrated before the first recorded appearances – in Greece and the Balkans towards the middle of the 14th century; in Central Europe, Italy and France in the first quarter of the 15th century; in Spain and probably England and Wales, in the middle of the century; certainly in Scotland, Scandinavia, Poland and Russia by the end. They were, however, not of Egyptian origin, though some modern gypsies still repeat the story.

Gypsies repeat other legends also. Some stem from biblical sources, for instance, the story that the gypsies are the descendants of Cain, cursed and doomed to be fugitives and vagabonds; or that they are the descendants of Tubal-Cain, 'the forger of all instruments of bronze and iron', mentioned in Genesis (chapter 4). Christian influences are seen in other legends: that it was a gypsy blacksmith who forged the nails for the Crucifixion and kept or stole the fourth nail; that the gypsies refused to help the Virgin Mary at the flight into Egypt; that as Christ's bodyguard they got drunk and failed to defend him; and in punishment for these sins they have been condemned to wander the earth.

Stories of Creation

But the gypsies also preserve older, pre-Christian myths, some of which may echo man's earliest attempts to explain the universe and the nature of life. In one such myth the earth is called De Develeski, the Divine Mother of all existence, echoing the Sanskrit *deva* meaning 'celestial being'.

The creation of mankind and the personification of the principles of good and evil appear in another myth which shows parallels with the account of the creation in the book of Genesis. On the earth one day appeared o Del (God) and o Bengh (the Devil), who competed in making figures of clay. The Devil fashioned them in the shapes of man and woman, and God breathed life into them. These were Damo and Yehwah, Adam and Eve. One gypsy myth tells that their clay became flesh only when they were touched by the branches of a pear tree and plum tree growing beside them. Adam ate a pear; the serpent tried to prevent Eve from eating an apple, but was stopped by God – a reversal of the story in Genesis – and the fruits aroused their sexual desire. Adam was soon satisfied, but Eve demanded more; and since then woman has not ceased to crave for love. In this mythical account, in contrast to Genesis, God later made the sun and the moon out of the earth.

Another gypsy myth says that before man

The gypsies began to move into Europe in the 14th century. The mystery of their origin, their romantically nomadic way of life and their supposed magical powers surrounded them with a lasting atmosphere of awe and fear. Gypsies on the march, two engravings by Jacques Callot, early 17th century

was created, Sky and Earth had five sons – Sun, Moon, Fire, Wind and Fog. They all quarrelled with each other and their parents. First Moon attacked his mother, Earth; then Fog and Fire their father, Sky; but without success. Sun was equally unsuccessful in attacking Earth. But Wind rushed at Earth and separated her from Sky. Then Earth banished Wind, Sun and Moon, but let Fog and Fire stay with her. Since then, Sky and Earth have been separate, and their five sons remain in perpetual conflict.

In happy contrast with the guilt-laden Christianized legends about the origins of the wandering exiled gypsy race, there is the story that God made the figure of a man out of lime and baked it in the oven. But he forgot to take it out in time. This was the ancestor of the Negroes. Next time he erred on the safe side, and that was the ancestor of white men. But the third time he baked a nicely browned man, and he was the ancestor of the gypsies.

A tale which hovers on the borderland between myth and legend recalls the spurious Egyptian origin of the gypsies. The Pharavono made war on the Horachai (Turkish and Jewish Christians), and having blasphemed were swallowed up by the sea. Only a few escaped, and their descendants, having neither power nor country, State nor Church nor writing, are the underprivileged gypsies of today.

Facts, however, as opposed to fancies, point to an Indian origin for the gypsies. Various other hypotheses of their descent have been advanced in the past, ranging from Nubian and Abyssinian to Assyrian, Chaldean and even Jewish origins. But linguistic evidence provides a safe guide. Although Romany, the gypsy language, has developed several varieties amongst the main branches of gypsies, it clearly belongs to the Indo-European family of languages and is descended from Sanskrit. About half its primary vocabulary (the words for numbers, parts of the body, and basic nouns, verbs and adjectives) is closely connected with the languages and dialects spoken today in northern India, while many grammatical forms follow Sindhi and Hindi patterns. Onto this basic stock have been grafted words from various Near Eastern and European languages, which reflect contact with these cultures as the gypsies migrated and eventually developed sub-cultures. Work still remains to be done on the way in which different European languages have modified the linguistic structures of the various Romany dialects.

Sara the Black Virgin

Gypsies are on the whole deeply religious. But it is interesting that their religion seems to operate on two separate planes. Gypsies share the religious observances of non-gypsy groups, but also have special rituals of their own. These reveal parallels with the observances of other ethnic groups of eastern origin.

As part of the process of accommodating to the various societies in whose midst they live, gypsies have adopted at various times and in various places Mohammedanism and Orthodox, Catholic and Protestant Christianity, and have even joined special sects like the Methodists and Lutherans. The Church is normally called in for such ceremonies as baptism and burial; but non-Christian rituals on the occasion of births, marriages and deaths are also observed, and clearly play a major role in the religious life of the gypsies.

This is true even on formal occasions of Christian observance, as when Catholic gypsies go on pilgrimages. The best known is that to Les Saintes-Maries-de-la-Mer in the Camargue region of France, where there is a special cult of Sara la Kali (the black). In Catholic tradition she was the black servant who accompanied the three Marys (Mary the sister of the Virgin, Mary the mother of James and John, and Mary Magdalene) when they were transported to France. In gypsy tradition she was a gypsy woman who had visions of their arrival and helped them to reach land. The pilgrims keep vigil before a statue of Sara in the church crypt. Medallions and photographs of the sick or absent are pressed against the statue and votive offerings of kerchiefs and rags hung around it – a practice which recalls the Dravidian custom in India of purifying the clothing of the sick by hanging it on a sacred tree. (Irish tinkers are also known to place rags and coins in certain trees for luck, but any connection between these customs remains speculative.) Later the gypsies leave the church and go in procession to the sea where they totally immerse themselves.

Icons and holy pictures are often seen in gypsy caravans, Sara the Black Virgin appearing alongside the Virgin and the Sacred Heart of Jesus. But the consolations of the Christian religion are not enough. Belief in demons, witches and supernatural creatures is rife, and at life's crises recourse is had to older rituals which Christians and sceptics might term pagan or superstitious.

A man or woman is a gypsy by right of birth. Anyone who marries outside the gypsy race loses caste: neither he nor his children remain true gypsies. The adoption of a non-gypsy as a blood brother, despite popular notions, is extremely rare; nor does it seem that such a person is regarded as in all respects fully a gypsy.

The family unit is all-important. Property, apart from personal accoutrements, belongs to the family, not the individual; and although traces of a matrilineal kinship system have been found, amongst east European gypsies in particular, the father is the head of the family and, in extended family systems, 'king' of his tribe. But much respect is also paid to the mother's and grandmother's authority.

Gypsy Weddings

Traditionally, betrothals and marriages are arranged and a bride-price is asked, though this practice is nowadays declining. So are the practices of marriage by 'rapt', carrying the girl off, and its conventionalized substitute, abduction with consent or 'runaway' marriage, when the boy runs off with his girl and some weeks later brings her back to her parents' camp, where mock reprobation is heaped on the couple before they are eventually forgiven.

Marriage ceremonies vary. Today many young couples go to priest, minister or registrar, but the traditional gypsy rites are usually enacted also, civil ceremonies customarily following the gypsy rites as if in confirmation of the marriage. Bride and

Mary Evans Picture Library

groom hold hands or have their wrists tied with ribbon, while the head of the family breaks bread, sprinkles it with salt and gives a portion to each. These portions are then exchanged and eaten. The family feast may last two or three days. Among Spanish gypsies proof of defloration is sometimes obligatory.

Fidelity in marriage is strictly enforced, though divorce and remarriage are admitted. While gypsy prostitutes are not unknown, they tend to be despised, as do unmarried girls who lose their virginity. Sexual jealousy is strong. An adulterous wife is commonly punished by having her hair shaved off; a male adulterer is more likely to have his life made miserable by continuous upbraiding on the part of his wife and female relatives.

The lurid tales of promiscuity to be met with in romantic literature about gypsy life have little basis in reality. Modesty is obligatory, as may be seen from the ankle-length dresses worn by the women and the fact that married women usually have their arms covered except when working at such tasks as washing-up. But modesty, like beauty, is in the eye of the beholder. For gypsies in general the breasts have no erotic significance: a gypsy mother will feed her baby in public quite unselfconsciously.

It is often remarked that gypsy women bear their children with the minimum of fuss under a hedge, and a few hours later go on their way as if nothing had happened. This needs qualification. Admittedly the active outdoor life keeps gypsy women's muscles in good trim, and labour is often easy and quick. But few would choose to travel on at once unless compelled to by hostile landowners or the application of vagrancy laws.

A Secret Name

Gypsy births entail their own special observances. Men are banished from the scene, for a woman in confinement is unclean and, for instance, may not prepare food for some weeks after the birth. Before labour starts, all knots in her clothes must be undone to encourage an easy birth – an example of imitative magic. To avoid polluting the caravan or tent, the woman must give birth outside it. If the weather is bad, she may take shelter under the van or a special tent may be erected.

Baptism is usually conducted twice: firstly by total immersion, when the child is named within the gypsy tribe or family; and secondly according to the rites of the Church, when a name for official use is conferred. There are reports of yet another secret name being conferred by the mother in a whisper at the moment of birth. This is explained as a device to mislead evil spirits who, not knowing the child's true name, will be powerless to harm it – an ancient and widespread magical belief.

As in birth and marriage, gypsies operate on two religious levels in the face of death. Burial according to the forms of the Orthodox, Catholic or Protestant Churches is normal, though even here special features are to be found. But there are also other, specifically gypsy rituals to be observed.

A dying gypsy is customarily taken outside his tent or caravan, often into a death tent erected for the last hours. He is dressed in his best clothes, usually with new boots. After death the male relatives keep vigil over the body until it is placed in the coffin. Certain articles are commonly placed close to the body – a sod of turf on the chest, personal possessions such as the deceased's knife, fork and drinking mug, and perhaps a tobacco pipe or violin, or harness and corn. A woman's personal jewellery is buried with her if she has no daughters of full gypsy blood to inherit it. The relatives file past and drop amulets or coins into the coffin, which is normally pierced with holes on the lid and at each side of the head. Thus prepared for his final wanderings in eternity, the gypsy is buried according to the rites of his Church.

The Gypsy's Violin

Whatever his occupation may be, the Gypsy knows how to play the violin, and cannot live without this instrument. Gypsy legends have not failed to relate the miraculous origin of the violin . . .

There lived formerly in a forest a young girl, with her father, mother and her four brothers. The beautiful Mara was in love with a foreigner (a non-Gypsy) and, in spite of her beauty and powers of seduction, she did not succeed in attracting the glances of the brave *gadjo*. Whereupon she had recourse to the Devil. The latter, only too willing, promised to help her, but on condition that she betrayed her four brothers to him. Of these he made four strings, and of the father a sound-box, and next her mother, of whom he made a bow. From the five souls that were sold was born the violin. Mara learnt to play it, and the music soon fascinated the hunter who no longer resisted the beautiful girl's charms. But the Devil, always dissatisfied, suddenly reappeared and carried them both off. Only the violin remained on the ground abandoned. One day a poor Gypsy who was passing picked it up, began to caress it, and set out from village to village bringing laughter and tears.

Jean-Paul Clébert
The Gypsies

Ritual Destruction

By traditional custom his caravan or tent is then destroyed by burning and its ironwork hammered out of shape and buried. Family property such as china and ornaments are first removed; but if the children have married outside the gypsy race then this is destroyed too. In the past the deceased's horse was slaughtered and buried – a ritual which recalls that of the nomadic Scythians of antiquity – but nowadays it is usually sold to a non-gypsy. In Britain, at least, this is often the fate of an expensive modern caravan. By this means any ill-luck, or haunting of the van or horse by the spirit of the dead, is diverted from the gypsy community to non-gypsies.

The ritual destruction of horse and van is so important that it is sometimes carried out symbolically, for instance, by placing on the coffin wreaths of red flowers formed in the shapes of horses and vans (red is a common mourning colour amongst gypsies). In 1965 an English gypsy woman's coffin was bedecked with wreaths in the shapes of a dog, a bird-cage, matches and cigarettes, a chair, a cushion, a cooking-tripod, a boar's head and a horse collar – all articles prized in life and likely to be appreciated on the last journey.

Some of the commonest and oldest themes of folklore underlie these observances. Such themes include fear of the malevolent return of the dead; fear of their jealousy if their possessions are enjoyed by the living; propitiation of the spirits; and provision for their sojourn in the other world.

Remedies for rheumatism, aches and pains are peddled in exchange for crossing a palm with silver

Left **A gypsy 'king', head of one of the tribal groups** ***Above*** **This gypsy carries her gold round her neck and within her head; when a gypsy woman dies her jewellery is buried with her, a continuation of the very old and widespread custom of providing the dead with 'grave goods' for the next life** ***Right*** **A Turkish gypsy showman wrestles with his tame bear. Itinerant bear-leaders in the Balkan area were commonly gypsies, and the bear is a popular figure in gypsy folklore**

As a nomadic people, gypsies are skilled food gatherers and trappers. Wild fruits and berries, fungi, many kinds of small animals and birds, and to a lesser extent fish, feature in their diet. If hedgehogs, squirrels and even rats are acceptable meats, however, certain others are strictly forbidden. There is a dietary prohibition of the flesh of horses, dogs and cats. Dogs are regarded as unclean by many gypsies, who refuse to drink water from a stream where a dog is drinking, but happily drink the same water as their horses.

In many gypsy groups there is a prohibition against washing dishes in the same basin that is used for washing clothes or the person. As one might expect of travelling folk whose water supplies are limited, personal ablution is sparing and not popular.

Wild herbs, including garlic, add savour to gypsy cooking and are also used medicinally. As is commonly found in folk medicine, the medical lore of gypsies is a strange medley of magical rites and the physical administration of various herbal and animal brews, some of which are effective.

'Cross My Palm With Silver'

The gypsies often use their traditional knowledge of herbal remedies to impress and even exploit non-gypsies. Remedies for rheumatism, aches and pains, are peddled in exchange for crossing a palm with silver, while means of producing an abortion, of unproven reliability, are also offered to gullible housewives. The demand for love potions and aphrodisiac preparations is also catered for; these are generally used in conjunction with charms and incantations.

The extent to which gypsies themselves believe in the efficacy of all this is open to question. It is a question they perhaps do

not ask of themselves, and one, if put by an outsider, to which they could hardly be expected to give a straight answer. But on balance it would appear that gypsies are in this respect like the members of other traditional communities: only the most sophisticated – and therefore untypical – would doubt or disbelieve.

Gypsy folklore encompasses belief in many kinds of supernatural events, powers and creatures. Tales are told of witches and vampires, demons, fairies and ghosts. As a consequence of these beliefs, various kinds of magic are used either to circumvent evil forces or on occasion actually to inflict ill upon others.

From their first appearance in Europe, these nomads with their strange language, secret signs and mysterious ways impressed themselves on their hosts as sorcerers and magicians. No doubt the use of the *patrin*, or sign language, by which information about a household is left by one gypsy family for another, contributed to the notion that gypsies had occult powers and supernatural perceptions. They were not, and are not, slow to exploit this, especially in telling fortunes or, when crossed, in trying to frighten the superstitious by invoking curses or predicting ill-fortune. It has indeed been argued that their reputation for supernatural powers is greater amongst non-gypsies than amongst themselves.

In the practice of black magic, gypsy folklore displays the features found universally. Power over an enemy is exercised by gaining possession of hair, nail parings or articles of clothing. Figurines of wax are melted to the accompaniment of curses and spells, or clay figurines are transfixed with pins in order to cause illness or death. Belief in the Evil Eye is frequent.

There are various counter-measures which can be taken against bewitchment. These include the well-known remedy against witchcraft of binding a red thread round the wrist or finger; licking or spitting three times in the eye; and protecting young children by washing them in water which has been run over a knife blade or used to cool a smith's irons.

Amulets and talismans are also much in use, either worn as ornaments or sewn onto the clothes. Magical symbols on these amulets include the sun, moon and stars; zodiacal signs; snakes and other creatures;

and arrows. The relationship of these symbols to gypsy and other eastern religions and mythologies requires further study.

Patterns in the Tea Leaves

It is especially in the arts of divination and fortune telling that the gypsies enjoy high repute. This is entirely a female skill and occupation. The use of Tarot cards (see CARDS; TAROT) is less frequent today than in the past but consulting playing cards or patterns formed by tea leaves or scattered beans remains standard practice. Even more frequent at fairgrounds is the use, often by practitioners pretending to be gypsies, of the crystal ball for occult vision. Palmistry is perhaps the most common method of all.

In gypsy palmistry the various lines on the palm have the usual significance (see PALMISTRY). But in addition, the thumb and fingers play important roles. The thumb is associated with misfortune, the index finger with good luck and decision, the middle finger with death and destiny, the fourth finger with health and liveliness, and the little finger, nicknamed 'the magpie', with theft or the acquisition of goods. Palmistry is used to predict love and lovers, marriage, children, fortune and death, and is almost invariably practised on non-gypsies, a fact which arouses interesting speculations in those with an ironical turn of mind.

The number of full-blooded gypsies – always difficult to ascertain – is dwindling, in common with so many other traditional cultures. Their customs and way of life are also on the decline, many gypsies tending nowadays to reject them. The systematic recording of these customs is therefore an urgent academic task, for gypsy studies have a major contribution to make to the understanding of human history and development. But one does not need to be either a scholar or a romantic to recognize the colourful contribution gypsies have made to human imagination and the arts.

Hagiography

Or hagiology, the biographies of saints; one of the earliest is a 2nd century life of St Polycarp; the oldest biographies in English literature are lives of saints in the Anglo-Saxon period, including Adamnan's life of St Columba and Bede's biography of St Cuthbert.

See SAINTS.

Underlying the story of Samson's disastrous haircut is a primitive belief which persists in many parts of the world: that strength, virility and magic power reside in the hair, and to allow it to fall into hostile hands is to court danger

HAIR

THE HUMAN HEAD has been associated with innumerable rites and taboos arising from a common belief that it was the abode of forces of great power (see HEAD). The hair, because of its close physical association with the head, was assumed to have magical properties of its own and was surrounded with its own system of magical rites, devised for the purpose of protecting the head from psychic injury and of protecting those who had the task of dressing or cutting the hair from the anger of the indwelling spirits.

Analogous to this was the superstition that human strength resided in the hair and that cutting it reduced bodily vitality. This is the motif of many folktales, including the biblical story of Samson and Delilah (Judges, chapter 16). Deprivation of hair was always regarded as a dreadful form of punishment, a superstition that was exploited to the full by the penal authorities in the Dutch East Indies who, by threatening to remove the hair of their prisoners, usually managed to secure an immediate confession without recourse to torture.

The belief that the strength of the community might in some mysterious way be bound up with the profusion of its monarch's hair was the reason why the locks of the old Frankish kings always remained unshorn. Communal prosperity might likewise be promoted by a profusion of hair: for instance, in ancient Mexico, girls wildly tossed their unbound hair in ritual dances in honour of the maize goddess, the 'long-haired mother', as this encouraged a luxuriant growth of the maize crop. The same magical principle applied in witchcraft, for a witch could double the power of her spell by shaking her hair loose in the wind.

There is an element of reasoning behind the supposed connection between bodily strength and hair growth: boys and eunuchs

are beardless and, by inference, virility must have been equated with the presence of a profusion of hair. This no doubt explains why the cutting of the hair was once considered a violation of Nature and, if imposed by force, a shameful punishment.

Cropping the beard of a defeated enemy has always been one of the most humiliating insults that could be offered him. Shearing the hair of criminals has long been practised not only to ensure easy identification but as an act of degradation, while in the aftermath of war female fraternizers with an enemy occupying force have suffered a similar humiliation at the hands of their compatriots. Shaving the hair as an act of ritual mourning has always represented an extremely abject form of personal sacrifice.

Best Time for a Haircut

A complicated system of taboos and social prejudices therefore surrounded the cutting of hair for thousands of years in communities both primitive and sophisticated. The hair might be cut in accordance with the waxing or waning of the moon, dependent upon how quickly it was required to regrow. Some of the precautions, especially among savages, have been taken to extreme lengths, as in Fiji where the chief of the Namosi tribe used to eat human flesh whenever he had a haircut. The ancient fear that an incautious haircut might outrage Nature had great force among the citizens of ancient Rome, who held it to be one of the major causes of storms. For this reason, many Romans postponed their visits to the hairdresser until those times when a storm had actually broken out. Modern American superstition advises against cutting your hair on a Friday or a Sunday, while a belief from Washington sees ill luck in shaving on Monday. Girls should not cut their hair in March, or it will become lifeless, and cutting the hair after dark reduces sexuality.

From a conviction that cut hair, although separated from the body, continues to be linked to it by an invisible bond, people in many parts of the world have been prompted to dispose secretly of their shorn hair to prevent it from falling into hostile hands. Sometimes it would be cast into a stream where it would be borne away out of danger. In ancient Rome the discarded locks of the *flamen Dialis*, the priest of Jupiter, were

invariably buried for safety beneath a magic tree. Even the notorious modern magician Aleister Crowley was careful to secrete from enemies his shorn hair and nail clippings.

The association between cut hair and the person to whom it had originally belonged might be used to the owner's advantage, however. Included in the magical practices of the European witch-doctors known as Cunning Men or Conjurers was the ritual burning of portions of hair taken from a victim of a spell, in order to project the pains of fire into the body of the witch; this action in itself was a diabolical form of counter-magic. And in the Negro 'conjure' magic of the Old South, hairs were crucial ingredients in the deadly conjures placed in a person's path to harm him.

Shaving a Witch

The supposed continuing association between an individual and his hair found further expression in the European superstition that should birds happen to build their nests with discarded hair, the late owner would suffer from severe headaches or even become insane. A number of other bizarre beliefs still survive: the writer of this article was told in all seriousness that a woman who had burned tufts of her hair in the living room fire became ill almost at once. Rural American lore still advises the 'transferring' of an illness by placing some of the patient's hairs into a hole in a tree, tying them to a frog, and so on.

It was one of the strongest beliefs in witch-hunting times that the magical potency of the sorcerer resided in the hair; in consequence, depilation of the witch frequently preceded torture. Once shorn of her bodily hair, it was thought that the most obdurate of witches would become helpless and make the confession required of her. The notorious Inquisitor Jacob Sprenger (see MALLEUS), it would appear, was satisfied with merely shaving the heads of his victims, holding this to be completely effective. Depilation was similarly practised by the Aztecs to neutralize the magical powers of witches and sorcerers prior to their execution.

The Gorgon Medusa, whose head was struck off by Perseus, had snakes instead of hair: *Head of Medusa* by Rubens

Kunsthistorisches Museum, Vienna

Because of its inherent magical powers and its association with virility, hair was employed for centuries as a charm to lure a loved one; it also played its part in the love philtres manufactured by village quacks. In Ireland an amorous young man would run a hair from the girl of his choice through the fleshy part of the leg of a corpse in order to make his girl-friend 'mad with love'. More common was the gift of a hair bracelet or lock of hair between lovers, which has been described as 'an act of surrender and faith', since according to the laws of magic such a gift gave the recipient absolute power over the life of the donor.

A love charm could rebound somewhat drastically on the head of an unscrupulous lover, however, as the Scottish wizard John Fian was said to have discovered to his cost when he attempted to obtain some of the pubic hairs of a young girl for use in a philtre to make her love him. The ruse being discovered and hairs from the udder of a young cow substituted, the villain found himself pursued all over town by an excessively amorous heifer.

As an index of character fair hair is said to signify timidity, curly hair good temper and straight, lank hair cunning of the lowest order; whilst red hair is regarded as a sign of bad temper. Brown and black hair are thought by many people to indicate bodily strength; black hair is often regarded as a luck-bringer, particularly in the ceremony of the First Foot at New Year (see FIRST).

The hair is also known to respond to the emotional state of the individual, giving rise to the common belief that shock can turn a head of hair white or grey in a single night. There are a number of interesting historical accounts of such cases, notably those of Queen Marie Antoinette and the luckless Damiens, who was fiendishly tortured in public before being torn to pieces between four horses, as a punishment for his attempt on the life of Louis XV of France.

An abundance of hair on the arms is said to portend wealth. Conversely, loss of hair is unlucky, being an omen of loss of children, health and property. Hair growing to a peak in the centre of a woman's forehead, known as a widow's peak, foretells widowhood; in the United States, however, it is considered an extremely lucky sign.

Hair and beard styles, like religious dogmas, have succeeded in dividing mankind into warring camps, the conflicts being resolved less by the clash of swords than by the malicious snipping of barbers' shears. Ever since St Paul issued his famous dictum that 'if a man have long hair, it is a shame unto him' (1 Corinthians 11.14), the champions of the short haircut have conducted a relentless warfare against their more hirsute fellow citizens. St Wulfstan, Bishop of Worcester in the 11th century, became notorious for sudden assaults upon unsuspecting passers-by, whose beards he proceeded to hack with his knife, thrusting the severed tufts into their outraged faces with the command that they shave off the remainder or go to hell.

Harald Schultz

A Tax on Beards

The vanity of princes has influenced tonsorial fashions to an alarming degree. Philip Duke of Burgundy in 1461 compelled 500 of his nobles to sacrifice their hair, for no better reason than that he had lost his own as the result of illness.

When Francis I of France decided to grow a beard to conceal a scar on his chin, the whole male population of his kingdom were ordered to follow suit. Filled with reforming zeal, Tsar Peter the Great of Russia attempted to reduce the vast acreage of hairiness in his dominions by the simple expedient of taxation. Any beard seen in public without an accompanying tax receipt could be hacked off on the spot.

Long hair in men still excites the most violent emotions among otherwise rational citizens and is assailed as symptomatic of degeneracy and effeminacy, on the assumption that the wealth of the nation and the virility of its male citizens can in some mysterious way be threatened by delaying a visit to the barber. In Syria the long-haired are liable to be jailed, while in Greece recently they have been compulsorily shaved. (See also HEAD-DRESS.)

Picturepoint, London

Halcyon
Fabulous bird, supposed to breed at midwinter in a nest which floats on the sea; the wind and waves remain calm for seven 'halcyon days' to make this possible; from the Greek word for 'kingfisher'.

Halo
Disc of light surrounding the head or sometimes the whole body of a god, spirit or holy person in religious art; the halo round the head is called a nimbus; the halo round the whole body is an aureole. See DOUBLE.

The power of the thunder god Thor lay chiefly in his hommer, Mjölnir the 'crusher' or 'grinder', with which he subdued giants and kept mankind in awe

HAMMER

TO EARLY CRAFTSMEN, the hammer was an essential instrument, used particularly in the forging of metal; assuming a wider significance, it became one of the earliest symbols drawn from technology. In myths it stands for creation and fertility as well as for ordinary physical force: the idea of sexual potency is also sometimes implied. In historical times, the hammer represents military, political or industrial power.

In the 8th century, Charles Martel, or Charles 'the Hammer', the grandfather of Charlemagne, inflicted Christendom's decisive victory over Islam at Poitiers in 732. 'Hammer' was also the name assumed by the Russian revolutionary Molotov. The Bolsheviks adopted the hammer and sickle as a symbol of the union of the industrial working class and the peasantry as early as 1918, although it was not the official flag of the Soviet Union until 1923. The hammer on that flag specifically symbolizes 'the power of the working people'.

The Bolsheviks were not the first to associate the hammer and sickle. The southern Gauls had a god who was sometimes represented with a hammer and sometimes with a sickle. The god with a hammer was an important deity in the ancient Celtic pantheon. He was often depicted on altars and a famous statue of him was found at Prémeaux. He was sometimes regarded as an ancestor of the Gauls, and under the name Sucellus ruled the underworld. He was regarded as a benevolent god, associated with the great Earth Goddess, and his hammer was a symbol of creative power.

In most ancient mythologies there is a god with a hammer. In Greek mythology Hephaestus the smith, god of fire, is the son of Zeus for whom, with his hammer, he makes thunderbolts. At a certain stage in the development of civilization the hammer became the supreme symbol of the power of creation, and in one Chinese myth the Creator himself is described as having a hammer and chisel in his hands.

The hammer is one of the earliest symbols to be drawn from technology and in the Soviet Union symbolizes the power of the working people: the combined motif of hammer and sickle represents the alliance of the industrial working class and the peasantry

But it is in the Icelandic sagas, the great medieval collections of Nordic poems known as the *Eddas*, that the hammer, in the hands of the thunder god Thor, comes into its own as a mythical object with a proper name, Mjölnir, the 'crusher' or 'grinder'. Thor, the most powerful of the gods, destroyer of giants, was never without his hammer, or the iron gloves he wore to get a proper grip on it, if he could help it. If he ever was deprived of Mjölnir, the best part of his power was lost.

Mjölnir the Murder-Greedy

Mjölnir had been forged by the dwarf Sindri, who made the haft too short. But however heavy the blows Thor struck with it, the hammer never failed him. It would also return to his hands like a boomerang, however far he hurled it. Mjölnir also had the miraculous quality of shrinking in obedience to Thor's will.

Mjölnir was the terror of both the frost giants and the hill giants, to whom it was known as 'murder-greedy'. The hammer was identified with the thunderbolt: when the ground was struck by lightning, Thor had hurled his fiery hammer down to earth.

In a 10th century saga the story is told how Thor's hammer was stolen by the giant Thrym while he was asleep. Thrym then buries Mjölnir eight miles deep and demands the goddess Freyja for his wife. At the suggestion of the cunning Loki, Thor reluctantly disguises himself as Freyja, putting on a woman's head-dress, necklace, girdle and dress, and goes to the marriage feast, where he astonishes Thrym by eating an ox, eight salmon and all the dainties set out for the women guests, and drinking three huge vessels of mead. When the moment comes to consecrate the marriage, Thrym orders the hammer Mjölnir to be brought and laid in the maiden's bosom, 'that Vor, goddess of vows, might bless both bride and groom'. Thor then throws off his disguise, seizes Mjolnir, and slays not only Thrym but all his companions.

The 'sign of the hammer' was regularly used by the ancient Nordic peoples in the consecration of marriages as a means of bringing fecundity and warding off evil powers. It was also made over cups of liquor at sacrifices, and was believed to heal sickness. When a newborn child had been acknowledged by its father and allowed to live, its acceptance was solemnly confirmed by washing it and making the sign of Thor's hammer over it. These customs survived into the early Christian period in Iceland, and there are incidents in the saga which point to rivalry between the symbolism of Thor's hammer and that of the Cross.

Among some Scandinavian peoples hammers, as a result of the myths about the thunder god, were credited with magic powers. Small hammers were sometimes worn as amulets, and beautifully carved double-headed hammers made of reindeer horn were, along with drums, part of the mysterious equipment of the Lapp Shamans. The Lapps also offered up large wooden hammers, smeared with blood from sacrificed deer, to their thunder god.

A Hand of Glory from Whitby Museum: this unpleasant charm was made from the hand of a hanged man, pickled and dried; used as a candleholder or with the fingers themselves set alight, it cast those exposed to its influence into a stupor and stopped sleepers from waking

HAND OF GLORY

TO MAKE a Hand of Glory, a human hand was cut from the corpse of a hanged man, and dried and prepared in a prescribed manner. It was used as a charm to prevent sleepers in the vicinity from waking, so enabling the possessor to carry out robberies with impunity or, according to another account, to stupefy any person to whom it was displayed and render him or her incapable of speech or movement. There were two ways of using it. Sometimes a specially made candle was fixed in the hand, as in a holder; sometimes the hand itself became a five-fold candle, the outspread fingers and thumb being set alight to burn slowly for as long as was necessary. Belief in the powers of this gruesome object was once widespread in a number of European countries including England and Ireland, and tales of its employment by witches, and also by robbers, are still remembered.

A method of making the Hand of Glory and its accompanying candle is described in a book entitled *Marvellous Secrets of the Natural and Cabalistic Magic of Little Albert*, published at Cologne in 1722. The author's knowledge was apparently gained from hearsay; he tells us that he has never proved the efficacy of the charm for himself but that he had several times been present when sentence was passed upon criminals who confessed to using it in the course of their robberies. The hand, left or right, had to be taken from the body of a felon hanging on a roadside gibbet, wrapped in a piece of winding sheet, and squeezed as tightly as possible in order to drive out any drops of blood that might still remain in it. It had then to be put into an earthenware jar in which it was left for two weeks, together with nitre, salt, long peppers and a mysterious powdered substance known as 'zimat' or 'zimort'. Then it had to be exposed to the sun in the dog-days, or it could be dried in an oven heated by fern and vervain.

A 'sort of candle' had then to be made from the fat of a hanged man, virgin wax and 'sisamie de Laponie'. This last has usually been translated as Lapland sesame; but Grillot de Givry, in his *Witchcraft, Magic and Alchemy* (1931) gives sesame and 'ponie' as separate ingredients, and says that the latter word is of unknown significance today. He suggests that horse dung was possibly intended, since 'ponie' has that meaning in a dialect of Lower Normandy, and horse dung, which burns well if thoroughly dried, would not be an altogether unsuitable material. When the candle was finished, lighted and thrust between the fingers of the prepared hand, the charm was ready for use.

Although witches were supposed to employ the Hand of Glory for their own dire and secret purposes, and were sometimes accused of doing so at their trials, it is the thieves' use of the charm which is most often recounted in surviving stories. By its power they were able to break into houses without fear of discovery. As long as the fingers, or the candle, remained alight, no one already asleep could be roused from his charmed slumber. John Aubrey, the 17th century antiquary, refers to 'a story that was generally believed when I was a schoolboy (before the Civil Wars) that thieves when they broke open a house, would put

Tindale/By courtesy Whitby Literary and Philosophical Society

a candle into a dead man's hand, and then the people in the chamber will not awake.'

The same belief evidently existed in Ireland two centuries later. The *Observer* of 16 January 1831 reported an attempted burglary that had taken place some days earlier at Loughcrew, Co. Meath. The robbers took a Hand of Glory with them, 'believing in the superstitious notion that . . . if a candle in a dead hand be introduced into a house, it will prevent those who may be asleep from awaking.' In this case something seems to have gone wrong with the magic, for the householders did waken in spite of it and the burglars fled, leaving the hand behind them.

Quenched Only by Milk

When the dead hand was used by itself, without the added candle, the fingers were lighted at the tips and left to burn like five baleful tapers at the top of the upright hand. If the thumb would not catch fire, it was a sign that someone in the house was still awake and free from the effects of the charm. It was generally believed that the flames could not be blown out by any ordinary person, nor could they be extinguished by any liquid thrown over them, with the exception of milk.

An English version of a story also known in other countries relates how a beggar came one night to an inn (variously located in Yorkshire or Northumberland) and asked for shelter. No bed was available for him, but he was allowed to lie down in front of the kitchen fire. When the household retired to rest, one of the maids, mistrusting the man's looks, stayed up and watched him through a hole in the door. She saw him take a dead hand from his pocket and set it upright in the candlestick on the table. He then smeared it with ointment and lit the four fingers, but was unable to light the thumb. The frightened girl rushed upstairs to rouse the family but was quite unable to do so. Returning to the kitchen, she found that the thief had left it, but the burning Hand of Glory still stood upon the table. She tried to blow out the flames, and then to quench them first with water and afterwards with beer, but they only burned more brightly. Finally she emptied a jug of milk over them and immediately they went out. The spell being broken, the inmates of the house awoke and easily overpowered the beggar, who in due course was hanged. An almost exactly similar tale is told of a band of thieves and a brave servant at Huy, in the Low Countries, and there are other variants elsewhere.

The author of *Marvellous Secrets*, having described how the Hand of Glory is made, obligingly supplies his readers with an antidote to its evil powers. The charm will, he says, become ineffective, and thieves will be unable to use it, if the threshold of the main door and all other possible entries are smeared with an ointment specially made in the dog-days from the gall of a black cat, the fat of a white hen and the blood of a screech-owl.

Hanuman

Monkey god of Hindu mythology who plays an important role in the *Ramayana*, an epic poem about a war between the rulers of India and those of Ceylon; he has many temples, especially in southern India, and is also popular in Japan; the hanuman monkey which bears his name is one of the commonest Indian monkeys.

R. K. Singh

Hara-kiri

Literally 'belly-cutting', vulgar term for ceremonious suicide by disembowelling in Japan; long practised by the Samurai, the warrior class, when in disgrace; one or more cuts were made with a short sword, drawn across the abdomen and turned upwards; sometimes the execution was swiftly completed by a friend or relative who beheaded the victim; the act of hara-kiri, performed with due ritual solemnity, restored the personal honour of the suicide.

Thousands of Indians alive today believe that a remarkable holy man, who was born in 1865, was the promised reincarnation of a saint, and an embodiment of the god Krishna

HARANATH

THE REINCARNATION of Gouranga, the 16th-century saint who was renowned throughout India as an embodiment of Krishna, was prophesied in 1592 by Manohardas Goswami, a Bengali sage. Exactly 273 years later, on 1 July 1865, Sri Haranath was born at Sonamukhi – which means 'Golden Mouth' – in western Bengal, the son of a Brahmin. His disciples believe that he was the reincarnation of the saint and that he came, as he had come before, to distribute *Krishna prem* (divine love) on a vast scale.

It is related that Haranath's father, Jayaram Banerji, while on a visit to Calcutta had a dream in which a *sadhu* (holy man) visited his house at Sonamukhi and requested hospitality of his wife, Sundari Devi. Being overwhelmed by the radiance of the sadhu, she admitted him to a magnificent temple of Shiva which Jayaram had built before leaving for Calcutta. There she served the sadhu devotedly and locked the outer gates of the temple after the evening ritual. Next morning there was no trace of the sadhu, although the temple walls were too high to scale.

So vivid was the dream that Jayaram returned immediately to Sonamukhi and related it to his wife. He was astonished to learn that a sadhu had indeed been received by Sundari the previous evening. Soon after these events, Haranath was born. His unusual life and, later, his appearance, suggested that he and the sadhu were identical.

The saintly Gouranga (or Krishna Chaitanya, as he is sometimes called) had fired all India with his ecstatic chanting of Krishna's name; but his mission had not been wholly fulfilled. Being a *sannyasin* (celibate sadhu) his life was incomprehensible to the mass of the people. Consequently, as the centuries passed his influence waned and a new impulse became necessary. This was initiated by Haranath. He lived the

life of an ordinary householder engaged in worldly activities. He married Kusuma Kumari Devi when he was 14 years old, she being nine at the time. Later in life he implied that Kusuma was Vishnupriya, who had been the wife of Gouranga before he renounced all worldly ties to tread the austere path.

Very early in life Haranath is said to have manifested strange powers. His mother would conceal various objects in fun and he would locate them immediately, unerringly, no matter how far from the house she hid them. He frequently went into trances and, while studying for his degree at the Burdwan Raj College, Calcutta in 1889, fell into such profound ecstasies that he could only be aroused with difficulty. He would then roam the Calcutta streets, unconscious of his surroundings. His college days were spent listlessly. He had no real interest in worldly knowledge; his mind was continually being absorbed by a mysterious inner power and he spent most of his waking life in the contemplation of spiritual truths. Because of this he did not pass his B.A. examination, for which he sat three times. With characteristic resignation to the will of Krishna he told a devotee: 'I could not possibly have passed if I had appeared a *lakh* (100,000) times more, because no worldly object could then attract me.'

Chanting the Name of Krishna

When not lost in meditation he was busy organizing parties in which the chanting of Krishna's name and the commemorating of Krishna's divine activities were the dominant features.

Haranath earned his living in government service in Kashmir. He raised a family, thereby fulfilling one of the chief duties of a householder according to Hindu thought. But his love was seen to flow out to all beings and his small family soon increased to embrace many tens of thousands in India and other places.

Although living at a great distance from his wife and family during the 20 years of his service in Kashmir from 1893 to 1913, he asked his devotees always to couple her name with his, thus forming the sacred incantation or *mantra* 'Kusuma Haranath'. The full and tremendous potency of the mantra would, he said, be discovered only after his death.

Haranath exercised superhuman powers that affected all kinds of people, many of whom were personally unknown to him. There are cases on record of his conversion of vicious people into saints, of ferocious animals into harmless and affectionate companions. He could leave his physical body at will and travel on the astral plane in order to warn his devotees and friends of impending dangers, saving their lives or enabling them to avoid agonies of mind and body. He had the power of hearing spirit voices and communing with divine beings, of seeing through opaque bodies, and visiting the abodes of Vishnu, Krishna and other gods. He also possessed the power of clairvoyance to a very high degree. He never claimed any of these powers as his own, always referring them to Krishna alone.

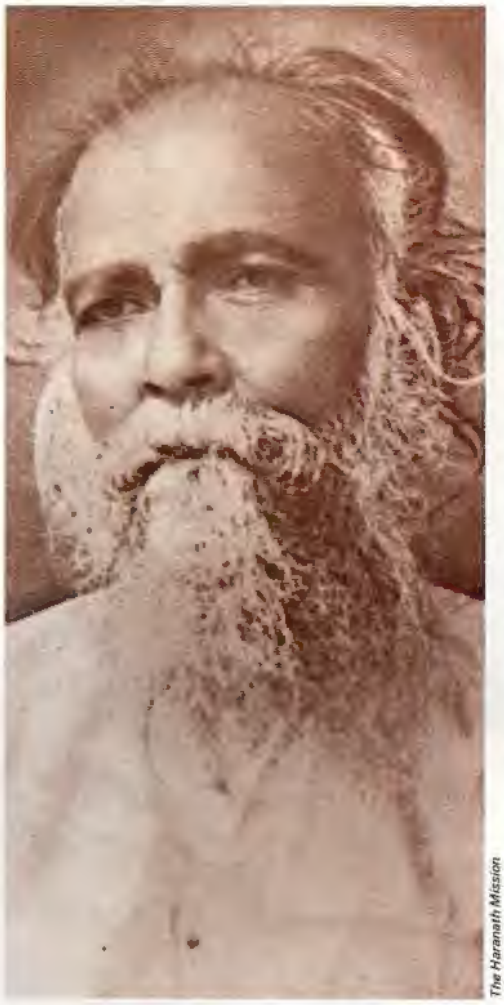
Crazy with the Love of God

During the time of his service in Kashmir there were some who recognized him as an *avatar* (direct incarnation) of Krishna, but to the majority of his devotees he was Pagal Haranath, so called because he was crazy *(pagal)* with the love of God. He imparted his mood of divine joy to all, regardless of caste, age, sex or creed. He wrote thousands of letters during his life; they all extolled the efficacy of 'taking name' (repeating a divine name) and showed the way in which Krishna himself could be ensnared by his devotee in the net of love and longing.

Haranath said of the sage Narada, that he gave salvation through his harp; of Krishna, that he gave salvation through his flute; while he claimed his own pen to be sufficient means of salvation in the present age. The first volume of his letters appeared in 1910 under the title *Pagal Haranath*, and it is today the main devotional book of his followers. Like all the letters which flowed unceasingly from his pen, *Pagal Haranath* is steeped in divine love.

Haranath had no equal as a healer, and relieved sufferers by absorbing diseases into his own body. For hours and sometimes days afterwards his body registered the symptoms and agonies of the sufferer; yet he described the sensations as blissful. Such was his overwhelming love for humanity, especially the weak and the vicious, that he was willing to assume all their burdens. The only fee he asked was that they should chant aloud, or repeat mentally, 'any divine name that melted their hearts', such as Radha-Krishna, Rama, Vishnu, Christ or Gouranga. It began to be customary for those he healed or enlightened to repeat the name Kusuma Haranath, and this is still done by multitudes in India and elsewhere today.

Haranath is recognized by many Indians as an avatar, a divine personality whose mission was to initiate a spiritual rebirth among Hindus: he was clairvoyant, had remarkable powers of healing and was said to travel on the astral plane and commune with spirits



The Haranath Mission

Dead for Ten Hours

The most critical experience in Haranath's life occurred in April 1896. He was about to journey from Jammu to Srinagar but on stepping into the carriage he lost consciousness. This occurred at three in the afternoon. He remained absolutely inert until one o'clock the following morning and was given up for dead. His heart had stopped beating, all signs of life had disappeared, and his travelling companions made arrangements for the body to be cremated. During the ten hours of death, however, Haranath claimed to have experienced the most intense interior activity. This included communion with a *Mahapurusha* (Great Being) whom he had seen before as a child of five while out walking with his elder brother. On this first occasion a vast form had hovered over them, as high as a two-storeyed building close by. He had at that time been mysteriously absorbed into the Mahapurusha; now it was the latter's turn to be absorbed into Haranath.

This great being was none other than Haranath's own self – Gouranga; and when he returned to life at one o'clock the following day, the merging had been accomplished. Haranath remained silent about the full significance of this experience. But his complexion underwent a permanent change to a fair golden hue (Gouranga means *the golden one*). Haranath became literally the 'one who spoke golden truths from a golden mouth', as Manohardas had prophesied centuries earlier.

During the period of 'death' it is said that the Mahapurusha dismembered Haranath's body into 64 parts. This he did in order to effect some kind of spiritual regeneration. On reassembling them, three were found to be missing. Haranath urged that these would not be necessary. He was anxious to re-enter the body again, not because he feared death or what might follow, nor because he cared particularly about living in a bodily form, but because of the anxiety which he knew his mother felt at that moment, having become telepathically aware of his sudden 'death'. The Mahapurusha therefore made up the missing parts with 'earthly matter taken from the hills', and Haranath revived.

Haranath left his reconstituted body permanently in May 1927. His followers explain that his devotees had become too numerous for individual attention and he consequently became universal once more so that he could appear to all who needed him, as Krishna himself had appeared to each of his devotees, intimately and uniquely.

KENNETH GRANT

Formerly associated with the moon and reverenced as a holy creature, the hare came to be feared as a beast of ill omen. Witches often took the form of hares to work their mischief, and in this shape could only be killed by a silver bullet

HARE

'NOW WE WILL BEGIN with the hare. And why Sir will you begin with the hare rather than with any other beast? I will tell you. Because she is the most marvellous beast that is on this earth.' So wrote William Twice in his 14th century treatise on hunting.

Marvellous indeed is the hare. As a symbolic figure from the unconsious the hare constantly recurs in dreams, and in world mythology it is closely associated with the moon. It has performed the role of deity and devil, of witch and witch's imp, and for reasons hard to comprehend this most timid of creatures has been regarded by mankind with a mixture of horror and awe.

It was generally accepted that a witch could assume the shape of a hare at will and resume her true form by an incantation. Witches in the shape of hares were notorious for ravaging the farmer's fields and for stealing the milk of cows. They could only be destroyed by a silver bullet – symbol of the moon – fired from a gun. If they were merely injured a search was at once begun for a woman with a similar injury; if such a woman was found, she was often condemned to death.

The Algonquin Indians worshipped the Great Hare, who was credited with forming the earth (see ALGONQUIN INDIANS). In Greece and China the hare was associated with the moon; in the former country it was connected with the lunar goddess Hecate and in the latter with the powers of augury. Buddha in one of his reincarnations took the form of a hare, which leaped into a fire and implanted its image upon the moon.

In pre-Christian Europe the hare was regarded as a symbol of fertility and therefore of the spring. The Romans divined the future from its movements and its sacred flesh was denied to ordinary mortals.

Many people feel an aversion to eating the meat of the hare and there is a suggestion of totemism underlying this objection. But it is possible that it was also based on the rules of magic: it would be extremely dangerous to consume the flesh of so timid an animal for fear that this same timidity would be transmitted to the eater.

The hare was reverenced in Europe as the spirit of the corn, particularly in Germany, Holland, France and Ireland, where the reaping of the last of the corn was known as 'cutting the hare'. Reapers were urged on at their labours at harvest end with the cry, 'We'll put the hare out of it today.'

Many relics of the old traditions of divining the future from the movements of the hare survive in modern Europe. In the British Isles a hare running down a village street is an omen of fire. For a hare to cross the path of a traveller is highly ominous, especially if the traveller is a pregnant woman. In this case it is necessary for a piece of cloth to be torn from her clothing to prevent her from giving birth to a hare-lipped child. Fishermen were known to abandon a day's fishing after a hare had crossed their paths, and under no circumstances could the word 'hare' be uttered at sea. A fatal accident in a mine was thought to be foreshadowed by the presence of a white hare or a white rabbit; this is in itself an interesting example of a superstition originally associated with the hare becoming attached to the rabbit, a later arrival in Great Britain.

The white hare also occurs in ghost lore. A typical example was described by Robert Hunt in his *Popular Romances of the West of England*, in the legend of a betrayed girl who died from grief and returned in the shape of a white hare to haunt her lover.

Melancholy as a Hare

Hares have acquired a reputation for melancholia. Many people shunned the flesh solely from fear that by eating it they would become contaminated by melancholy. The belief that the hare's melancholy increased to the point of madness in the month of March (when this creature is specially shy and wild, this being the mating season) survives in the expression 'mad as a March hare'.

The hare strikes a happier note as one of the symbols of the Easter festival, for it was the Easter hare that laid the Easter egg. The ceremony of scrambling for hare pie, which still takes place on Easter Monday at Hallaton in Leicestershire, however, has undertones of ritual sacrifice.

Possibly the best known surviving reminder of the hare's ancient powers is the custom of carrying a hare's foot as a charm against colic, rheumatism and misfortune generally. It is mentioned in the diaries of Samuel Pepys, who remarked after touching a hare's foot to cure the 'colic', or severe indigestion: 'Strange how fancy works, for I had no sooner handled his foot but I became well and so continue.'

Arthur Rackham

Harlequin

Pantomime clown, his clothes covered with triangular patches of many colours, who carried a stick (the original 'slapstick') which later became his magic wand; descended from Herlequin, a jester connected with the Devil in medieval French mystery plays; in Italian comedy of the 17th century Arlecchino turned into a hero of satire.

Michael Holford

Harp

Musical instrument venerated in many societies and believed to keep evil forces at bay, as in the case of David soothing Saul (1 Samuel 16.23), though he may really have played a lyre: in the tomb of Rameses III in Egypt priests are shown playing harps: in Western Europe the harp is associated with bards and fairies: the belief that angels play harps in heaven probably stems from Revelation (14.2) in which harps are associated with the redeemed on Mount Zion.

B. Peacock

C. M. Dixon

C. M. Dixon

Harpies are commonly described as birds with the faces of women, and this is how they are depicted on the Tomb of the Harpies in Asia Minor; they appear to be carrying away evil-doers for punishment by the Furies. With their habit of carrying off people and food, the Harpies are associated with whirlwinds and sudden squalls: they 'keep pace with the blasts of the winds on their swift wings, for they swoop high aloft'

To call a woman a harpy is to imply that she is a fierce, grasping hag. The original Harpies of antiquity were winged monsters with women's faces, who descended like birds of prey to snatch up their victims with long, hooked claws

HARPY

LIKE THE SIRENS, the Furies and the Gorgons, the Harpies were female monsters of Greek legend. They were depicted in art and literature as winged women, or as birds with women's faces and long, hooked claws, and their peculiar activity was to swoop upon human begins, or at least upon their food; their victims were carried off to unknown places. The origin and nature of the Harpies are in dispute, but they seem to have a definite connection with the underworld, having some of the characteristics of ghosts.

Wind and spirit were closely allied in ancient thought (see BREATH), and the Harpies are linked in literature with storms, whirlwinds or sudden squalls such as are particularly dangerous at sea and damaging on land. They appear first in Homer, where the Harpy Podarge (swift-foot) is mentioned in the *Iliad* as mating with the wind Zephyrus, and giving birth to the two supernatural horses of Achilles, Xanthus and Balius. In the *Odyssey* (book 1) Telemachus says that Odysseus has been away so long that he must have been carried off by the Harpies 'with no tidings, out of sight'. So too, in her grief, Odysseus's wife Penelope wishes that she had been carried away to the mouths of Ocean by a storm such as swept off the orphan daughters of Pandareus. A legend relates that the goddess Aphrodite, who had been protecting these girls, left them unattended for a period while she interceded for them on Olympus. The Harpies then swept them off and 'gave them as servants to the hateful Erinyes'. Since the Erinyes or Furies belonged to the underworld, the Harpies must have brought the maidens alive to dwell among the dead. This was the fate which Odysseus's family and friends imagined had overtaken the hero.

In Hesiod's *Theogony* two Harpies are mentioned, Aello (storm-wind) and Ocypete (swift-flier), children of two vague figures, Thaumas and Electra, who were also the parents of Iris, the goddess of the rainbow and messenger of the gods. These Harpies 'keep pace with the blasts of the winds on their swift wings, for they swoop high aloft'. In some Hesiodic fragments more details are found. The historian Strabo (c 64 BC–21 AD) quotes from the *Guide to the Earth* the story of King Phineus who was carried off by the Harpies 'to the land of the eaters of milk-curd who have waggons for houses'. These are obviously nomads living to the north of the Black Sea. This seems to be a different story of Phineus from the well known one, where Phineus's food and not his person was carried off.

Snatching at Table

Persecution by the Harpies was one of the punishments sent by the gods on Phineus, the blind king who indiscreetly used his gift of prophecy to reveal secret plans of the gods. In Aeschylus's play *Phineus* they appear with ravening jaws and snatching hands, and wearing ankle-boots and stout socks, to seize food from Phineus's table. In one of the fragmentary plays by Sophocles also called *Phineus*, the Harpies are called snatchers; in the other they are compared to locusts.

The Harpies belong particularly to the Argonautic legend, in which the Argonauts visit Phineus on their way eastward to Colchis to find the Golden Fleece, and the fullest account of them, which has become traditional, appears in the *Argonautica* of Apollonius Rhodius, written in the 3rd century BC. The Argonauts arrive at the palace of Phineus on the west coast of the Black Sea and are welcomed by him because they will deliver him from the Harpies. Phineus had accepted the gift of prophecy even at the price of blindness and a long old age, but had misused it and offended the gods. As his punishment, the Harpies

were sent to swoop down upon his table at every meal, carrying off nearly all the food but leaving enough to keep him alive and miserable, and leaving also a disgusting stench which could be smelt for some distance.

A Chase Through the Air

Fortunately, among the Argonauts are the winged Boreades, Zetes and Calais (sons of the north wind), who promise to rid Phineus of the Harpies if this is permitted by the gods. When the Harpies appear, they chase them away through the air with drawn swords; they catch them by the Plotae islands and are about to kill them when Iris flies down from Olympus to forbid it, promising that the Harpies will never return to plague Phineus. The Boreades turn back at the islands, now to be renamed the Strophades or Turning Points, and the Harpies dive into a cavern on Crete.

In a fragment from Apollodorus is another version of this legend, where the Harpies Nicothoe (victorious speed) or Aellopus (wind-foot) and Ocypete are pursued by the sons of the north wind. Nicothoe falls into the River Tigris in the Peloponnese (called Harpyes after her), and Ocypete flees to the Strophades; these islands were not originally localized but were later placed west of the Peloponnese.

Later poets, including the Latins, add little more information about the Harpies. Virgil, however, in the *Aeneid* (book 3) makes the Harpies sweep down on Aeneas and his Trojans as they try to spread a banquet on the beach of one of the Strophades Islands. The Harpies behave as they do in the account in the *Argonautica* but they are not driven off successfully; one of them warns Aeneas that his men will suffer hunger before they found a new city.

Ancient poets, commentators and lexicographers were inclined to derive the name 'Harpies' (Greek *Harpyiai* or sometimes *Arepyiai*) from the root of the Greek verb *harpazein* meaning 'to seize' or 'to snatch'. Modern philologists, concentrating on the form *Arepyiai*, tend to interpret the name as meaning 'tearers' or 'slicers'.

HARRANIAN RELIGION

THE CITY OF HARRAN in northwest Mesopotamia became in ancient times the centre of a mysterious religion that included the worship of the planets. Information about this religion is sparse and difficult to interpret, especially since much of it comes from hostile sources.

As far back as the second millenium BC, Harran was an important centre of the cult of Sin, the moon god. The original centre of the cult was the Sumerian city of Ur, known in the Bible as Ur of the Chaldeans. The Bible preserves an interesting connection between these two cult centres of moon worship; for according to the book of Genesis (11.31) Abraham, a native of Ur, journeyed with his father Terah and wife Sarah from Ur to settle in Harran.

In Mesopotamian mythology, Sin was an important deity connected with the regulation of time through the lunar month. He was regarded as the father of Shamash, the sun god, and of Ishtar, the goddess of fertility, who was identified with the planet Venus (see ISHTAR). The great temple of Sin at Harran was patronized by various Assyrian kings; but its greatest patron was Nabonidus (555–539 BC), the last king of Babylon. He claimed that he had been directed in a dream to rebuild the temple of Sin, where his mother was priestess. A stele (monumental stone) commemorating this rebuilding in 552 BC shows Nabonidus worshipping the emblems of the moon, the sun and the planet Venus. The temple of Sin attracted many visitors during the Roman period, including the emperors Caracalla and Julian.

Although the great temple of the moon god at Harran has vanished without trace, recent excavation at Sumatar Harabesi, in the Tektek mountains about 18 miles from Harran, has provided some valuable evidence about Harranian religion. A group of seven ruined stone buildings around a central mound were found to be of various shapes – round, square, and round on a square base. Inscriptions in Syriac discovered there mention Sin and a deity named Marilaha. The identity of the latter is a mystery. 'Mara' (lord) was a title of Baal-Shamin, 'master of the heavens'. There is evidence that Sin was sometimes called 'Sin Marilaha', thus equating him with the supreme deity. The cult signs of Marilaha were a sacred pillar and stool; Sin's emblem was a pillar, crowned by the upturned crescent of the moon and adorned with two tassels.

In neighbouring Edessa curious evidence of the cult of Atargatis, with whom Ishtar was identified, still survives in the form of teeming pools of fish which are tabu and never eaten: fish were associated with the ancient cult of the goddess (see FISH).

This archeological evidence, fragmentary and enigmatic as it unfortunately is, is supplemented by equally puzzling accounts by early Moslem writers. They identified the Harranian pagans with the Sabians, mentioned in the Koran as one of the religious communities permitted to exist. According to these writers, the Sabians of Harran recognized a supreme deity who was the primal cause of the universe. This deity had no contact with mankind but had placed the universe under the rule of the planets. Hence the Sabians worshipped the planets, or rather the demonic beings that governed them.

Rites of Human Sacrifice

Each planet was believed to have a special influence over some particular type of person. The Sabians were also reputed to celebrate 'mystery' rites, addressed principally to Shamal, lord of the *jinn*. In these secret rites they were suspected of using human sacrifice. There was a curious Harranian tabu on the eating of beans, because they were elliptical in shape whereas the celestial sphere is globular.

The Harranians and their planetary religion disappeared during the Mongol invasions in the 12th or 13th century. Some scholars believe that the Sabians still survive in the Mandaeans, a religious community living on the lower reaches of the Tigris and Euphrates; on the available evidence this identification seems unlikely.

Harrowing of Hell

The harrying or despoiling of the land of the dead by a hero who enters the underworld, defeats Death and returns alive; the most famous example is Christ, who harrowed hell in the time between the Crucifixion and the Resurrection: in Greek mythology Hercules, Theseus, Orpheus and others visited the underworld and returned: King Arthur was said to have successfully raided the otherworld.
See HELL.

HARVEST

Linked with death, for the corn came from under the earth where the dead resided, but even more with fertility and new life, the harvest was accompanied by rituals the world over, to ensure an abundance of crops

IT IS DIFFICULT for us to realize nowadays, with tins and frozen foods available throughout the year, and imported tropical fruits on our tables even in the middle of winter, the anxiety which our ancestors felt as they waited for the annual harvest. When man first progressed from the primitive stage of gathering wild foodstuffs to cultivation of the soil, the procession of the seasons became increasingly important. In an agricultural economy his very life depended on the success or failure of the crops, and enormous efforts were made to ensure a fruitful harvest.

The Jews still celebrate Succoth – the Feast of Booths or Tabernacles – as they have done since the time of the command in Deuteronomy (chapter 16), 'You shall keep the feast of booths seven days, when you make your ingathering from your threshing floor and your wine press; you shall rejoice in your feast.' Citron, palm, myrtle and willow (the 'four kinds') are carried in procession during the synagogue service, and each family builds a booth before the festival begins. As a rule it is set up in the garden if there is one, or if not, on the flat roof. The top of the booth is covered with green boughs, arranged in such a way that the starlight can shine through. This is to remind the Jews of the time of the Exodus, when they were nomads in the wilderness. Inside are gay decorations taken from the season's produce – apples, grapes, pomegranates and brightly coloured Indian corn.

The Harvest Supper

Churchgoers today send vegetables, fruit and flowers to the Harvest Festival service, a popular occasion followed by the traditional Harvest Supper. Best known as Harvest Home, it had many dialect names, like Kern, Mell and Horkey Supper.

On the evening of the day when the last load had been brought in, the farmer and his wife would traditionally provide a good meal for the reapers. As a rule it was served in the barn, which had been specially decorated with garlands and branches. In Lincolnshire the Old Sow often put in an appearance. This was two men disguised with sacking and wearing a head stuffed with furze, which they used for pricking the others.

Frumenty sometimes used to be served, a milk pudding made from wheat boiled in milk with raisins and currants, and flavoured with spices and sugar. More often there would be a round of beef, followed by plum pudding and served with plenty of beer.

Probably it was the memory of suppers such as these that the Pilgrim Fathers carried with them from England to America. During the autumn of 1621, settlers in Plymouth Colony gathered to give thanks for the harvest after their first difficult year in the New World. This was America's first Thanksgiving. The exact date of this first celebration has never been established (it has even been said that it was in February). But in 1864 President Lincoln set aside the last Thursday in November as the appointed day. (Canadians hold Thanksgiving earlier, in October.)

Today Thanksgiving Day is an important family occasion, with a traditional meal that includes roast turkey, corn on the cob, and pumpkin pie, in honour of the Pilgrims' typical fare. The day is also rich in special leisure activities, among them important football games. Interestingly, the ancient Mayans held an annual harvest celebration each autumn, on a particular day, which also featured turkey on the festive menu and ritual ball games. And many forest Indians of the American South, such as the Natchez, celebrated the harvest with a feast of specially grown corn and their own forms of ball games.

The English ancestors of the Pilgrim Fathers traditionally brought in their harvest with great style. The last load, decorated with branches and garlands, was taken triumphantly through the village. Handbells were rung, everyone cheered and shouted, and children who helped were presented with slices of plum cake. At some stage people hiding in the bushes threw buckets of water over the cart; the custom was rooted in imitative magic, being designed to ensure rain for next year's crop.

Seated on top of the load, and probably drenched to the skin, were the Lord of the Harvest and his Lady. Before the coming of mechanization farmers were obliged to engage extra hands to assist with the harvest. The men appointed one of their number to negotiate with the farmer and take the lead in the scything: he was called Lord of the Harvest. The second reaper, a man dressed as a woman who replaced the Lord in his absence, was known as the Harvest Lady. If anyone swore or told a lie in front of the Lord of the Harvest, he was obliged to pay a fine. In Cambridgeshire each new workman was 'shoed' by the Lord of the Harvest, who tapped the soles of his shoes in return for a shilling.

Mechanized farming eliminated the Lord and Lady of the Harvest. Gone too are the elaborate rituals surrounding the cutting of the last sheaf, in which it was supposed that the power of the harvest resided. In some countries a few ears of corn were left standing in the field because people were afraid of exhausting the strength of the crop. They were said to be an offering for Odin's horses, or those who dwell under the earth. However, cutting the last sheaf was a more usual ceremony. This could be a great honour, but it also seems to have been regarded as a disagreeable duty. In England the men sometimes used to throw their sickles at it in turn, as if they were anxious that the responsibility should be shared. Behind this custom lay the old belief that the spirit of the corn had taken refuge in the last sheaf.

Crying the Mare

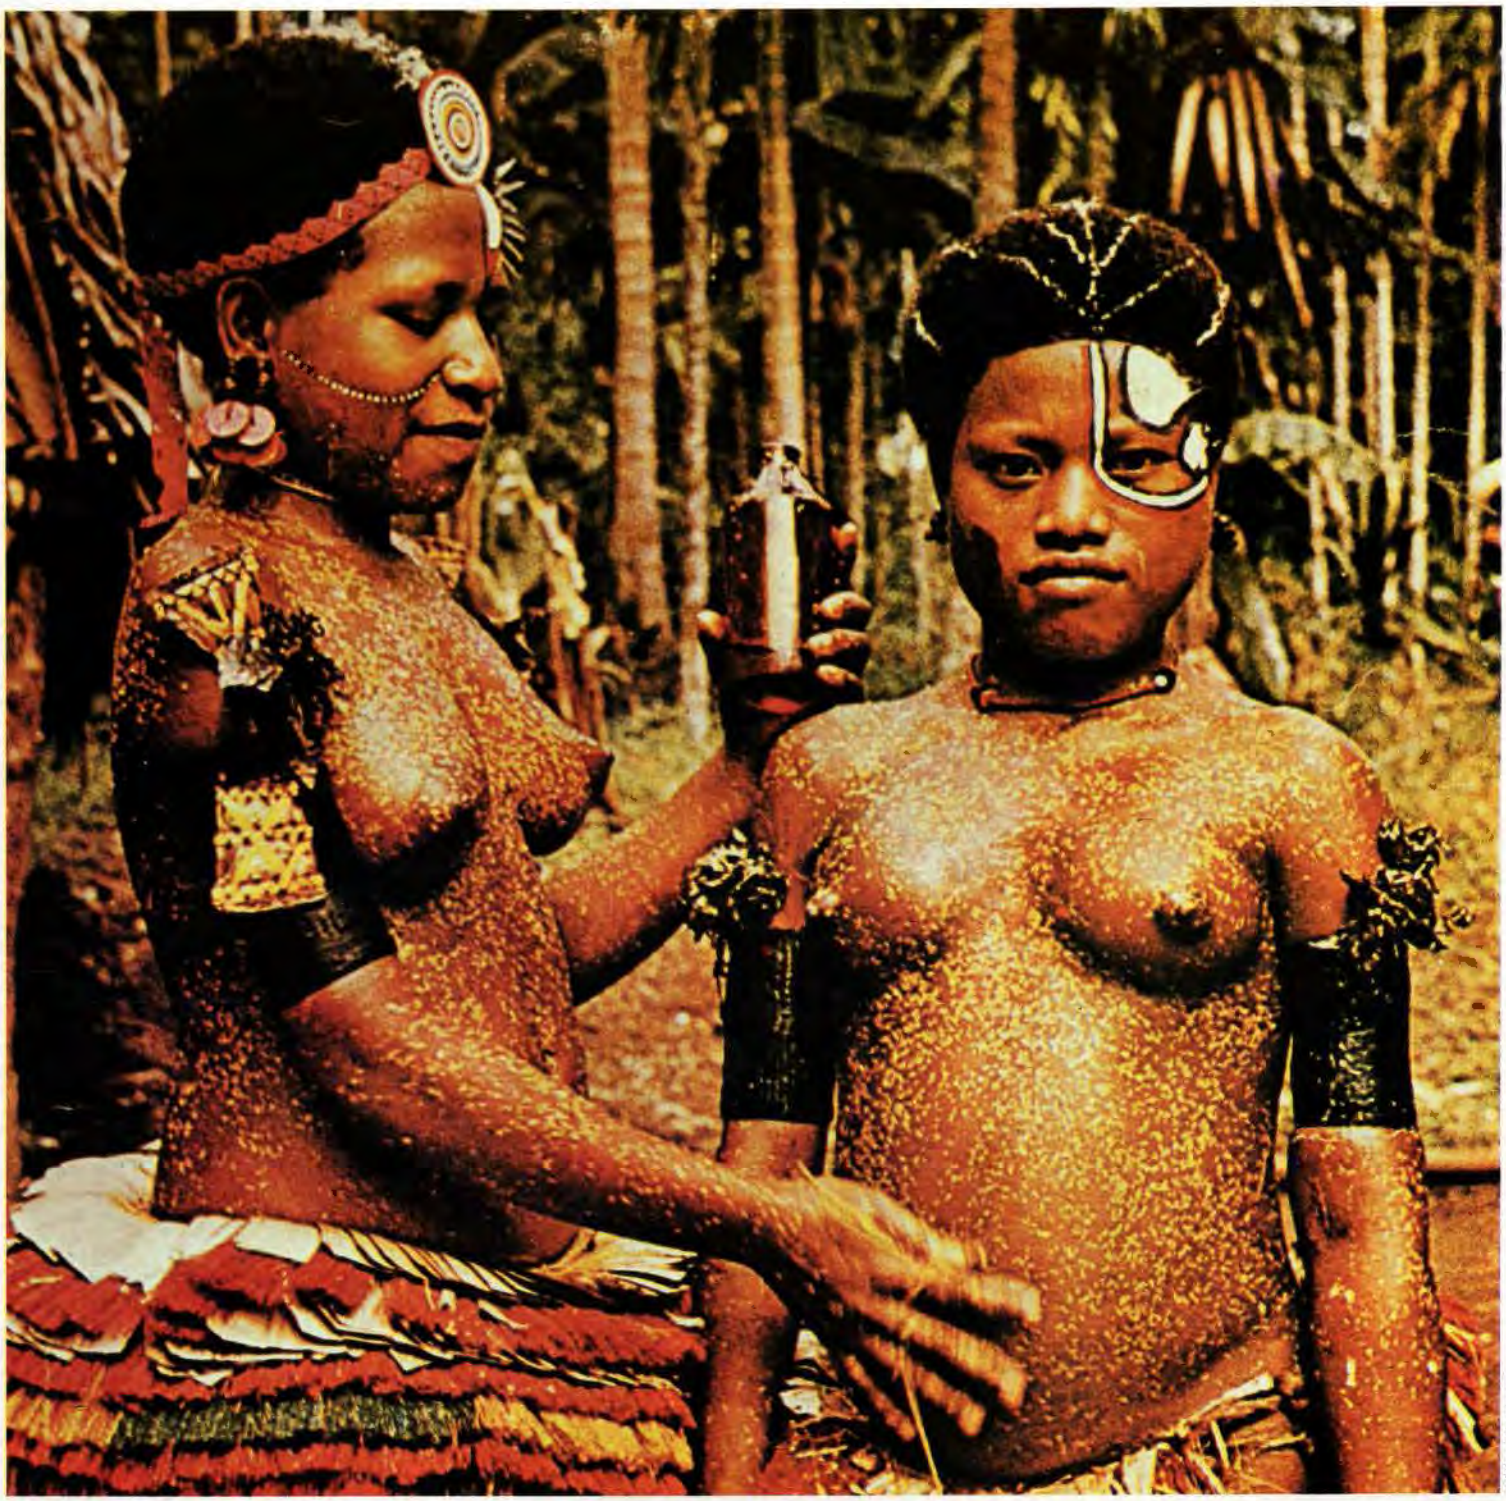
Sometimes it was carried in triumph to the farmhouse but often it was dumped on a neighbour's land to get rid of it, in case it brought bad luck. Around Herefordshire and Shropshire the final handful of corn was grasped and tied together. The men flung their sickles towards it and whoever was successful cried:

'I have her!'

A brief ritual exchange followed:

'What have you?'
'A mare, a mare, a mare!'

This was called Crying the Mare. An old Devonshire custom known as Crying the Neck suggests, on the contrary, that the final sheaf was thought to bring good luck. While the reapers were finishing, an old harvester went round, selecting all the best ears he could find. These were gathered into a bundle, known as the neck, which he plaited and arranged as attractively as possible. When the work of harvesting was



Richard Harrington

To celebrate the yam harvest festival, girls in the Trobriand Islands in Melanesia wear bands of leaves round their arms, which they believe contain magical properties; they also rub their bodies with coconut oil, afterwards plastering themselves with marigold petals

done, everyone formed a circle and the man who had made the neck stood in the centre, holding it firmly with both hands. He stooped, lowering the neck down to the ground, and all the men took off their hats; they too bent low, hats in hand. Then slowly standing upright, they raised their hats above their heads, and the man with the neck held it high in the air. Everyone cried 'the neck', and the whole ceremony was repeated three times over. There was a great deal of cheering and, during the melee which followed, someone seized the neck and ran with it to the farmhouse. A maid was waiting, ready at the door with a bucket of water. If the man could get past her, or enter the house by any other route, he was allowed to kiss her. But if he failed she soaked him thoroughly with water from her bucket.

Harvest competitions of this kind used to be very popular. In Scotland and the north of England, groups of three or four men each took a ridge of grain and raced to see who would finish reaping first. But there used to be a day when 'kemping' as this was called, and indeed all harvesting, was forbidden. As John Brand, the Newcastle antiquary, tells us: 'There is one day in harvest on which the vulgar abstain from work, because of an ancient and foolish tradition, that if they do their work the ridges will bleed.'

A version of this strange belief turns up in the Shetlands. Swinaness, on the Island of Unst, was traditionally thought too sacred for cultivation because, so it was said, the sea kings had fought many furious battles there. One man ignored the prohibition and planted some seeds of corn but when the time for harvesting came, to his horror the ears dripped, not dew, but salty tears and the stalks were filled with blood.

This suggests that there was thought to be some connection between the harvest and the realm of the dead – 'those who dwell underneath the earth'. In Germany peasants used to break the first straws of hay brought into the barns, saying, 'This is food for the

With the change from merely gathering crops to deliberately growing them, the sowing and the harvest became two of the great ritual occasions of the year: harvest scenes from the Tomb of Menena in Egypt showing *(above left)* winnowing in progress, as bearers transport the grain in baskets and *(below left)* grain being trodden out of the husk, to be carried away by boat

Right 'False Face' harvest mask: these grotesque wooden masks were worn by North American Indians of the eastern seaboard during agricultural rituals, to drive off evil influences and encourage a successful harvest

dead'. Many peoples throughout the world hold annual festivals honouring the departed. The time of year chosen varies according to the region but there is a tendency to associate it with harvest.

In Arabia the last sheaf is ceremonially interred in a miniature grave, specially prepared with a stone placed at the head and another at the foot. The owner of the land, announcing that the Old Man is dead, prays that Allah will send 'the wheat of the dead'.

But if the harvest fields are associated with the realm of the dead, there are probably more ways in which they are linked to fertility and new life. In some countries people used to speak as if a child had been separated from its mother by the stroke of the sickle. A Pole who reaped the last handful of corn was told: 'You have cut the navel string.' In Prussia the last sheaf was called the Bastard: a boy was concealed inside, and the woman who bound it cried out as if in labour. An old woman acted as midwife until the 'birth' took place, and the boy inside the sheaf then squalled like a baby. The sheaf was swaddled with sacking and carried into the barn.

The Baby Rice Soul

In early Egypt fertility of the crops was closely associated with human fecundity. Min, god of vegetation and sexual reproduction, is always represented with phallus erect, a flail raised in his right hand. He was honoured as Lord of the Harvest, and temple carvings show him receiving a ceremonial offering of the first sheaf. Indonesians perform a ritual marriage at the time of the rice harvest. Two sheaves are fastened together in a bundle: this is called the bridal pair. One sheaf contains a special rice, the bridegroom. The other, which contains rice of the ordinary variety, represents the bride. A magician lays them together on a bed of leaves, so that their union may increase the next yield of rice.

Elaborate rituals surround the 'birth' of the Baby Rice Soul at harvest time in Malaya. Rubbish and unpleasant smelling herbs are burnt in advance to drive away evil spirits, and a magician is employed to choose seven stalks of rice, which are cut and swaddled like an infant. The Rice Baby is carried to the farmer's house, and all the protocol surrounding a human birth is carefully observed. On each of the three days

Bystanders at the burning of Latimer and Ridley are said to have remarked that the executions might have saved the crops, performed at the proper time

Museum of the American Indian

following, only one small basket of rice is allowed to be gathered. The reaper works in silence, taking care that his shadow never falls across the plants. But the real work of harvesting cannot begin until the seventh day after the birth of the Baby Rice Soul. Whatever is gathered then must be donated towards a feast held to honour the spirits of dead magicians.

Dolls Made of Corn

The power which was thought to exist in the crops was in fact often personified, not necessarily as a baby. Sometimes it took animal form – a wolf, pig, goat, hare or cock – perhaps because small creatures often took refuge in the final sheaf when the rest of the field had been scythed. In England the last sheaf was used to make an effigy which was dressed in women's clothes and carried on the Horkey Cart to the Harvest Supper, where it sat on a special chair. This puppet had many regional names: kern baby, mell doll, harvest queen and, in Kent, the ivy doll. The Yorkshire mell sheaf was made from different varieties of corn, plaited together and decorated with ribbons and flowers. It was placed in the middle of the room for people to dance round. Sometimes the kern baby was hung up in the farmhouse and kept through the following year to bring good luck and be a protection against witchcraft. A Lancashire farmer is said to have laid a curse on anyone damaging his puppet before the coming harvest.

In 1899 an Old Lincolnshire woman remarked that one of these dolls – made of barley straw and stuck up on a sheaf facing the gate – would ward off thunder and lightning: 'Prayers be good enough as far as they goes, but the Almighty mun be strange and throng with so much corn to look after, and in these here bad times we musn't forget old Providence. Happen it's best to keep in with both parties.'

Rick decorating used to be quite popular in England. A corn dolly was worked into the corner of the stack to bring good luck. Some stacks in the west of Somerset still carry a little stook at each end of the ridge, and a peaked projection on some cottages in that area is called the dolly by very old people. A few farmers leave the last stook in the field to stand till it falls apart, or it may be hung in the barn. But if the farmer is questioned about this custom, he usually replies that it is intended for the birds; the meaning has been forgotten.

Harvest knots – twists of straw in attractive shapes – are still made in parts of Ireland. Girls wear them in their hair and men fasten them to their coats. At one time they were exchanged as tokens of love. In England, if an engaged girl wished to bear children from her marriage, she went secretly to the harvest fields on a Friday night. Taking a straw from the stooks for every child desired, wheat for a boy and oat for a girl, she plaited them into a garter, murmuring a charm referring to the straw on which the Christ Child lay in the manger. The garter had to be worn until the following Monday morning. If it stayed in place the omen was good, but if it broke or slipped the spell would not succeed. It was also very important that the girl's fiancé should know nothing about this. Only a virgin could use the charm: a girl who was not would cause harm to all her children.

In southern Europe, 15 August, the Feast of the Assumption of the Virgin Mary, is sometimes called the Feast of Our Lady in Harvest. In Italy it replaced the festival of the goddess Diana on 13 August: further north, where the harvest comes later, the crop is dedicated to the Virgin Mary on 8 September, the Feast of her Nativity.

A young virgin features in the central role of a once popular Polish custom. *Wienjec*, the harvest wreath or crown, was made from the final sheaf and prettily decorated with a variety of flowers, nuts and apples and perhaps even a gingerbread cake. It was blessed in church, usually on the Feast of the Assumption when herbs were also blessed, and worn by the chief girl harvester. It was essential that she should be chaste for, if she were not, it was supposed that the fertility of the land would be destroyed and the harvest would be a poor one. The girl was expected to walk in procession to the farmhouse door, where she was received by the farmer who drenched her with water – a rain charm again.

This custom of throwing water on the last sheaf, or else on the person who brings it, is widespread. In the north of the Greek island of Euboea, when the corn sheaves had been stacked, the farmer's wife brought out a pitcher of water and offered it to the men for washing their hands. Each sprinkled water on the corn and on the threshing floor. The farmer's wife then held the pitcher at an angle and ran as fast as she could around the stack without spilling a drop. When this had been done she made a wish that the stack would last as long as the circle she had just made.

Human Flesh to Aid Crops

Rituals of this kind are harmless by any standards. Not so some of the customs of the past: 'The seven of them perished together. They were put to death in the first days of harvest, at the beginning of barley harvest' (2 Samuel, chapter 21). This ambiguous remark, referring to the killing of seven men in time of famine, dates back to biblical days. However, English bystanders at the burning of Bishops Latimer and Ridley on 16 October, 1555 are said to have remarked that the executions might have saved the crops, had they been performed at the proper time.

The Khonds, a tribe of Bengal, offered a sacrifice to assist the harvest until the middle of the 19th century. The victim, often the descendant of other victims, was

Harvest Booths

Boughs of fruit-trees, branches of palm-trees, of leaf-trees and of Arabah-trees from the river beds were taken, and from them and their foliage, booths were constructed in which the congregation of Israel dwelt during the Feast of Tabernacles. The later texts alleged that this was done to commemorate the deliverance from Egypt, but this was clearly a reinterpretation of an earlier agricultural practice, the purpose of which was to promote fertility at the end of harvest, and to secure the much-needed rain at a critical moment marked by the Rosh hashShanah (New Year's Day) on the first of Tishri, when the autumnal rites began.

No doubt in their Canaanite form they included feasting and erotic dancing such as obtained outside the vineyards at these seasons, referred to in the book of Judges, when ecstatic revels not very different from those engaged in by the Maenads of Dionysus in Thrace and Phrygia, were held in joyous abandon for the bounty received, and to secure a fresh outpouring of vital energy in the crops and in mankind in the forthcoming season.

called the *Meriah*. About two weeks before the sacrifice was due to be offered, his hair was all cut off, and he was taken in procession to a virgin forest and anointed with melted butter. When the moment arrived he was drugged and crushed to death, or roasted over a fire, and cut into little pieces. Representatives from many villages arrived for the occasion. Each of them was given a small portion of flesh, which was taken home and ceremonially buried in the fields. What remained, chiefly the bones and head, was buried and the ashes scattered over the farmland so that the harvest would be successful. This custom was eventually brought to an end by the British authorities.

In Tibet, to the north, the chief purpose of the Harvest Festival was to propitiate the *Zhidah*, local spirits of the mountains, so that they would send enough sun and rain to assist the crops and hold back any frost or hail. The *Yonnehcham*, Dance of the Sacrificers, was performed specially in their honour. This took place around the middle of September. For 100 days before, the priests stayed indoors to avoid accidentally stepping on any of the many worms and summer insects about at that time of year. They were forbidden to quarrel amongst themselves and anything borrowed had to be returned. It was also very important that the sky should not look upon a corpse, so anyone who chanced to die during the festival was temporarily buried in a stable. Since there was always the risk of light from moon or stars, even night burial was ruled out. Harvest was a gay occasion and large crowds came to see the dancing. They pitched tents and cooked on great outdoor stoves: some popular favourites were noodles, meat balls, steamed wheat bread, green peaches and buttered tea.

Evidently the Zhidah were among those spirits well disposed towards mankind. Probably the forces appealed to by ringing church bells in England were imagined to be less benign. The ostensible purpose of this custom was to ensure the safety of the gathered crop. In Cheshire bells were rung three times over oats, twice over wheat.

'Burning the Witch', a Yorkshire custom, perhaps also derives originally from some ritual disposing of a malevolent influence. At harvest time peas were left to dry in small piles, known locally as 'reaps'. On the last day, when the remaining corn had been cut, some of these piles were pushed together and burnt in the straw. Boys and girls ran about, blacking each other's faces with charred straw. Everyone enjoyed the peas and there was dancing and Cream Pot Supper – cream and currant cakes flavoured with caraway.

In Shetland the menu for the *Foy* was not dissimilar. This traditional party, held at the skipper's house, is interesting since it was, in effect, a Harvest Home of the sea. It was held at the beginning of August, when the summer white fishing season closed. Crew members and their wives were entertained with high tea and plenty to drink. A favourite toast was: 'Lord! Open the mouth of the grey fish, and hold thy hand about the corn.' (See also CORN).

Spreading from the ghettos of Poland to Rumania, Hungary, the Ukraine and other parts of Eastern Europe, Hasidism produced a rich vein of legend and folklore. A popular movement based on the mystic teachings of the Cabala, it was strongly opposed by the orthodox rabbis

HASIDISM

THE SITUATION of East European Jewry in the 18th century was very conducive to a religious revival. They lived in abject poverty and misery, and had not yet recovered from the disastrous massacres of the 17th century, when the Cossacks and local peasantry had killed over 100,000 Jews. These terrible events had undoubtedly predisposed Polish Jewry to accept the message of the pseudo-Messiah Sabbatai Zevi. The shameful collapse of this messianic movement (the messiah apostatized and became a Mos[illegible] to save his life) left behind it a trail of confusion, despair, despondency and moral chaos. The poverty-stricken and – by rabbinical standards – ignorant masses suffered from a sense of religious inadequacy, heightened by the intellectual presumption of the rabbinical elite, who held that only Talmudic learning opened the gates to the full religious life.

There were also circles of 'spirituals' associated with the mystical tradition of Lurianic Cabalism (see CABALA) or with groups that had arisen in the aftermath of the Sabbatian messianic movement; these were keenly aware that the traditional forms of piety, such as meticulous observance of the law, Talmudic learning, strict asceticism and mortifications, did not assure spiritual perfection. It is against this background of misery, demoralization and spiritual bewilderment that the rise in southern Poland of the religious and mystical revival known as the hasidic movement has to be seen.

The term Hasidism is derived from the Hebrew noun *hasid* which, in biblical Hebrew and especially in the Psalms, means one who is steadfast in his trust and faith in God and in his devotion to him. The plural form *hasidim* or 'pious ones' came to be used more than once to designate groups outstanding for their religious fervour and devotion. The circles of Jewish zealots in Palestine who took up arms, in the times of the Maccabees, against the repression of the Jewish religion were known as Hasidim, and the same term was used by a circle of Jewish mystics that flourished in Germany in the 12th and 13th centuries. There is, however, no historic connection between these earlier movements and 18th century Polish-Russian Hasidism.

Master of the Good Name

Among the impoverished masses superstitious practices were part of the current folk-religion. For them the Cabala was connected with the use of amulets and charms to ward off sickness and other evils, and 'masters of the name' (masters of the powerful names of God, capable of preparing potent amulets or of healing ailments) were much sought after. The founder of Hasidism was such a 'master of the name' (in Hebrew *Baal Shem*), but he was also a genuine mystic with a message.

'Palphot' Herzlia

Two members of the Hasidim wearing their traditional costume buy willows in a Jerusalem market for the New Year ceremony of shaking away their sins. Israel is now one of the main centres of Hasidism

Little is known about Israel ben Eliezer (c1700–1760), the *Baal Shem Tov* ('master of the good name') and the halo of legend that very soon surrounded his life and personality makes it extremely difficult to reconstruct his biography and teaching with any precision. According to hasidic hagiography, his career was a chain of miraculous events: his birth was foretold by the prophet Elijah, his soul was a spark from that of the Messiah, he was taught by celestial mentors, and his life was shot through with miracles and heavenly interventions.

An increasing number of admirers flocked to him seeking his blessing, intercession and guidance for their spiritual as well as physical welfare. Among those who became his disciples were some scholars, one of whom, R. Dov Bev of Mezhiritch, became the leader and organizer of the movement after the Baal Shem's death. The presence of these scholars and their acceptance of the Baal Shem's authority helped to counteract hostile propaganda to the effect that his following consisted exclusively of the ignorant and superstitious.

For opposition was not lacking. The mystical heresies and moral chaos that had come in the wake of the messianic movement of Sabbatai Zevi had made the rabbinical leadership doubtful of any new movement, and the Hasidim were suspected of heresy or at least of religious anarchy. In fact there was little that was completely new in hasidic teaching and many of its elements and formulations were derived from traditional rabbinical, moral and cabalistic doctrines. The Hasidim never thought of questioning the authority of rabbinical law, or the competence of the rabbinical authorities to interpret and administer it. But their emphasis on the 'inner meaning' of the law and on the paramount necessity of ecstatic devotion and singleness of heart in its performance, their fidelity to charismatic leaders and their adoption of certain slightly different devotional and liturgical practices only antagonized the opposing camp even more.

Thus their emphasis on inwardness and spiritual exaltation (that is, on the right 'mood' of joy and enthusiasm) made them attach less importance to the exact times prescribed for the statutory prayers. They also adopted the Sephardic rite of the prayerbook because they held that this rite lent itself better to the practice of mystical meditation. The Baal Shem himself said that his mission was 'to stir the hearts of those seeking communion with God. This contains nothing new . . . It is merely a strengthening of the faith which has somehow been forgotten.'

A Scandal to the Orthodox

Like many other spiritual movements, Hasidism ranged from pure contemplative mysticism to the crudest forms of popular enthusiasm and superstition. The Baal Shem's doctrine of 'serving God with joy' and 'in bodily things' shocked the stern rabbis, especially as this joyful service expressed itself in ecstatic singing, wild dancing and not infrequent resort to strong drink. Anti-hasidic writers may have exaggerated in their descriptions of these excesses; yet the fact that Hasidism very emphatically did not wish to teach the way of perfection to a small spiritual elite but sought to bring the living experience of communion with, and love of, God to all and sundry, inevitably meant a vulgarization of spiritual values and techniques. Thus prayer was considered as a state of ecstatic communion with God in which the personality was free from the trammels of the body; and hasidic legend tells how the body of the Baal Shem used to tremble violently at prayer so that bystanders were also seized by trembling and the building would shake. When this ecstatic prayer spread to the hasidic masses, it would take the form of shouting and twisting of the body – enough to make the hasidic key concepts of *simhah* ('joy'), *kawwanah* ('inwardness'), *devekuth* ('communion with God') and *hithlahavuth* ('enthusiasm') objects of scandal to the orthodox and of ridicule to the rationalists.

For any adequate understanding of the movement it is necessary to take into account its various components. There is the teaching of the hasidic masters as laid down in their voluminous writings (mainly in the form of commentaries and homilies on biblical books); there are the stories and anecdotes told about the great masters; there is the popular hasidic literature (mainly extolling the miraculous powers of the hasidic saints); and there is, last but not least, the actual life lived by the Hasidim.

Lifting the Divine Sparks

Hasidic doctrine, whilst continuing to use the vocabulary of Lurianic Cabalism, added new emphases which in fact gave it a totally new quality. The hasidic use of the traditional phrase 'there is no place empty of him' had a meaning that went far beyond the orthodox one and came very close to pantheistic heresy. Hasidism took over from Lurianic Cabalism the idea of the cosmos as a chain of emanations in which 'higher' and 'lower' worlds reflected and influenced one another, and in which man occupied a key position, precisely because he could act upon the higher (and even divine) spheres through the meditative quality of his actions. In Lurianism this had meant that man had the task of performing the *tikkun* (restoration) of the fallen world by liberating and 'lifting up' the sparks of divine light that had fallen into matter and into the grasp of the demonic powers. But in terms of hasidic spirituality this meant that man fulfilled his religious calling not merely in specifically ritual acts but in everything and in everyday activity. Because the divine sparks, yearning to return to their source, are buried everywhere in the world and embedded in all things – in human beings as well as in all animate and inanimate beings – man encounters them in every situation and engages in the redemptive activity of *tikkun* and of the 'lifting of the holy sparks' in everything he does – the most ordinary labour, business, small talk, eating and drinking – provided he does it with the proper meditative intent, kawwanah, devekuth and total sincerity of purpose.

The Role of the Tsaddik

The connecting link between the spirituality of the charismatic mystic and that of the mass of simple folk was the institution of the *tsaddik* (literally the 'righteous', the hasidic leader). The tsaddik, having reached the higher rungs on the ladder to spiritual perfection, could bind to himself in a bond of mystical community the souls of his followers. In precisely the same way as he could stoop down and perform the descent into the lowest spheres in order to lift up the fallen sparks, so he could bind to himself imperfect souls and raise them, with himself, to spiritual perfection.

A new type of loose social organization evolved round the hasidic leaders. In the centre was the tsaddik surrounded by his close disciples and his permanent and often sumptuous court; next to them was the mass of followers and devotees who would make the pilgrimage to his court on festivals or special occasions when they felt the need of help and advice in spiritual or mundane matters. Whereas some hasidic leaders opposed 'tsaddikism', others made it a cornerstone of their doctrine. To many orthodox people the hasidic doctrine and practice of tsaddikism came dangerously near the notion of a 'mediator' between the individual and his god – a notion generally considered to be typically Christian and heretical from a Jewish point of view.

Tsaddikism, for all the socially integrating role it played in the development of early Hasidism, subsequently became a demoralizing and corrupting factor. The leading disciples of the great hasidic masters became founders of dynasties, and their descendants acted as tsaddikim and commanded the loyalty and devotion of their followers by an almost matter-of-course right of succession. Eventually the various hasidic groups came to be distinguished not so much as schools or sects (although there were doctrinal and other differences between them) as by loyal adherence to dynasties.

Spread of Hasidism

The Baal Shem's way of 'serving God' in joy and mystical contemplation attracted an increasing number of followers. Although he left no writings, many of his teachings and sayings are quoted in the works of his disciple R. Jacob Joseph of Polnoye. His other disciple, R. Dov Bev, the 'Great Maggid' of Mezhiritch (d 1772), succeeded him as the leader of Hasidism and became the real organizer of the movement. The great leading figures and early masters of Hasidism were all direct or indirect disciples of Dov Bev. From Mezhiritch the movement branched out in three main directions. There was a Ukrainian branch, a Lithuanian branch and a Polish-Galician branch, represented by Hasidism as it developed in the Jewries of Poland, Rumania and Hungary.

Rabbinical opposition to the new Hasidic movement was conducted with all the bitterness of which the Jewish communities in the ghettos of Eastern Europe were capable. The leader of the anti-hasidic struggle was Elijah of Vilna (d 1797), the leading rabbinical authority of the age and an outstanding Cabalist. (Evidently the conflict was not between 'rabbinical' and 'mystical' Judaism but between institutional rabbinical forms – which included Cabalism – and what appeared to be a dangerous mass movement of spiritual anarchy.) Bans of excommunication were issued by Elijah of Vilna against the new movement, and for several generations feeling ran high. Only the rise of the modern enlightenment in the Jewish ghetto brought the two groups together: in face of the common enemy the two types of uncompromising and fundamentalist orthodoxy closed ranks.

The propagandists and polemicists of the enlightenment took Hasidism as their special butt, for to them it represented the very incarnation of superstition, bigotry and stupid obscurantism. The dependence of the believer on the tsaddik and the faith in his unlimited miraculous powers, the custom of making pilgrimages to the tsaddik's court and depositing there one's request accompanied by a gift of money, the luxurious growth of hasidic legend and folklore (including stories of demonic possession and of exorcisms performed by the power of the tsaddik), these and many other manifestations of Hasidism could easily be held up to ridicule. Historical scholarship has tended, until recently, to be unsympathetic to Hasidism, which was viewed as a sad, though perhaps understandable product of the dark and miserable ghettos. With the emergence of romantic tendencies in Jewish life and literature, a reappraisal of Hasidism began. Its mystical orientation, its yearning for a pure intensity of life, its folk-character which seemed to make it a manifestation of the soul of the people, its folkloric expressions in song, dance, tales and legends – all these were extolled in a new, romanticizing literature. This tendency reached its peak in the monumental work of Martin Buber, who devoted many of his writings to an interpretation of Hasidism in terms of his own, essentially existential, philosophy.

The main centres of Hasidism having been in Eastern Europe, they were wiped out by the Nazis in the Second World War. At present the main centres are in Israel and in the United States, where a number of hasidic dynasties have re-established themselves.

Lady Lisgar, who in 1881 married Sir Francis Fortescue-Turvile of Bosworth Hall, a Roman Catholic stronghold since 1630, refused to allow a priest to give supreme unction to a dying maidservant; as a result she was condemned to haunt the house, and her ghostly figure has been seen in her bedroom and at the end of corridors

'Some people have experienced such intolerable sensations of misery and fear in that corridor that they have found it impossible to remain in it': there are too many well-attested cases of hauntings to write the whole phenomenon off as an illusion

HAUNTED HOUSES

MOST PEOPLE, when they think of ghosts, think first of haunted houses. This is not, of course, because apparitions are generally supposed to appear, or strange happenings to occur, only in family dwellings. On the contrary, if it were possible to compile a detailed map of all the places which are now, or once were, said to be haunted, a great diversity of open-air sites would have to be marked upon it, as well as many buildings other than homes. Ghostly manifestations have been recorded in the vicinity of prehistoric barrows and ancient burial-grounds, in fields where medieval deserted villages once stood, on battlefields known to history and sometimes in places where tradition preserves the memory of some battle or local skirmish about which history has nothing to say (see ARMIES).

Nevertheless, a host of stories, some very well attested, support the popular belief that many houses of all ages and sizes, from castles to cottages, are or have been haunted by those who lived or died in them, and sometimes by entities more difficult to account for than simply the returning dead. Sights and sounds outside normal experience have undoubtedly been seen and heard in such houses, and have been vouched for by a great number of reliable and serious witnesses. Various theories have been put forward in an attempt to explain these happenings, ranging from acceptance of the oldest and most usual

belief that they are straightforward visitations from beyond the grave, or possibly instances of telepathy between the living and the dead, down to the view that every such experience is purely subjective and due to hallucination on the part of the percipient.

Ghostly manifestations are of many different kinds. Some apparitions are no more than fleeting and elusive forms, suddenly perceived and quickly gone. Often they are quite unknown to those who see them, no legend accounts for them, and they seem to be unaware of, or uninterested in, the living occupants of the house. Yet they cannot be dismissed as mere illusion, because they appear again and again, and have been seen at different times by a variety of witnesses. Others are distinct and recognizable figures, and some are so normal in appearance that they are mistaken for living people, at least at first. Or that which haunts the house may not be seen at all. Noises are heard, though nothing visible makes them, sometimes loud and terrifying, sometimes slight yet clearly audible, like the faint murmur of voices, or the sound of crying, or footsteps passing along a corridor or down the stairs. There are houses which contain rooms that are 'restless'. They are not haunted in the sense that anything ghostly has been seen or heard in them, yet it is impossible to sit in peace in them, or concentrate upon any work, for more than a very short period. Others have rooms or passages which from time to time are filled with a brooding atmosphere of sadness or fear. A curious phenomenon frequently recorded by ghost-hunters as a preliminary to certain forms of psychical activity is a sudden and distinct fall in room-temperature, and in one haunted farmhouse at Yarnton in Oxfordshire, the inmates are warned that the ghost is about to 'walk' by the slow spread through the house of a peculiarly sweet scent.

To the difficult question of what causes some houses to be persistently haunted, sometimes by more than one ghost, there can be no certain answer in the present state of our knowledge. These ghosts may perhaps be accounted for by the theory that somehow, in some manner we do not understand, they are bound to their old homes by emotional ties so strong that even death

cannot sever them. The popular belief is that these ties are nearly always the result of some past state of bitter unhappiness, or violent terror, or the guilt of an unexpiated sin, and in many recorded cases, family tradition runs along the same lines. There are, however, other tales which suggest that the dead sometimes return for no other reason than that they loved, and were happy in, the places that they now haunt.

The *Athenaeum* of January 1880 contains an account of what must surely have been a ghost of this unharassed type, written by Dr Augustus Jessop, the antiquary. He relates how, on 10 October 1879, he went to stay with Lord Orford at Mannington Hall in Norfolk. His purpose was to consult certain rare books in the library, and that night, at his own request, he was left alone to work in an adjoining room after the rest of the household had gone to bed. At about one o'clock in the morning, while he was quietly writing, he suddenly perceived, first, a hand within a foot of his own elbow, and then, when he turned his head, a figure which he described as 'a somewhat large man, with his back to the fire, bending slightly over the table and apparently examining the pile of books that I had been at work upon.' The apparition was seated, with his face turned away from the observer, so that only part of it was visible; he had closely cut reddish-brown hair and wore 'a kind of ecclesiastical habit of thick corded silk, or some such material', with a close-fitting upstanding collar. Dr Jessop realized instantly that the figure was not of this world but he felt no fear, only curiosity and keen interest. 'There he sat,' he writes, 'and I was fascinated: afraid, not of his staying, but lest he should go.'

He did go, a moment later, when the antiquary stretched out his hand to move one of the books. The living scholar went

Glamis Castle, the home of the Earl and Countess of Strathmore: somewhere in its thick walls lies the Secret of Glamis, a chamber where a previous Earl is supposed to have hidden his son who was half man and half beast; Malcolm II of Scotland was murdered in the castle in 1033, and for years there was a bloodstain on the floor of a room known as 'Malcolm's Room'

on writing and after about five minutes, the ghost reappeared in exactly the same place and attitude as before. Side by side they sat, the only beings still awake in the silent house, the phantom still intent upon the books, and Dr Jessop trying to think of something to say to his companion, until he suddenly found he was afraid to speak. He finished the last few words he had to write and threw down the book he was using; at the slight sound it made in falling, the apparition vanished again. This time he did not return, though Dr Jessop waited for a few moments to see if he would do so. Then, his work being done, he carried the books back to the library; but on second thought, he kept one of them 'and laid it upon the table where I had been writing when the phantom did me the honour to appear to me.' He went to bed and slept very soundly, and we shall never know now whether his visitor returned or not to read the book that had been left out for him.

In his *Early Reminiscences* (1923), Sabine Baring-Gould describes the haunting of his house at Lew Trenchard in Devon, by the ghost of an ancestress, known in her day as Madam Gould. Her son dissipated a good part of the estate by his extravagances, and when he died, she set herself to restore the property. This she did by sheer hard work and business ability. She died in 1795, sitting upright in her chair because she refused to allow illness to drive her to bed, and thereafter she haunted the house.

Footsteps believed to be hers were heard on more than one occasion, passing down the Long Gallery. Once, when a member of the family was very ill, the night-nurse was roused from sleep by a loud knock on the door and a woman's voice saying, 'It is time for her to have her medicine.' No one was visible when the door was opened, and no one was afterwards traced as the speaker. In 1918, when two of Baring-Gould's grandchildren were staying at Lew Trenchard, their two nurses gave notice because they had both seen a ghostly figure bending over the children as they slept. A guest going alone into the drawing-room saw an elderly lady in a satin dress and an old white-haired man sitting, as though in conversation, on opposite sides of the fireplace. No such people were staying in the house but from the description given, it seemed likely that they were Madam Gould and her friend

Parson Elford, who often used to sit together there when they were alive.

A variety of other stories were remembered by the local people, some of which suggest that the family ghost had absorbed other legends of the district, as strong-minded spectres sometimes do. These tales can be discounted but the actual haunting of the house is well attested. It is difficult to think of any reason for it other than Madam Gould's unwillingness (or perhaps, inability) to leave the place which had been the centre of her earthly hopes and affections for so long.

Corridor of Agony

Longleat in Wiltshire, now famous as the home of lions, has at least two ghosts. One of them is a friendly and unalarming figure, an old man wearing a long black robe reminiscent of the garments favoured by elderly Elizabethan gentlemen, who haunts the Red Library. The identity of this phantom is not altogether certain but the most probable theory is that he is Sir John Thynne, the builder of the house, who died in 1580. If he now returns occasionally to the immense and lovely house which was his greatest achievement, it is perhaps not entirely surprising.

The second haunting is of a quite different character. In a passage at the top of the house, the ghost of a woman appears, walking up and down in an agony of grief and terror. Even when she is not visible, some people have experienced such intolerable sensations of misery and fear in that corridor that they have found it impossible to remain in it. The ghost is believed to be that of Lady Louisa Carteret, whose portrait may be seen in the Lower Dining-Room. She died in 1736, and a grim family legend accounts for her continued presence in the house.

She was the daughter of the Earl of Granville and the wife of the second Viscount Weymouth. The latter seems to have been a man of somewhat difficult temperament, and the marriage was not happy. Tradition says that she had a lover, though who he was is not now remembered, and that her husband, returning unexpectedly to Longleat after an absence, found the young man and his wife together. The two men fought a duel then and there, up and down the passage, without seconds or any witnesses except the horrified girl. The lover was killed; and since his death in this furtive and unwitnessed fight was legally murder, his body was hastily and secretly buried in the cellar.

This story is legend, not history, but there is some evidence to support it. Soon after the time when the duel is supposed to have taken place, Lord Weymouth appears to have taken a strong dislike to Longleat. He left it and went to live at Horningsham, returning to his home only on rare occasions. From then on, he neglected the place entirely, and when his son (afterwards the first Marquess of Bath) inherited it in 1751, he found the house in a state of disrepair, and the once elaborate formal gardens an overgrown wilderness. We do not know what reasons Lord Weymouth had for acting in this way but if he had in fact murdered a man and buried his corpse there, that might be a sufficient explanation. Some years ago, a curious discovery was made, which looks very much like a confirmation of the legend. When central heating was being put into the house, the cellar flagstones had to be lifted. Under them the remains of a young man wearing jackboots and clothes of the early 18th century were found. It cannot be proved that these bones were those of the unhappy lover but it seems very probable that they were, especially as no other known incident in the history of the house can account for them.

We cannot tell why, of the three persons involved in this tale of hatred, jealousy and crime, it should be Lady Louisa alone who haunts the house, and not either the murderer or his victim. As yet, we do not understand the laws that govern these matters; nor do we know what it is that causes some ghostly manifestations to persist for years, even centuries, and then cease for no obvious reason, either abruptly, or by a gradual process of fading. Genuine ghost-tales are rarely neatly rounded off, as are their fictional counterparts, though there are, of course, cases where the haunting has, apparently, been ended by some human action, such as resort to exorcism, or the burial in consecrated ground of hitherto unhallowed remains, or occasionally the destruction of the house involved. This last is not always as effective as might be expected; sometimes the psychic power is transferred to a new building on the same site, which may account for curious happenings recorded in council houses.

In a Black Cloak

Sudden death, and especially death by violence, has often been cited as a reason for known hauntings. So has suicide, which was once widely regarded as an unforgivable sin, and which in any case presupposes extreme unhappiness, amounting to despair, in the person concerned. A house at Clifton Hampden in Oxfordshire was haunted for many years by the ghost of Sarah Fletcher, who hanged herself from the curtain-rod in her bedroom in 1799, when she was only 29 years old. She is traditionally said to have been driven to suicide by the news that her husband, a naval officer then away from home, was planning a bigamous marriage with another woman. No mention is made of this in the report of the inquest printed in *Jackson's Oxford Journal* for 15 June 1799, but we are told that 'the derangement of her mind appearing very evident, as well as from many other circumstances, the jury, without hesitation, found a verdict – Lunacy.' It was thus made possible for her to be buried in Dorchester Abbey, where her tombstone can still be seen. Nevertheless, from then on her house at Clifton Hampden was haunted by her restless ghost.

In the mid-19th century it became a boys' school. At first, the children seem to have been unaware of the haunting, but some of the masters heard footsteps coming out of Sarah Fletcher's old room and going along a passage and down the stairs. One man said he had heard these steps coming down as he was going up, and had felt a cold wind passing him, but had seen nothing. In 1854, Edward Crake, the headmaster's son, heard some invisible person entering his bedroom during the night, seeming to hesitate, and then going out again. This happened on three successive nights; on the third occasion he followed the sounds into the passage and saw a young woman standing there. She wore a long black cloak and had a purple-red ribbon in her hair, which was auburn and curly. As he looked at her, she vanished. He saw her again several times during the following year and then, suddenly, the haunting ceased.

For ten years the house remained untroubled but in 1865 the manifestations began again as inexplicably as they had ended. Now, however, there was a difference. The ghost was seen by several people, including some of the boys, and extraordinary noises were heard, as of furniture being moved, doors opening, bells ringing, and iron laths being dropped on the floor. Edward Crake, who by now had become a clergyman, tried to exorcize the spirit but the effects were not lasting. The disturbances continued until, for this and other reasons, the school was moved elsewhere.

With the departure of the school, the more violent manifestations came to an end but the house remained uneasy and no one stayed long in it. At one time it was divided into cottages, and later it was used as an institution for girls. In *True Ghost Stories* (1936), Maude ffoulkes writes of a visit which she paid to this institution in 1913. Whilst waiting for the Matron, she saw in clear daylight the figure of a woman in a black cloak standing near her in the passage. The apparition looked at her for a few seconds with an expression of deep melancholy, and then vanished. The Matron, on being questioned, admitted that odd noises were heard in the house but supposed this was natural in an old building. She added that she had never seen anything unusual herself, and though she knew that queer rumours circulated in the village, she preferred to ignore them. Since then, the house has once again become a private dwelling. No ghostly sights or sounds have been reported there for some years now and it is possible that the haunting has faded out at last.

Groaning Skulls

At Burton Agnes in Yorkshire a human skull is said to have been bricked up in some part of the walls in order to prevent its removal from the house. Tradition says that whenever it has been moved in the past, violent noises and disturbances have immediately broken out, and continued until it was brought back. This house was built by Sir Henry Griffith in the early 17th century and passed after his death to his three daughters, one of whom, Anne, was passionately attached to it. It is her skull which is now walled up there. She died while still young as the result of injuries received in an attack made upon her by footpads on the Harpham road. In her last moments, she made her sisters promise that her head should not be buried with the rest of her

remains, but should be separated from them and kept in the house. When, perhaps understandably, they failed to keep this promise, life was made hideous for them by nightly outbreaks of extraordinary and terrifying noises, including groans, crashes and the violent slamming of doors. On the advice of the local clergyman, the head was removed from the grave and brought into the house, where it has remained ever since, except on a few occasions when someone has ejected it, with the same result as before. It was to prevent any unbelieving busybody from moving it again that it was buried in the walls, though its exact position in them has now been forgotten.

Burton Agnes is not the only old house in which the skull of some former inhabitant is, or was, carefully preserved because of a legend that it is unsafe to remove it. When Theophilus Brome of Higher Chilton Farm in Somerset died in 1670, he required his heir to detach the head from his corpse before the funeral, and to keep it permanently in the house. His reasons for this demand are not known; but that a skull kept in a cabinet in the hall was his appears quite likely because, when his grave in Chilton Cantelo Church was opened some 70 or 80 years after his death, the skeleton was found to be headless. Collinson, in his *History of Somerset* (1791), remarks that several later tenants attempted to bury it, but were always forced to restore it to its place by 'horrid noises portentive of sad displeasure.'

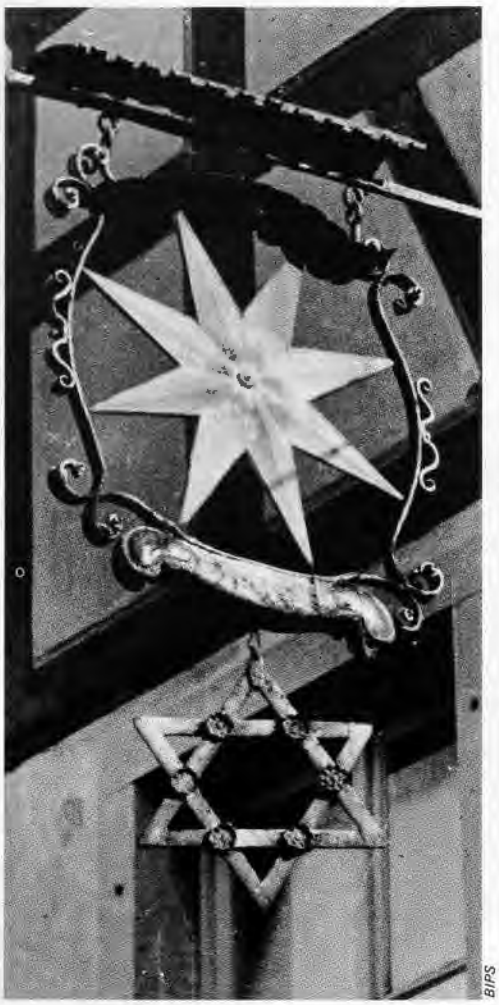
At Bettiscombe Manor in Dorset an imperfect skull, now sealed up for safety, is supposed to be that of a Negro servant who died there of consumption in the early 18th century. If this is so, it is not easy to understand why it should have been retained in the house in the beginning. It can hardly be imagined that this exiled West Indian can have wished it for himself. Nevertheless, every attempt to shift it, even to give it Christian burial, is said to have been instantly followed, not only by the usual disturbances indoors, but also by serious bad luck on the farm.

At Tunstead Farm, near Chapel-en-le-Frith in Derbyshire, a skull, locally known as 'Dickie', was variously said to be that of Ned Dixon, a former owner, or of a woman whose ghost haunted the house in visible form. In both versions of the tale, the cause of death was murder, though the details of the crime were only vaguely remembered. This skull, like the others, resented removal and retaliated in the same distressing manner, but it also had some less usual habits. It gave warning, by sounds varying from gentle tapping to loud thuds and clatterings, of an impending death in the family, or any emergency requiring the farmer's attention in the lambing season, or when a cow was calving, and of the approach of strangers. These last it disliked intensely, so much so that, on more than one occasion, Irish labourers, brought in for haymaking and housed in the outbuildings, were kept awake at night by constant and inexplicable noises. In *Wilmslow Graves* (1886), Alfred Fryer records that he was told of the skull's activities by the farmer himself and that the latter spoke of the occurrences, not as traditions of the past, but as part of his own direct experience.

It is not always, and indeed rarely, possible to find evidence that would satisfy the Society for Psychical Research for stories of this type. They are nevertheless extremely interesting, not only because the presence of skulls in houses is itself a curious fact, but also because the tales seem to be rooted in concepts of great antiquity. Bones, like blood, were once believed to be the centre of psychic power and to retain a kind of life and consciousness after the death of their original owners. This is especially true of skulls. In some cases, these gruesome relics were regarded as guardians of the houses

Many houses are said to be haunted, generally by ghosts who are bound to their old homes by strong emotional ties *Below left* In *The Ghost Goes West* Robert Donat played a long-dead Scotsman who accompanied his old home to the United States *Below* In the 16th century Emperor Maximilian of Austria always sent a party of guards ahead of him when travelling, to make sure there were no ghosts in the hotel he intended to stay in overnight; this eight-pointed star above the Star of David, outside an inn in West Germany, is one of many that were erected as 'all clear' signals *Facing page* 'Hauntings have been scientifically investigated for many years': Benson Herbert, who has constructed machines designed to detect ghosts, in his paraphysical laboratory

National Film Archive



BIPS

that contained them. 'Dickie' certainly acted as a protector of his home, and it may be that both Theophilus Brome and Anne Griffith had some such idea in mind when they made their strange and inconvenient requests. A ghost which is commonly supposed to be that of the latter has occasionally been seen at Burton Agnes, in the form of a small woman in a fawn-coloured gown.

Finally, one last paranormal appearance may be mentioned, out of the many hundreds available, because of the extraordinary nature of the apparition. It was seen in 1817 by Edmund Lenthal Swifte and his wife, when he was Keeper of the Crown Jewels in the Tower of London, and lived with his family in the Jewel House. The Tower is, of course, haunted by many known ghosts but this was not one of them. According to his own account, published in 1860 in *Notes and Queries*, Mr Swifte, his wife, his little son and his sister-in-law were all at supper one night in a curtained and candlelit room, with the doors closed. He and Mrs Swifte both saw something like a cylindrical glass tube, filled with a dense and moving liquid, hovering between the table and the ceiling. It moved slowly round the room and, passing behind Mrs Swifte, paused above her for a moment, whereupon she crouched down in terror and cried out, 'Oh Christ! It has seized me!' Her husband struck at it with a chair and hit the wainscot behind it, the apparition vanishing as he did so. It was not seen again and the most minute enquiries failed to produce any rational explanation. The other two people in the room saw nothing from first to last. The whole thing might indeed be written off as a delusion on Mr Swifte's part but for the fact that his wife saw it as clearly as he did, and was terrified by it. As it is, the manifestation remains as inexplicable today in its nature, origin and purpose, as it was in 1817.

Hawk

Like the eagle and falcon, hawks are frequently connected with the sun in symbolism, because of their flight, dominating ferocity and yellow eyes: the sparrowhawk belonged to Horus in Egypt and was a solar bird in Greece and Rome: the kite was sacred to Apollo as lord of the Delphic oracle, because circling in the sky it sees everything; in Japan there was a divine golden kite, Nihongi

HAWTHORN

MAY DAY was originally an agricultural festival, the beginning of summer, and the may, hawthorn or whitethorn (*Crataegus monogyna*) became its foremost plant emblem. At many festivals it was believed that witches and fairies were especially active on this day and farm produce in particular had to be protected against otherworld influences. Although in Ireland and Scotland the rowan or mountain ash answered these purposes, in England and France the most important of many plants associated with May Day was the hawthorn. In some places trees were cut down and set before houses (see also MAY DAY).

Spencer and Shakespeare both mentioned the May Day festivities and the may tree's use; perhaps the most charming contemporary evocation is that of Herrick, in 'Corinna Going a-Maying', a poem published in 1648:

> How each field turns a street, each street a park
> Made green and trimm'd with trees: see how
> Devotion gives each house a bough,
> Or branch: each porch, each door, ere this,
> An ark, a tabernacle is,
> Made up of whitethorn neatly enterwove . . .

The last line quoted refers to the importance of weaving magical plants into circlets or crosses, which increased their power. Herrick's poem goes on to describe lovers plighting their troth, for May Day was the best moment for engagements; in France hawthorn adorned girls' windows in particular. Geoffrey Grigson has remarked that 'the stale, sweet scent' of the hawthorn blossom was suggestive of sex (although also suggestive of decay, and it was later believed that the flowers preserved London's plague-smell).

To the Greeks the hawthorn has long been a symbol of betrothal. In ancient times, if possible, its boughs in bloom were carried by attendants at weddings, and torches of hawthorn lit the newly married couple to their room. Till quite recently, and possibly still today in some places, Greek brides wore hawthorn wreaths. In Britain during the last century hawthorn was used in various forms of marriage divination. Norfolk girls bringing home May Day branches had to remain silent, because if they uttered a word they would not marry that year.

Flowers of Death

As with many magical plants, churchmen came to terms with pagan hawthorn and allowed it into their churches, both literally on May Day and in carved ornament, where the plant can still be seen, in company with carvings of the Green Man (see GREEN) with branches sprouting from his ears or hornlike from his head. There is an entry in the Reading churchwardens' accounts for 1499 for 'the gathering of Robin Hood' which takes us straight back to the Green Man, alias Jack-in-the-Green, alias the May King, and the ancient notion of a tree spirit.

The use of hawthorn on May Day, involving much cutting of the tree, is in curious contrast to considerations still existing here and there that it is unlucky to cut down a hawthorn. Anyone who had to do this, however, could be protected by having a Bible close by, offering a prayer, or by initially asking permission of the fairies.

Naturally enough, hawthorn had protective power against evil at all times, especially if picked with certain rituals or on specific days, which varied according to locality. It has been suggested that its supernatural powers as well as its thorns made it a recommended hedge plant (haw is an ancient word for hedge) and that its use for walking sticks derived equally from its magical properties.

But hawthorn could turn on you; it is still widely believed to be unlucky, to the point of bringing death, to bring its flowers into the house. This seems to be a fairly modern superstition. And, as in many similar cases, the fact that hawthorn protects against fairies associated it with these spirits. This made it unwise to sit under a hawthorn on days when fairy activity was to be expected, such as May Day, Midsummer Eve and Hallowe'en. To do so courted the risk of enchantment. Despite this it was generally

Michael Holford

In France it was believed that Christ's Crown of Thorns was made of hawthorn, and Norman peasants wore a sprig in their caps: *The Crowning of Thorns* by Hieronymus Bosch, in the National Gallery, London

advisable to shelter beneath a thorn in a storm, for the hawthorn safeguarded against lightning.

A rather comical use of hawthorn by witches is as one ingredient of a sleeping potion which they gave their husbands on nights when they wished to be abroad.

As with other solitary trees, a single hawthorn – 'Lone Thorn' or 'Fairy Thorn' it was called – was particularly to be avoided, for fairies met or even lived there. In Ireland, however, it was customary to plant a single hawthorn above holy wells, on which the locals still leave offerings of pieces of clothing – as on fig trees in Palestine – to ensure recovery from illness or fulfilment of wishes.

In France it was until recently believed that hawthorn composed the Crown of Thorns. Norman peasants would wear a sprig of the tree in their caps as appropriate reverence. A Herefordshire farmers' custom connected with this belief was that of the hawthorn globe. This ball of hawthorn twigs was made on New Year's Day. Each year, before dawn, the old globe would be taken down. While the women made a new one the men took the old globe to their fields, and, in a ceremony called Burning the Bush, carried it aflame over the wheatfield or burnt it on a bonfire. Because the hawthorn globe stood for the Crown of Thorns, its burning would drive the Devil – in the shape of the wheat smut disease – from the farmland.

The Crown of Thorns link is seen again in the manifestation of the Glastonbury Thorn (see GLASTONBURY). This was, and is, a freak hawthorn (*Crataegus monogyna praecox*) which flowered in late December as well as in May. Legend has it that its Christmas flowering occurred because it had been the Crown of Thorns. Another legend was that Joseph of Arimathea thrust his magic hawthorn staff into the ground on reaching sacred Glastonbury, where it grew. The three original Glastonbury Thorns are there no longer, but this old form propagated by cuttings, can be purchased.

In the Victorian language of flowers, hawthorn stood for hope, while in the Turkish equivalent the gift of a hawthorn twig expressed the wish for a kiss.

A. J. HUXLEY

Hazel is a particularly powerful tree in magic, used to make magic wands and divining rods. The wands of Moses and Aaron were traditionally made of hazel, and its branches were used as lightning conductors

HAZEL

THE WANDS of priest and magician are as ancient as mythology itself; there are references to them in Chaldean and Egyptian records. Hazel *(Corylus avellana)* was one of the main plants to be used for wands, and also for royal sceptres. It is to be found as such in Hebrew, classical and Nordic mythology; in Scandinavia it was sacred to Thor, and a protection against lightning. The Romans believed that Mercury was given a hazel rod by Apollo, which he used to calm human passions and improve their virtues. This ancient heraldic staff, or *caduceus*, was imagined as intertwined with serpents and bearing a pair of wings at the top, and was taken over by Aesculapius to become the symbol of the medical profession.

Pilgrims carried hazel rods which they would retain all their lives and which were buried with them. Such staves have been found in Hereford Cathedral.

On a more practical plane the hazel was used in divination, and we find Pliny explaining its use for the discovery of subterranean springs. It was widely believed to assist in finding metal deposits and buried treasure, and to this day the water diviner will carry out his scientifically belittled but undoubtedly effective occupation with a forked hazel twig (see DOWSING). Divining rods were even used for tracking criminals.

In the 17th century Sir Thomas Browne wrote of the 'forked hazel, commonly called Moses' Rod, which, held freely forth, will stir and play if any mine be under it.' He mentions 'the magical rods in poets – that of Pallas, in Homer; that of Mercury, that charmed Argus; and that of Circe, which transformed the followers of Ulysses: too boldly usurping the name of Moses' rod; from which, notwithstanding, and that of Aaron, were probably occasioned the fables of all the rest. For that of Moses must needs be famous to the Egyptians, and that of Aaron unto many other nations, as

A hazel rod is the traditional tool of dowsers: an Austrian diviner searches for gold in Wales

being preserved in the Ark until the destruction of the Temple built by Solomon.'

Hebrew tradition traces the rod of Moses from one originally cut by Adam in the Garden of Eden, taken by Noah into the Ark, passed down to Shem, Abraham, Isaac and Jacob, given to Joseph and to Moses. Unfortunately, modern translators often turn these hazel wands into almond rods.

The making of a magic wand was inevitably attended by ritual. An old Hebrew tradition stipulates the use of a 'virgin branch' – a young growth with no sideshoots upon it. Divining rods were also cut under very special conditions. They had to be made at night on holy days such as Good Friday, St John's Day, Epiphany or Shrove Tuesday. They could also be made on the first night of a new moon or on the previous night. The cutter had to face east, the rod had to be cut from the eastern side of the tree, and the freshly cut rod had then to be presented to the rays of the rising sun.

There are many lesser beliefs connected with hazel. It was anciently held in Germany to be symbolic of immortality, perhaps because of its end-of-winter flowering. More recently it was linked with happiness in marriage, a belief arising from the paired nuts; at Black Forest weddings the leader of the procession would carry a hazel wand. In medieval England the hazel nut symbolized fertility.

Ireland's lack of poisonous snakes is attributed to St Patrick who, holding a hazel rod, caused all the snakes to come together, and then cast them into the sea. In Ireland, incidentally, the hazel becomes the Tree of Knowledge. In Sweden the hazel nut was believed to confer invisibility, in Bohemia to cure fevers, in Ireland (a nut in the pocket) to keep off rheumatism, and in Devonshire (a double nut) to cure toothache. One amusing tradition is that a piece of hazel cut at midnight on Hallowe'en will, if carried in the pocket, prevent its owner from falling over, however drunk he may be.

Hazel was generally efficacious against the machinations of witches, fairies and evil in general, not merely as a protector but, in the form of a rod, as a positive means of forcing evil spirits to restore things or powers they had taken. This could be extended to human enemies: a hazel rod cut on Good Friday or St John's Eve, if swished through the air with appropriate naming of the victim, would cause him appropriate pain wherever he was. The Scots would keep double nuts handy to throw at witches. The hazel rod was used to protect animal feeds and grain in general; in Prussia, a rod cut in spring was used, during the first summer thunderstorm, to make the sign of the cross over all stored grain.

Lightning Rod

To pick hazel nuts on a Sunday was to risk the Devil appearing before you. This belief probably derives from older associations with specific demons, elves or boggarts who guard hazels – the Churn-milk Peg from Yorkshire, the Melsh Dick of the north country, or the Hind Etin, whose activities are celebrated in a fine antique ballad. When May Margret comes to the copse to pick hazel nuts:

> She had na pic'd a nut, a nut,
> A nut but barely ane,
> Till up started the Hynde Etin,
> Says, Lady, let thae alane.

But after threatening to kill her, he is taken by her beauty, marries her and they have children to the magic number of seven.

Branches bearing catkins (lambs'-tails) and kept in water at farmers' houses at lambing time would help the sheep; branches picked on Palm Sunday and similarly kept would protect the house against lightning. This lightning protection could extend to fire-proofing a house if three hazel dowels were fixed into its beams.

In Wales a cap or wreath of hazel twigs would bring luck to its wearer, and protection from shipwreck if he was a sailor. In Scotland it was customary to give infants born in nutting time a 'milk' made from the nuts to ensure health and good fortune.

Like many another plant with ancient pagan associations, hazel was 'Christianized'. The medieval Normans decreed that it should be known as the nut of St Philibert, a Benedictine monk of the 7th century, originally a nut-grower, who founded a famous abbey. From this we find the English filbeard or filbert. St Philibert's feast day is on 22 August, when hazel nuts should be ripe.

In more recent time the nuts were used in divination of a different kind from that of the rod. A girl, wishing to know if her lover was faithful, placed two nuts side by side on the bars of the grate. If they burnt as one, true love was assured but if one failed to burn, or the nuts popped apart, her lover was surely faithless. A charm that accompanies double nuts of various kinds – like the almond – was to share a double hazel nut with whoever you wished would love you. If the other person ate the kernel as you ate yours, in silence, the charm was a sure one. A nut with two kernels in one shell, as opposed to the double nut, was especially magical. The finder of such a nut made a wish, eating one kernel and throwing the other over his left shoulder. He had to maintain silence until someone asked him a question to which he could reply 'yes'. Wishes would also be granted if a hazel nut, thrown into the fire, flared up brightly as the wish was repeated to oneself.

To dream of hazel trees, and especially of eating the nuts, means happiness and wealth, and to dream of finding hidden nuts means the finding of treasure (perhaps the divining rod in reverse). If an Irishman dreamt of finding buried treasure he would dig for it after marking three crosses on a hazel stick to the accompaniment of a blasphemous formula. In the language of flowers, hazel stands for reconciliation.

Mongolian devil-mask: since prehistoric times the head and the skull have been thought to contain the essential being, the personality, and therefore the power of a human being or a spirit

HEAD

Belief in the healing power of water drunk from an ancestor's skull survived into this century in Scotland: this is one example of the conviction that the human head contains powerful magic, which comes out particularly strongly in the headhunting of primitive peoples and in the role of the head in Celtic religion.

HEADHUNTING is based on the belief that the human head has magical powers of great potency, which benefit those in possession of a skull severed from someone's body. The motives for the practice are diverse and complex, however, and the cultural implications differ from region to region. In colonial territories headhunting was suppressed wherever an effective administration was established. But even in the first half of the 20th century there were still many populations addicted to the custom of capturing heads, and various anthropologists have been able to observe the accompanying rites and ceremonies. Today organized headhunting raids are confined to a few remote regions, but rites previously connected with headhunting are sometimes performed as a sequel to individual cases of homicide.

In Southeast Asia headhunting was widespread among tribal populations which had remained outside the spheres of Hindu, Buddhist and Moslem civilizations, including many of the hill tribes of Assam and Burma, the aboriginals of Taiwan, the mountain peoples of Luzon in the Philippines, and some of the more archaic peoples of Borneo, Celebes and Sumatra. All these

Jorgen Bitsch

populations practise agriculture and there is a deep-seated belief that the capture of heads has a beneficial influence on the fertility of the soil and on the growth of crops. Human blood is considered a substance capable of promoting fertility (see BLOOD), and both headhunting and human sacrifice served to ensure good harvests. Additional incentives for the capture of heads were the prestige gained by successful headhunters and the desire to avenge the losses of one's own clan or village by killing enemies and bringing in their heads as trophies.

Among such tribes as the Nagas of the Assam-Burma borderlands (see also NAGAS) the wish to capture heads was the cause of many feuds between villages which otherwise had no conflicting interests. Only in exceptional cases did warriors set out on a raid with the intention of wiping out an opposing village. The main aim of raiding was the capture of heads. These were carefully preserved, and there was a definite belief that their presence enhanced the fertility and prosperity of the village. To maintain their magical power they were fed with rice-beer at all village feasts. The sex, age and status of the victims had little relevance. Old people, women and children would be killed as occasion offered, and the capture of their heads earned the slayer scarcely less prestige than the killing of armed warriors. Those who were keen on acquiring a head without risking their own lives, could buy slaves who were killed.

When the head of a victim was brought to the captor's village, all the men of the village turned out to welcome the headhunters. The first rites were performed outside the village. The captured head was put down and the senior man of the captor's clan smashed raw eggs on the head; this was meant to blind the kinsmen of the dead foe. A clan elder then poured rice-beer into the mouth and in doing so addressed the victim with the request to call his relatives and kinsmen, in order that they too might be compelled to come and fall victim to the spears of the victorious tribesmen.

The head was then carried into the village and tied to a large log gong, which was beaten in a rhythm announcing the capture of a head. There was dancing and singing

Captured heads were thought to enhance the prosperity of a village; the Naga tribes used to feed the heads with rice-beer to maintain their magical powers

Headhunting is based on the belief that the human head contains powerful magic. most of the night, and next day all the men of the village dressed in ceremonial clothes and painted their bodies and faces with lime. The head was carried in procession to an upright stone standing in a ritual place. There a priest cut off small pieces of the ears and tongue, and called again on the kinsmen of the dead man or woman. He killed a chicken and sprinkling its blood on the stone repeated the incantation. Next the head was taken to a tree and hung up there to dry.

About a month later a great feast was celebrated to mark the final disposal of the head, which was taken down from the tree and fed once more with rice and beer. Finally it was deposited either in the community house or the ancestral house of the headtaker.

Some of the Naga tribes believed that the victim of a headtaker remained close to the killer until the latter's death. Then he would accompany the headtaker to the land of the dead, where he became his servant or slave. Most Naga tribes were firmly convinced that the capturing of heads was essential for the well-being of a village and that a community which failed over a period of years to bring in a head would suffer a decline in prosperity. The capture of a head gave a Naga the right to a special tattoo on the chest and face. Among some Naga tribes a youth was not considered fully adult until he had participated in a head-hunting raid, and among other tribes a sham raid, imitating the incidents of a head-hunting expedition, formed part of the initiation rites for adolescent boys.

The Cherished Heads

Several hill-tribes of Assam and Burma and some of the tribes in the interior of Borneo considered the taking of a head a necessary precondition for the termination of mourning for a dead chief. The captured heads were placed on the tomb, or alternatively slaves would be killed to provide the chief with servants in the land of the dead. Here headhunting and human sacrifice were closely linked and intended to serve similar purposes.

Among the Dayaks of Borneo heads were captured and preserved mainly in order to obtain the helpful presence and power of the spirit adhering to the head. At the feast celebrating the capture endearments were lavished upon the head and food was thrust into its mouth. Its spirit was told that he was adopted into the captor's tribe, and must henceforth hate his old kinsmen and friends.

The Kayans of Borneo dried and smoked captured heads in a specially made small hut. Then they were solemnly installed in the house of the captor, hung up over the main hearth on a beam on which old heads were hanging. At all times the heads were treated respectfully and somewhat fearfully. The fire beneath them was always kept alight so that they should be warm and dry. On certain occasions pork and beer were offered to them, and their presence in the house was believed to bring prosperity, especially in the form of good crops (see also BORNEO).

In the Philippines headhunting used to be practised by such tribes as Ifugaos, Kalingas, Igorots and Ilongots. Usually raiding-parties were organized with the intention of taking revenge for an injury suffered by a village or kin-group. The warriors armed with spears, head-axes and shields stole into enemy territory, carefnlly avoiding pit-falls and traps set up by all villages as a protection.

Open encounters with the enemy were avoided as far as possible but lone travellers or wood-cutters were easy victims. The raiders would swoop down on the defenceless or out-numbered victim, and the head was quickly severed and carried home in triumph.

The returning warriors were greeted with shouts of joy and preparations for the rituals and festivities began at once. Pigs were slaughtered and food prepared. The skull caps might be removed from the captured heads, the brains mixed with sugar-cane beer and consumed by the warriors. The head was then boiled and the bones and broken bits of the skull distributed among the participants. The most potent and highly prized part of the skull was the lower jaw, and jaw-bones were used as handles of metal gongs. Anyone participating in a successful headhunting expedition, not only the actual killer, was entitled to a special very extensive tattoo covering chest and arms. Occasionally young women accompanied small raiding-parties and helped them by carrying supplies. These women were given a share of the captured heads and were accorded the right to a special tattoo. There was a widespread belief that taking of the life of an enemy would cure childlessness and result in general prosperity. But the overt motives for capturing heads were the desire to retaliate for injuries suffered, to even the score when the community had lost a life through illness or accident, and above all to gain prestige and status. A record of many killings made a man feared and respected

Salisbury & S. Wiltshire Museum/Michael Holford

The Celts worshipped the human head and believed that in it lay the soul, the essence of being, the reflection of divinity

and earned him the title of 'brave warrior'.

It is likely that in the past the termination of the period of mourning for a deceased kinsman was the occasion for a headhunting raid. Even today the Kalingas indicate the end of mourning by staging a symbolic raid. A party of men in war-attire proceeds to the border of the village-land and throws spears at a figure made of ferns. They then return to the village with chants of triumph similar to those marking the return from a successful headhunting raid.

Skull Trophies

The ritual use of head trophies was not confined to the headhunting tribes of Southeast Asia but occurred also in other parts of the world. In the Solomon Islands, for instance, skulls of enemies were set up on a post when a canoe was launched, and canoe houses were decked with skulls. The heads of slain enemies were prominently displayed by certain African peoples: in Dahomey they were placed on the roofs or the gates of the king's palace.

The practice of preserving as a trophy the head or some other part of the body of an enemy is very widespread in South America. A great variety of psychological, social and religious motives underly the taking and preparation of these trophies, which may be classified into four main types: skulls; mummified heads; shrunken heads; and skull caps. The most famous of these trophies are the shrunken heads of the Jivaro Indians, who severed the heads of slain enemies, smashed the skulls and extracted the bone-fragments through an incision. The remaining flesh, skin and scalp were dried till they shrank to the size of a small monkey's head. The possession of such a miniature head was believed to ensure good luck to the owner, first because it contained magic power, and secondly because it secured the good will of the ancestors whose desire for revenge was satisfied.

Early and recent accounts alike mention head trophies among the Amazon tribes. Among the Tupinamba, the skulls of enemies were stuck on posts in front of huts or on the palisades. The Shipay greatly valued the skulls of their enemies and hung them in nets from the roofs of huts. The trophy heads of the Mundurucu are famous because of the skill with which they were prepared. After the brain and soft parts had been removed, they were plunged in oil and then exposed to the sun and to smoke. The empty sockets were filled with artificial eyes made of wax, and a carrying cord was laced through the lips.

The use of head trophies is reported also from many historic civilizations. The Babylonians and Assyrians cut off the heads of fallen enemies, and a similar custom prevailed in ancient Egypt where kings were depicted holding bundles of heads. The ancient Scythians also presented their king with the heads of slain enemies, and often attached scalps to their bridles.

Although headhunting in the narrow sense of the word was most highly developed in Southeast Asia, similar ritual practices involving the use of heads are found among a variety of peoples and cultures. However, there is a fundamental difference between the capture of heads undertaken primarily for the purpose of obtaining the powerful soul-substance adhering to the skull, and the temporary display of the heads of slain enemies as trophies and symbols of victory in battle. The latter custom occurred in many civilizations of very different nature, whereas headhunting for the sake of gaining magical powers is restricted to comparatively primitive societies in certain specific parts of the world.

CHRISTOPH VON FÜRER-HAIMENDORF

The Severed Head

The hero Peredur sees the Grail as a head:

Thereupon he could see two youths coming into the hall, and from the hall proceeding to a chamber, and with them a spear of exceeding great size, and three streams of blood along it, running from the socket to the floor. And when they all saw the youths coming after that fashion, every one set up a crying and a lamentation, so that it was not easy for any to bear with them. The man did not, for all that, interrupt his conversation with Peredur. The man did not tell Peredur what that was, nor did he ask it of him. After silence for a short while, thereupon, lo, two maidens coming in, and a great salver between them, and a man's head on the salver, and blood in profusion around the head. And then all shrieked and cried out, so that it was hard for any to be in the same house as they. At last they desisted therefrom, and sat as long as they pleased, and drank.

The Mabinogion (trans G. and T. Jones)

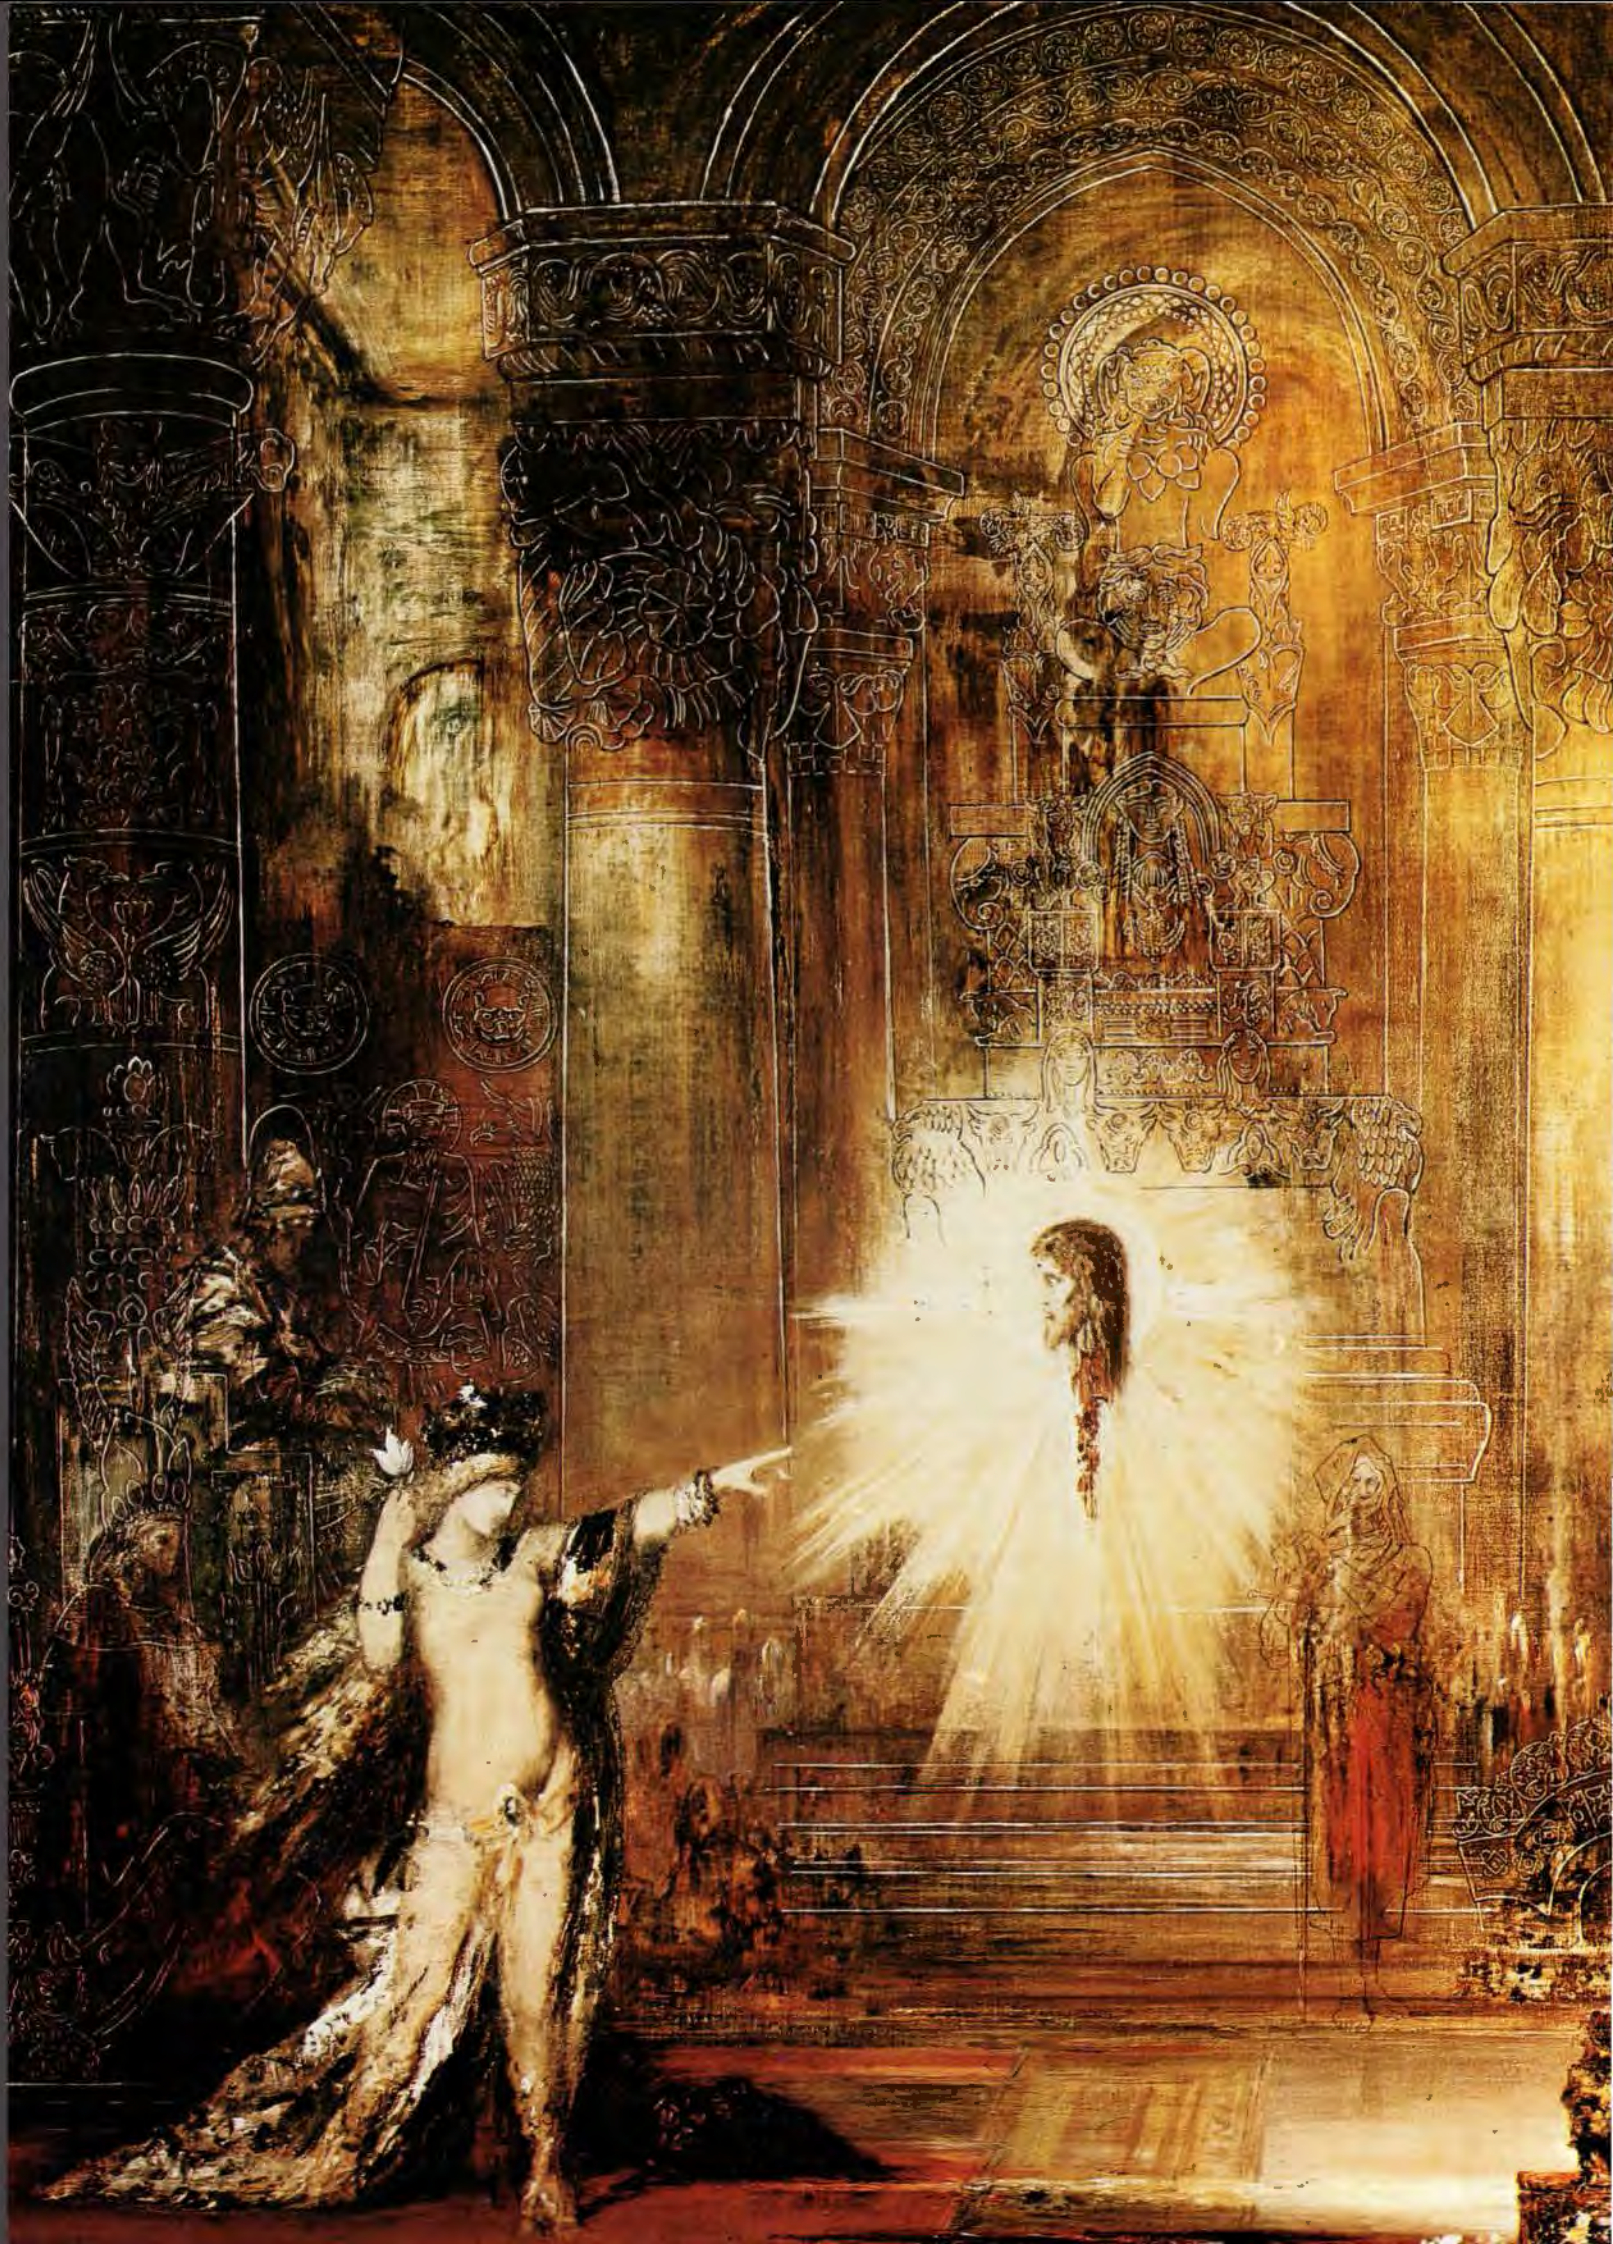
The Celts and the Head

The human head was of supreme importance to the Celtic peoples at all stages of their evolution and can be said to have served as a symbol of their religious attitudes, in the same way that the sign of the cross symbolizes the Christian faith, or the crescent the Mohammedan. Not only did the Celts hunt the heads of their enemies, as did many other barbaric peoples, but they actually worshipped the human head, and believed that in it lay the soul, the essence of being, the reflection of divinity. They venerated real heads, and they fashioned imitation heads from a variety of materials, thousands of which are still in existence.

Individual deities were sometimes portrayed as heads alone, perhaps bearing some distinctive characteristic such as horns or animal ears, or having two, three or four heads. Again, the head was used simply as a symbol of the concept of divinity, a shorthand method of summing up a complete way of religious and superstitious thought.

The Greek historian Diodorus Siculus (1st century BC) said of the Celts: 'When their enemies fall, they cut off their heads and fasten them about the necks of their horses . . . and carry them off as booty, singing a paean over them and striking up a song of victory, and these first fruits of battle they fasten by nails upon their houses . . . the heads of their most distinguished enemies they embalm in cedar oil and carefully preserve in a chest, and these they exhibit to strangers, gravely maintaining that in exchange for this head someone among their ancestors, or the speaker himself, refused the offer of a great sum of money. And some men among them, we are told, boast that they have not accepted an equal weight of gold for the head they show . . .' Human skulls recovered from the Celtic fort of Puig Castelar were found to have retained the actual nails from which they were hung. An altar from Apt dedicated to the war god had a deposit of human skulls buried underneath it. The Roman historian Livy (died 17 AD) comments on the Celtic custom of decorating human skulls with gold, and using them as cups for their libations.

Archeological evidence confirms this veneration of the human head. The stone temple at Roquepertuse, dating from the 2nd century BC or earlier, contains convincing evidence of the cult of the head in



Mary Evans Picture Library

Left: **The severed head of John the Baptist appears to Salome, in *L'Apparition* by the 19th century French painter Gustav Moreau. this region of the lower Rhône. The portico was surmounted by a great stone goose, a bird sacred to the Celts. Below was a frieze of horses, and niches in which human crania were set; the human heads had all been taken from young men in the prime of life, and were therefore presumably those of esteemed enemies, offered to the appropriate deities in the sanctuary.

Another temple of this kind, dating from the 2nd century BC, at Entremont, also in the lower Rhône region, tells the same story. There is a stone pillar decorated with human heads in relief, and several examples of severed heads, including one of a male head with a mask-like appearance being gripped in a very sinister fashion by a large hand, perhaps a symbol of death.

The heads of the slain were sometimes dedicated to Taranis, 'the Thunderer', one of the great Celtic gods. The 9th century Irish glossary of Cormac refers to the threefold goddess of war Macha. (She was one of the three *Morrigna* or Morrigans, with their crow or raven transformations.) Cormac glosses her name in this way: 'Macha, that is a crow; or it is one of the three Morrigna. *Mesrad Machae*, Macha's mast, that is the heads of men after their slaughter'. Thus the human head in Ireland was regarded as this goddess's tribute.

The Mask of Protection

In Britain human skulls were found in the fortifications at Bredon Hill and at Stanwick, and their position suggests that they had either been attached to poles beside the gateway or nailed onto the structure of the gate itself. Heads feature a great deal on native Celtic coins, being treated with typical Celtic fantasy, having distorted or non-natural features, huge eyes and wild hair, and often showing tattooing on the cheeks and bearing, or being associated with, cult symbols such as the boar. Sometimes smaller heads are chained to a larger central head; some have horns, others are janiform (two-faced) or in triplicate.

A great many heads must have been made of wood (often oak) and although considerable numbers have undoubtedly perished enough survive, and are being found from time to time, to show that this must have been an important medium. The astonishing discovery in 1963 of 190 figures, all of oak heart-wood, at the Gallo-Roman sanctuary to the goddess Sequana at the source of the River Seine, contained 40 heads, and 16 pieces of wood carved with two or three heads. Again, several wooden heads were found in the Temple de la Fôret d'Halatte. So the Celts not only venerated actual human heads, but made images of them in stone, in wood and in metal. La Tène art contains endless variations on the theme of the human mask, often highly stylized, forming part of a flowing design, or decorated with leaf crowns or swelling horns, and associated with masks of animals and birds. The placing of this vital symbolic object on articles used in everyday life – personal ornaments, weapons, horse-trappings – would ensure protection from evil forces and assist in victory against opponents.

The evidence of the classical writers, and the major contribution made by archeology towards an understanding of the cult of the human head, is supported and enlarged by the written literatures and the folk traditions of the Celtic world. It is these references which make it possible to appreciate the overall nature of the significance the head possessed as a venerated object, by providing details of the various qualities with which it was believed to be imbued.

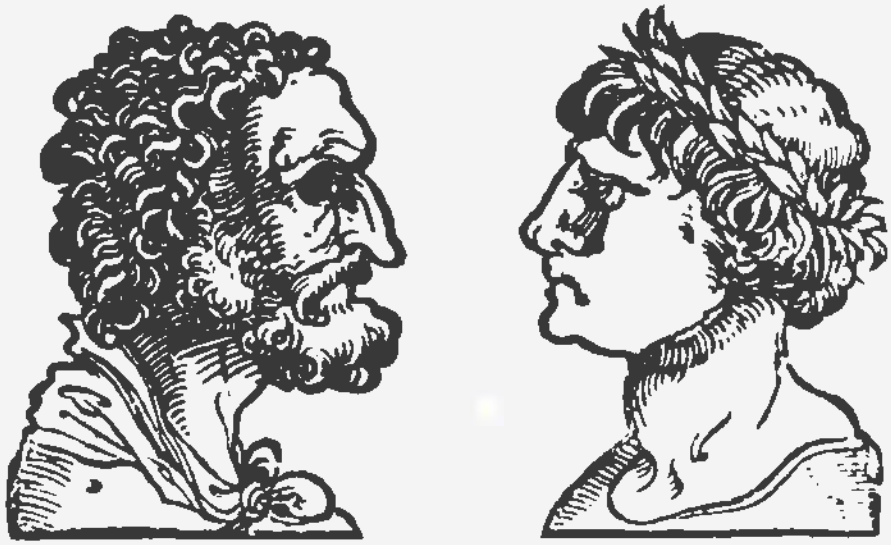
One of the most striking and convincing pieces of evidence for the role of the head in Celtic mythology occurs in a medieval Welsh tale in the *Mabinogion*. This concerns the magic head of Bran (see BRAN) who was clearly of divine origin. In the story his head, after his death, continues to live and remains uncorrupted, providing magnificent hospitality and entertainment in a magical realm until such time as Bran's followers ignore the warning he gave them before his death. All the magic then ends, and it remains for the head to be buried in the White Mount, in London. There it keeps at bay all plague and evil from the country. Its talismanic qualities cease when it is discovered and exhumed.

The Speaking Head

This tradition of a severed head presiding at a feast, or participating in festivities in this world or the next, is also found in the literature of early Ireland. The motif occurs in one of the tales connected with Finn (see FINN). Lomna, Finn's fool, chances upon Finn's wife in the act of committing adultery with a warrior, Coirpre. When Lomna informs his master of this association, Coirpre decapitates the fool in revenge and carries off his head. When Finn finds the decapitated corpse he puts his finger in his mouth, and thereby is able to divine whose body it is, for Finn has the power of supernatural knowledge. He goes in search of the head and comes upon Coirpre who is cooking a salmon, with Lomna's head stuck on a stake beside him. When the warrior is apportioning the fish he does not offer any to the head. The head speaks, but it still gets none. It speaks again, and Coirpre puts it outside the door. The fish is divided out once more, and when the head is again not given any it speaks from outside.

Heads are also associated with feasting in a story about the death of one of the Irish gods, Fothad Canainne, who was known as Caindia, 'Fair God'. The Celtic deities were not regarded as invulnerable. Fothad Canainne never sat down at a feast without having decapitated heads before him – this no doubt refers both to his prowess as a warrior as attested by these trophies, and also obviously points to the traditional association of severed heads with feasting and merry-making. Fothad's chief enemy is Ailill Flann Bec of Munster. Fothad desires his wife, and abducts her. In the resulting clash between the two warriors Fothad is worsted and falls, and Ailill decapitates him, according to custom. Fothad's mistress raises up his head which immediately chants a long poem to her, bewailing its condition and instructing her about future action.

Two essentially pagan traditions about the power of the severed human head occur in the tale of the battle of Almu (preserved in an 11th century Irish manuscript), in spite of the predominant Christian atmosphere and historical setting. Fergal Mac Maile Duin is slain while fighting against the Leinstermen. His head is taken to Cathal, king of the opposing side. A remarkable passage then occurs in the text, which



Illustrations showing the forehead of a vain man *(left)* and of a lustful man *(right)*: from Cocle's *Compendium of Physiognomy*, published in Strasbourg in 1533

tells how Cathal honours the head of his enemy: he has it washed and its hair braided, and he drapes it with a silk cloth. He then causes seven oxen and seven sheep and seven pigs to be cooked, and placed in front of the head – a strange reference to the actual veneration of a head. The Christian emphasis of the tale is reasserted when the head is made to blush and open its eyes and give thanks to God for the great honour and reverence shown to it.

The same tale contains another episode which illustrates an additional aspect of head worship that is well attested in the pagan tradition. Donn Bo, a youth who was renowned for the sweetness of his singing, was also killed in the battle, and decapitated. He had given his promise that he would sing that night for Fergal, no matter where they might be. One of the Leinstermen goes out onto the battlefield to take a head back to the feasting place. As he draws near he hears the severed heads entertaining the dead king. Donn Bo's voice is by far the sweetest. When the warrior goes to lift the head it protests, and says it is pledged to sing that night to Fergal alone. In spite of this the head is taken to the feasting hall and set upon a pillar. When requested to sing to the company it turns to the wall, so that it is in darkness, and then sings with moving sweetness. After this it is returned to the battlefield. Here again the head is alleged to be capable of independent movement, speech and powers of entertainment after its separation from the body.

The Well of the Heads

Wells and springs were of fundamental cult importance to the Celts and according to Celtic belief a sacred severed head, when brought into conjunction with a venerated well, increased the powers of both. The Church, instead of forbidding the continued worship of wells countenanced it, converting well-worship associated with pagan forces into well-worship presided over by saints, some of whom are the old deities thinly disguised. Thus, in the Christian context, the heads of saints rather than those of deities are connected with the sacred waters. Many sacred springs and sources have been found on excavation to contain, amongst other cult objects, one or more human skulls.

The earliest literatures, the lives of the Christian saints, and later Celtic folklore and tradition abound in references to the motif of severed heads in wells; and the amazing wealth of legends still current in Celtic-speaking parts of the British Isles indicates the fundamental character of this ancient concept. The firm belief in the curative powers of water drunk from the skull of an ancestor, especially in the case of epileptics, was still operative in the Scottish Highlands in the 20th century, and no doubt still lingers on in places.

A striking parallel to the Celtic material, and one which may owe its origin to a Celtic source, is that of the Old Norse tradition of Odin and the head of Mimir. Mimir's head was cut off by the Vanir (divine beings having powers of fertility). Odin took the head and preserved it with oils and herbs (as did the Celts) and kept it in a well. He recited magical charms over it, and it became capable of speech and obtained prophetic powers; and thereafter was a valuable source of information to the deity. Another tradition, this time preserved in an Elizabethan play, contains elements which again are purely Celtic in feeling. In Peele's *Old Wives' Tale* Zantippa goes to the Well of Life with a pitcher to draw water. As she is about to dip it into the water, a head rises above the surface and in true Celtic fashion speaks and makes meaningful statements. This is clearly connected with fertility and all the powers attributed to severed heads in Celtic mythology.

Many of the early Celtic saints are associated with such traditions. For example, St Melor of Cornwall and Brittany was murdered, and in the place where his assassin, who was carrying his head, almost died of thirst the head commanded him to strike his staff into the ground and a spring would appear. The staff grew into a fruit tree, and a holy well sprang from its roots. Like several other Celtic saints Melor was associated with healing springs over a wide territory; the powers of healing, prophecy and fertility believed to be inherent in the severed head were easily transferred into a Christian setting.

A story still current in the island of Vatersay, in the Outer Hebrides, contains all the ancient pagan elements. Three brothers are murdered and decapitated at a well known as *Tobar nan Ceann*, 'the Well of the Heads'. The father recovers the heads of his sons from the well, and makes for home to bury them. As he approaches a standing stone one of the heads speaks and makes a prophetic statement. A woman who is pregnant by this son at the time gives birth to a son; and as the head prophesied this boy in the fullness of time avenges his father. He decapitates the murderer as he bends over a well to drink. He leaves the head in the well, which from then on is known as *Tobar a' Chinn*, 'the Well of the Head'.

Finally, a passage from a Scottish folktale reveals the ancient belief in the powers of independent action and speech by severed heads. In the story of 'The Knight of the Red Shield' *(Gaisgeach na Sgeithe Deirge)*, 'One looked hither and one thither, and they saw a head coming in a flame of fire, and another head singing the song of songs. A fist was struck on the door of the mouth of the king, and a tooth was knocked out of him, and there was no button of gold or silver on the coat of the king but showered off him with shame. The head did this three years after each other, and then it went home.'

All the evidence for Celtic religion emphasizes the fundamental importance of the human head to early Celtic society. It was a prized trophy in battle; but much more than this it was a potent symbol of the total religious attitudes of the Celtic peoples. The head stood for divinity. It was the supreme conveyer of hospitality, the distributor of the divine feast. It had powers of prophecy, healing, fertility, speech, independent movement and incorruptible life. It was regarded as the essence of being, the seat of the soul, the symbol of evil-averting divine power. Its meaning for the early Celtic peoples is clear throughout every phase of their history – it can truly be said to contain the essence of their religious philosophy and to be the most distinctive and powerful of all their cults.

HEAD-DRESS

The impracticability of many types of military headgear reflects the fact that 'the element of magic is never entirely absent' from head-dress

THE RATIONALISTIC NOTION that people put things on their heads to protect themselves against rain or sun is plainly an inadequate explanation of all the various kinds of headgear that have appeared in human history. Other considerations must, from the first, have entered into the matter. The desire to enhance the personality by making oneself look taller is an obvious motive. The desire to adopt a badge of office, to express superior social status, the desire to frighten an enemy, to propitiate the gods, to frighten away evil spirits, to nullify the Evil Eye; all these have contributed to the size, shape, colour and decoration of the structures which men have put on their heads. The element of magic is never entirely absent, even in the case of modern hats.

Not all peoples have at all times worn hats. The hats of the ancient Greeks were more in the nature of parasols, hats with very wide brims worn, for the most part, on the shoulder and only put on the head when the heat of the sun became oppressive. The Romans did not usually wear hats; they merely draped a fold of the toga over the head when in mourning or for some religious ceremony. The ancient Egyptians were content with a fold of cloth, or a wig, but the pharaoh wore a crown, or rather two crowns: the Crown of the North and the Crown of the South. These symbolized his rule over both parts of Egypt but they probably had a deeper significance for they form a perfect example of the *lingam* or union of the masculine and feminine principles. Almost all the deities in the Egyptian pantheon were provided with symbolic head-dresses: Isis had the sun disc between cow-horns, Thoth also had the disc between horns, Hathor had the disc between two feathers.

Crowns would seem, therefore, to have preceded hats in the modern sense and to have been worn for magical purposes. A

Camera Press London/John Blumer

The notion that people wear hats for protection against the weather fails to explain the weirder kinds of headgear. Horned head-dresses are frequently meant to give the wearer the strength and virility of powerful horned animals like the bull: small boy of the Ashanti people of Ghana

Eric Cross

Eric Cross

Impressive headgear is particularly important to fighting men and priests, to instil power and frighten enemies, natural or supernatural. Some American Indians added a feather to a warrior's head-dress for each enemy he killed *(left)*: Caraja medicine-man of Brazil going into trance to cure a patient *(right)*

crown is merely the rim of a hat with neither top nor brim. It is a simple ring into which the wearer inserts his head. Freud maintains that every putting on of a hat is a symbolic coitus, and it seems likely that what the early kings were doing when they put on their crowns was to symbolize their mystical marriage to their people or to their land.

A special head-dress for priests is of immemorial antiquity. We learn from the Old Testament that Moses ordered the priests, and in particular the high priest, to wear a special kind of head-dress, but the Bible does not give a detailed description. However, the Jewish historian Josephus does describe the high priest's headgear at the beginning of our era. He tells us that it consisted of a hand of material wound round the head and sewn to resemble a turban. Over this was another strip of finer material wound round it. Josephus also speaks of a bonnet of blue material encircled with a triple gold crown. In the front was a plaque, called the ziz, on which was inscribed the name of God.

The Fish and the Mitre

The early Christians adopted a headgear of their own which (except in the Armenian Church where all priests wore it) was reserved for bishops. The word *mitra*, or mitre, had in the beginning no particular liturgical significance, being worn also by women. It certainly took a long time to attain its final form, for when the tomb of St Cuthbert, Bishop of Lindisfarne in the 7th century, was opened his forehead was adorned merely with a gold circlet set with precious stones. It is difficult to determine exactly when this form of sacerdotal headgear was abandoned in favour of what is usually called a mitre. This was at first a kind of folding cap, the two sides lying flat when not worn. A mitre of this kind, reputed to have been worn by Thomas Becket, is in the Victoria and Albert Museum in London. By the 12th century it had been assumed by all bishops of Western Europe as their proper liturgical head-dress. Mitres with peaks on either side were worn by the end of the 12th century but the custom grew up of wearing the peaks back and front, and it is this shape that has survived. What has happened, however, is that it has grown taller and fuller, reaching what is probably its final form in the 17th century. The curious thing is that this final form bears a close resemblance to the headgear of the priests of Dagon. Dagon was a Phoenician fish god and it is the head of a fish with open mouth that this ancient pagan headgear resembles. As such it conferred upon the celebrant the power of the god. It is at least curious that Christ was often, in early Christian times, symbolized by a fish.

There can be little doubt that in the 14th and 15th centuries there was a real witchcraft cult in Western Europe which involved not only the peasantry but some of the highest in the land, and there is a curious diabolism in the fashionable clothes of the time. It was indeed at this period that 'fashion' may be said to emerge. Between the fall of the Roman Empire and the mid-14th century there is hardly anything that could be called 'fashion' at all. And then, in a single generation, in the luxurious courts of France and Burgundy, and in England too, the scene was transformed. Instead of being clothed in shapeless garments which made it impossible to divine the body underneath, and with the head concealed by a veil, women began to exploit their natural charms. The three weapons of fashion were invented in a single generation and these were: tight-lacing, décolletage and elaborate head-dresses.

The veil, which had for so long been the only headgear allowed to women, suddenly began to take on, as it were, a life of its own. The coiffure consisted at this time of a kind of network studded with pearls and enclosing the hair, and from this by means of pins the veil was raised from the head. Moreover it began to be made of so fine a material as to be almost transparent with the result that, instead of concealing the head and part of the face, it drew attention to them. Various shapes were tried but the most popular was the horned head-dress, which immediately brought down upon its wearers accusations of immodesty and even of witchcraft. For

what did the horns signify if not an implied worship of the Devil? Certainly the clergy of the period thought so and the Archbishop of Paris even went so far as to offer indulgences to those who would insult women wearing the new head-dress in the street. The preaching friars took the same line and when, in the next century, the horned head-dress was replaced by a steeple-like structure not without phallic significance, the denunciations grew louder.

It is interesting that in men's clothes at this period the phallic significance is to be seen not in the headgear but in the footgear. The *cracawe* or *poulaine* shoe came to an elongated point in front and was sometimes actually formed in the shape of a phallus. These styles of women's head-dresses and men's shoes lasted until the second half of the 15th century.

Ferociously Virile

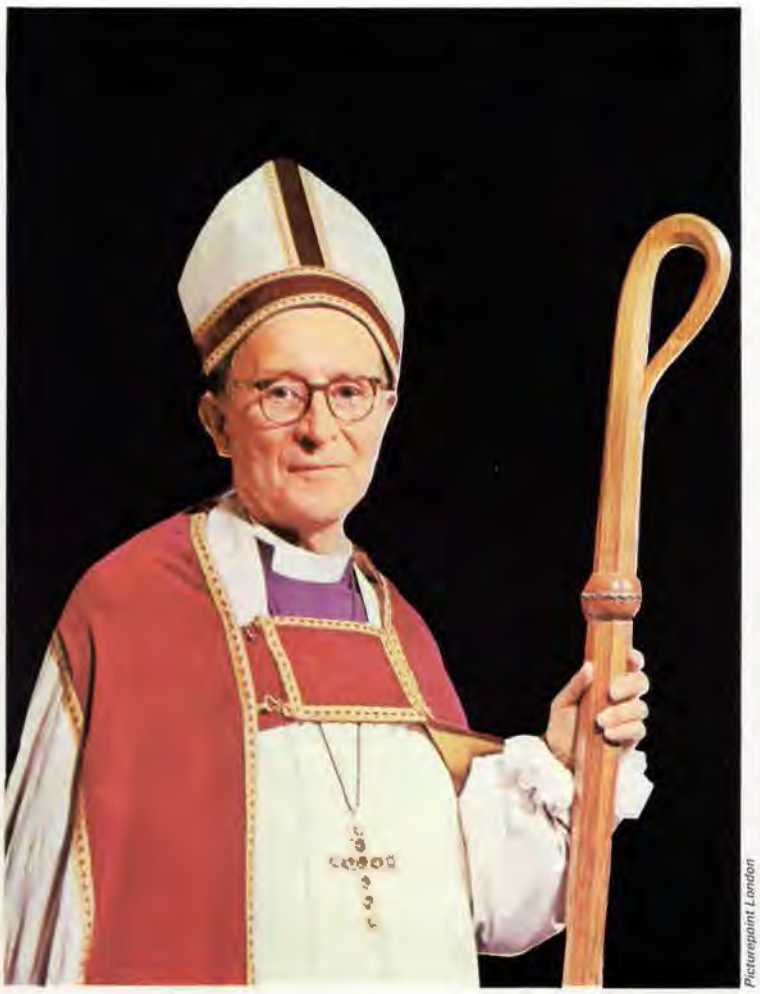
Something must be said of the magical element in soldiers' helmets. From the earliest times military headgear had been something more than defensive equipment for turning aside the stroke of an enemy's sword. It was also intended to make the wearer more imposing, and therefore more frightening, by increasing his apparent height (this motive being plain in all military headgear until modern times), to scare the enemy off by a ferocious appearance (the final example of this being the skull on the fur cap of the 'Death's Head Hussar') and to nullify the influence of the Evil Eye. This last desire perhaps explains the extraordinary prevalence of horns added to helmets, 'horns of power' being an accepted protection. Viking helmets are an obvious example.

Long after such considerations had ceased, or had sunk into the depths of the unconscious mind, soldiers' headgear continued to develop in a way which had nothing to do with efficiency in combat, and indeed was often hostile to it. It was of no advantage to a medieval knight (except perhaps for purposes of identification) that his helmet should be surmounted by an elaborate heraldic structure; and when we come to more recent times, we find the same principle at work.

Military uniform does not really come into being until the last quarter of the 17th century, and it is astonishing to find that it is much less suitable for its purpose than the clothes worn, for example, by the men who formed the armies of Cromwell. The sensible 'pot' or steel helmet was replaced by the three-cornered hat, difficult to keep in place during a charge, especially when placed on the top of a full-bottomed wig. The principle of utility did, however, impose itself on the dress of those of the infantry whose weapon was the grenade: the grenadiers. These men found it almost impossible to throw a grenade without knocking off their three-cornered hats. They were therefore provided with a soft cap rather like a nightcap. And then an extraordinary thing happened. It was as if the cap had been made of erectile tissue. It began to experience a kind of tumescence, to rise from the head, until it became the stiff mitre-cap to be seen, for example, in Hogarth's engraving of 'The March of the Guards to Finchley'. The behaviour of the later 'bearskin', still worn by the Guards when they parade in full dress, was even more extraordinary. The bearskin was originally a cap with a fur border, and this border gradually swallowed the rest of the structure, rising ever higher and higher until it was a third of the height of the whole body, was of great weight and could only with considerable difficulty be kept on the head.

A similar tendency can be observed in female head-dresses in the last quarter of the 18th century. At the beginning of the century there had been a high head-dress in the form of the *fontange*, but in the next generation this had disappeared in favour of a neat little coiffure like that worn by Madame de Pompadour. And then, in the late 1760s, women's hair began to rise from the head. By 1776 coiffures had attained the most astonishing proportions, sometimes rising to a yard in height. In its earliest form the head-dress consisted of a wire or other frame placed on the head. The natural hair was drawn over it, artificial hair was added, and the whole was adorned with colourful plumes and ribbons. The inconveniences of following such a fashion were considerable. Women going to court had to spend several hours with the coiffeur and

Transworld Features Syndicate



Picturepoint London

once erected, the structure often remained in place for weeks or even months making, one would have thought, natural sleep impossible. Another disadvantage was that the flour mixed with pomatum with which the hair was daubed formed an excellent breeding ground for lice.

Meanwhile men had abandoned the tricorne and assumed an early form of the top hat. In origin this had been a utilitarian hat, a hunting hat, with very narrow brims so as not to catch the wind when riding to hounds, and a very tall crown to serve, if the wearer was unhorsed, as a kind of primitive crash helmet. In the early 19th century it became the accepted town wear of the Regency dandies and for the rest of the century it was worn by men in all ranks of society.

Left **The hoods of the Ku Klux Klan were worn to terrify**

Right **The bishop's mitre took centuries to reach its final form: whether deliberately or by chance it resembles the head of a fish, an early Christian symbol of Christ**

It varied considerably in height and it has been suggested that it is possible to estimate the degree of male domination (if we accept the view that a high hat is an affirmation of virility) by noting its height. It would certainly seem that at the last high water mark of the patriarchal system (say, in the middle of the century) the top hat had an exalted crown. And then, with the emergence of the 'New Woman' in the 1880s men modified their pretensions and adopted the new low-crowned straw hat known as the 'gent's boater'. At the very end of the century came the Homburg hat, with its dented crown which, curiously enough if seen from above, is the very symbol of femininity; the 'yoni-on-top'. In our own day both men and women have largely abandoned hats altogether; and the astonishing implications, social, religious and magical which have been seen in the past in the headgear of both sexes, have finally faded away.

The Cap of Liberty

A brief word on this hat (the Phrygian cap): made famous for us moderns when the first French Republic adopted it as the symbol of freedom. It provides us with a good example of how any ordinary useful object – in this case an ordinary working-cap – may be endowed with a symbolic character. 'The head-dress of the Persian Monarchs,' Layard wrote in his *Nineveh*, 'appears to have resembled the Phrygian Bonnet or the French Cap of Liberty.'

The cap of this particular type became the symbol of liberty because, when a Roman or Latin manumitted his slave, he made the man a present of a cap, as a symbol of the ex-slave's newly acquired freedom. And though hats were not generally worn by men in the Roman state – Servius considered it a matter of reproach to the Phrygians that they 'dressed like women', because they wore hats – a newly manumitted slave used to wear, for some time after his being freed, the cap which proved his rank of freeman.

Of course, it was because hats and caps had fallen out of use among the Romans that a cap – any cap – could acquire some symbolical value. In the countries where caps were worn, this type of cap had no other than a practical purpose; and before the Greeks gave up wearing hats, the Phrygian cap was to be seen, along with a number of other basic types.

Michael Harrison *The History of the Hat*

HEADLESS SPIRITS

THE IMPORTANCE of the head in the constitution of the body is obvious, and from the earliest times a unique significance has been accorded to it in myth and ritual magic (see HEAD). Conversely, headlessness has been regarded as a baleful state of being and has inspired some strange and eerie conceptions.

In the later Paleolithic era, at Mineteda in eastern Spain, headless human figures were engraved on rocks. They are depicted in upright posture and apparently in movement, and have been interpreted as representations of spirits. Possibly the horror of a decapitated body prompted the fear that the decapitated dead would be especially baleful and vindictive towards the living.

A different significance seems to attach to the depictions of headless persons in the remarkable mural paintings found recently at Catal Hüyük in Anatolia. At the Neolithic settlement on this site, which dates back to the 7th millennium BC, the ruins of a shrine dedicated to a goddess were excavated. From various objects found there, it is evident that this goddess was connected with both fertility and death. Among the frescoes which adorned the shrine were pictures of great black birds, of horrific appearance, menacing decapitated bodies. These depictions have generally been interpreted as representing vultures preying on human corpses. But there are reasons for doubting this interpretation. In the first place, such a subject would seem to have no relevance, and also to be inappropriate, to the cult of a mother goddess. Then there is the problem of the headlessness of the corpses – if indeed they are corpses; for they appear very animated in their postures. Since both human and vulture skulls were found specially deposited in the sanctuary, it would seem that the headless bodies have some hidden meaning beyond our knowing (see also HELL).

In ancient Egypt the famous mortuary god Osiris (see OSIRIS) could be conceived of as 'the headless one' for, according to his legend, his murderer Seth mutilated his body. His severed head was subsequently recovered and buried at Abydos, which became the chief cult-centre of Osiris. But in ancient Egyptian inconography, Osiris is never depicted as headless (except in bas-relief at Philae where his headless corpse is the subject of a magical ceremony). The whole purpose of the Osirian mortuary ritual was, on the contrary, to ensure the complete re-constitution and eternal preservation of the body of the deceased, with emphasis upon the security of the head.

However, in Greek magical papyri of Egyptian origin Osiris became 'the strong Headless One', the 'Creator of Heaven and Earth, Day and Night, Light and Darkness', 'the Lightener and Thunderer', 'the God who holds the eternal Fire' (meaning the sun). He is also referred to as the 'good Osiris, who no one has seen with eyes'. This mysterious being, called in the Greek text *Akephalos* ('Headless'), is imagined as having a head and face at his feet, and a mouth burning with fire. In two magical papyri of the period (now at Oslo and Berlin respectively), fantastic representations are given of headless monsters, showing some distorted remembrance of Egyptian symbols. There may also be some connection in this strange

A large black bird threatens headless bodies on this fresco from the shrine of a mother goddess at Catal Huyük

E. A. Lowcock/University of Manchester

and horrific imagery with the fact that the first decan god of the constellation Capricorn, in the Egyptian star-map, was shown as headless. (The decans are divisions of the zodiac signs.) This decan god was associated also with the incidence of fever. The association is particularly interesting, since there is other evidence connecting headless spirits with disease and its cure.

Another class of headless spirits were the ghosts of those who died by decapitation, and were in consequence restless and haunted the living. A similar belief existed in connection with those who had been hanged or crucified. The folklore of many northern peoples contain instances of such belief, of which the well-known idea of the decapitated ghost, holding its head under its arm is a romanticized version. It is interesting to note also that the Nordic god Wotan, in one of his manifestations, was the 'headless rider on the white horse'.

The medieval English Romance of *Sir Gawain and the Green Knight* (see GAWAIN) which is related to the Arthurian cycle of legends, contains a remarkable episode of the beheading of a being who continues to live on headless. It seems likely that the 'beheading game' in *Sir Gawain and the Green Knight* preserves some reminiscence of ancient Celtic religion in which ritual decapitation and a cult of severed heads were practised.

Headless deities and heroes are also known in India. In the Hindu *Markandeya Purana*, the goddess Devi assumed the form of Chhinnamastaka (the 'Headless'), in order to destroy the demon Nisumbha. In the Punjab, at Bahraich, where his headless body was buried Ghazi Salar is venerated as a headless champion of Islam. The headless trunk of Lakkhe Shah Darwesh is fabled to have fought its way to Ambala, to curse the wells there with brackishness. At Panipat, the Binsira was a 'headless saint' of the Hindus.

Medieval Christian art graphically contributed to the imagery of the headless dead. The legends of many saints told of their martyrdom by beheading; in consequence they were sometimes depicted headless and holding their heads as, for example, St Nicasius is represented in the sculptures of the Cathedral of Rheims.

S. G. F. BRANDON

Many successful cures at the shrines of Asclepios were effected by dreams – an early example of what we now call psychosomatic medicine, the healing of the body through the mind

HEALING GODS

THE MOST FAMOUS healing god of classical antiquity was the Greek Asclepios (the Roman form of his name was Aesculapius) who was at first a divine being of the second rank, not a great Olympian god like his father Apollo. For that reason alone he was closer to mortals than the great gods and more concerned with their affairs, but he was closer still because his special province was the art of healing. In his relations with his worshippers or patients he showed many of the traits of a good human physician, and he was consulted on many other problems of life beyond those arising from sickness. He also sometimes punished presumptuous or deceitful patients.

The Epidaurian *Iamata* or 'cures' are records of cures and miracles at the god's great temple at Epidaurus in southern Greece. They were inscribed on tablets along the inner wall of the colonnade, on the north side of the sacred enclosure. Six tablets alone remained in the time of the famous traveller Pausanias (2nd century AD) but earlier there must have been more. This building was designed for those who came to sleep and to be cured. Its inscriptions, like those at many other centres, were an official compilation by the priesthood, written to maintain belief and awe.

The Epidaurian 'cures' are not written in any classified order and the more extraordinary acts and events often burst upon the reader without warning. Pandarus of Thessaly suffered from a mark on his forehead. Asclepios, appearing in a dream, put a bandage round his head, which he was to take off when the god had gone. When Pandarus did take off the bandage, he found the marks transferred to it. Echedorus, who had a similar mark, was sent by Pandarus to pay over money for a statue of Athene to be put in the shrine. When Asclepios appeared and asked about

the money, Echedorus denied receiving it but promised to paint a picture and dedicate it. Asclepios bound Pandarus' bandage round Echedorus' head; when he woke and took it off, Echedorus found no marks on the bandage, but on his own forehead the marks of Pandarus added to his own.

Euhippus, who had a spear point embedded in his jaw, was cured in his sleep by the god, who drew it out and left carrying the point. A man with an ulcer on his toe was cured in his sleep when one of the sacred snakes licked it. In his dream he had seen his toe treated with a remedy by a handsome youth. When Arata of Laconia had dropsy, her mother slept at Epidaurus for her. The mother dreamed that Asclepios cut off her daughter's head, emptied out the liquid and then replaced the head. The daughter had the same dream, and had recovered when her mother returned. Clinatas of Thebes was cured of lice when Asclepios in a dream swept him down with a stiff broom.

These are some of the more unusual tales among much more ordinary cures. It is not always possible to see what happened in dream and what in the waking state. It seems to have been assumed that operations seen in dreams were done on some sort of ghostly counterpart of the body, and took effect on the actual body.

Diary of a Hypochondriac

The curious case of Aelius Aristides in the 2nd century AD is described in the *Hieroi Logoi* or 'Sacred Tales', which Aristides himself wrote by compiling a diary of his experiences. He became a permanent invalid or hypochondriac after the rigours of a journey across the Balkans to the Adriatic and to Rome, undertaken in mid-winter. On his return in very poor health to his house at Smyrna, he was summoned in a dream to become a patient and devotee of Asclepios in the great shrine at Pergamum (now Bergama) in Asia Minor where, in the intervals of sickness and cures, he lived a zealous literary life.

Aristides was hysterical, and no unified diagnosis of his various ailments seems possible, but he was as tough as only a chronic invalid can be. He was afflicted with periodic paralysis, convulsions and difficulties in breathing, in combinations characteristic of hysteria. Asclepios prescribed not only baths and special food but also long periods of fasting without washing, which left Aristides extremely thin and exhausted under his blankets, especially as they were sometimes accompanied by emetics, and by constant purges and blood-lettings. In the throes of these ailments, and of this treatment, he was from time to time ordered in midwinter to run naked round the sacred enclosure and to take plunges in frozen rivers and lakes. He survived each ordeal in triumph, when physicians and friends expected him to fall into convulsions. When Aristides accepted human doctoring, the god was liable to punish him with deadly chills, catarrh and digestive disorders. He lived thus for 17 years, making occasional excursions from Pergamum, while Asclepios arranged for the defeat of his literary rivals, for his winning the imperial favour, for his escape from punishment when he was charged with not carrying out official duties required by the Roman authorities, and for his preservation in time of plague.

According to Homer, Asclepios belonged to Tricca in Thessaly, and it is agreed that his first cult was there. He was the son of the nymph Coronis and the god Apollo, who among his other attributes had powers of causing health or sickness. While she was still pregnant with Asclepios, Coronis took a mortal lover. Apollo in his anger sent the goddess Artemis to slay Coronis and many of her neighbours with her shafts, which could be a mythological way of describing an epidemic. As Coronis lay dead upon a burning pyre, Apollo snatched their baby son from her body and gave him to Chiron, the centaur, to rear and to instruct in medicine. Asclepios grew up to be a famous healer, but overstepped the mark when he brought a man back from the dead. For this, Zeus killed him with a thunderbolt.

But after his mortal life, Asclepios became a famous hero in the full Greek sense, one of the mighty dead who received cult. In time his status gradually rose until he became greater than ordinary heroes and took rank first as a minor god and later even as one of the great gods.

His cult spread southward, from c 600 BC onward, and its most famous centre was at Epidaurus. The remains of the ancient precinct with its temple, theatre, stadium and other buildings, are well known to tourists. The cult also reached the island of Cos in the eastern Aegean, though the great shrine there is of later origin. It was introduced in some form at Athens in 420 BC by the dramatist Sophocles who for a time housed one of the sacred snakes.

Rome, Shrines and Snakes

The Roman cult of Aesculapius began in consequence of a mission in 292 BC, which sought deliverance from a plague and was advised by the Delphic Oracle to go to Epidaurus. When it arrived, an immense serpent glided down from under the base of the great statue of Asclepios. Turning its head from time to time as it went, as if to bid farewell, it boarded the Roman ship and coiled itself up under a tent. On the voyage it swam ashore at Antium, where it hung from a tree for three days before it came aboard again. As the ship sailed up the Tiber, the serpent went ashore on Tiber Island and disappeared. The plague immediately came to an end. At this spot the Roman temple of Aesculapius was founded.

The shrines of Asclepios at Epidaurus, Cos, Pergamum and elsewhere were elaborate combinations of a hospital and its grounds with something like a cathedral precinct. They contained long colonnades or peristyles where the patients or devotees slept, springs, baths and groves of trees, usually cypresses. There were temples, often more than one, of Asclepios and other gods, and great altars open to the sky. At Epidaurus there was a renowned theatre; at Pergamum there was a library for the wealthy and cultured patients. Beside the sacred snakes, for which such places as the labyrinth under the round temple at Epidaurus were intended as pits, there were also sacred dogs.

The statues of Asclepios were usually of a grave bearded man of middle age, often with a curiously distant look in the uplifted eyes. Occasionally there were contrasted statues of a youthful Asclepios. Most often, he was shown seated on a throne attended by his great snakes, executed in bronze. The whole of each shrine had a well-marked bonndary, within which neither birth nor death was permitted to happen. Very often the sites were on hillsides exposed to the sun and health-giving breezes, like our sanatoria for the tuberculous.

The cures, whether by Asclepios or by saints of later times, were not brought about by the known methods of clinical medicine and surgery. The decisive element was the direct power of the god, which was felt in a psychic manner. Much illness is now recognized to be psychosomatic, showing physical symptoms but originating from mental causes.

Dreams and Visions

Many other supernatural beings, whether gods or heroes, were approached for help in healing. Apollo, who was famous for sending plagne on offenders, was also a healer. Connected with Apollo was Paieon or Paian, who may have been the personification of a song called *paian* (our 'paean')

which was originally a healing song but was also a song of victory, not only over disease but over other afflictions and perils.

As the popularity of Asclepios grew steadily in the later centuries of antiquity, so did the vogue of the alien Isis and Serapis (or Sarapis), until these divinities too were overcome by Christ and his saints. Isis was believed to sustain the vigour of the healthy and to give health to the sick, particularly in diseases of the eye. At some of her shrines, especially in Egypt, the sick took up residence by her command to be healed, usually by visions in which she performed miracles or gave instructions.

Even in ancient times the origin of Serapis was a little mysterious. It was said that Ptolemy I (3rd century BC), soon after establishing his rule in Egypt, saw the god in a dream and was ordered to fetch his image (apparently a Greek statue of Pluto) from Sinope on the coast of the Black Sea and establish it in Alexandria as a blessing to the realm. When Ptolemy delayed, Serapis appeared again in a more threatening manner, so that the king in alarm had the image fetched and installed with due pomp in the new Serapeum in Alexandria.

The Graeco-Egyptian god Serapis healed the sick through dreams and visions. In spite of poverty, discomforts and quarrels, some patients could not tear themselves away from the shrine until the god ordered them to go, a striking demonstration of the strength of the faith which made the cures effective: Roman head of Serapis

G. Drury/Guildhall Museum

Like Asclepios, Serapis appeared in dreams and visions to heal those who slept in his temples. At Memphis and elsewhere he had a class of resident devotees who were in a state called *katoche*, which seems to have meant that they were detained by the inner compulsion of the god's command until he should let them go. Papyri have been discovered which show their uncomfortable and poverty-stricken condition, and their bitter quarrelling with one another, with the priests and with the population.

Another healing god was Imouthes, who was originally a real person, an Egyptian royal official named Imhotep. After his death he was credited with all manner of wisdom, especially in medicine, and he rose to the rank of a god. He was one of a circle of deities worshipped with Serapis at Memphis, where he had his own shrine. A papyrus of the 2nd century AD tells how the writer, who had delayed translating into Greek a book on the miracles of Imouthes, was punished with a high fever. The god appeared to him, holding a book and saying no word but merely looking at him. The patient then broke into a sweat and was cured of his fever.

Most of the shrines of these gods had special quarters where the devotee-patients could sleep or even spend periods of many weeks. Those of Asclepios were famous for their buildings, gardens, springs and baths laid out in the most elegant Greek style. Those of Serapis and other such gods were no doubt less agreeable. The Serapeum papyri from Egypt give a picture of uncomfortable and crowded rooms which were sometimes open to outsiders but sometimes walled off so that the inmates could communicate with others only through a small window.

The practice of incubation, as this 'sleeping in' is called, cannot be traced to any one place of origin. It would arise in any community which had great faith in dreams and visions to be received only on holy ground. It is a feature of old Japanese religion also, where no influence from western Asia or Europe need be assumed. The basis is entirely in faith healing and trust in supernatural beings, whose orders must be obeyed however paradoxical they seemed, both in medical treatment and often in the conduct of life in general. The divine healers, like human physicians and psychiatrists, might be consulted on any matter which had a deeply emotional significance for the worshipper.

The symbol of a heart is popularly used to signify that love is emanating from the very centre of being: a Valentine card of 1846

HEART

Among the vital organs of the body, the heart, 'that secret hidden centre', holds a supreme place. It has been seen as the seat of the soul, of the emotions and of the intellect; in magic, it dominates the rites of love and hate

HEART

IN LITERATURE, in art and in the language of communication the term heart suggests a wide range of emotional and intellectual phenomena, ranging from coldness of heart at one extreme to the melting of hearts at the other. To many peoples the heart has symbolized the centre and essence of being. The common expression 'take heart' meaning 'be of good courage', is the relic of the old belief that moral courage had its residence within the heart, physical courage being supposed to be sited in the stomach.

Because of its important function in the government of the body, the heart has played a profound role in psychic beliefs. In prescientific ages when occult properties were ascribed to all physical forces that lay beyond the understanding of mankind, the heart was considered to be a symbol of eternity and the true seat of the intellect, the brain being thought to be no more than purely instrumental.

From the evident fact that the heartbeat responds immediately to variations in the mental state, as in moments of extreme anxiety, tension and terror, when the heart pounds and the pulse races, this organ also became in mythological terms the seat of the emotions.

In symbolism the heart shares with the lotus flower and the rose the qualities of the secret centre that is hidden beneath the outer surface of things. In numerology the heart number represents the hidden character and the real identity which is secreted behind the facade of the interior. To the alchemists the heart was the sun's image within man.

Extreme care was taken by the priests of Egypt to safeguard the heart of the dead, so that it might duly accompany the body into the afterlife. The hearts of the dead were weighed in the balance in the presence of Osiris (see JUDGEMENT OF THE DEAD).

Tabernacle of Virtue

Biblical teaching incorporates innumerable poetic allusions to the traditional properties of the heart: it is the seat of the affections, of the desires, of hopes and motives, of the understanding, the intellectual perceptions, and is representative of the spiritual nature of man. Yet from this tabernacle of infinite virtue it can degenerate into the most repulsive vessel of sin. Michel de Noble, who lived at the turn of the 16th century, published a series of remarkable pictures describing the various vicissitudes which can befall the unwary heart in its contest with the temptations of the mind and flesh, and representing the soul in a state of mortal sin as a heart occupied by a grinning devil, while a soul which is in a state of grace is depicted as a heart containing at its centre the representation of the crucified Christ.

In Christian art the heart is an attribute of St Teresa and the flaming heart a symbol of charity, often associated with St Augustine. The Order of the Bleeding Heart is a semi-religious order established in the Middle Ages in honour of the Virgin Mary 'whose heart was pierced with many sorrows'. The symbolism of the heart occurs repeatedly in Martin Luther's works; his sermon at the celebration of the consecration of the castle church at Wittenberg included a passage in which he says: 'Christ must be sought with a heart . . . Such a request coming from the heart, God will grant . . . Thus He would have our hearts; and thus every feast of dedication should not merely be an outward consecration of a Church but rather of a consecration of a heart unto God.'

The dedication of the heart to the deities controlling the destinies of man found its most awe-inspiring form in the rites of the Aztecs of Mexico, who tore the hearts from the breasts of living prisoners in order to feed the voracious appetites of the gods of the earth and sun. The ancient Maya sacrificed to the sun god the hearts of living animals which they cast into the flames. There is a modern echo of this cruel theme of heart sacrifice in M. R. James's macabre story *Lost Hearts*, in which hearts are torn from the bodies of children to obtain command over the elements.

Equally barbaric, but not without a certain logic, was the long-standing custom among some primitive tribes of eating the heart of heroic enemies in order to acquire

Cine International

their valour. In some communities in the past, the hearts of dead kings were ritually eaten as a matter of course by their successors. The hearts of animals were also eaten to acquire their characteristics; lions' and leopards' hearts were always in great demand by aspiring heroes, but that of the jackal was naturally shunned since this animal is notorious for its timidity.

As one would expect, rituals involving the heart formed part of witchcraft practices the world over, for by the control of the heart of another a corresponding command could be gained over his whole being. It was a common belief in 13th century Germany that a witch could steal the heart of her victim, replacing it with a bunch of straw. An almost identical belief was held by an Indian tribe of the southern United States who regarded sickness as a sign that the heart had been stolen by witchcraft; to recover it they battled with the invisible forces of evil, returning in due course with a symbolic heart consisting of a stuffed ball of rags containing grain at its centre, which the sick person had only to swallow to regain health.

The belief that the heart is the seat of the soul occurs in many religions *Below left* Aztec human sacrifice from a painting by H. M. Herget: priests tear open the chest of a voluntary victim to offer his still throbbing heart to the god; the soul then ascended to the highest of the Aztec heavens *Below* The heart of the deceased is weighed in judgement against the feather of truth: from the Egyptian Book of the Dead

In the British Isles protection against this form of witchcraft could be obtained by laying a leaf of the Bible over one's heart. This was a perfectly logical remedy if one seriously believed that an enemy was attempting one's destruction by the traditional method of inserting pins and thorns into a sheep's heart which was then thrust up the chimney, to be consumed by flame and smoke. As recently as 1897 a Devonshire woman, imagining her disabilities to be the result of witchcraft, is said to have stuck pins into a sheep's heart while reciting the following spell:

May each pin
Thus stuck in
This poor heart
In hers go
Who hurts me so
Till she departs.

As a defensive measure against attacks of cattle plague, cows' hearts were boiled and stuck full of pins in Yorkshire just over a century ago.

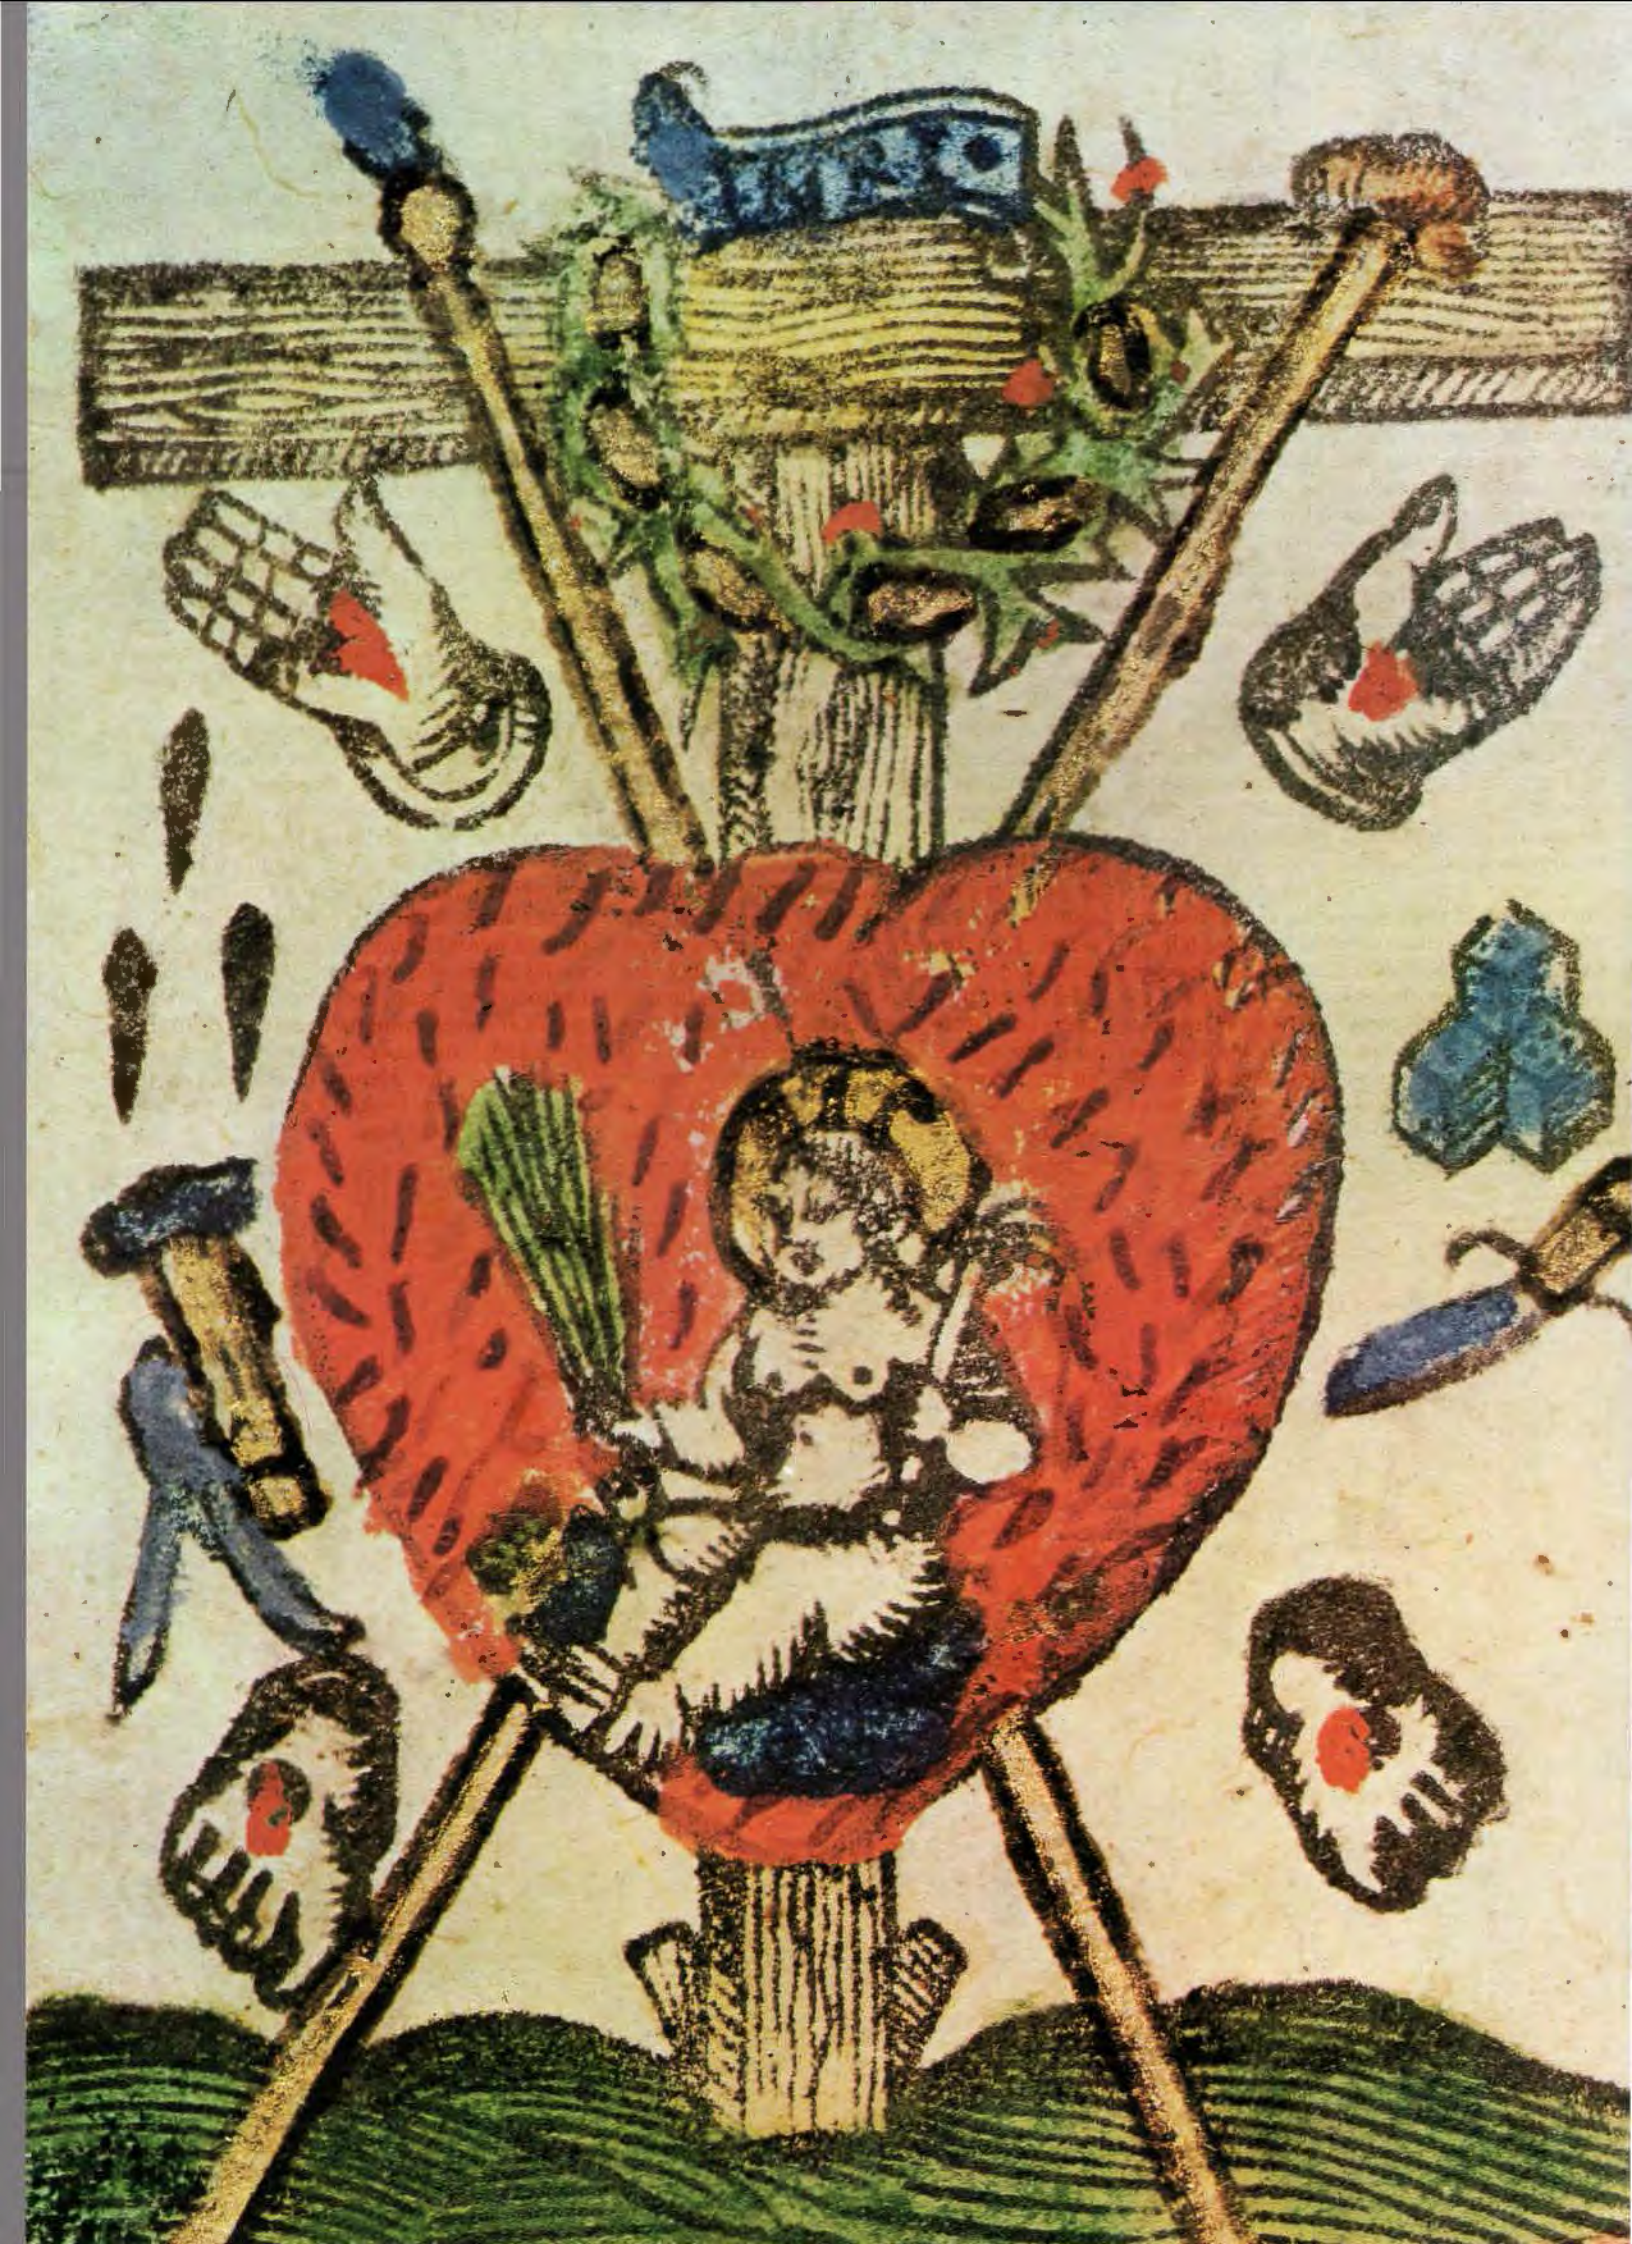
Burial for Noble Hearts

In popular symbolism, however, the heart is more familiar as the sign manual of love rather than hatred, and to 'lose one's heart' means to fall in love. The heart symbol signifies that the lover has become the instrument of a force that impels the whole being towards a focal point. The heart pierced by an arrow represents the female mystic centre penetrated by the male phallus, and is a clearly defined symbol of conjunction and therefore of sexual intercourse.

In its emblematic form the heart signifies that love emanates from the very centre of being, the core of illumination and joy. It is often depicted as surmounted by a cross, a crown, flames or a fleur-de-lis. As a motif in art the heart remains fairly popular, particularly in the Valentine card and in the stylized symbolism of the cartoonist. Yet it is no doubt a sign of the decline of romantic love that the pierced heart, while making an occasional appearance on the tattooed torsos of seamen, is less frequently discovered carved upon tree trunks nowadays. In the past the heart found its rightful place as an ingredient of the love charm, and in a ceremony said to be still practised today among young girls in parts of the United States, the raw heart of a chicken is swallowed as a means to acquire both beauty and beau.

Disappointment in love was thought, in the past to be the cause of a 'broken heart' in a literal sense. Stevens' *History of Methodism*, published in the 1850s, refers to the case of a girl who died within a few days of being deserted by her lover; the writer explains that 'One of the ventricles of her heart burst, so she literally died of a broken heart.' While few medical men today would deny the possibility of death being hastened by grief, its association with the physical heart remains hardly more than an outdated metaphor. Great men like Artaxerxes and Henry II are supposed to have died from broken hearts at the rebelliousness of their sons.

William MacQuitty



Significant evidence of the belief that the heart once represented the centre of spiritual and bodily existence is provided by the custom of heart burial, common in the 12th and 13th centuries, when the hearts of nobles who died abroad were frequently returned to their native lands for interment. Monarchs whose hearts have been buried separately include Richard I ('Lion Heart'), Henry I, Henry III, Edward I and the exiled King James II. The most romantic story of heart burial is that of Robert Bruce, King of Scotland (d. 1329), who willed that his heart should lie in the Church of the Holy Sepulchre of Jerusalem. Douglas was entrusted with the mission, but he broke his journey to help the Spaniards fight the Moors and was killed with the heart around his neck in a casket.

The Dashwood Museum at West Wycombe, in Buckinghamshire, contains an urn which once held the heart of Paul Whitehead, Secretary of the notorious Medmenham Hellfire Club; it had been buried with great solemnity in a mausoleum in 1775 but was stolen half a century later and never recovered. Shortly before his death at Genoa in 1847 Daniel O'Connell, the Irish patriot, issued his last request: 'Let my heart be carried to Rome and my body to Ireland'. A box containing his heart was in due course solemnly buried in the church of St Agatha.

The study of heart totemism among the common people has sometimes produced unexpected results. During an investigation into the curious circumstances surrounding the attempted peasants' revolt in the Canterbury area, led by Sir William Courtenay in 1838, the author of this article discovered that not only were tufts of hair cut by the labourers from the beard of their revered leader after his death at the hands of the military, but that his heart was secretly extracted from his body and preserved as a precious relic for over a hundred years.

Centre and Essence

Children, when they wish to give a pledge of secrecy, still say 'Cross my heart and hope to die'; this link between the heart and the taking of oaths occurs also in legends of pacts between human beings and elves, in which the penalty exacted for any breach of faith on the part of the mortal was the forfeiture of his heart and its replacement by a stone.

The effigy of a heart was once considered to be an effective prophylactic against storms and other perils of the sea and for this reason heart-shaped cushions stuck with pins were presented by wives and sweethearts to sailors before they embarked on a voyage, while among landsmen the familiar heart-shaped horse-brass protected the animal against witchcraft. In jewellery the heart-shaped locket containing the portrait of a loved one represents a modern survival of the same ancient principle, while in playing-cards the theme of the heart as the symbolic centre is asserted yet again; according to some authorities, the Hearts suit originally represented the ecclesiastical powers, at one time central figures in the community.

Heart lore also entered into the old philosophy of medicine known as the Doctrine of Signatures (see DISEASE) for some plants with heart-shaped leaves were used for the treatment of heart disease, among them the wild pansy still known as Heartsease.

Language abounds with allusions indicating the multiplicity of roles once played by the heart as the symbolic mainspring of the intellect and emotions. A 'heart-to-heart' talk is a frank conversation between two people and the person who 'wears his heart on his sleeve' is one who exposes his feelings to the world.

Clear evidence that in the unconscious level of the mind the heart occupies a position of special importance exists in the considerable disquiet which has been aroused recently by the subject of heart transplants. There is a powerful emotional resistance to the idea, which is not felt to the same extent towards the transplanting of any other organ. Plainly there are deep psychological implications involved in the transference of the human heart, which has always been regarded as the very centre and essence of being, from one individual to another.

HEARTH

THE EVOCATIVE TERMS hearth and home conjure up visions of domesticity and peace, for the hearth is the traditional centre of family life, symbolizing warmth, security, and companionship; a place for dreaming where it becomes possible, by peering into the embers, to find physical and mental renewal and to discover by signs and portents the secrets of the future. In another sense the glowing hearth is the symbol of the domestic sun, the Promethean fire stolen from the heavens to become the caged servant of the human race, a feeble yet significant snbstitute for the parent sun.

Basically the hearth consists of a clay or stone slab placed at the centre of a cave or hut to supply a foundation for the domestic fire, and in this form it continued relatively unchanged from prehistoric to Norman times. In the Middle Ages it was moved to the wall, and later still, in the 16th century, the grate was introduced. From surviving traditions and relics of ancient customs it appears that a communal fire was maintained in former times within each village or township, providing the basic 'stock' from which the community drew its individual requirements. This fire was religiously maintained by specially appointed fire-tenders and delivered to each household by runners. The fire-tender's role was vital to the community for should the communal fire ever be allowed to go out social life might be threatened, while symbolically such an omission represented the destruction of the community's collective spirit or soul. This attitude prevailed long after the act of fire-making had become general; and was maintained as a magical rite sanctified by time and by usage. Within the home itself the fire symbolized the soul of the family and it was traditional that when a son broke away from the family unit to set up a separate establishment he took a portion of the ancestral fire with him, thus keeping alive from age to age the sense of domestic continuity. The lighting of this first fire in the new home has come down to us in modern times as 'house warming'.

Sotheby's Michael Holford

In pre-Christian times the bride, upon entering her house for the first time, would be ceremonially taken to the hearth and presented with a pair of tongs as a symbol of her new authority. In the East it was the younger son who became the hereditary tender of the domestic hearth. In Irish peasant life the importance of preserving the domestic fire as an unbroken link between past and present was a restatement of the same theme. The turf fire was tended continuously throughout the year as a symbol of family continuity, and is responsible for the expression, 'When the turf fire goes out the soul goes out of the people of the house.'

Altar of the Domestic Gods

Side by side with the domestic and public fire rites there developed a cult of sacred fire which provided a focal point for the religious instincts of the community. Indeed, the Latin word *focus*, from which our word is derived, conveys the meaning of fireplace, home and altar. The sacred fires of the Greeks were under the jurisdiction of Hestia, the fire goddess, protectress of household, family and city, who symbolized not only the home but the earth's centre and later even the earth itself. Among the Romans the cult of Vesta with its sacred fire-tenders, the Vestal Virgins, probably represented a survival of an earlier practice in which the daughters of a chieftain or king were allocated the task of keeping alight the tribal fires. For the Romans the hearth constituted the core of family life, the altar of the domestic gods, the Penates and of the divine Vesta.

Relics of hearth worship continued to persist in European folk customs until very late and took many curious forms. As an act of propitiation to the spirit of fire the Estonian bride flung a handful of coins into the hearth, while her Bohemian sister threw breadcrumbs instead; such a custom had no place in the British Isles, where the burning of bread was considered to be a crime against man and God. However, there is evidence in Britain of sacrifice to the hearth gods from the discovery of the bones of animals buried beneath the floors of old cottages, and coins and in some cases mummified animals and birds bricked up in chimney breasts.

In European folklore the fire spirit is generally represented by the grotesque bearded dwarf or house fairy of about the size of a young child, who often dwells by the hearth and makes his entries and exits by the chimney, and is known variously as Kobold, Nis, Brownie, or Billy. The Irish peasant housewife had as her last duty at night to 'smoor' the fire, that is to ensure that a glowing turf was left burning in the centre of the ashes 'or otherwise the fairies would be displeased'.

There is a distinct possibility that at some period in the past the worship of the fire spirit became fused with ancestor worship. This is suggested by the fact that the Russian household spirit is named Domovik, meaning 'Father of the Family'; when the Russian peasant removed to a new house he would take with him an ember from his old hearth which he would place on the new hearth saying 'Welcome, grandfather, to the new home'.

On special ceremonial occasions such as sacred anniversaries it was once the custom in Europe to light a new fire by friction. This special fire was known in the British Isles as 'need fire', and it was essential at this time for the fires in every household to be extinguished or the spark would not come. Once ignited, brands from the need fire were carried to each household, sometimes by runners, and the domestic fires were then rekindled from the 'new life-giving flame'. It was essential for the need fire to be carefully tended and never extinguished until the next kindling of need fire, if the luck of the household was to be preserved.

An analogous principle lies behind the custom of igniting the Yule-log at Christmas. This log, which was in reality a combustible fire-back, was borne into the house on Christmas Eve with a great deal of ceremony and sometimes with a girl enthroned upon it. It was essential that it should be kindled from a portion of last year's Yule-log which had been preserved for that particular purpose. The Yule kindling was a domestic symbol of family

The household hearth is the symbolic centre of the home and the soul of the family: at one time its fire was never permitted to die. The Yule-log was lit each year among great festivity from a fragment of the previous year's log, to ensure continuity and good fortune: 19th century engraving

Mary Evans Picture Library

regeneration and a time of fertility.

It was customary in the West of England to burn an ashen faggot, in an identical ceremony. In Ireland a carved tree stump sometimes called 'Cailleach Nollich' (The Old Woman of Christmas) was burned to ashes in the heart of a peat fire in the belief that it would 'keep off the Angel of Death' for the ensuing year.

At Burghead in Scotland a very ancient fire rite called Burning the Clavie is still observed at the New Year. A large tar or herring barrel is ignited with burning peat, and the pieces then distributed to the various houses to bring luck. Finally the Clavie becomes the nucleus of a huge bonfire of split casks on the site of a Roman altar called Doorie. The villagers scramble for portions of the burning barrel from which they kindle their own domestic New Year fires, while the embers are placed in the chimneys as a defence against witches.

In Lancashire the hearth fire was religiously kept burning throughout the night of New Year's Eve, but not a single ember or lighted candle would be passed to another householder, however desperate his need, as this would transfer the good luck from the house.

Fortune in the Fire

The original connection between the sun and its domestic counterpart is very possibly responsible for the well-known superstition that sunlight has the power to extinguish the domestic fire. There is a suggestion here of a reluctance on the part of the greater luminary to countenance the presumption of the lesser one. In this respect it is interesting to note that the blazing sun was the symbol selected by the founders of the Sun Fire Office. An imagined connection between the sun's rays and the glance of the human eye is no doubt responsible for the American superstition that anyone who looks into a fire while it is being kindled will hinder its combustion.

Inseparable from the cult of the hearth is the lore of the chimney which appears as a frequent motif in folk beliefs. The chimney sweep, if seen in his working clothes, brings the luck of the hearth spirits to the bride who meets him on her wedding day, but only if he is walking towards her; and a 'sweep's sixpence', a blackened silver coin brings good fortune to its finder. On the other hand, witches and devils, those implacable enemies of domesticity, were said to preside over smoky chimneys, by means of which they entered and left the home and from which vantage point they constantly sought to extinguish the fire in the hearth. It was for this reason that the poker was frequently placed against the top bars of the grate, ostensibly to make the fire draw, but in reality to form a cross and frustrate their designs. It was perhaps only poetic justice that the last case of witch-burning in the British Isles, that of Bridget Cleary at Clonmel, Ireland in 1894, was carried out by members of her family upon the domestic hearth.

Our ancestors used to see signs and portents, as they sat by the hearth, and innumerable were the inferences drawn as to the vicissitudes of fate from the behaviour of the fire. A hollow oblong cinder which spurted from the coals represented a coffin and was therefore an omen of death, while an oval cinder symbolized a cradle; most welcome of all, a round cinder indicated a money box. One might even receive advance information of a visitor, for if the fire suddenly blazed up or a flake of soot became suspended on the bars it meant that a stranger was about to enter one's life. Should the coals burn brightly after being poked, it was an indication from the oracle of the hearth that the absent lover, husband or wife, was in good health for the spark of life still burned. To dream of seeing a spark fall on another's arm or breast signified that a dead child would soon lie there.

Before the days of the barometer, fire served mankind as an infallible weather prophet, for in Wellsford's *Nature's Secrets* (1658), we learn that 'When our common fires do burn with a dull flame they presage foul weather. If the fire do make a buzzing noise it is a sign of tempests near at hand. If the ashes on the hearth do clodden together of themselves it is a sign of rain.' Ashes provided an ever potent oracle for these were in effect the seed of fire, a manifestation of the elemental spirits of the hearth. For a flame to spurt without warning from the ashes was a symbol of good fortune. In the Isle of Man the ashes were carefully examined for signs and if a shape like a footprint were discovered pointing towards the door, it was thought to signify a death in the family, but if pointing inwards a new arrival, a birth.

From camp fire to house fire, the domestic hearth has continued to provide a point of contact between man and man. In the course of ages rigid rituals grew up around this most sacred of the symbols. The master of the house sat at the right of the hearth of the home and the mistress on the left. The custom was universal among the Gaels of Ireland and the Highlands; the Mongols also allocated the right hand side to the men, and the left to their womenfolk.

The Vestal Virgins

Whatever happened to other people's fires, there was one which must always have been carefully tended in a little early community, and that was the domestic fire of the chief or king. So long as that burned, there was a supply of fire for the whole people, and there is some reason for saying that it was in a sense an embodiment of the communal life . . . So it is not to be wondered at that there was a public Vesta in Rome, and that her fire was tended by virgins, the successors of the king's daughters . . . There were six of these women in historical times, originally, it is said, four. They were chosen, while still little girls, from families of patrician origin, that is to say descended from original or early settlers of Rome, and they served for 30 years (originally it had been but five), during which time they must not marry. If one of them was found unchaste, she was not executed, for she was too holy to kill, but put into an underground chamber in the Field of Ill-Luck *(Campus sceleratus)*, and there left to die of hunger and lack of air, or be miraculously rescued, if Vesta chose thus to vindicate her innocence. It was an ordeal, not an execution. Her lover, if known, was beaten to death.

H. J. Rose, *Ancient Roman Religion*

Mansell Collection

In classical times the communal or sacred hearth, was kept continuously alight; Vesta, the Roman hearth goddess, was served by Vestal Virgins whose duty it was to tend the perpetual fire in her temple: 5th century statue from the Museo Communale, Rome

Heather

Popularly thought to bring good luck, white heather is considered to be particularly effective and is often sold by gypsies and worn as a charm: at one time heather was burnt to induce rainfall and the broomsticks on which witches rode to the sabbaths were traditionally made of heather or broom.

Chris Barker

Heaven

The final home of the righteous after death: the joy of the Christian heaven consists in being eternally close to God; in Valhalla, the paradise of the Norsemen, warriors engaged in tournaments during the day and feasted at night: the Egyptian dead were thought to live in eternal happiness with the sun god or to be ritually assimilated to the god Osiris: the Mohammedan paradise contained the beautiful black-eyed houris to serve the pleasures of the faithful. See PARADISE.

Bodleian Library

Tate Gallery/Layton-Sun

The Greek goddess Hecate, mistress of ghosts and spectres and of everything dark and uncanny, is shown in a painting by William Blake in company with nightmarish, eerie creatures

Heralded by wolves, she journeys through the night with a band of uncanny followers, terrifying the unwary traveller; because of her association with the underworld, the goddess Hecate's aid is often enlisted by sorcerers, black magicians and necromancers

HECATE

A MINOR GODDESS of the Greek pantheon, Hecate was not a true Olympian. But she was the most important representative of the uncanny, a powerful figure in the kind of popular and private belief that is ignored in Homer. Indeed she is not mentioned in the *Iliad* or in the *Odyssey* or in fragments of heroic epic. If her name is Greek, it is the feminine form of the epithet *hekatos*, which as applied to Apollo means 'far shooting' but might in her case mean merely 'distant' or 'remote'. She has connections with Apollo's sister Artemis, also an archer, and she may share with Artemis a common origin in Asia Minor.

The earliest full account of her is in Hesiod's *Theogony* (c 8th century). Most scholars consider this an interpolation, though an early one, interesting in its own right. Most recently it has been argued by M. L. West that it is on the contrary a personal confession of faith by Hesiod, who was less interested in his other deities. In this passage Hecate is said to be daughter of the Titan Perses by Asteria who was sister of Leto, the mother of Apollo and Artemis. 'Zeus honoured Hecate above all and gave her glorious gifts, to have a portion in the earth and in the unharvested sea'; she thus has a portion or a footing in earth, in heaven and in the sea, and is invoked by any who make sacrifices to the gods. Those whose prayers she receives favourably achieve great honour and wealth. Though she had been among the Titans defeated by the gods, Zeus did her no violence and she continued to be honoured on Olympus. She sits by kings in judgement, helps speakers in the

assembly and gives victory and glory in war to those whom she favours. She is a helper in games, in sea-fishing and in cattle-breeding. She is appointed by Zeus to be nurse of the young.

In strong contrast to this dignified, universal and wholly anthropomorphic goddess stands the figure presented in nearly all the other references. Her special connection with the underworld appears in the Homeric Hymn to Demeter where she alone, except for the sun god Helios, hears the cry of Persephone as she is carried off by Pluto to Hades. By the end of the 5th century BC literature presents her in her usual character, which must have been much older in common belief, as the mistress of ghosts and spectres and of everything dark and uncanny. She appears sometimes with the title of *antaia* (she who meets), since travellers or walkers by night might meet her in lonely places as a terrifying apparition. In this aspect she was also called *einodia* (the goddess who appears on the way), once apparently a name for a goddess in her own right, and *triodos* or *trioditis* (the goddess of parting ways). She is in many scattered references connected with the ghosts of suicides or of those who had died untimely, who could join her host of uncanny followers at night. Her favourite animal was the dog, which was often sacrificed to her. She was even reckoned the mother of the monster Scylla with her many dogs' heads; she could send up ghosts from Hades, drive people mad, and cause epilepsy by her assaults. She is associated with sorcery and black magic, and in the *Argonautica* of Apollonius, the sorceress Medea shows her beloved Jason how to win Hecate's aid by a sacrifice.

Medea instructs Jason to bathe in the river and then, alone and clothed in dusky raiment, to dig a round pit. In the pit he is to kill a ewe and sacrifice it whole on a heap of faggots and to propitiate Hecate he must pour on honey from a goblet. He must then retreat from the pyre and not turn back when he hears the sound of feet or the baying of hounds, or he will spoil the rites and may even not return to his comrades. Jason carries out these instructions, wearing a robe given to him by his former lover, queen Hypsipyle of Lemnos. He pours mixed libations on the victim as it lies on the faggots, calling on Hecate under the name of Brimo (Mighty One) to be his helper in the ordeal which faces him, of yoking the fire-breathing bulls of Aeetes. When he steps back, Hecate, who has heard the invocation in her cave, comes to receive the offering. Round her head is a garland of oak leaves, among which are fearful snakes. There is a gleam of innumerable torches and shrill howling from her infernal hounds. The ground trembles at her tread and the river nymphs cry shrill.

Queen of the Ghosts

Hence we find a grim and fantastic Hekate who is queen of the ghosts, and therefore of all manner of magic, the blacker the better. In this capacity she is also goddess of the cross-roads . . . for cross-roads are great centres of ghostly and magical activity in wellnigh all countries. It is apparently for this reason that her statues are often triple, so that she may look down all three at once of the roads which meet at the point where she stands. At this uncanny spot, then, offerings of food for Hekate were commonly placed . . . and here the goddess was believed on occasion to appear, especially by night, in terrible aspect . . .

H. J. Rose *A Handbook of Greek Mythology*

She Who Makes Dogs Shiver

In Theocritus Simaetha weaves a love spell to win back her faithless lover, in the course of which she prays to Hecate of the underworld 'before whom even the dogs stand shivering as she comes over the graves of the dead and the dark blood' to make her drugs potent. In Lycophron's *Alexandra* Cassandra prophesies that Hecuba will be turned to a dog, will be stoned to death and will then become one of the hounds of Hecate, terrifying with her baying all who will not worship the image of the goddess. Ulysses, who will lead the stoning, will later on his wanderings be forced to build a cenotaph to Hecuba in Sicily, fearing the anger of the three-necked goddess.

So too in Virgil's *Aeneid* Aeneas is instructed by the Sibyl to invoke Hecate for her necessary help if he is to be admitted to the underworld, and Hecate's coming is attended by the howling of wolves and the trembling of the ground. In Ovid's *Metamorphoses* Hecate is one of the powers invoked by Medea to help in rejuvenating Aeson by magical rites. In Lucian's *Philopseudes* (*The Liar*) Hecate is raised to bring with her Chrysis, who had been the lover of Glaucias. But she disappears at dawn with Chrysis and all her infernal spectres. From these passages it is clear that Hecate's help was needed in many forms of magic, particularly of black magic, including necromancy.

Hecate seems to have originated in Caria, in the south-west corner of Asia Minor, where Greek personal names based on hers, such as Hecataeus, were most common. The boundary between her and Artemis is not always easy to define, particularly because both have some connection with the moon, but in Homer and in the more accepted mythology the two goddesses have different places in the divine genealogies. The explanation of this affinity between dark and infernal Hecate and bright Artemis who may not stay in the presence of death, is no doubt historical. Artemis herself in some cults was savage and in Ephesus had many breasts, like a mother goddess. The Greek imagination, so productive of myths like later philosophical thought, was increasingly given to clear distinctions and definitions. Natural forces and phenomena which even for us have contrasted aspects, were personified in ancient myth in deities that had often contradictory natures. In Greek myth the contradictory aspects of a great Nature goddess were developed into distinct goddesses, rather as white light is broken into component coloured rays by the spectroscope. One of these aspects was Hecate, who retained primitive characteristics. Thus in the Orphic *Argonautica* of the 3rd century AD she still appears with three heads, on the left that of a maned horse, in the middle that of a savage snake, on the right that of a frenzied bitch.

Statues or other representations of her with three heads or three bodies joined back to back, facing three ways, appear only late in Greek art, but must represent an ancient conception. The threefold aspect of Hecate, however represented, is clearly an antique notion, recalling that of savage idols as depicted in other mythologies and traditions of art.

Helen of Troy

According to Greek mythology, the most beautiful woman in the world: daughter of the mortal Leda and the god Zeus in the guise of a swan: her beauty attracted all the princes of Greece and to avoid strife her foster-father made the suitors vow to defend the chosen husband against anyone who resented his good fortune; she married Menelaus, and on her abduction by Paris, the former suitors stood by their oaths and besieged Troy: Helen reappears in some of the Faust stories of the Middle Ages.

HELL

Det Kongelige Bibliotek Copenhagen

The cold darkness of the grave, reflected in early ideas of the underworld, turned in Judaism and Christianity into a hell of eternal fiery torment for the wicked

'Oh, you knotty, rugged, proud piece of flesh! You stony, rocky, flinty hard-heart, what wilt thou do when thou art roaring amongst the damned?' Bellowed by a hellfire preacher of the 17th century, the question frightened a ten-year-old boy named John Rogers half out of his wits, and he went to sleep every night with his hands in an anxiously prayerful attitude in case the demons came to fetch him. Ola Elizabeth Winslow quotes the story in her life of John Bunyan, who as a boy was so haunted by nightmares of hell that he wished he was a devil himself, on the principle that it would be better to be a torturer than one of the tortured. Another famous preacher of the day, Vavasor Powell, traced his conversion to a bout of toothache which caused him to wonder, if the temporary pain of toothache was so hard to bear, what would the eternal agony of hell be like?

At this period the established doctrine of hell was beginning to be challenged, though rarely in public because those who disbelieved in it considered the threat of hell the supreme deterrent to atheism, immorality and crime. But hell kept its hold on most Christians, though with steadily weakening force in succeeding generations, into this century. In 1916 James Joyce published, in *A Portrait of the Artist as a Young Man*, one of the most powerful descriptions of the horrors of hell ever written, based on what he had been taught at a Roman Catholic school in Ireland. And on the Protestant front, fundamentalist hellfire preaching is by no means extinct.

Hell retained its long grip on the Christian mind because its existence is stated in the New Testament, because of its supposed value as a deterrent, and because of the common human observation that in this life the wicked flourish while the good suffer, with the consequent demand for rewards and punishments to right the balance in the life to come. In descriptions of hell, much ingenuity was frequently devoted to making the punishment fit the crime.

In addition, though to explain belief in hell solely in terms of sado-masochism is to oversimplify, there is no mistaking the lip-licking avidity with which its torments were relished. For hundreds of years the 'dooms', horribly imaginative pictures of the tortures to come, were carved and painted on the walls of churches to warn unbelievers and sinners. The *Apocalypse of Peter* of the early 2nd century, which ranked second in popularity among Christians only to the beauties and terrors of the Book of Revelation itself, described the 'place of punishment':

> And some were there hanging by their tongues; and these were they that blasphemed the way of righteousness, and under them was laid fire flaming and tormenting them . . . And there were also others, women hanged by their hair above that mire which boiled up; and these were they that adorned themselves for adultery . . . And in another place were gravelstones sharper than swords or any spit, heated with fire, and men and women clad in filthy rags rolled upon them in torment. And these were they that were rich and trusted in their riches . . . Beside them shall be girls clad in darkness for a garment, and they shall be sore chastised and their flesh shall be torn in pieces. These are they that kept not their virginity until they were given in marriage . . .

The medieval picture of hell, a gigantic concentration camp of appalling fiery heat far underground, with its entrances through volcanoes like Etna (or through the gaping mouth of Leviathan, the terrible dragon of the Old Testament) hit on something very close to geological truth, as Jacquetta Hawkes has pointed out (in *A Land*) for beneath the earth's surface the rock substance is molten with heat. 'Only a score of miles below the surface on which we walk the crust is molten . . . we do in fact maintain our fragile lives on a wafer balanced between a hellish morass and unlimited space.' It also hit on a psychological truth, for accounts of hell closely resemble some visionary experiences, and some states of mind induced by drugs or by mental illness.

Prehistoric burials suggest that the earliest human beings were believers in some sort of existence after death; and the custom of burying the remains in the earth suggests the belief that the dead lived on underground (see CULT OF THE DEAD; EARTH). Depictions of headless figures, if they represent the spirits of people who had been beheaded in life, may contain the glimmerings of the idea that what happened to a man while he was alive would affect him after he was dead. The headless figures attacked by huge black vultures at Catal Hüyük may even, at a guess, represent the wicked being punished after death (see HEADLESS SPIRITS).

Land of No Return

The earliest people who definitely believed in a judgement after death, with rewards and punishments, were the Egyptians (see BOOK OF THE DEAD; EGYPT) but they concentrated on the rewards and said little of the punishments. There is one reference to the wicked being tortured in pits of fire but generally the Egyptians thought that those who were weighed and found wanting after death would be eternally annihilated.

In Mesopotamian literature there is no punishment after death, and no reward either. All the dead, good and bad, rich and poor, powerful and humble alike, go to the 'land of no return', the house of darkness which was like a gigantic communal grave, surrounded by walls and barred by gates, where the ghosts flew about like spectral birds and gnawed miserably on clay and dust.

Homer's underworld is also not a hell but a place of dreary darkness to which all, or nearly all, the dead go. This was the house of Hades, the god of death, whose name means 'the unseen' and who ruled what the *Iliad* calls 'the hateful Chambers of Decay that fill the gods themselves with horror.' Some vengeful lines of Sappho emphasize the hopeless condition of the dead:

> When you are dead you will lie in your grave, forgotten for ever,
> Because you despise the flowers of the Muse; in Hades – as here –
> Dimly your shadow will flit with the rest, unnoticed, obscure.

The Greeks feared death so intensely that they did not like to name it, saying as many people still do that someone who died had 'departed'. In the *Odyssey* the ghost of Achilles says that he would sooner be alive

The Stench of Hell

They lie in exterior darkness. For remember, the fire of hell gives forth no light. At the command of God, the fire of the Babylonian furnace lost its heat but not its light, so, at the command of God, the fire of hell, while retaining the intensity of its heat, burns eternally in darkness. It is a never ending storm of darkness, dark flames and dark smoke of burning brimstone, amid which the bodies are heaped one upon another without even a glimpse of air. Of all the plagues with which the land of the Pharaohs was smitten, one plague alone, that of darkness, was called horrible. What name, then, shall we give to the darkness of hell which is to last not for three days alone but for all eternity?

The horror of this strait and dark prison is increased by its awful stench. All the filth of the world, all the offal and scum of the world, we are told, shall run there as to a vast reeking sewer when the terrible conflagration of the last day has purged the world. The brimstone, too, which burns there in such prodigious quantity fills all hell with its intolerable stench; and the bodies of the damned themselves exhale such a pestilential odour that, as Saint Bonaventure says, one of them alone would suffice to infect the whole world. The very air of this world, that pure element, becomes foul and unbreathable when it has been long enclosed. Consider then what must be the foulness of the air of hell. Imagine some foul and putrid corpse that has lain rotting and decomposing in the grave, a jelly-like mass of liquid corruption. Imagine such a corpse a prey to flames, devoured by the fire of burning brimstone and giving off dense choking fumes of nauseous loathsome decomposition. And then imagine this sickening stench, multiplied a millionfold and a millionfold again from the millions upon millions of fetid carcasses massed together in the reeking darkness, a huge and rotting human fungus. Imagine all this, and you will have some idea of the horror of the stench of hell.

James Joyce *A Portrait of the Artist as a Young Man*

as the servant of a landless peasant than be king of all the dead.

Hades became a name for the underworld itself, and later a name for the Christian hell. It was either far in the west, where the sun died in the evening, or deep underground with the entrances at many places on the earth's surface. These entrances may be the legacy of an earlier belief that the dead stayed in the places where they were buried. The Styx, a stream in Arcadia, which disappeared underground, became the principal river of the underworld, across which the dead had to be ferried by Charon (see CHARON). What later became the most famous entrance of all ('easy is the descent to Avernus') was at the lake of Avernus, not far from Naples in Italy, which Virgil described in the *Aeneid*. 'There was a deep and rugged cave, stupendous and yawning wide, protected by a lake of black water and the glooming forest . . . poisonous the breath which streamed up from those black jaws and rose to the vault of sky.'

An intense love of, and concentration on, this life naturally tends to reduce the next world to a faint shadow-play. But although the Homeric picture of the dead remained extremely influential, there were other views. Some of the more important dead lived on their tombs, where they were venerated and consulted by mortals. Belief in different treatment for different people in the next world was stimulated by the mystery religions which promised a blessed afterlife to those who were initiated (see ELEUSIS; MYSTERY RELIGIONS; ORPHEUS).

Punishment in the underworld appears even in Homer. In the *Iliad* the Furies 'make men pay for perjury in the world below' and the deposed god Cronus and his allies (see CRONUS) are imprisoned in 'the bottomless pit' of Tartarus, 'where the deepest of all caverns yawns below the world, where the Iron Gates are, and the Brazen Theshold, as far below Hades as the earth is under heaven.' In the *Odyssey* (book 11) a fortunate few go to a happy afterlife in Elysium and a few who have personally insulted Zeus are tormented in Tartarus.

In Plato's time (4th century BC) there were stories about punishment after death. A character in the *Republic* mentions them and says that when a man grows old he cannot help uneasily wondering whether the stories are true. In the last book of the *Republic* the 'myth of Er' describes how the dead are judged and how the unjust are sent down under the earth. For every wrong they have done they will suffer tenfold and after a journey of 1000 years under the earth they will be purged. Er saw tyrants and other peculiarly evil men at the mouth of a cavern. When any of them who had not been sufficiently purged tried to emerge from it, the mouth 'gave a roar' and 'wild men of fiery aspect' seized them, flayed them with scourges and took them away to plunge them into Tartarus.

The descent of Aeneas to the underworld influenced the medieval picture of hell, and especially Dante's *Inferno* (see DANTE) which was so graphic that simple-minded people assumed that the poet had really visited hell. In the *Aeneid* (book 6) Aeneas sees the great battlements of Tartarus and the burning Phlegethon. The entrance is guarded by a Fury and from inside comes the sound of savage flogging, the clanking of iron chains and a terrible lamentation.

The Valley of Fire

The picture of life after death as a powerless obscurity in darkness, found in the literature of Homeric Greece, Mesopotamia and early Palestine, conflicts with the archeological evidence from the same areas that the dead were buried with grave goods, implying an active life in the otherworld. Evidently the literature does not adequately reflect the full range of beliefs, and in Palestine it seems clear that the adherents of Yahweh as the one supreme god deliberately discouraged belief in an active life after death, to prevent people from trafficking with any other supernatural beings.

In the older passages in the Old Testament all the dead, good and bad alike, go to Sheol where they live in dust and darkness (like the Mesopotamian dead) and where they know nothing, so that it is no use trying to consult them. Sheol is a great pit or a walled city, 'the land of forgetfulness', 'the land of silence'. Maggots are the bed beneath you there and worms are your covering. No god rules in Sheol and the dead are forgotten by Yahweh. But as the story of the witch of Endor (I Samuel, chapter 28) shows, they were not entirely forgotten by men and some tried to enlist their help.

Jewish hatred of foreign oppressors, with the desire to see them punished in the next world if not in this, was partly responsible for a change of attitude. So was the old problem of the unfairness of life, vividly expressed in the book of Job (chapter 21): 'One dies in full prosperity, being wholly at ease and secure, his body full of fat and the marrow of his bones moist. Another dies in bitterness of soul, never having tasted of good. They lie down alike in the dust, and the worms cover them.'

Considerations of this kind led to a growing belief that the lot of all men after death was not the same. In the 2nd century BC the Jewish leader Judas Maccabaeus made an offering of money at Jerusalem on behalf of some of his dead soldiers, on whose bodies have been found objects consecrated to idols. This was 'a reconciliation for the dead that they might be delivered from sin' and implies the belief that they would otherwise suffer in the afterworld (2 Maccabees, chapter 12). The book of Daniel predicts the 'many of those who sleep in the dust of the earth shall awake, some to everlasting life, and some to shame and everlasting contempt.'

There is no mention of physical torture here, but there is in another work of the same period, *1 Enoch*, which includes a vision of 'a place chaotic and horrible' with 'seven stars of the heaven bound together in it, like great mountains and burning with fire.' It was here that the angels who lusted after human women (see DEVIL) would be punished, an early trace of the belief that the fallen angels, or demons, live in hell. Then Enoch sees Sheol itself, a mountain in the west with hollow compartments in it where the souls of the dead are to wait for the day of judgement. One is for the righteous and one is for the sinners, who wait there 'in great pain' (chapters 17–22). In a later passage there is 'a deep valley with burning fire. And they brought the kings and the mighty, and began to cast them into the deep valley' (chapter 54).

This valley of fire was Gehenna where, it came to be believed, the wicked would writhe tormented in the flames. Some of the Jewish rabbis said that the punishment there would not last more than 12 months. Some said that the righteous would go straight to paradise, the wicked to eternal pain in Gehenna, and the in-between would suffer for a year in Gehenna and then be annihilated. Gehenna has three entrances, one in

For hundreds of years sadistically imaginative visions of the horrors of hell served as a warning to sinners and unbelievers. Great ingenuity was exercised in giving each sin an appropriate punishment. In the *Damnation of Lovers* by the 16th century German artist Mathias Grünewald *(right)*, the flesh in whose joys the sinners have luxuriated is aged and withered and is pierced by noxious beasts, representing the poison and corruption of lust

Giraudon

the wilderness, one in the sea, and one in Jerusalem. It was next door to paradise, with the implication that part of the misery of the condemned was to see the bliss they had lost, an idea that passed into Christian theology.

The development of a Jewish hell may have been influenced by Persian Zoroastrianism in which the 'followers of the lie' are punished after death. Hell is in the far north, deep down beneath the earth, dark and stinking, the home of demons and lies, a place of stench, filth, pain and misery. There the damned soul must remain until Ahriman himself is destroyed (see AHRIMAN), by which time it will at last have come to understand reality and the wickedness of Ahriman, and will be ready for its release.

A holy man named Artay Viraf saw hell in a vision induced by hashish. It was like the inside of a grave. He experienced 'cold and an icy wind, dryness and stench', and he saw a narrow and fearful pit, thick with darkness. Noxious beasts tore and worried at the damned. And this hell had also the horror of the grave's solitariness, for each soul thought 'I am alone'.

Fire and Brimstone

From Gehenna the Christian hell developed. Jesus said that when the Son of Man comes in glory, he will separate the good from the wicked like sheep from goats. The goats will be driven away 'into eternal punishment' in the fire prepared for the Devil and his angels (Matthew, chapter 25).

The association of fire with hell, sometimes taken as a symbol of purging, seems to have originated in the idea of burning up rubbish. Gehenna took its name from the valley of Hinnom where the rubbish of Jerusalem was burned. There is the same notion in Malachi (4.1): 'all evildoers will be stubble; the day that comes shall burn them up.' Again in Matthew (chapter 13) Jesus tells a parable about the burning of weeds and explains it with: 'The Son of Man will send his angels, and they will gather out of his kingdom all causes of sin and all evildoers, and throw them into the furnace of fire; there men will weep and gnash their teeth.'

Many of St Paul's references to the fate of the wicked suggest that they will be annihilated, though in Romans (chapter 2) dealing with 'the day of wrath', he says that

Sinners descended to the bottomless pit through the gaping maw of a monster *Left* The mouth of hell, from the 12th century Winchester Psalter *Above* After his crucifixion, Christ was believed to have descended into hell, broken open the gates and released the dead from the chains binding them: *The Harrowing of Hell* by a 15th century painter of the School of Savoy

for every human being who does evil 'there will be tribulation and distress'. In the book of Revelation (chapter 21) 'the lake that burns with fire and brimstone, which is the second death' is the final destination of the cowardly, the faithless, the polluted, murderers, fornicators, sorcerers, idolaters and all liars. The brimstone is sulphur ('burning stone') and the reference is to Isaiah (30.33): 'For a burning place has long been prepared . . . the breath of the Lord, like a stream of brimstone, kindles it.'

Only one passage in the New Testament (Matthew 25.46) says that the punishment in hell will last for all eternity and in the 3rd century the great theologian Origen suggested that the torment in hell would not last for ever, that the wicked and even the Devil himself would eventually be redeemed and evil totally annihilated, and that the 'fire' of hell might not be a real fire but the pangs of guilty conscience. Even he was worried that by questioning the eternity of punishment he might weaken the chief deterrent to immorality, but in fact his views were rejected by the majority of Christians and condemned as heretical by the church.

The Harrowing of Hell

In the medieval hell the damned suffered 'the pain of loss' the agony of being cut off from God, and 'the pain of sense' the physical tortures inflicted by demons. Most of the dead did not go to hell, or to heaven, but to purgatory where they were purified of sin and could be helped by the prayers of the faithful on earth, but in most descriptions of purgatory the agonies are almost as frightful as those of hell itself. Many modern Christians have returned to the outlook of Origen, seeing hell as a place where the guilty are purged of evil and unbelief, but not by physical torture. Others reject hell entirely, believing that God's infinite mercy will extend to everyone, or alternatively, that the irredeemable are not tormented and tortured but are simply annihilated.

Christ was crucified on the first Good Friday and, as the Apostles' Creed says, 'descended into hell'. He rose from the dead on Easter Sunday and the story grew up that in the interval he had 'harrowed' or despoiled hell by conquering Death and releasing his captives. The souls of the dead were in the darkness of the underworld when at midnight there appeared a great light, like the light of the sun, and a voice like thunder demanded, 'Lift up your gates, ye princes, and be lifted up, ye everlasting gates, and the King of Glory shall come in.' Death skulking in his lair asked, 'Who is this King of Glory?' and was answered, 'The Lord strong and mighty in battle' (Psalm 24). The gates and bars were broken down, the dead were loosed from their chains, the King of Glory entered in the form of a man and all the dark places of Hades were filled with light. Christ trampled on Death and seized Satan, ordering him to be tied hand and foot. He raised up Adam and the patriarchs and prophets, the righteous men of old from Abraham to John the Baptist, and led them to paradise.

Outside Christianity there are many

Bodleian Library Filmstrip

Hell, final resting place of the damned, is the demonic counterpart of Heaven, home of the righteous. The Devil rules in the nether regions, while Christ sits enthroned on high: medieval manuscript illustration

stories of descents to the underworld, including those of Odysseus, Aeneas and the hero of the *Kalevala* (see FINLAND). In some of the stories the hero harrows hell by stealing one of its treasures, which may carry immortality with it (as Arthur stole the otherworld cauldron – see ARTHUR), by releasing a victim from Death or by alleviating the pains of the tormented. The Greek hero Theseus went to the underworld but was held fast there until he was released by Hercules, who also fetched away Cerberus, the many-headed dog who guarded the gate of Hades. This Labour of Hercules may really have been a quest for immortality and a conquest of death. According to the *Iliad*, Hercules shot Hades with an arrow at the gate of the underworld and left him in agony. Xenophon's *Persian Expedition* says that the Greeks anchored near the Acherusian peninsula on the south coast of the Black Sea, 'where Heracles is said to have descended into the lower world to fetch Cerberus, and where they still show evidence of his descent for a quarter of a mile down into the earth.'

There was a Sumerian myth that the goddess Inanna went to the underworld to bring back her lover Dumuzi (Tammuz). She turned into a corpse but was revived by the messengers of the god Enki and came back to earth. It is likely that in the original tale she succeeded in rescuing Dumuzi. In Hindu mythology the god Krishna went to the kingdom of the dead and obtained the release of a favourite pupil. In Buddhism a Bodhisattva often enters a hell and releases the sufferers there from their pains. The Chinese Buddhist goddess Kwan Yin visited a hell in a trance and it was turned into a paradise.

King of the Dead

The word 'hell' itself comes from an Anglo-Saxon root meaning 'to cover' or 'to conceal' with an obvious application to a grave. The Scandinavian goddess Hel ruled those who died of old age or disease (those who fell in battle went to a happy afterlife in Valhalla). She was fierce and pitiless and her underworld of Nifelheim was freezing cold, like the lowest circle of hell in Dante's *Inferno*.

The Islamic picture of hell resembles the Jewish and Christian ones, by which it was influenced. In India the idea of punishment of the wicked after death is very old but in both Buddhism and Hinduism the numerous hells are not places of eternal torture but stages in the chain of birth, death and rebirth which the self must undergo unless it can escape from the cycle altogether. At each death the self goes to a paradise or a hell corresponding to the way it has behaved in each life.

The Tibetan Book of the Dead says that after death each person goes before Yama, the King of the Dead, who holds up to him a mirror in which his deeds are reflected. 'The mirror in which Yama seems to read your past is your own memory, and also his judgement is your own. It is you yourself who pronounce your own judgement, which in its turn determines your next rebirth.' The terrible god and the frightening monsters which are seen are 'an illusion'. But popular belief in India, China and Japan imagines tortures and torturers as real, as vindictive and as ingenious as any in the western traditions. The history of hell is a descent into the infernal pit of the human mind.

HELSTON FURRY DANCE

THE HABIT of giving vent to communal rapture, protest or solidarity by means of some form of procession has grown out of that most ancient of folk rituals, the processional dance. In the ancient borough of Helston, in Cornwall, the beginning of May is made the occasion for a civic festival which may be older than the borough itself. At the centre of this annual celebration is a procession, or succession of processions, known locally as the Furry Dance, which now takes place on 8 May. Throughout the day the town band play the 'Processional' tune, one of the oldest folk tunes in Europe and head each column of dancers as it wends its way along one of the prescribed routes. In their gala dress, bedecked with sprigs of lily of the valley, the files of men and women move forward for the first phrase of the melody and then turn inwards to 'swing corners' and 'swing partners' on the second phrase, before heading forward once again.

This street perambulation is broken occasionally by a 'mark time' and, while the band continue to play in position, the column melts into single file and the dancers enter a nearby house, threading through the rooms and lobbies, knocking on doors or ringing the bell and touching the wall as they go, before re-emerging into the street. The bearing and style of the dancers conveys both the gaiety and dignity of the ritual, calculated to express both a

Homer Sykes

The Helston Furry Dance performed in May, celebrates the conquest of good over the forces of evil and darkness, and the welcoming of the new spring; it embodies an amalgam of myths and lore *Above* The parade figure of a dragon relates to a local legend of the defeat of a dragon *Right* Children garbed in white perform a traditional Flora's Day dance in the streets

deliverance from the powers of darkness and a welcome to the miracle of spring.

The occasion is known as Flora's Day. It is in essence one of the great May Day folk customs of antiquity and was formerly celebrated on 1 May; in recent times it has been held on 8 May, the feast day of Helston's patron, St Michael. This shift of date and the move from pagan tradition to a Christian feast possibly indicates its adoption by the Church, as happened with so many other seasonal folk festivals. For the Furry Dance on Flora's Day in Helston is analogous to the many forms of spring perambulations still surviving in Europe and other parts of the world.

A significant aspect of the Day which has only recently been revived and admitted into the 'proceedings' is the second dance called the *Hal an Tow*, possibly a corruption of 'heel and toe'. A party of youths set out in the early morning light to gather fresh branches of sycamore in the woods, then foregather outside the town by St John's Bridge to enter singing the Hal an Tow song – another ancient folk melody. While they sing, the young men wave the sycamore branches and perambulate along their prescribed route. The words and tune of this Hal an Tow song with its chorus 'For Summer is acome O and Winter is agone O', find an echo in other May Day revels, such as the Padstow Procession of Mayers.

There is little doubt that the greenery collected by the Hal an Tow contingent was once available for all the Furry Dances. They may be all regarded as 'Mayers' performing their office of purging away from the streets and houses the darkness and evil of winter and bringing in the life and light of summer in a prehistoric ritual of 'spring-cleaning'.

Helston no longer has a central dramatic character to portray death and revival in its annual ritual, as at Padstow, but instead there are local legends of dragons and of the Devil himself, that beast of darkness, being driven off by St Michael, which account for the procession of rejoicing Mayers. Comparison with May Day folk festivals in other countries conjures up a picture of centuries of dancing life-givers dispensing their magical spells as they perambulate the bounds of the community in the spring of each year.

The divine smith of Greek mythology, Hephaestus was cast into the sea at birth by his mother Hera, who wished to rid herself of such an ugly child. Found and reared by two nereids, his fame as a craftsman quickly reached the ears of the gods and he was summoned to assume his rightful place in heaven: the return of Hephaestus to Olympus, from the Clitias krater

The word 'volcano' comes from Vulcan, the Latin name of the lame smith god Hephaestus; his role as god of elemental fire and patron of metal-workers caused him to be feared and respected by mankind

HEPHAESTUS

THE UNCOUTH GOD of smiths, who was himself a smith, Hephaestus (or Vulcan as he was known to the Romans) was originally a god of fire, in the aspect of flaming gas rising from the earth in certain places. It was only later that he came to be associated with volcanoes in Sicily and Italy. His name was used poetically as a synonym for fire from Homer down to poets who were familiar with Nature-philosophy. He was not in origin a Greek god, his name having no etymology in Greek, but his cult spread from Lycia in southwestern Anatolia to various parts of Greece; there are frequent references to him in Greek literature.

In the *Iliad* he is the son of Hera, who threw him into the sea in shame at having borne such a weakly infant. He was rescued by the nymphs Thetis and Eurynome and remained with them in secret for nine years, making jewels and ornaments, until his talents were discovered by the gods and he was given a smithy on Olympus. Reconciled with his mother, he once tried to protect her from the anger of Zeus, but for this interference Zeus seized him by the foot and hurled him out of heaven. He fell for a whole day before finally striking the island of Lemnos, crushing his legs in the fall: this is only one explanation for his lameness. Hephaestus built the palaces on Olympus and Zeus's golden throne, but is particularly famous as a maker of armour: of Diomedes' breastplate, of the sceptre and also the aegis, or shield held by Zeus, which when shaken produced storms and thunder, and of the arms made for Achilles to replace the armour lost with the slaying of Patroclus. Among his other wonders are mechanical handmaidens of gold, possessed of thought and speech, who support him as he moves, and who assist him at his work. Sometimes he acts as cup-bearer at the feasts of the gods, who laugh at him as he bustles round clumsily on his lame legs. In his elemental character he is called by Hera to drive back the river Xanthus because the river god is furious at his stream being blocked with corpses slain by Achilles, and threatens to overwhelm him. Hephaestus spreads fire everywhere, burning the corpses and the vegetation by the river, and then begins to dry up the river until Xanthus entreats Hera to stop him.

A Net to Ensnare Lovers

In the *Odyssey* Hephaestus, with Athene, is called 'skilled in making gold flow round silver'. He is the maker of a silver mixing bowl with gold edges given by Phaedimus of Sidon to Menelaus; also of the gold and silver hounds that guard the palace of Alcinous, immortal and ageless animals. In a celebrated mythological scene, the lay of Demodocus, minstrel of Alcinous, Hephaestus takes revenge for the faithlessness of Aphrodite, here his wife. While he is away in his favourite island of Lemnos, Aphrodite is joined by her lover, Ares, but at dawn they are trapped together by an invisible gossamer-light metal net which Hephaestus had forged for the purpose. While they are ensnared, the gods are called in to laugh at them.

Hesiod in the *Theogony* states clearly that Hera bore Hephaestus without any union with Zeus because she had a bitter quarrel with him at the time. This could be the reason why Hephaestus was born lame: Hera on her own was not breeding in the normal manner. Hephaestus's wife here is Aglaia, the youngest of the Graces. Hesiod relates how Zeus, who wishes to punish men for having acquired fire through Prometheus, orders Hephaestus to create the beautiful Pandora to be a plague to them. She was fashioned of clay in the form of a beautiful maiden, like the immortal goddesses, and other deities gave her other qualities, including a deceitful nature and a shameless mind.

In the Homeric Hymns it is said that Hephaestus, like Athene, taught men on earth to make glorious works. They had formerly lived in caves in the mountains like beasts, but now, having learned crafts through him, they live in safety and comfort all their lives in their own houses. Much the same claims are made by Aeschylus for Prometheus as teacher and benefactor.

Among the lyric poets, Simonides (c 556–468 BC) said that Hephaestus made for Minos of Crete the bronze giant Talos who guarded his coasts. Pindar, following others, mentions Hephaestus as maker of the bronze axe which split open the head of Zeus for the birth of Athene. In his *Pythian Odes* the expression 'fountains of Hephaestus' is used for the volcanic fires of Etna which are said to be the breath of the monster Typhon. In Aeschylus's *Prometheus Bound* Hephaestus appears with the giants who drag Prometheus to the place where he is to be chained on the crag. They remind him that he has orders from Zeus to fasten Prometheus to the rock in bonds of adamant, impenetrably hard, with wedges driven through his body. He is most unwilling to do so and greatly pities Prometheus, a god of his own kin. The sound of his cosmic hammering disturbs the nymphs of Ocean in their caves so that they rise to lament with him.

In Sophocles's *Philoctetes* Hephaestus's fire on Lemnos is mentioned, and in his *Daedalus* the making of Talos by the smith god is prominent. In his satyr-play *Cedalion* it seems that the scene was Hephaestus's workshop on Lemnos, and that the god gave to the blinded giant Orion, his servant, the dwarf Cedalion, as a guide to keep him walking eastward until the rising sun struck his face and restored his sight. In Plato's *Protagoras* Hephaestus works with Athene in a heavenly workshop from which Prometheus steals fire.

In Callimachus's *Hymn to Artemis* the goddess as an infant is taken by her mother Leto to visit Hephaestus on the island of Lipara, where he has his forge and the Cyclopes Arges and Steropes are working under his direction on a golden horse-trough for Poseidon. In Apollonius's *Argonautica* the returning Argonauts pass the smith god's forge in the Aedian islands. Iris swiftly brings word to him from Hera that he shall keep his fires quiet until the Argo has passed. Later Hephaestus drops his hammer to watch, as other deities do, the passage of the Argo through the Wandering Rocks.

God of Erupting Fire

The presence of Hephaestus in the volcanoes of Italy and Sicily becomes even more marked from the time of Aeschylus and Pindar onward, in the 6th century BC. By their day the Greek colonists who settled on these coasts, some of whom came from the eastern Aegean, had transferred to their new homeland the scene of Hephaestus's

In his heavenly smithy, Hephaestus, known to the Romans as Vulcan, forged many fabulous and magical objects, from a shield for Zeus which caused storms and thunder, to golden handmaidens who could both walk and talk: *Vulcan* by Rubens

Prado Museum

activities, as of other fiery manifestations. The god's first western home was apparently Lipara (now Vulcano) also called Hiera Hephaistos, the sacred isle of Hephaestus. He came only later to Etna, where the earlier established Cyclopes became his workmen.

The original seat of Hephaestus was in Lycia where the Lycian Olympus, as described by Maximus of Tyre 'gives forth a flame from its summit, not like the fire of Etna, but peaceful and moderate. This fire is regarded by the Lycians as the temple of the god and his visible images.' The hot gas, as modern travellers have found, was in fact a small escape of burning petroleum. In the Aegean there was such an escape of gas on Hephaestus's mountain Mosychlus on Lemnos, his first foothold. The sudden spread of fire which Hephaestus was able to make is most like that of igniting gas over a wide area. The vents of gas were commonly regarded as the chimneys of his underground forge.

In Asia Minor Hephaestus had 50 shrines but far fewer in other Greek lands, though his cult as a craftsman god was well known in Athens. The Greeks who arrived in the Sicilian and Italian volcanic belt attributed its much more devastating fires to the same god, no doubt fusing him with earlier native gods of fire and volcanic action.

The history of the Roman Volcanus (Vulcan) forms a rather puzzling epilogue to that of the Greek Hephaestus. In classical Latin literature Vulcan makes his appearance very much in the style of Hephaestus. The name Volcanus is of doubtful origin and meaning, but there appears to be an Etruscan deity Velchanos; scholars are inclined to think that Volcanus or Velchanos is an eastern deity, perhaps brought by the Etruscans, and perhaps having a common origin with Hephaestus. Volcanus is a god of fire, but usually of a more menacing or destructive fire than thatt of the original Hephaestus in his normal manifestations. Thus his name is the source of our word 'volcano'.

Michael Holford

The goddess Hera was possibly an ancient Minoan mother goddess who, with the increasing supremacy of the Greek Zeus, was linked with him in sacred marriage; they were honoured as patrons of lawful marriage despite their own marital irregularities: section from the Parthenon, from the British Museum

Although the queen of heaven was traditionally the patron of lawful marriage, she was frequently unfaithful to the philandering Zeus and their union produced no lawful offspring; as special protectress of females, there is a hint of her origin as a mother goddess

HERA

'LADY' OR 'MISTRESS' was possibly the original meaning of the name Hera, which indicates a line of descent from the old Aegean mother goddess. She became a goddess of marriage and, especially in this capacity, she was worshipped in most areas of Greece in historical antiquity. Yet there can be no doubt that her principal cult centre was the Argive territory in the north-east of the Peloponnese. Tracing the origins of the cult back into Mycenean times, it becomes clearer that the Argolid peninsula was her real domain and that other genuine early centres are indeed rare. In fact these can be reduced to three: Euboea, the large island which lies adjacent to the coasts of Attica, Boeotia and the southern part of Thessaly, whose inhabitants are called Abantes by Homer; Samos, another principal island of the Aegean, off the coast of Ionia; and Olympia, a small plain in Elis, in the west Peloponnese, where there was the sacred grave of Zeus and where the Olympic games were celebrated.

In Euboea, the myth and ritual of Hera were almost identical with the Argive. The name Euboea means the island 'of fair oxen'. Legend said that the Abantes settled there under the leadership of Abas, an early Argive king.

Her temple on Samos was very large and her cult there of considerable antiquity. Tradition said that her image came there from Argos, though the Samians disputed this and believed she had been born under the willow tree in the sanctuary. The confusion in the tradition may support the view that Hera had supplanted an even earlier cult of a goddess but again there is memory of a connection with the Argive.

Hera's temple at Olympia was the oldest and this would imply an association with the tradition that the games were founded by the Argive Hercules – the hero 'called after Hera' (see HERCULES).

Here the chief centre of her cult was the Argive Heraion, 'Our Lady's Temple', built on the lower slopes of a mountain called Euboea and said to have been so called after Hera's nurse. As the principal goddess of the Argive plain, where Agamemnon's royal stronghold of Mycene was situated, she gave wholehearted support to the cause of the Achaeans in the Trojan War. 'The three towns I love best,' says Hera in the *Iliad*, 'are Argos, Sparta and Mycene.'

The Spartan cult of Argive Hera was brought from Argos. Hera's most northerly shrine was at Pharygai, on the Gulf of Malis, in south Thessaly, and this was founded by settlers from the Argolid. She had cult centres in most of the cities of Boeotia, but the oldest appears to have been on Mt Cythaeron at the top of the Corinthian Gulf. Here she had cult centres too at Corinth, Heraia and Sicyon, which are included in Agamemnon's domains as they are defined in the *Iliad*. It seems from excavation that her cult at Heraia was actually derived from the Argive Heraion and, according to tradition, her cults at Sicyon derived from the same centre.

It has been plausibly argued by G. Thomson (in his *Prehistoric Aegean*) that, if the focus of Hera's worship on the mainland was the Argive Heraion, it follows almost of necessity that she must have reached the Argive plain from overseas. Her oldest image in the Heraion, made of pear wood, had been brought there from Tiryns, which was only a short distance away from Nauplia, with its fine natural harbour, which could well have been a main port of call for Minoan traders. At Nauplia there was a cult of Hera Parthenos, 'the Maiden'. At Hermione there was another good

harbour. Here also there was a cult of Hera Parthenos; and there was a tradition that Zeus and Hera landed at Hermione when they arrived in Greece from Crete.

Uneasy Marriage

Not the least contradictory aspect of the relationship of Zeus and Hera, traditional Olympian patrons of lawful marriage, is its lack of lawful offspring. Zeus is father of many children, but Hera is not their mother. Hera has fewer children, but Zeus is not their father. According to Hesiod, Hebe, Ares and Ilithyia at least were the children of Zeus and Hera, but it is doubtful if this claim can be substantiated. Ilithyia, however, could well have been Hera's daughter. For the birthplace was a cave near Cnossus in Crete.

The evidence from inscriptions and from coins in historical times certainly confirms the continuing importance of Hera in Cretan religious belief. Her early Cretan associations are decisive for the view that she was originally a manifestation of the Minoan mother goddess; and they equally support the inference that, despite, or rather perhaps because of, the supremacy of Argive Hera on the mainland, the worship of Hera had been carried over from Crete into Greece.

Hence the uneasy marriage relationship of Zeus and Hera has been plausibly explained as the result of the intrusion of a Greek patriarchal deity, whose original partner may have been called Dione, into the province of the Minoan mother goddess, whose partner, supplanted by Zeus, had once been the hero 'called after Hera', that is to say, no other than Hercules himself. Certainly the Greek evidence for a sacred marriage of Zeus and Hera, though most of it is comparatively late, in part does indicate that Zeus seems to have had an older partner who was not Hera, or Hera an older partner who was not Zeus.

It should be explained that the sacred marriage *(hieros gamos)* is part of the Oriental ritual pattern underlying the concept of such relationships as the Great Mother – Attis, Ishtar-Tammuz, Aphrodite-Adonis (see CYBELE). In our oldest literary source, Homer, there was a sacred marriage in Crete between Iasion and Demeter in a thrice-ploughed field, that is to say, in a field prepared for sowing. The sacred marriage was involved with the religious conception of a vegetation cycle, of the death and rebirth of crops (see DYING GOD; FERTILITY).

There are definite mythological grounds for the view, maintained by Sir James Frazer and A. B. Cook, that, at Cnossus in Crete there had once existed a ritual marriage of sun god and moon goddess in bovine form. In later cult the ritual became a sacred marriage of Zeus and Hera, which reputedly occurred near the river Theren, where a sanctuary was built and yearly sacrifices were offered with traditional wedding rites. Similarly, at Gortyna, also in Crete, the goddess Europa, possessed by Zeus in the form of a bull, became identified with Hera.

Here mention should be made of the view that Hera, described by Homer on many occasions with the traditional epithet *boopis* ('cow-eyed', 'cow-faced') was originally a cow goddess. Her priestess at Argos was Io, who was ravished by Zeus when she had been transformed by him into a cow. The myth of Io also reflects a sacred marriage, the bride being the priestess of Hera, the bridegroom the priest of Zeus disguised as a bull. The ox-herd Argos who watched over Io was *Panoptes* ('all-seeing') – an epithet of Zeus and the sun; and Argos wore a bull's hide.

Mother of the Minotaur

According to the famous myth, Pasiphae ('She who shines on all', that is, the moon), wife of King Minos, conceived a passion for a bull, sent in answer to the prayers of Minos. Instead of sacrificing this bull, as he had promised, Minos sent it away among his herds and sacrificed another one. His punishment for this piece of deception was the unnatural passion of his wife. Daedalus made for Pasiphae a hollow wooden cow on wheels, sewed it up in the hide of a cow which he had skinned, and put it in the meadow where the bull grazed. Inside this image he put Pasiphae, and the bull coupled with it. In due course Pasiphae gave birth to Asterios ('Starry One'), who was called the Minotaur ('Minos bull'). The Minotaur had the head of a bull, but the rest of him was human. In obedience to certain oracles, Minos then shut him up under guard in the labyrinth, which had also been made by Daedalus. The labyrinth, in the Greek tradition, was a building whose intricate windings led astray those who sought to escape from it.

The cow and bull became such integral factors in the life of the communities that they figure in mythology as guides in the founding of cities by those who followed the advice of the sun god. The story of Cadmus, who, in obedience to the Delphic oracle, followed a cow until it lay down on the site of Thebes, is familiar. Since the sun was conceived as a bull, it seems likely that the labyrinth at Cnossus was an actual arena of solar pattern designed for the performance of a mimetic dance, in which a dancer may have masqueraded as a bull and represented the movement of the sun. The labyrinth supposedly built by Daedalus was recognized in antiquity as an imitation of the Egyptian labyrinth, which, in turn, was generally believed to be sacred to the sun. The dances in the labyrinth were connected in antiquity with the Roman Game of Troy, performed by bands of armed youths on horseback.

Juno was identified by the Romans with Greek Hera, and she was worshipped as the queen of heaven, protectress over females, as was Jupiter over males. She was supposed to watch over women from birth to death and the month of June which was named for her, was supposed to be most favourable for marrying.

The Etruscan Herkle and Unial and the Roman Hercules and Juno were in the same sort of mythological relationship as Greek Hercules and Hera. At Roman weddings the bride's girdle was consecrated to Juno and its knot, untied by the bridegroom on the marriage couch, was called the 'Herculean knot', which, as Cook concluded, indicates that, when the cult of Hercules spread to Italy, at a very early date, the acknowledged partner of Hercules was Hera.

Dill water, which has been given to babies for centuries to cure them of wind, was once thought equally effective for driving out witches; the real or imaginary properties of herbs led to their use for both medical and magical purposes

HERBS

IN MAGIC, as in medicine, herbs have been used since ancient times. As early as the 5th century BC the Greek doctor Hippocrates listed some 400 herbs in common use and Dioscorides (1st century AD) wrote a herbal using 600 plants, which became the basis of many later works. It was in the Dark Ages, however, that ignorance and superstition combined to pile magical attributes on to plants, sometimes with minimal reason, and to preserve the mystery of herbalism the 'herbwife' took to elaborate rituals, such as the need to gather plants at night, preferably by moonlight. Only in this way, unseen by the sun, was the hurt to the plant and the theft from Mother Earth or the Earth Mother to be cancelled.

One of the most popular herbals ever written was that of Nicolas Culpeper (1616–1654). In his explanation of healing herbs, astrology and the Doctrine of Signatures came together. The latter is the notion that Nature has indicated the uses of plants by their appearance (see DISEASE). Once in a while there was real value in such a plant, and many herbs found their way into medical books and pharmacopoeias.

The wood anemone has an antique mythology through its more colourful Mediterranean relations. The scarlet anemone is often connected with the death of Adonis, representing his spilling blood after he was mortally wounded by a boar; and red flowers were strewn at the ritual celebrating his death and rebirth dating back to perhaps 3000 BC. Greek legends suggest that Anemos, the Wind, sent his plants – the anemones – as heralds of spring.

Angelica, a stately plant related to cow parsley, is widespread in Europe and was highly valued for medicinal purposes; indeed the root was still listed recently in some European pharmacopoeias. In Eastern Europe there are records of ancient customs

in which the plant was carried into towns to the accompaniment of chanting before being offered for sale, which suggests a ritual origin. More recently angelica became associated with the festival of the Annunciation, whence came its Latin specific name – *Angelica archangelica*. It was sometimes linked with St Michael the Archangel and was even called 'The Root of the Holy Ghost'. As such it protected against witchcraft, evil spirits, spells and enchantment.

The King of Plants

The main mythological interest in the group of plants named after Asclepios, the founder of medicine, is in that of the soma plant, an Indian native which was personified as Soma, one of the Vedic gods. The ninth book of the *Rig-Veda* is devoted to his praise, and here the soma plant is described as the king of the plants. The juice was prepared at a sacred ceremony, by crushing the plant between two millstones, and it was supposed to be a drink of the gods, conferring health, long life and immortality. Under its influence Indra created the universe. In later writings soma became identified with the moon.

Sweet basil is believed by some to have derived its name from the basilisk, the fabulous dragon-like creature that was deadly to anyone who looked at it. This may well be based on an old belief that basil attracted or even begot scorpions. Parkinson (1629) wrote that 'being gently handed it gave a pleasant smell, but being hardly wrung and bruised would breed scorpions'. Culpeper quotes the experience of 'Hilarius, a French physician, who affirms upon his own knowledge, that an acquaintance of his, by common smelling of it (basil), had a scorpion breed in his brain'. Culpeper goes on to assure us that basil, connected with scorpions as it is, will draw the poison out of an insect sting or snake-bite. In India, it was sacred to Vishnu and Krishna, and was regarded as a protective plant – even more than that, as a benificent spirit. A basil leaf on the body of a dead Hindu was his assurance of reaching Paradise. Bush basil, a smaller species, was used in Italy and Moldavia as a love token and in Crete represented 'love washed with tears'. To the ancient Greeks, however, it symbolized hate and misfortune.

Betony is supposedly the original herb of magic and medicine discovered by Chiron the Centaur, used by Asclepios and mentioned by Dioscorides. In a 10th century collection of herbal remedies it cures the elf-sickness. In Pechey's *Compleat Herbal* (1694) nothing seems capable of withstanding it: 'It discusses, attenuates, opens and cleanses'. Culpeper wrote that it was 'a very precious herb . . . most fitting to be kept in a man's house both in syrup, conserve, oil, ointment and plaster.' It was even believed that wounded animals sought it out, and there is a legend that snakes placed in a ring of betony would kill each other. Alas, betony has no real medicinal virtues; as Geoffrey Grigson says, this plant, once believed to be 'a pharmacopoeia in one herb', is really a fraud. Not surprisingly it was believed magically powerful as well, generally useful against evil spirits. It was used in amulets, planted in churchyards, and equally sown around houses.

The pink-flowered bistort gets its name, meaning 'twice-twisted', from allusion to the twisted root, which somewhat resembles a snake. Hence it has the English names snakeweed or adderwort and, according to the principles of sympathetic magic, was regarded as a cure for snake-bite and other poisons. Among its other names is Easter ledger, a corruption of *logia*, derived from *Aristolochia*, the name of a group of plants. Now Aristolochias are called birthworts because they encourage conception, help childbirth and keep away witches; and bistort also according to a 16th century herbal 'hath virtue . . . to cause to retain and conceive'. The Easter ledger pudding, of which bistort was an ingredient, is still eaten in the Lake District around Easter, to help conception.

The blackberry, which must have been one of the earliest foods of man and his ancestors, was a holy plant. In the Highlands they called it the 'blessed bramble', and evil spirits could be kept off by a wreath of bramble, rowan and ivy, while

The use of plants for medicinal purposes is as old as civilization, and the first known written record of curative plants was a Sumerian herbal of 2200 BC: illustrations from a 12th century copy of the herbal of Apuleius, showing the digging up of herbs and the mixing of medicines

brambles – or alternatively osiers – would be plaited around graves to prevent the dead from rising as ghosts. Legend has it that Christ used bramble to drive the money-changers from the temple and to spur his donkey on his ride to Jerusalem. Various ailments could be cured if the sufferer passed under an archway of bramble rooted at each end.

In autumn, blackberries ferment or mildew. This normally occurs in early October, and in former times Michaelmas Day, now 29 September, fell on 10 October. It was on Michaelmas that the Devil was believed to spit or urinate on the blackberries, because when he was first cast out of heaven by St Michael, he landed on a bramble bush, and consequently curses the plant anew on the anniversary of his fall; for this reason it was not recommendable to eat the fruit after that time. The Irish, however, went on picking blackberries until Hallowe'en, when the puck, or hobgoblin was thought to defile the fruits.

The yellow broom and its relatives were used herbally and according to John Gerard, author of the famous *Herball* published in 1597, a decoction of broom had tonic properties for the liver and kidneys; he also writes of 'That worthy Prince of famous memory Henry the eighth King of England' who 'was wont to drink the distilled water of broom flowers against surfeits, and diseases thereof arising.' Culpeper thought it effective also against dropsy, gout, ague, black jaundice, sciatica and pains in the joints. The custom of wearing a broom sprig in the cap perhaps arose from broom's ancient reputation as a plant both useful to witches and against them, as a magic sleep inducer and as a power in love.

Trinity College Cambridge

Herb of Beaten Wives

White bryony, which is unrelated to black bryony, is remarkable because it makes enormous roots which, with a little assistance from the witch or herbalist, could pass for mandrake, always a very expensive commodity, which was supposed to make women fertile (see MANDRAKE). Bryony mandrakes in the form of children, sometimes with grass seed sown on the 'head' to provide hair, were to be seen in English herb shops 150 years ago. It is a poisonous plant once used as a purge and recommended for a number of complaints. In Lincolnshire this plant was called womandrake and mandrake was reserved for the black bryony; this also has large roots but they are tubers, the plant being related to the yams. It seems possible that it was once known to enchanters and witches as a useful ingredient of potions; in France it was known, among other names, as the 'herb of beaten wives', because, as Gerard tells us, the berries and roots 'do also very quickly waste and consume away black and blue marks that come of bruises and beatings.'

The starry pink-flowered centaury is another herb reputed to have been discovered by Chiron the Centaur who used it, to quote Gerard, to open 'the stoppings of the liver, gall and spleen', and to cure fever; the family was once named *Chironia*. Centaury was reckoned a powerful herb against wicked spirits and witches, while a translation of a French work on magic, the *Little Albert*, tells us that 'if it be joined with the blood of a female lapwing, or black plover, and put with oil in a lamp, all that compass it about shall believe themselves to be witches, so that one shall believe of another that his head is in heaven and his feet on earth; and if the aforesaid thing be put in the fire when the stars shine it shall appear that the stars run one against the other and fight.' In Ireland, centaury was a sacred and good luck herb, while in the Isle of Man it was called *Keym Chreest*, 'Steps of Christ' because it had supposedly grown on the path to Calvary.

Because the bright blue flowers of the chicory open only when the sun shines, the plant was believed by sympathetic magic to be a cure for failing sight and sore eyes. If gathered according to a special ritual it would make a person invisible and also open locked doors and chests. The ritual was to cut the plant with a gold blade at noon and midnight on St James's Day, 25 July. If a word was spoken during the cutting, the gatherer would surely die.

The Latin name of the cinquefoil is *Potentilla*, meaning 'small and powerful'. The herbal and magical species is the creeping cinquefoil or five leaf grass. It is still used to allay fever and as an astringent. Its five-lobed leaves have given it names meaning 'five-fingered' since ancient times and in Gaelic it becomes 'five fingers of Mary'. It

Trinity College, Cambridge

was hung in doorways to keep out evil spirits, and can be seen occasionally in carvings on cathedrals. Less pleasant is its association with witches, whose standard ointment, according to Bacon, contained cinquefoil among its ingredients.

The Devil's-bit scabious, when established, has a tap-root that looks as if it had been bitten off. Gerard explains that 'old fantastic charms report that the devil did bite it for envy because it is a herb that have so many good virtues and is so beneficial to mankind'. Apart from this legend, the plant was widely renowned for dealing with anything from the plague and other diseases to curing snake-bite. In Cornwall, where it was called the 'Devil's button', to pick the plant invited a nocturnal visit from the Devil.

Dill, an annual of the cow parsley family which shares its reputation as an anti-witch plant, is a culinary herb which has an ancient renown and was known to Dioscorides. It was a popular general-purpose drug in the Middle Ages; its name is believed to be derived from old Norse *dilla*, to lull, from its soothing properties, and indeed it is still given to fretful babies to this day. It was also popular both for making spells and for keeping off witchcraft.

The brilliance of the blue flower of eyebright, coupled with the stripes and speckles on the petals, led to its comparison with a bloodshot eye. Thus it became, according to the Doctrine of Signatures, a cure for sore or failing eyes. In *Paradise Lost* we find the Archangel Michael, after Adam's fall, anointing his eyes with a mixture of eyebright and rue with three drops from the Well of Life.

A herb with genuine wind-expelling properties, fennel was one of the herbs used in medieval times to keep away evil spirits, especially on Midsummer's Eve when, in company with the herbs like St John 's Wort, it was hung over doorways. Keyholes blocked with fennel seed prevented the entry of ghosts. It was cultivated by the Romans, as in modern Italy, as a flavouring and (a related species) for the succulent roots; it was known to Pliny as a cure for many complaints and especially for improving sight. He records that serpents were known to eat it or rub themselves against it, on casting their skins, in order to 'sharpen their sight'.

Trinity College, Cambridge

Facing page above **A doctor brings a sick man peonies, to cure him of epilepsy** ***Left*** **The soothing properties of the aromatic rosemary were considered helpful for sore or inflamed eyes: two illustrations from a 14th century herbal. Each herb had its own particular virtue and legendary lore** ***Below*** **from left to right: anemones, which according to a Greek myth sprang from the blood of Adonis after he was mortally wounded by a boar, were used to cure colds, gout and leprosy; betony, named after Beronice, a woman healed by Christ, was believed to cure almost all ills, both of the body and of the soul, and it was a powerful protection against witchcraft and evil spirits; blackberry brambles were legendarily used by Christ to drive out the money-changers from the temple, and children were at one time passed through a bramble arch as a cure for rickets; bryony, used by witches in spells was taken as a purgative and is still considered a potent aphrodisiac; chicory was credited with great magical virtues, including the power of invisibility and of opening locked chests and subterannean caverns for those in search of treasure; eyebright, which was rubbed on Adam's eyes to permit him to see the future mortality of man, is still used by modern herbalists for eye complaints; Solomon's seal, which has the mark of a magic pentacle on its roots, was a useful anodyne for the after-effects of a brawl, while its flowers were used in love potions; in popular tradition viper's bugloss was believed to help lumbago and increase milk production in nursing mothers**

It was further believed to convey longevity and to improve both strength and courage.

The Latin name for the foxglove is *Digitalis*, formed from a word meaning fingers. The foxglove is so called in English because the fox was given the 'gloves' by the fairies so that he could invade the chicken run without fear of capture. It has always been associated with fairies and elves: if the 'little people' put on these 'gloves' they could do almost whatever they liked. It was considered dangerous to cut foxglove, but once you had done so it was a defence against the little people; in Wales the plant's juice was rubbed into the floor in the form of a cross for this purpose. It could in addition be used to kill a changeling child, either by giving it 'tea' made from the leaves (which would be poisonous) or by rubbing the changeling with the foxglove juice. In Scotland it was considered unlucky to have foxglove in the house, or on board ship. Some of the other names of the foxglove, such as 'deadman's fingers', 'thimbles' or 'bells', probably come from the belief that the souls of the dead inhabit the flowers. Variously used as medicine, the plant became well known for its powers as a purge and to make one vomit, which led to its serious investigation by Dr William Withering. He noted its effect on the heart, and digitalis came to play an important part in treating heart disease.

The insignificant 'herb Robert' has been known by over a hundred local names in Britain alone, an indication of its importance in country folklore. The plant is associated with Robin Goodfellow and his counterparts in several parts of Europe, the red, hairy appearance of this plant being thought to resemble the red-faced and bushy-haired goblin. Just as it was unlucky to offend Robin, calamities could follow the destruction or picking of herb Robert; its Cumberland name was 'death-come-quickly'. And just as Robin Goodfellow's plant was herb Robert, so his bird was the robin, similarly unlucky to kill; the plant is also known as 'poor Robin', 'little Robin', and so on in many countries.

St John's Girdle

Mugwort, a pungent relation of wormwood, has long been considered to have both medicinal and magical properties: it

Su Gooders/Linnean Society

was known as *Mater Herbarum*, mother of herbs, and throughout Europe as St John's Herb. Some believed that John the Baptist wore a girdle of mugwort during his sojourn in the wilderness. Like St John's Wort it was picked on St John's Eve, purified in the magic bonfires, and placed over doors to keep away evil. Such use was certainly still active in the Isle of Man during the last century. Besides this powerful protective magic, mugwort – very much a wayside herb – was reputed to prevent weariness in a traveller who carried it with him.

The tubers of many species of orchid and its relations are still gathered in many parts of Europe and in Asia for the preparation of *salep*, a nutritive flour-like substance usually taken mixed with water, and once carried on long sea voyages as an emergency ration. The name of this family comes from the Greek word orchis meaning testicle, for these plants have a pair of tubers, one for this year's growth, one for next. The resulting symbolism and magic are doubtless plain: Dioscorides recorded how women in Thessaly would make a salep with goat's milk, using the full, new tuber if they wanted to excite desire, the emptying old one to discourage. It was also believed that the sex of children, could be controlled by similar means, male children being born if the man had eaten of large new tubers, girls if the women had eaten small old tubers. All over Europe orchids became aphrodisiacs; one kind was at one time known as *Satyrion*, after the lecherous satyrs. The early purple orchid is the 'long purples' in Ophelia's garland – 'to which the liberal shepherds give a grosser name, but which cold maids do dead men's fingers call'.

A relation of the orchid, the 'autumn lady's tresses', was called sweet cullion by Gerard (cullion, a word used by Chaucer, means testicle) and he remarks how 'The full and sappy roots of Lady traces eaten or boiled in milk and drunk, provoke venery, nourish and strengthen the body, and be good for such as we are fallen into a consumption of fever hectic'. There we have the whole gamut of the herbal use of orchids – and all quite unjustified.

Parsley was not regarded by the ancients as a herb; it had connections both noble and funereal. Thus it was made into wreaths at games – dried parsley at the Isthmian games, fresh at the Nemean. The Greeks also strewed it on graves, and the phrase 'to be in need of parsley' was used of people near death.

There is a legend that, because it often takes so long to germinate, it goes nine times to the Devil before appearing above ground. In some places one had to sow it on Good Friday to counteract the Devil's influence, and it was unlucky to sow it at any other time. In some quarters it was thought unlucky to grow parsley at all, and there is still a widespread belief that parsley should never be transplanted. Other sayings suggest, according to locality, that parsley grows best where the wife 'wears the trousers', or for an honest man, or alternatively, only for the wicked. To plant parsley might, if you were a young woman in Lincolnshire, result in your bearing a child

Trinity College Cambridge

In addition to their curative powers, many herbs had magical properties and were used by witches and exorcists: casting out devils, from the herbal of Apuleius

soon; but if you did get into this plight before marriage you might rescue yourself from it by eating parsley three times daily for three weeks.

The reason we use parsley as a garnish is its long reputation as an antidote to poison, so that to place it on a dish of food was a token of trust. In William Turner's *New Herball* of 1597 there is the delightful suggestion that 'the seed taken beforehand helpeth men that have weak brains to bear drink better.'

The peony's medicinal properties were known to the ancients and it is named after Paeon, who is recorded as a physician, even to the gods. It was, in ancient times, regarded as of divine origin; it would keep off evil spirits and storms, and protect in particular shepherds and their flocks, farmers and their crops. It was believed to be dangerous to dig up, like the mandrake, and similar precautions had to be taken when extracting it. It was further thought necessary to make sure that no woodpecker was near or the gatherer would lose sight.

Sage for Long Life

The plantain weed has been used for a great many ailments, and herbalists still recommend it. In Northern Ireland the plantain is still known as *Slan-lus*, 'healing herb', and in Scotland as 'healing blade'. In earlier days the way plantain stood up to being trodden on suggested its use for wounds and bruises and Dioscorides recommended it for this. According to the Anglo-Saxon *Charm of the Nine Herbs*, plantain, here referred to as 'waybread', was reputed not only to resist crushing by chariot wheels and the trampling of bulls, but to withstand 'the venom that flies through the air, and the loathed things that through the land rove.'

The handsome, aromatic rosemary has a long list of supposed medicinal virtues and also many holy and magical attributes. It was supposed to be effective against the dreaded plague; it was believed, in various differing recipes, to remove the effects of poison, to assuage gout, to make hair grow, to cure giddiness, to improve sanity, reduce anxiety, and avoid nightmares. It was until recently common for mourners to drop sprigs of rosemary on a coffin to show that they would not forget the dead person – 'There's rosemary for remembrance,' as Ophelia said. It was also used at weddings as a symbol of fidelity; it was woven into bridal wreaths, and sprigs of the plant would be dipped into the wine to ensure the happiness of the married pair. From there it is a small step to marriage divination; there were several ways for a young woman to foretell her future husband by using rosemary. Rosemary is said to grow well for the righteous; it is also said only to flourish where the wife rules the household. Among its other attributes was the affording of protection against all kinds of spirits, physical injury, thunder and lightning; it could also help special enterprises to succeed and renew youth.

Sage, now used mainly as a culinary herb in Britain is still used medicinally in the United States, mainly as a gargle. It has an ancient reputation for healing and was thought to confer long life. There is a tradition that as the plant flourishes or dies, so the owner's business will succeed or fail.

Solomon's seal is said to bear a symbol on its roots, the two interwoven triangles which make up the Star of David, the magic pentacle which scares off evil spirits. However, though Gerard at one point suggests that this symbol may be imagined occasionally upon the fleshy roots, elsewhere he states that the name comes from the plant's supposed capacities to seal and heal up 'green wounds'. He leads on to explain how Solomon's seal 'taketh away in one night, or two at the most, any bruise, black or blue spots gotten by falls or women's wilfulness, stumbling upon their hasty husbands' fists or such like.' In the Middle Ages the plant was also called seal of St John or of the Virgin. Besides its supposed value against bruises it was also believed to knit bones together, and was given for consumption, bleeding of the lungs and other haemorrhages. The white flowers were used in love potions.

Tarragon is also known as 'little dragon', and is reputed, like the pungent mugworts and wormwoods, to have sprung up where the serpent passed on its banishment from Eden. Dragons were both protective and terror-inspiring, and a dragon plant was protective, in particular with the ability to cure snake-bite.

Viper's bugloss derives its English name simply enough from the resemblance of its seeds to a viper's head; this was made by Dioscorides who therefore believed it both a cure and preventative of snake-bite. Yarrow is noted for its wound-healing powers and is also called bloodwort, soldier's woundwort and knight's milfoil. It also had magic power and was anciently regarded as a herb dedicated to the Devil.

HERCULES

Possessed of more than human qualities, Hercules became one of the most important gods during the last years of paganism

Michael Holford

Though Hercules was fathered by Zeus and eventually became a god himself, his courage, physical strength and occasional bursts of fury made him a peculiarly human hero; a quality for which he was chosen to be the special representative of the gods in their dealings with mankind

THE GREATEST HERO of Greek legend, Hercules (in Greek, Herakles) was the only one to become an Olympian god. His legend is complex and widespread, being associated in Greece with Boeotia and the Peloponnese, while some of his exploits are set in eastern and western regions remote from Greece and imperfectly known. He was adopted by the Romans because of his doings in Italy.

Hercules is one of the great wanderers, like Perseus, the Argonauts and Odysseus. His legend, like theirs, contains material of great vitality which comes from folktale and supernatural myth. Only with these more than human qualities could he have ended as not only a god but as one of the most important gods during the last years of paganism. His deeds, even though he sometimes leads an army, are individual feats of strength. Attended usually by his squire, Iolaus, he faces perils and monsters too great for human valour.

In this he is like the Mesopotamian Gilgamesh or the English Beowulf, whose greatest deeds were not done on human battlefields. Such primeval figures are but little modified by the conventional traditions of a heroic age. Yet his most famous deeds, the Labours, were not done by him as a free agent but by order of the unworthy ruler Eurystheus, whom the gods decreed that he should serve. In his own character Hercules was noble as well as valiant but was subject to fits of fury or madness, in which he committed terrible crimes.

His name is puzzling but evidently significant. There is no reason to disbelieve those ancient writers who interpreted it as 'glory of Hera'; yet Hera (the Latin Juno) queen of heaven, appears as his relentless enemy during all his earthly life. Some light on its original sense may perhaps be got from the myth of Gilgamesh, who was persecuted all his life by the great Nature goddess and queen of heaven, Ishtar (see GILGAMESH). She had first desired Gilgamesh for her lover, but he refused and thus was punished. It appears that some Babylonian and Sumerian kings were regarded as official consorts of Ishtar or Inanna. Does the name Hercules descend from a remote time when some Greek kings were regarded as Hera's consorts?

During the 19th century some scholars argued that Hercules, who was certainly in classical times a favourite of the Dorian Greeks, was originally a Dorian hero only, and was no more than an intruder in legends inherited from the Mycenean Greeks whom the Dorian invaders overthrew. But although Dorian chiefs claimed later to be descendants of the exiled children of Hercules who departed northwards, there is not sufficient reason to tear Hercules loose from his pre-Dorian setting, which represents the Mycenean age of history.

The gods decreed that Hercules should perform 12 Labours imposed upon him by Eurystheus, the ruler of Mycene *Previous page* Hercules's ninth Labour was to fetch the girdle of Hippolyta, the queen of the Amazons, for Eurystheus's daughter; scene on a clay shield, c 700 BC, showing Hercules battling with the Amazons *Above* Commanded to bring back alive the wild boar of Mt Erymenthus, Hercules captured it in deep snow; according to one version of the legend, the sight of the beest so terrified Eurystheus that he hid himself in a wine jar: Greek vase in the British Museum *Right* In order to accomplish his first Labour and bring Eurystheus the skin of the invulnerable Nemean lion, Hercules stunned the animal with his club and then strangled it: Greek vase in the British Museum

Early poetry dealing with Hercules has come down to us in fragments or in allusions only. A complete cycle of myth concerning him may be assumed with certainty, but it is not likely that this was well ordered or consistent. Nor can it be shown that there was a complete cycle of formed poetry about him. However, the distinction between legend and its literary embodiment is hard to draw for ages when literature itself was oral. Our material of all dates does make possible a general outline of Hercules's life through his Labours until his death or deification. But there is no definite relation between his stray exploits and the well-known Labours which he carved out for Eurystheus. The clearest among continuous narratives are those of the late compilers

Michael Holford

of mythology, Diodorus (1st century AD) in a legendary part of his *Universal History* and Apollodorus (c 1st century BC) as represented in the summary *Library of Mythology* attributed to him.

Hercules was born at Thebes to Alcmena, wife of Amphitryon who had come from Tiryns to live at Thebes. His father was Zeus who took the form of Amphitryon, then absent, for a supernaturally prolonged embrace. At the same birth Alcmena bore Hercules's twin brother Iphicles, the son of Amphitryon. Hera in her jealousy sent two serpents to kill the infants as they lay cradled in a shield but Hercules strangled them. As he grew up, he was taught chariot-driving, wrestling and the use of weapons, particularly bowmanship; Linus, brother of Orpheus, also taught him music. When Linus struck his pupil once to discipline him, Hercules in a fit of temper killed him with the lyre. He was sent to guard cattle, and while on watch killed the lion of Cythaeron whose skin he afterwards wore with the head as helmet or hood.

When Erginus king of Orchomenus in Boeotia sent envoys to demand tribute from the Thebans, Hercules outraged the envoys, so that Erginus made war. Hercules killed him and compelled the Minyan inhabitants of Orchomenus to pay double the tribute that they had exacted from the Thebans. As a prize for valour, Creon, king of Thebes, gave him his daughter Megara to be his wife. By her he had three sons but later, driven mad by Hera, he killed them. When he recovered his reason, he went into exile and inquired of the Delphic oracle where he should live. He was ordered to settle in Tiryns, his family's original home, and to serve its overlord Eurystheus of Mycene, for 12 years; in some accounts his servitude was decreed even before his birth. He was to perform the Labours that would be imposed on him, but after these had been accomplished he would be made immortal.

The number and details of the Labours vary in different sources, but eventually a canon of 12 was recognized. The earliest evidence for this total appears in the reliefs on the pediments of the temple of Zeus at Olympia carved during the 5th century BC. Firstly, Hercules was to bring back the skin of the invulnerable lion of Nemea in Argolis; on finding that his arrows had no effect, he stunned the lion with his club and then choked it. Next he had to kill the Hydra, the many-headed water-snake that infested the marshy plain of Lerna in Argolis; it had nine heads, the middle one being immortal, while the rest grew again whenever Hercules smashed them with his club, until Iolaus burned their roots. Hercules cut off and buried the immortal head, but this feat was not accepted by Eurystheus because of Iolaus's help.

Thirdly, Hercules was set the task of catching the Cerynean hind and bringing it from the border of Arcadia to Mycene. It had golden horns and was sacred to Artemis (Diana). After hunting it for a year, Hercules shot it as it was crossing the River Ladon, and was eventually allowed by Apollo and Artemis to carry it alive to Eurystheus. His next Labour was to bring back alive the boar of Mt Erymanthus in Arcadia. On his way Hercules was entertained by centaurs but eventually fell out with them, so that he had to disperse them with arrows and flaming brands; he caught the boar in deep snow and carried it to Mycene.

The fifth task was to carry out the cattle dung from the stables of Augeas, king of Elis, in a single day; the stables had not been cleaned for many years. When Hercules arrived, Augeas promised him a tenth of the cattle if he accomplished this. He did so by diverting the rivers Alpheus and Peneus through the stables. But Augeas broke his promise and would not pay the reward; later Hercules made war on Augeas, killed him, and devastated the country. Hercules next had to rid the Stymphalian lake in Arcadia of a great flock of birds that used their feathers as darts; he did so by scaring them with castanets of bronze presented by Athene and shot some of them on the wing.

The seventh Labour was to bring to Mycene the bull given to Minos by Poseidon (Neptune) but not sacrificed as promised, so that Poseidon drove it wild. Hercules captured it and brought it to Mycene, but Eurystheus let it go. After this Hercules had to bring to Mycene the man-eating mares of Diomedes, king of the Bistones, in Thrace. After fighting with the Bistones, Hercules succeeded in taking the mares to Eurystheus. The next task was to bring back the girdle of Hippolyta, queen of the Amazons, who lived by the River Thermodon in northern Asia Minor. When Hercules's

Hercules in his greatness and his fits of madness is quoted as a legendary example of the melancholic man, the ancient forerunner of our man of genius

ship arrived at Themiscyra, her capital, Hippolyta promised to give him the girdle. But Hera, disguised as an Amazon persuaded the women that Hercules intended to carry off their queen. When the Amazons charged down on horseback to the ship, Hercules killed Hippolyta and set sail with the girdle to Mycene. On his way back he set free Hesione, princess of Troy, who had been chained on a rock as prey for a sea monster. The monster had been sent to ravage the country by Poseidon and Apollo, who had fortified Troy for King Laomedon and had been cheated of their reward. Hercules killed the monster, but was also cheated; later he besieged and took Troy.

The tenth Labour was to fetch the cattle of Geryon from the island of Erytheia in the far west. Geryon had three heads and bodies joined at the waist, below which again he had three pairs of legs and feet. Hercules journeyed through Libya, destroying many wild beasts, until he came to the western end of the Mediterranean, where he erected two great rocks known as the Pillars of Hercules (Gibraltar and Ceuta on Mt Hacho in Morocco) before going on to Tartessus and Erytheia. He crossed to Erytheia using the boat of the sun god, and killed Geryon, his servant and his hound. Returning eastward with the cattle by Iberia and Liguria to Italy, he crossed to Sicily in pursuit of a bull stolen by Eryx, son of Poseidon, whom he killed. He then drove the cattle round the Ionian (Adriatic) sea, but lost many of them when a gad-fly sent by Hera dispersed them about Thrace. When he brought them to Mycene, Eurystheus sacrificed them to Hera.

After this exploit, Hercules had to fetch the golden apples of the Hesperides, nymphs who lived in the far west of Libya, though sometimes they were thought to dwell in the far north of Europe. The apples were guarded by a gigantic many-headed serpent, usually said to have been immortal. According to some accounts Hercules persuaded the Titan Atlas, who held up the heavens on his shoulders, to approach and charm the serpent and so bring the apples for him, while he supported the burden. The last of Hercules's Labours was to fetch the three-headed hound Cerberus from the entrance of Hades; Pluto allowed Cerberus to be carried off by Hercules provided he was brought back again.

On one of his journeys, Hercules was bringing home a new wife, Deianeira, when the centaur Nessus offered to carry her over a swollen river. Nessus attempted to rape Deianeira and was shot down by Hercules with his poisoned arrows. Before he died, Nessus told Deianeira to preserve his blood, saying that it would be a charm for reviving Hercules's love for her if it should fail. Some time later Hercules came home from the wars with a captured girl, Iole, and Deianeira in her distress gave Hercules a garment stained with the blood of Nessus to wear. The tunic stuck to his skin and spread deadly poison through his body. Maddened with pain, Hercules had himself burned on a pyre on the top of Mount Oeta. The myth held that after his death he became an Olympian god, was reconciled to Hera and married Hebe, daughter of Zeus and Hera. But a shadow of him went to Hades.

A number of well-known works, passages or fragments within surviving poetry and drama deal with Hercules. Homer says that Zeus swore irrevocably, when the birth of Hercules was expected, that on that day the next child born of his own blood would rule over all that dwelt about him. Hera, by delaying the arrival of Hercules, contrived that the first birth should be that of Eurystheus.

Hesiod's *Theogony* tells how Hercules killed the eagle that fed on Prometheus's liver, of his origin, of his killing of Geryon, and of his marriage to Hebe and immortal bliss. The poem *Shield of Hercules*, attributed to Hesiod, relates the battle between Hercules and Cycnus, son of Ares, and describes Hercules's elaborate shield.

Among lyric poets, Stesichorus of Himera in Sicily told of Hercules's expedition to fetch the cattle of Geryon. Pindar tells vividly the stories of his birth and killing of the serpants; of his expedition against Troy; of his journey through Libya and his wrestling with the giant Antaeus; and of his founding of the Isthmian and also the Olympic Games. He mentions his journey to the Ister (Danube) to get an olive spray to plant, so that he himself and later athletes might have shade. Other details given by Pindar include Hercules's gluttony, his eating of two oxen seized from the plough and, curiously, his short stature.

Among dramatists, the *Trachiniae* of Sophocles covers all the events leading up

The Strength of Ten

Hercules sighed gustily. 'The poor child is an orphan. I killed his father myself. This was what happened. I was wandering through western Thessaly on some expedition or other, and one day I happened to feel hungry. I came across a Dryopian farmer ploughing a fallow field in a sheltered valley, and uttering, for luck, the usual obscene imprecations. I saluted him with: 'My lucky ploughman, I am so hungry that I could eat an ox.' He answered, with a smile, but continuing to curse, that I should at any rate not eat his ox until the field had been ploughed and harrowed too. 'Holy Serpents,' I cried, losing patience, 'I will, if I like.' 'Hold hard,' said he. 'I am Theiodamas the Dryopian. I must ask you not to speak to me in that peremptory way.' I answered: 'To the crows with your "peremptory." I am Hercules of Tiryns and I always say, do, and get, just whatever I please. At Delphi the other day I told the Pythoness exactly what I have just told you; but she refused to believe me. I pulled the sacred tripod from under her and carried it out of the shrine. "Now," said I, "if needs must I will have an oracle of my own." Ho, ho! That soon brought her to her senses.' But Theiodamas either had never heard me or else could not believe that I was I. He threatened me with his ox-goad, so I gave him a friendly tap with my club and cracked his skull like an eggshell. Alas, I never meant to kill him. I never know my strength, that is my curse. The same thing happened to me when I was a boy learning to play the lyre, and my music-teacher, a pompous fool named Linus, rapped my knuckles and told me that my fingering was incorrect. I gave him a playful whack with the lyre and dashed out his brains. A pure accident, that I swear! I pleaded self-defence and the affair blew over, but I have never touched a lyre since.

Robert Graves *Hercules, My Shipmate*

For his eleventh Labour, Hercules was ordered to fetch the golden apples guarded by the Hesperides, nymphs who lived in a fabulous garden in the far west: Hercules and the Hesperides, relief in the Villa Albani, Rome

to the death of Hercules on the pyre on Mount Oeta, but contains no mention of his deification, though he appears as a god at the end of *Philoctetes*. Euripides's *Mad Hercules* presents the insane frenzy of Hercules as he is struck by the demon Lyssa, sent by Hera, and tells of how he kills his children. His *Alcestis* shows Hercules first as a greedy, cheerful and insensitive guest in the grief-stricken house of Admetus, after the death of his wife Alcestis, but later as the deliverer who restores Alcestis after defeating Death. The cruder aspects of Hercules are shown in Aristophanes's *Frogs*, where everyone in the underworld remembers his plundering gluttony.

Ambassador of Zeus

Among prose writers, the Sophist Prodicus, (c 5th century BC) appears to have originated the idea of the Choice of Hercules, made between the lives offered to him by the seductive figure of Vice and the austere one of Virtue. This was the beginning of the long history of Hercules as a symbolical figure used by the philosophers. He was a useful subject for sermons because he was a famous folk hero everywhere in the Greek world and had ended in unique glory.

Hercules's slow change of character from hero to something more was foreshadowed by the Athenian orator Isocrates (436–338 BC), who celebrates his intelligence. In Aristotle's *Problems*, in a discussion of the melancholic man, the ancient forerunner of our man of genius, Hercules in his greatness and in his fits of madness is quoted as a legendary example of the type. In Roman times the Stoic philosopher Dio of Prusa developed the idea of the Choice of Hercules as one between tyranny and kingship. Hercules was moving toward being a pagan saint. Among the Stoics he became a symbol of divine energy and order.

Meanwhile the Romans themselves had eagerly adopted Hercules. This is shown in literature by the litany of his exploits which appears in Virgil's *Aeneid*. A peculiarly Roman addition was his killing of the monster Cacus who had driven off the cattle of Geryon to his cave in the Aventine Hill. His sufferings and his death on the pyre as treated by Ovid and Seneca make explicit in another way his change to divine nature by telling how the pyre burned away only the mortal part of him.

Hercules continues to grow in stature and in wisdom in late philosophical and religious literature. Because he had fought and suffered as a man battling against beasts and monsters and hardship, he became a saviour who had much greater appeal than the traditional Olympians who had never endured the mortal state. He came to be regarded as the special representative of Zeus or Jupiter in dealing with mankind.

The development had gone far by the 4th century AD when Christianity was made the official faith of the Empire by Constantine. Scholars have noticed an affinity between the legendary Hercules, who had acquired a new religious and philosophical significance, and the Christ of Christian theology. Though some have exaggerated this, there was certainly an analogy between the Herculean theology and Christian belief, which was influenced by Stoic modes of thought. In some writings of the apostate Emperor Julian, Hercules appears to be a figure maintained as a rival to Christ. But Hercules was not more than a legendary or mythical figure and no more than one of many gods. He could not really rival Christ, the historical saviour and manifestation of one God.

FURTHER READING: L. R. Farnell, *Cults of the Greek States*, 5 vols., (Caratzas Bros., 1977); Gilbert Murray, *Greek Studies* (Clarendon Press, 1946).

Among Christians heresy was a grave evil which must be mercilessly rooted out; in Spain, during the Inquisition, the first Grand Inquisitor was credited with burning at least 2000 heretics

HERESY

TO MOST PEOPLE the word 'heresy' is connected with the Christian religion. It is also linked with the Inquisition, as the notorious means by which the Christian Church sought to exterminate heresy, a view that is soundly based in historical fact. However, before dealing with the subject in this context, it would be well to look first at earlier forms of the idea.

The English word is derived from the Greek *hairesis*, meaning 'selection' or 'choice'. It was most notably used in the Graeco-Roman world to describe adherence to ideas or beliefs of a philosophical kind. Those who adhered to such notions or principles were recognized as forming a school, party or sect. The Jewish historian Josephus in the 1st century AD described the Pharisees, Sadducees, Essenes and Zealots, the chief religio-political parties of his day, as 'heresies'. The term is applied in no derogatory sense. It is similarly used of the Pharisees in the Acts of the Apostles. But it soon takes on an opprobrious meaning in the New Testament, as when St Paul puts heresy together with such vices as idolatry and sorcery (Galatians 5.20).

In Christian usage 'heresy' became a technical term for religious belief and practice deemed contrary to the established form of the faith. This meaning naturally implied that there was a right form of Christian doctrine or 'orthodoxy' (from Greek *orthos*, 'right', and *doxa*, 'opinion'). Deviation from this orthodoxy was regarded as a dangerous evil, to be condemned and rooted out. This attitude became a distinctive feature of Christianity. It played a decisive part in the development of faith; and was responsible for the infliction of terrible cruelties on those condemned as heretics.

The persecution of people for religious errors has, however, occurred in religions other than Christianity and it is necessary to look at some examples in order to appreciate what was peculiar in the Christian attitude to heresy. The earliest known example is the attempt of the Egyptian king Akhenaten (see IKHNATEN) to change the religion of his country. He has often been called 'the heretic Pharaoh', and the title is apt, if not strictly accurate. Theoretically, the Egyptian pharaoh was the sole representative of the Egyptian people before their gods. He was also the divine son of the sun god Re, the supreme deity of Egypt. Hence the king's religion was necessarily the religion of Egypt. But Akhenaten set out to change the established form of Egyptian religion for one of his own choosing, and took action to suppress the cult of the god Amun, the chief rival of the Aten, his own deity. There is, however, no evidence of his having persecuted the devotees of Amun. Akhenaten's case is unique: he was a heretic in relation to the religion of which he was the supreme representative. It was only after his death that the traditional religion asserted itself, and his memory was execrated.

Other religions provide sporadic instances of the persecution of heresy. It usually took the form of the defensive reaction of traditionalists against new ideas. The Greek philosopher Anaxagoras of Clazomenae (c 500–428 BC) was accused of impiety and driven from Athens for teaching that the sun was a red-hot mass and not a god, as Greek religion held. Political issues were, however, involved in his condemnation. Socrates was also condemned in Athens for impiety and introducing new 'daemonic things'; he ended his life in 399 BC. The death of Mani, the founder of Manicheism, in 277 AD resulted from charges made by the Magi that his teaching was contrary to Zoroastrianism, the established religion of Iran (see MANICHEANS). In 922 AD, in Baghdad, Mansur al-Hallaj the famous Sufi mystic, was crucified for having identified himself with God. In the eyes of orthodox Moslems, his teaching, which was based on deep mystical experience, was heretical.

Two Christian Gods?

Such examples of the persecution of heretics, though each is very notable, are really more significant for their rarity. They reveal, in contrast to Christianity, that in other religions there has been no deep concern about heresy. The reason for this undoubtedly has been that they have never been as concerned about orthodoxy.

The reasons for Christianity's attitude towards heresy are complicated, and are bound up with the origins of the faith. Largely as the result of the teaching of St Paul, the Jesus of Nazareth whom the Romans had executed in about 30 AD was regarded as a divine being sent into the world to save mankind. Such a belief inevitably involved a host of theological problems, the chief ones being the relationship of Jesus to God, and the nature of Jesus. If Jesus was divine, were there two gods; God and Jesus? Such a view was wholly unacceptable, and some solution had to be found that would explain how Jesus was divine. One solution seemed to lie in the description of Jesus as the 'Son of God'. But the relationship of son to father implies the prior existence of the father, and this meant that Jesus as the Son of God was not eternal. For there must have been a time when God existed alone, before the generation of his Son.

This question led to one of the greatest controversies in early Christianity. A theologian named Arius became the exponent of the view that Jesus, though divine, had been created by God. He was opposed by Athanasius, who defined orthodoxy as involving belief in Jesus as 'co-eternal' and 'co-equal' with God. The dispute became so serious among Christians that the Emperor Constantine called a general council of bishops at Nicaea in 325 to decide the issue. The teaching of Arius was condemned as heretical. Jesus was defined as being *homoousios*, a Greek word meaning 'of the same substance', with God. Arius and his chief supporters were sent into exile. This political penalty for heresy is significant. Under the Emperor Constantine Christianity had become the established religion of the Roman Empire, and this meant that heresy might now be punished by the state.

The condemnation of the Arian heresy had resnlted from the desire to assert the full divinity of Jesus. The problem of the nature of Jesus arose out of the belief that he was both human and divine. Already by the 2nd century certain Christians, called Docetists, from the Greek *dokeo*, 'I seem', maintained that Jesus only 'seemed' to be a man. They explained that his physical body and sufferings were illusory. These Docetists were connected with Gnosticism, a widespread movement in the Graeco-Roman world, concerned with the duality of spirit and matter. Since Jesus was regarded as a divine spirit, he could not therefore have been really born as a human being. The 'orthodox' Christians rejected this view as heresy. They argued that Jesus, if he had not been a real man and suffered physically, could not have saved mankind.

In these early controversies about the nature of Jesus, the orthodox Christians conld only condemn and dissociate themselves from those they regarded as heretics. After the time of Constantine I, they were able to impose legal penalties on their opponents in controversies about the same issue. As a result, Apollinaris, who taught that in Jesus the divine Logos, 'Word', took the place of the rational soul, was condemned at the Council of Constantinople in 381; and in 388 the Emperor Theodosius banned his followers 'from walled cities, from civilized society, from the communion of saints'. Nestorius, Bishop of Constantinople, was condemned as a heretic for rejecting the title of *Theotokos*, 'God-bearer', for the Virgin Mary. He maintained that Mary was the mother only of the human nature, and not of the divine nature of Jesus Christ. He was banished to Upper Egypt, where he died in about 451.

First Execution for Heresy

The Church's attitude to heresy had taken a more ominous turn in dealing with Priscillianism, an obscure movement that seems to have been related to Manicheism; it also denied the pre-existence of Christ before his birth from the Virgin Mary. Its leader, Priscillian, Bishop of Avila, was condemned by a synod of Catholic bishops at Bordeaux. He appealed to the Emperor Maximus, but was sentenced to death on a charge of magic and was executed in 386, together with some of his followers. This was the first instance of capital punishment for heresy. Although it drew forth a protest from St Martin of Tours, the execution set a grim precedent for future persecutors.

During the Middle Ages heresy took on a somewhat different form from that current in the past. The major doctrines of Christianity had now been defined and authoritatively established, and as a result no longer represented opinions about matters on which Christian belief had yet to be formulated. Instead, new movements appeared which virtually sought to set up a new form of religion. Often these movements were

reactions against the corruption and formalism of established Catholicism, and particularly against ecclesiastical government.

The most notable heresy of this type was that of the Albigenses. The name was derived from the city of Albi in south-west France, which was the centre of the movement. The Albigensian heresy was related to that of the Cathars, 'the pure ones', which was found in other parts of Europe (see CATHARS). According to its teaching, which was based on Manichean dualism, there were two eternal principles of Good and Evil. The Good principle created spirits; the Evil principle created gross matter. Spirits were imprisoned in material bodies as a punishment and transmigrated from one body to another until they had expiated their original fault and merited heaven. The Albigenses taught that Christ was an angel, with a phantom body. He had become the Saviour by revealing the true (Albigensian) doctrine, which the Church had corrupted. The sacraments of the Church were rejected, together with its doctrines of hell, purgatory and the resurrection of the body. Albigenses lived according to a rigorous discipline: they condemned marriage, and even recommended suicide by starvation.

The Church regarded the movement as menacing both the Christian faith and ordered society. After unsuccessful attempts to convert its members by missions, in which St Dominic was involved, Pope Innocent III (1160–1216) launched a crusade against it. It was led by Simon de Montfort, and was conducted with great cruelty. Among the atrocities was the massacre of Béziers in 1209, in which 20,000 people were alleged to have died. The crusade ended in 1218. In 1233 Pope Gregory IX instituted the Inquisition to seek out and destroy the remnants of the heresy, a task that was entrusted chiefly to the Dominicans and Franciscans.

Pope Gregory's action followed quickly on that of the Emperor Frederick II, who in the previous year had commissioned state officials to hunt out heretics throughout his domains. The Pope doubtless deemed it unwise to allow laymen to become responsible for such a task. The papal Inquisitors travelled about a specific area, calling on those guilty of heresy to confess their sin. Voluntary confession involved a lighter penalty, such as fasting or making a pilgrimage. After a month's grace, the real work of the Inquisition began. Suspected persons were summoned by the parish priest concerned to appear before the papal Inquisitor, who was assisted by a select body of clergy and laity. Evidence for the prosecution was accepted on the testimony of at least two witnesses. The accused was permitted to have a counsel; but the duty of this officer was not to defend his client but to see that justice was done.

At first, when a confession could not be obtained from the accused after the production of evidence of his guilt, rigorous imprisonment under severe conditions was ordered. Since this course of action evidently did not secure the desired results, in 1252 Pope Innocent IV permitted the use of torture to obtain confessions.

Because of their opposition to the established Church, heretics were sometimes considered to be agents of the Devil: illustration from a 13th century manuscript, in which heretics are shown as evil-looking demons shooting arrows at a symbolized Trinity

Judgement was pronounced publicly at a ceremony known as the *Sermo Generalis*. After an exhortatory sermon, the sentences were solemnly read out. The penalties ranged, in graver cases, from confiscation of property, imprisonment either temporary or perpetual, to execution. The Church did not carry out the sentence of death; instead, the condemned heretic was handed over to the secular arm, and was usually burned at the stake. In Spain, the final ceremony was known as the *auto-da-fé*, meaning 'act of faith'. In this the accused was paraded in a special dress called *san-benito* which consisted of a yellow penitential garment, with a red cross on the front and back, and a yellow mitre. The garments of the unrepentant were embroidered with the forms of grotesque devils. According to the Bull *Ad Extirpanda* issued by Innocent IV in 1252, execution had to follow within five days of sentencing.

The Spanish Inquisition, which became particularly notorious, had a distinctive character, because of its close association with the state. It was originally established in 1479 by King Ferdinand V and Queen Isabella, with papal consent, to deal with a special problem. Many Jews and Moors,

called Marranos and Moriscos, had been converted to Catholicism, usually under duress. The sincerity of their profession had, however, become suspect, and more stringent control was thought to be necessary. The first Grand Inquisitor, Tomas de Torquemada (1420–98), a Dominican friar, was especially zealous in rooting out heretics; he is credited with the burning of at least 2000 of them. The last execution at the stake took place in Seville in 1781. The Spanish Inquisition continued until its final abolition in 1820. Joseph Bonaparte suppressed it in 1808 during the French occupation of Spain, but it was re-established in 1814.

The Inquisition had been instituted originally to deal with heresy. But in 1320 Pope John XXII instructed the Inquisitors to deal also with witchcraft, if connected with heresy. This decision represented a departure from what had generally been the saner attitude taken by ecclesiastical authorities towards witchcraft in earlier centuries. The situation worsened in 1488, when Pope Innocent VIII strongly commended the publication of the *Malleus Maleficarum*, 'Hammer of Witches', written by two Dominican Inquisitors. It has been claimed that in about 150 years the Holy Office of the Inquisition was responsible for burning 30,000 witches. This savage mania against witchcraft was not peculiar to the Inquisition; it was also shared by Protestants, who killed thousands of alleged witches during the 16th and 17th centuries.

The persecution of heresy entered upon a new phase with the rise of reforming movements such as that of John Wycliffe in the 14th century. Wycliffe attacked both the papal government of the Church and certain medieval doctrines such as that of transubstantiation. Although he died peacefully, his followers, called Lollards, suffered much persecution. In 1401 the English Parliament passed the Act *De Haeretico Comburendo* to deal with the movement, and many Lollards paid the penalty for their heresy at the stake. John Huss, the Bohemian Reformer, who was influenced by the writings of Wycliffe, was excommunicated by Pope John XXIII and burnt at Constance in 1415.

The Inquisition was used by the Catholic Church to stop the spread of the Reformation in most European countries and its cruelties left an indelible impression on the minds of Protestants. In 1542 Pope Paul III set up in Rome the Congregation of cardinals and officials commonly known as the Holy Office, as the final court of appeal in trials of heresy. In 1557 Paul IV caused the Congregation of the Inquisition to issue the first *Index Librorum Prohibitorum*, 'List of Prohibited Books', in an effort to warn the faithful against heretical writings. To keep this up to date, Pius V established in 1571 a special 'Congregation of the Index', to maintain and revise the list.

Persecution of what was considered to be heretical opinion was not confined to the Catholics but was also zealously undertaken by many Protestants. John Calvin was personally responsible for one of the most shocking instances: Michael Servetus, distinguished for his rejection of the dogma of the Trinity, escaped from the Inquisition to Geneva, Calvin's headquarters. But Calvin also regarded him as a dangerous heretic. Servetus was arrested and, on refusing to recant, was burnt at the stake on 27 October 1553.

With the increasing secularization of society, toleration of diverse religious opinion steadily grew. But condemnations for heresy have occurred even in modern times in both the Roman Catholic and other Churches. Where clerics have been involved, deposition from office has usually followed: the help of the state can no longer be invoked in punishing heretical laymen. However, the Church still evaluates heresy as a most awful evil. In its Litany it prays: 'From all false doctrine, heresy and schism, Good Lord deliver us'.

Hereward the Wake

Anglo-Saxon outlaw and resistance leader against the Normans, who became the hero of popular legends; he and his followers helped the Danes to sack Peterborough Abbey in 1070; his stronghold on the Isle of Ely was besieged and taken by William the Conqueror; Hereward escaped but nothing more is known of him; there is no evidence that he was called 'the Wake' in his own day, and the name probably comes from his supposed connection with the Wake family from Bourne in Lincolnshire.

HERMAPHRODITE

THE NOTION of a bisexual divinity seems to have arrived comparatively late in the ancient Greek world: there is certainly no trace of it in Homer and Hesiod. Hermaphroditos, the god who was described by the Latin poet Ovid as 'neither man nor woman, who seemed to be neuter, yet bisexual', is mentioned for the first time by a later 4th century author, who says that superstitious folk put garlands on his statue on the seventh day after a child's birth.

According to Ovid (43 BC–18 AD), Hermaphroditos was the son of the love goddess Aphrodite and Hermes, the messenger of Zeus. To conceal his birth, Aphrodite entrusted him to the nymphs of Mt Ida, who brought him up in the forests. In his teens, though as beautiful as both his parents, he was a savage young man chiefly interested in hunting. One day in Caria, as he was bathing naked in a clear lake, the naiad Salmacis saw him and fell in love with him, shouted out, 'He's mine!', and flinging all her clothes off, plunged in after him. The bashful youth resisted her kisses in vain, and the gods granted her prayer never to be parted from him by uniting their two bodies in one.

It is obvious that the name Hermaphroditos gave rise to the myth, and not the other way round, though the local men used the story as an excuse for the loss of their virility, blaming the lake waters for their enervating effects, whereas, according to Strabo (64 BC–19 AD) their effeminate and self-indulgent habits were the cause.

It cannot be said that Hermaphroditos was the subject of any important cult, and the representations of bisexual gods and heroes in Greek painting and statuary, which are fairly common from the 4th century BC onwards, are due to a variety of inspirations, ranging from the individual artist's more or less idle fancy to half-understood notions derived from Cyprus, Persia and Asia Minor. The treatment varies from the depicting of a beautiful young man with a woman's breasts to, at a later period, an Aphrodite-like figure with male limbs. It has been pointed out by one authority on the subject that the more the feminine aspect is stressed, the more 'unnatural' the hermaphrodite appears.

The treatment of the hermaphrodite in Greek plastic art links up with a side of ancient life of which we get only occasional glimpses in the texts which have survived. A Sicilian Greek historian, contemporary with Julius Caesar, says that Hermaphroditos is a god who sometimes appears to men, and it may be assumed that this is an allusion to the observation of human hermaphrodites whose incidence must have been a cause of great fear among ancient peoples. If we turn from physical hermaphroditism to psychical bisexuality, there are scattered references to bisexual or 'unisex' customs in the ancient world. At Argos, for example, it was at one time the custom for a bride to put on a false beard (there was also a curious statue of a bearded Aphrodite in Cyprus in Aristophanes's time in the 5th century BC), and at Sparta the newly-wed girl put on man's clothing to go to the bridal bed. There are various stories of men and women exchanging clothes at certain religious festivals, but as all these customs are only briefly mentioned, at different periods of history and in different places, we have no means of assessing their social significance, if any, let alone of reconstructing the psychological experiences to which they possibly related.

Alongside these public manifestations of interest in the phenomena of bisexuality there were also speculations of a private or individual kind. In Plato's *Symposium*, a curious story to explain the origin of sexual love is put into the mouth of the comic playwright Aristophanes. Mankind is descended, says Aristophanes, from an earlier race of circular beings, some male, some female, and some hermaphrodite. The reason that there were three sexes was that the male came originally from the sun and the female from the earth, while the bisexual beings came from the moon, which shares the nature of both sun and earth. These circular beings had four arms and legs, four ears, two mouths and two sets of genitals. They became so uppish, however, that the gods decided literally to cut them down to size, which they did by bisecting them. Since that time, each one of us is constantly looking for his or her other half, which may be male or female, irrespective of our own sex. For in this scheme only those descended from the androgyne will be seeking a mate of the opposite sex.

Michael Holford

When Hermaphroditos, the son of Aphrodite and Hermes, resisted the advances of the nymph Salmacis, she prayed that they should never be parted; the gods granted her wish by uniting their two bodies in one: statue in the British Museum

The link between the moon and bisexuality is found in a North American Indian legend where, of course, it cannot possibly have any connection with the ancient Greek or Egyptian myths. According to the Tsimshian Indians, the moon is a halfway house between heaven and earth, and is the domain of Pestilence, who is attended by four destructive, hermaphrodite dwarfs. There are a number of hermaphrodite myths in American Indian culture. The

Navaho tribe, for example, ascribed the invention of pottery and the wicker water-bottle to the hermaphrodite twins who were the first of five sets of twins born to the first man and the first woman.

One Pueblo Indian tribe, the unaggressive Zuni people, are reported to believe in a bisexual Creator, and hermaphrodite gods are connected with birth, self-perpetuation and rejuvenation in many places on earth, including ancient Egypt and pre-Columbian Central America. In American Indian mythology, the hermaphrodite may have originated with men who dressed as women and played an ambiguous role in tribal life, some of whom have been observed by missionaries and anthropologists, though it must be stressed that the connection, if any, between physical hermaphroditism and transvestism or other psychologically bisexual practices is obscure, and is only now being investigated scientifically.

It is possible that more fundamental notions underlie these myths. Analysing a myth of the Pawnee Indians of the North American Plains, in which a young boy is made pregnant as the result of a magic spell cast upon him by a malevolent medicine-man, Lévi-Strauss (in his *Structural Anthropology*) finds that confusion of sex in the boy is opposed to its irrevocable differentiation in the medicine-man. 'All of Pawnee metaphysical thought,' he adds, 'is actually based on the idea that at the creation of the world antagonistic elements were intermingled and that the first work of the gods consisted in sorting them out. The young child is asexual, or . . . the male and female principles co-exist in him.'

The idea of a bisexual deity occurs in ancient Indian religion, where the Hindu god Shiva is sometimes conceived as androgynous. Shiva is among other things a god of reproduction, and as such his cult is centred on the sacred *lingam*, a phallic emblem, which in temples and in the form of a small, portable object, is usually a round conical stone, rising perpendicularly from a stone platform, on which an oval rim is incised. The oval stone is the *yoni* or *bhaga* symbolizing the female genitals, so that this combination of *lingam* and *yoni* represents in some sense a bisexual principle. At the same time, the *yoni* symbolizes Shiva's wife, the goddess Parvati. It is not clear, however, how conscious the worshippers of these ancient Vedic gods are of the sexual connotations of these cult objects, which seem to be among the most time-honoured idols in India.

It has been asserted, for example by H. P. Blavatsky, that the concept of an androgynous god is universal in primitive religion, but if this is so, it is still doubtful to what extent we are confronted with a unified phenomenon. Moreover, in the few instances where some history of the hermaphrodite god can be traced, a number of ideas and experiences seem to have contributed to its invention. Human hermaphrodites (of which modern science distinguishes several distinct types, only the rare, extreme case having both male and female sexual glands) were regarded as ominous in ancient Babylon, as is known from an early text, and presumably elsewhere in the world. The impression they created on the primitive mind may have been the starting point of speculation about a bisexual divinity.

One notable point is that for the most part, Hermaphroditos, under whatever name he or she is known and worshipped, is a minor and peripheral deity. It remains to be seen whether there is any deep-lying connection between this deity and the bisexuality which some modern psychologists believe to be universal in human nature. At the turn of this century there was a great deal of interest in the subject in psychoanalytic circles, and Freud planned to write a book on the subject in collaboration with the Berlin physician Wilhelm Fliess (1858–1928), to whom Freud wrote in 1899: 'I am accustoming myself to the idea of regarding every sexual act as a process in which four persons are involved.' But a bitter dispute grew up between Freud and Fliess over precedence in the matter of having realized the significance of bisexuality, and though Freud was influenced by Fliess and by one or two other writers who developed the theme, it did not become the major theme in his work that it at one time promised to be.

HERMES

IN MANY WAYS Hermes is the most sympathetic, the most baffling, the most confusing, the most complex and therefore the most Greek of all the Olympian gods. Like the Olympian goddesses, he had a prehistory; he is a very uneasy kind of Olympian, with deep popular roots.

There seems to be little doubt that Hermes signifies 'the god of the stone heap', the spirit immanent in stones set up as cairns or pillars to serve as boundaries, or as landmarks for the wayfarer. Truly a god of the countryside, he was associated with the Minoan pillar cult and there is evidence that the cult of Hermes existed in Crete in historical times.

Coins found at Cydonia and dated to about 250–267 BC, feature a nude Hermes with his wand and familiar broad-brimmed hat. It seems that at Cydonia Hermes could have had very special associations with the old Minoan population. According to the historian Ephorus (4th century BC) certain festivals were regularly celebrated for the serfs of this district, during which no free persons entered the city; the serfs were masters of everything and even had power to flog the freemen. It is tempting to connect this account with another old tradition that festivals of Hermes were celebrated in Crete, and that while the serfs were feasting their masters assisted in menial duties. On these occasions they would have been assuming temporarily the free status which their old Minoan ancestors had once enjoyed.

As W. K. C. Guthrie explains Hermes was named by the Greeks from *herma* or *hermaion*, a cairn or heap of stones. To explain this connection the Greeks characteristically invented a myth to account for it, that when Hermes killed the many-eyed monster Argus, he was brought to trial by the gods. They acquitted him and, in doing so, each threw his voting pebble at his feet and a heap of stones grew up around him. In fact Hermes must simply have been the daemon or spirit of the stone heaps themselves, about which there were several superstitious beliefs. Even now, in some parts of Britain, the wayfarer who wishes for good luck will add a stone to the cairn which he finds on the hilltop. This custom also prevailed in antiquity; and belief in the spirit of the cairn is still an occasional feature of northern European belief.

As the mythological explanation suggests, the *herma* consisted of an upright monumental stone with a heap of smaller stones around its base. Gradually the god, and the pillar which represented him, became more and more human in conception. He was given a phallus to promote fertility, and finally emerged as a fully human figure. Yet even in the 5th century the 'herma' which stood in front of Athenian houses had not thrown off all traces of their origin, and were no more than half-human in shape.

As Charles Seltman put the matter, it is now becoming apparent that, just as in Christian theology there are always two distinct influences, one Jewish and the other Greek, so in pagan theology there are two distinct influences, one pre-Hellenic, the other Hellenic, for all the most important Olympian deities. This is certainly true of Hermes, whose name is Greek but whose nature and functions are mainly derived from the beliefs of earlier peoples. He seems to emerge as a pastoral god and a guide to travellers because of his association, in remote antiquity, with cairns.

The later Greek-speaking peoples did not know the name that the pre-Hellenic inhabitants had given to the god of these stone heaps; and the name, as often in similar cases elsewhere, was doubtless withheld from them. Therefore they could only refer to him as 'Hermes' from their word for 'stone heap'. In the Laconian dialect which some of them spoke, he was known as 'Herman', 'He of the stone heap', or more familiarly, 'Old Heapy'.

The most versatile of all the Greek deities, one of the many roles of Hermes was that of messenger of the gods; Hermes with Herse, one of two sisters who had disobeyed the goddess Athene: painting by Paolo Veronese

The Syndics of Fitzwilliam Museum, Cambridge

It is true, as Seltman added, that recent research has provided a clearer perception of what the Greeks at different times thought and felt about Hermes, and more is known about him than about several other deities. The multiplicity of his titles and functions must not be allowed to disguise the fact that he is one of the earliest and most primitive of all the gods of Greece. In the prologue to the *Ion* of Euripides Hermes introduces himself in this way:

> Atlas, who wears on back of bronze the ancient
> Abode of gods in heaven, had a daughter
> Whose name was Maia, born of a goddess:
> She lay with Zeus and bore me, Hermes,
> Servant of the immortals.

This introduction modestly stresses his prehistoric origin and his subordinate status in the Olympian hierarchy. Further insight into the varied functions of this truly popular god is given in the *Plutus* of Aristophanes, and in the Homeric Hymn to Hermes, familiar to English readers in Shelley's translation, and one of the longest and most charming of all the Homeric Hymns. It tells the tale of the infant god's adventures following his birth in a cave on Mt Cyllene in Arcadia, the ancient seat of his worship. From there it was carried to other parts of Greece.

Hermes escaped from his cradle, went to Pieria and carried off some of Apollo's oxen, which he drove to Pylos, in the neighbourhood of Olympia. Returning to Cyllene, he found a tortoise at the entrance to his cave, placed strings across its shell and so invented the lyre on which he promptly played. Apollo discovered the theft, went to Cyllene and charged Hermes with the crime. Hermes's mother Maia showed the god the child in his cradle but Apollo took him to Zeus, who obliged him to restore the oxen. By giving him the lyre Hermes won the friendship of Apollo and also various prerogatives, including a share in divination, lordship over herds and animals, and the office of messenger from the gods to Hades.

As herald of the gods, Hermes was god of eloquence. Prudent and cunning, he was master of fraud, perjury and theft. He was also credited with a variety of inventions apart from the lyre. God of roads, he cared for travellers; and as inventor of sacrifices, he protected sacrificial animals, and was worshipped by shepherds. He was god of commercial transactions and good luck, and patron of gymnastics. The famous sculpture of Hermes by Praxiteles is one of numerous representations of this most versatile of all the Greek gods.

Because man combines a godlike and a mortal nature, he is superior to the lesser gods who are only immortal, and to other creatures who are only mortal, and for the same reason he can create gods: these are among the ideas of the Hermetic texts of the early centuries AD

HERMETICA

THREE DIFFERENT intellectual movements met in the world of late antiquity. There was a style of philosophy which instead of busying itself with pedantic subtleties concentrated on those questions which move man to his depths, in the manner of Plato's great dialogues to which the Roman thinker Cicero and many of his contemporaries looked back. There was a new style of religious feeling, which searched for an intimate personal relationship with God. And, stimulated but not originated by the conquests of Alexander the Great, there was an intense interest in the old civilizations of Mesopotamia and Egypt, and in their 'ancient wisdom'.

One product of the mingling of these movements was a religious and philosophical literature which must have developed between the 1st century BC and the 2nd century AD. The works which make up this literature are called Hermetica because the principal character in them is usually Hermes Trismegistus. The name Trismegistus (thrice-greatest) shows that this is the Egyptian god Thoth (see EGYPT), who had been equated with the Greek Hermes by c 500 BC.

The Hermetic writings are in the form of dialogues in which, besides Hermes Trismegistus, the chief characters are Tat (Thoth again), the healing gods Asclepius and Imhotep, Ammon, Isis and Horus. Their purpose is to teach the understanding of God, man and the universe, and they announce their doctrines with the authority of the 'ancient wisdom' of Egypt. But they rarely make full use of the pretence that the speakers are Egyptian gods and demigods, and there is little genuine Egyptian tradition in the dialogues. The bulk of their teaching stems from Greek philosophy, especially from Plato and Aristotle. At times we have the impression that the writer has been satisfied with cursorily revising a Greek philosophical treatise or dialogue, with an air of solemnity and edification but quite often debasing or even mutilating the original thought. The Hermetic dialogues are not remarkable for consistency of thought or uniformity of terminology and the versions which have come down to us are crowded with obscurities and contradictions.

Quite a number of collections of Hermetic writings must once have existed. Some were gathered together at an unknown date in what is called the *Corpus Hermeticum*, which still exists. Another collection was made by John Stobaeus in the 5th century AD and most of it has been preserved. We know little of three others: one used by the Christian writer Lactantius c 300 AD; one quoted by the philosopher Iamblichus (early 4th century); and one of 15 books cited by the scholarly Christian theologian Cyril of Alexandria (early 5th century). Two other, longer texts stand alone. The first is the *Asclepius*, preserved in a Latin translation, possibly of the 3rd century AD. It is known and cited by St Augustine and is the text which defined the image of Hermetism in the Middle Ages and the Renaissance. The second is a dialogue between Isis and Horus, which has the strange title of *Kore Kosmou* (which might mean 'daughter of the world' or 'pupil of the world'). Stobaeus contains extracts from it.

Hermetism has frequently been compared to, and linked with Gnosticism and there are certainly many similarities. Gnosticism (see GNOSTICISM) flourished in the same period, is equally concerned with knowledge of God, the world and the soul, and equally teaches that the human soul can only escape from its bondage to matter if it possesses the true knowledge or understanding (the *gnosis*) which is the privilege of a select few. Large speculations about abstract cosmic powers are characteristic of Gnosticism and sometimes appear in the Hermetica too, and both were influenced by astrology.

But the extent of the connection should not be exaggerated. Much can be explained by common dependence on Platonism. Unlike the Hermetica, the gnostic texts were the sacred writings of communities of initiates and constituted a serious threat to the early Church. Hermetism and Gnosticism are related by the fact that they originate in the same period and spring from the same intellectual background but there is no closer connection.

Pictorial representation of the Hermetic philosophy of Nature; at the centre of the spheres of the seven traditional planets and the fixed stars is the Serpent of Wisdom, twined around the Tree of Life; the reference to the Philosophers' Stone points to the link between the hermetic tradition and alchemy: 15th century illustration to *Opera Chemica* by Raymond Lull

The first text of the *Corpus Hermeticum* is the most famous text in the collection, the *Poimandres*. The author tells us that he has been carried away in the spirit and met a superhuman being, Poimandres, the spirit of omnipotence. The author asks for understanding of the nature of things and knowledge of God. He is answered in a vision, in which he sees Darkness and Light. From Darkness comes moisture, and from it the other basic elements of which the world is made. Light is the Spirit (*Nous* or Mind) and from it comes reason (*Logos*). The original spirit gives birth to a second spirit, who is the demiurge, the creator of the world, which has two levels, the heavens and the earth.

The original spirit also gives birth to the original man, to whom is assigned the world of the stars. But earthly Nature falls in love with the original man, and as he looks down from above he sees himself reflected in the waters. He falls in love with his reflection, descends towards it and is embraced in the arms of Nature. This is clearly an interpretation of the Greek myth of Narcissus, who fell in love with his reflection in a pool.

Next, ordinary human man comes to life, with a mortal body, but he is also immortal because he contains part of the original man. As a mortal being he is subject to Fate but as an immortal being he is master of all things. At first all things were androgynous, combining both sexes, but then male and female were separated from each other, and the procession of the generations began. For man all that is important is to know 'who he is', that is, so far as he is the original man. Whoever knows himself reaches surpassing goodness but whoever remains enmeshed in love of the body stays in darkness and loses his immortality. The author is deeply moved by this pronouncement of Poimandres.

On Becoming God

For the Hermetists . . . it is through mystical experience that man attains liberation. In that experience, at its greatest intensity, the soul is wholly absorbed in the vision of God. 'Father,' says Tat to Hermes, 'you have given me my fill of this good and most beautiful sight, and my mind's eye is almost blinded by the splendour of the vision.' 'Nay,' Hermes rejoins, 'the vision of the Good is not a thing of fire, as are the sun's rays . . . It shines forth much or little according as he who gazes upon it is able to receive the inflow of the incorporeal radiance . . . He who has apprehended the beauty of the Good can apprehend nothing else; he who has seen it can see nothing else . . . He forgets all bodily sensations and all bodily movements, and is still. But the beauty of the Good bathes his mind in light, and takes all his soul up to itself, and draws it forth from the body, and transforms it wholly into the essence of God.'

In the ecstatic vision of the divine, man's being is deified; he passes into the divine Light.

In another tractate the writer suggests that it is possible to rise to the knowledge of God, which implies identification with Him, by the application of the principle that 'like is apprehended by like'. If thou canst not make thyself equal to God, thou canst not know God.' Such equalization to God can be attained by the illimitable extension of our being. 'Expand thyself into the immeasurable greatness, passing beyond all bodily limits; raise thyself above all time, become eternal. Then thou shalt know God.' A man is to transcend all spatial and temporal limits – to 'become higher than all height, lower than all depth', to take to himself 'the qualities of all creatures', to conceive himself to be in every place, in the living and the dead. By such an expansion of the range of his consciousness man may rise into oneness with God, who is Himself the Whole.

At death, Poimandres explains, man abandons the body, the senses and the two lower parts of the soul, passion and desire. Then he ascends through the spheres of the seven planets, leaving behind him in each of them part of his being, the part which the original man had received from the stars. Finally he will be reduced to just himself and can enter the eighth sphere and join the powers assembled there. With them he comes before the Father and enters God. 'For this is goodness and the aim for all those who have intelligence: to become God.'

Poimandres disappears, telling the author to teach this knowledge to those who are worthy of receiving it. The author explains how he has tried to do this, and the text ends with solemn praise of God.

The story seems strange and fantastic but on careful examination almost all its ideas can be traced back to Plato and his followers, to Aristotle, and to the Stoic philosophers. The same thing is true of the other texts in the *Corpus Hermeticum*.

The extremely influential *Asclepius* is a discussion between Hermes, Asclepius, Tat and Ammon. It begins with an incoherent exposition of the belief that 'all is one' and of the hierarchy that leads from God down to animal and plant life. Then follows an impressive consideration of the position of man in the universe and his task in life. The task is a double one, to show piety towards God and, by order of God and together with him, to rule the earthly world. The main virtues of men are piety and a contempt for the body and matter. Whoever co-operates with God merits release from his mission in the world and a return to the godlike life of the pure spirit. Those who fail to do this are reborn after death in other forms. False philosophy is attacked, the study of mathematics, musical theory and geometry, for the only use of these sciences is to induce admiration of the splendour of the ordered universe. All else is 'sophisticated subtlety'.

The work goes on to discuss God, matter and the evil which is part of the universe. God has given men spirit, knowledge and reason to fight evil. A hierarchy of gods is introduced. The first god is androgynous, without limit and incessantly begetting, because he is good and passes on his goodness. All other beings have their procreative power from him. Man has reason and knowledge, and because he combines a godlike and a mortal nature, he is superior to the gods who are only immortal, and to the other creatures who are only mortal. That is why he is capable of creating gods – the gods who live in the temples and enjoy the worship of the people. In the statues of these gods live divine souls, put there by men, which prophesy the future and send the people both diseases and cures.

Unexpectedly, we next come to praise of Egypt and a vision of its future. One day the gods will leave Egypt, religion will perish, barbarians will rule and the people will be ruined by cruelty and godlessness. But God will intervene and destroy all evil-doing with fire or flood or pestilence and restore the old glory of the world. The lower gods will return and assemble in a town in Egypt to which all mortals will gather. Asclepius asks where these gods are at present, and is told, 'They are in a very big town on the Libyan mountain. But now enough.'

The Creation of Gods

Eventually, after telling us that physical death is followed by the judging of the soul, with the punishment of offenders, the *Asclepius* returns to the subject of man's ability to create gods. 'Our ancestors discovered the art of creating gods.' They made statues, 'and because they could not create souls, they conjured the souls of demons or messengers (angels) and introduced them by holy and godly mysteries into the images of the gods, so that they received the power to cause good and evil.' The first Asclepius and the first Hermes were among the gods created in this way, and they are the ancestors of the speakers in the dialogue. Isis was also made in this way. These gods are approached through sacrifices, hymns and praises.

This is a strange theory of the images of the gods. Educated Greeks and Romans knew, of course, that the man-made statue of a god merely represented the presence of a god in his temple. But the beliefs of the less educated were probably never so clear-cut. It is typical of the period that ideas previously ignored as superstitious by the sophisticated now come to the surface and are formulated in literature, and it is doubtful that the idea of man installing demonic or angelic beings in the statues originated with the Hermetic authors. Certainly the theory was not confined to them.

The *Asclepius* ends with the statement that enough nourishment has now been given to the souls of the listeners and it is time for the body to have its share. A final prayer is said, requesting God to 'preserve us in the love of your knowledge so that we shall never be separated from this form of life', and the speakers sit down to a vegetarian meal.

Originality is not a virtue of the Hermetica. They contain scarcely a paragraph which cannot be considered as a development or continuation of older and more original ideas. Almost all the material is drawn from Greek philosophy, with a little from ancient Egyptian beliefs and Mesopotamian astrology, and still less from the Old Testament. But the spiritual atmosphere is distinctly impressive. God, the world and man are the topics that continually recur. The spirit is godly and good, matter and the body are evil. Man must live in conformity with the spirit, which means that he must try to know God and to share with God the task of administering the world of matter. Understanding and piety are the only important things.

The negative aspect of this is that the Hermetica do not offer us theological argument, still less any treatment of natural science or natural philosophy. Even though they discuss the creation and ordering of our world, scientific astronomy, meteorology or biology are matters of complete indifference to the Hermetic authors. Nor do they offer any guidance in practical ethics. Only to a small extent is this due to their device of setting the dialogues in a time long before, when the concrete ethical problems of life in the Hellenistic centuries could not yet exist. It is due far more to the fact that for the Hermetic authors there is really only one virtue: the piety that shows itself in longing to know, to understand, God, the world and man.

Hermit

Or eremite, a person who lives in solitude, retreating from the bustle of the world and human company to concentrate on religious devotion; from the Greek word for 'desert', because the first Christian recluses were those, like St Anthony, who lived alone in deserts; hermits were common and much respected in medieval times; with the craze for Gothic medievalism in the 18th century it was briefly fashionable to pay a 'hermit' to live picturesquely in a grotto on the grounds of a country house.

See ANTHONY; SELF-DENIAL.

HERNE THE HUNTER

THE CURIOUSLY PERSISTENT legend of Herne the Hunter has been associated with Windsor Forest for at least four centuries, and may quite possibly have been part of the local traditional lore in medieval times. It concerns the ghost of a man named Herne who is said to have been one of the keepers of the Forest during his lifetime. Because of some crime he had committed, varying in different accounts from poaching to witchcraft, he fell into very serious trouble, and eventually hanged himself upon an oak tree in the Forest which was afterwards known as Herne's Oak.

The period in which all this happened is as uncertain as some of the other elements of the tale; in some versions, the reign of Queen Elizabeth is mentioned, in others that of Henry VIII or Richard II. Nothing in the Windsor records supplies any evidence for the existence of a keeper named Herne, or for his tragic death. In a manuscript in the British Museum it is stated that one 'Rycharde Horne, yeoman,' was examined on a charge of hunting unlawfully in the King's Forest in Henry VIII's time. It has been suggested that this incident may have been the origin of the legend, but as nothing further is known about this yeoman, or the manner of his death, the connection cannot be regarded as proved.

Whoever Herne the Hunter may have been in life – always supposing that he ever had any real existence in the world of men – tradition is clear that he haunted the vicinity of the oak tree after his death, and was sometimes seen in other parts of the Forest as well. Moreover, his was not a simple and harmless phantom, but a malignant and, in some ways, a demon-like ghost. He wore horns like those of a stag upon his head. His appearance boded ill to all those who saw him, and many local misfortunes, including cattle ailments of various kinds, were commonly attributed to his evil influence.

Shakespeare knew this story, and it is from him that we have the earliest-known written reference to it. In *The Merry Wives of Windsor* (Act 4 Sc. 4), when Mistress Page is plotting to frighten and make a fool of Sir John Falstaff, she says:

> There is an old tale goes, that Herne the hunter,
> Sometime a keeper here in Windsor Forest,
> Doth all the winter-time, at still midnight,
> Walk round about an oak, with great ragg'd horns;
> And there he blasts the tree, and takes the cattle,
> And makes milch-kine yield blood, and
> Shakes a chain in a most hideous and dreadful manner . . .

The great tree that Mistress Page knew disappeared in George III's reign. In Collier's map of the Little Park, dated 1742, it is shown as 'Sir John Falstaff's oak', perhaps because the map-maker did not care to perpetuate ghostly legends. The little hollow beside it, commonly known as the Fairy Dell, is marked but not named. In 1790,

Mansell Collection

A malignant and demon-like ghost, Herne the Hunter wore horns like those of a stag: engraving by the 19th century artist George Cruikshank, showing the phantom huntsman riding through Windsor Forest

Herne's Oak died, and was cut down in 1796, when a number of other dead trees in the Forest were felled. But the legend did not die with it. Another withered oak was commonly pointed out as that on which Herne hanged himself, and round it the various traditions continued to be centred. Cooper-King, in his *History of Berkshire* (1887), remarked that 'it is but a counterfeit'.

Eventually, Edward VII caused a new tree to be planted on the site of the old one, and this now flourishes in the Little Park, a part of the Forest that is not open to the public. It, too, might be called a counterfeit, since it is neither Herne's true oak nor descended from it; but it can at least claim to be growing in the right place, and to be drawing its strength from soil that has been permeated with ghostly traditions for many centuries.

In the course of time, the details of Herne's legend have changed a little. Cattle diseases in the district have long since ceased to be attributed to his malice, nor is he now supposed to 'shake a chain in a most hideous and dreadful manner'. Stories told within this century speak of him as hunting by night through the Forest, and across the common at Cookham Dean near Maidenhead. Nothing is seen, but the sound of his horn is heard, and the noise of baying hounds and galloping horses. The fact that the horses are always mentioned in the plural suggests that he has become confused with the Wild Huntsman, and now rides at the head of an invisible ghostly band (see WILD HUNT).

He is also said to have been seen occasionally on the old site in the Little Park, horned as in the past and usually alone, though in some variants of the tale he is accompanied by a spectral white stag. What appears to be a more or less modern addition to his legend is the belief that his appearances, now fortunately rare, are forewarnings of some misfortune threatening the Royal Family, or of a national disaster.

Herne the Hunter is still usually considered to be the ghost of a forest keeper, even though practically nothing is known for certain about the man himself, and the curious detail of his horns is unexplained. One version of his story definitely connects him with witchcraft, and it has been suggested that he may once have been the horn-wearing 'devil', or chief, of a witch coven in the Forest. Another theory bypasses the man altogether, and associates the apparition with a local survival of the 'horned god' belief.

The most likely explanation seems to be that he began life as a forest spirit, perhaps as one of those borderline entities akin both to fairies and to demons who are often found in medieval legend; and eventually, when his true origin was forgotten, he became a ghost, as others of his kind have done in the folktales of many countries.

HERO

The hero in his quest for some priceless treasure blazes a trail for the less adventurous to follow; his end is often untimely but above all it is for the way in which they die that the great heroes of literature are remembered

USED IN EVERYDAY speech to mean an outstandingly brave man, or to designate the main character in a literary work, the word 'hero' may also be used in a specialized sense, to refer to figures in so-called 'heroic' literature. Such literature has flourished in many lands in many periods of history, whenever tales and songs are composed about a race of men whose strength and courage are above the ordinary, who accomplish great deeds, have dealings with supernatural beings, and may themselves be of supernatural parentage.

The heroes may occasionally become objects of local cults, with shrines erected to their memory and games held in their honour. Such cults existed among the Greeks, in particular the cult of Hercules, the semi-divine hero of enormous strength who accomplished a series of celebrated deeds, and saved the Greeks from many dangers.

In some cases the traditions of the heroes of the past have produced great epic poetry, as with the Homeric heroes whose exploits are the subjects of the *Iliad* and the *Odyssey*, and the Germanic heroes, who inspired such works as *Beowulf* and the *Nibelungenlied*. Elsewhere there are songs, stories, ballads and more sophisticated written literature which has developed out of the early heroic tales told by people who themselves could neither read nor write. Interest in heroic literature has developed greatly during the present century, since travellers and scholars have collected much material from native poets and reciters who composed their work

Left David, who fought and conquered the giant Goliath, is one of the heroic Jewish leaders whose exploits are recounted in the Old Testament: *David and Goliath* by Caravaggio, in the Prado Museum, Madrid *Right* Greek tradition is rich in heroes; Perseus, who rescued Andromeda from a dragon, is typical of this race of men who accomplished great deeds, often with supernatural aid: *Perseus and Andromeda*, painting by Lord Leighton, in the Walker Art Gallery, Liverpool

The hero is not content with the limitations of human existence, and his adventures may be seen as a spiritual quest

orally and never attempted to write it down.

Many heroic figures survive from the literature of the past, although countless names once of supreme importance have been lost for ever. The heroic poetry of Gaul, for instance, has disappeared without trace, while the Roman orator Cicero (1st century BC) lamented the disappearance of the old poems telling of the ancient Roman heroes such as Romulus and Horatius, who are remembered only in brief summaries of their exploits given by later Latin writers. Fragments of the very ancient *Epic of Gilgamesh*, now believed to go back to the 3rd millennium BC, show that the central figure was a human hero of outstanding powers, who defied the goddess Ishtar and went on a hazardous journey to the world's end to search for his comrade Enkidu who had gone down into the land of death, and to find some hope of escape from the mortality to which man is doomed (see GILGAMESH). Already the hero is not content with the limitations of human existence, and his adventures may be seen as a spiritual quest.

The epic poems ascribed to Homer, the finest example of epic poetry known to us, go back to the 8th or 9th centuries BC. The heroes of the *Iliad* and the *Odyssey* are of magnificent stature, living an idealized existence in small independent kingdoms in the eastern Mediterranean, and winning lasting glory by their courage and mighty deeds in times of war and peace. The gods support and oppose them in a very human way, and converse familiarly with one another in the background of the human conflict, while the realities of everyday life are convincingly portrayed. Yet there is nevertheless the sense of boundless possibilities opening out for the human mind and spirit, extending far beyond the limitations of the ordinary world.

There were a host of Greek heroes outside the Homeric stories. Figures like Prometheus the Titan who was imprisoned by Zeus for giving fire to mankind, a legend which has been remembered up to recent times in the folklore of the Caucasus; Theseus who slew the Minotaur, and Jason who sailed to find the Golden Fleece, have remained famous even though their stories have come to us only in fragments. Scenes from their adventures may be seen on many early

Michael Holford/British Museum

Greek vases, and in the case of heroes like Theseus and Jason it would seem that fact and fiction have become inextricably intertwined. For many of these heroes, what is important is the journey or the quest which they undertake and their end is often a tragic one.

Another heroic work of epic proportions from the ancient world is the *Mahabharata* of India, which contains much heroic and mythical material, although it has been extensively edited by the Brahmins so that it is difficult to reconstruct its early form. The Jews too had their own heroic age, when they were fighting to establish themselves in Palestine and overthrow the rival tribes which surrounded them. The historical books of the Old Testament contain some fine heroic leaders like Gideon and Samson, while the story of David and his followers is a heroic saga of splendid proportions, with the inner core of seriousness which marks out heroic literature at its best.

There is a wealth of heroic poems and stories from western Europe dating from early medieval times. The contribution of Britain is no small one, for it includes the Anglo-Saxon epic *Beowulf*, the tale of a northern hero who battled against monsters, established himself as a great king, and died defending his people from a dragon. All this is set against a more human background of wars and family feuds, which has proved of much value to scholars reconstructing the history of early Scandinavia and studying the way of life at this period. The epic has

Although some heroes are purely mythological figures, others are based on historical characters *Far left* Hiawatha defeats the Kenabeek, a many-headed monster; according to Iroquois tradition, he was a prophet who lived in the 16th century *Centre* The Hero God of Thrace *(above)*; the exact nature of his cult is not known, but more than 1000 memorials to him can still be seen in the Balkans. Robin Hood *(below)* the outlaw of Sherwood Forest, was commemorated in countless ballads *Above* St George, traditionally the patron saint of England, probably lived in Palestine in about the 3rd century: his legendary battle with the dragon is probably an allegorical expression of the Christian hero's triumph over evil: illustration from a 17th century Ethiopian manuscript

Revolution Press

claims to greatness in its own right as fine and moving poetry. The theme of man's struggle against evil powers and the constant threat of mortality at the height of human achievement links it with other heroic works, and once more the pattern is that of the quest of the hero, his fight against great odds, and his tragic end (see BEOWULF).

Other heroic poems from the Anglo-Saxon period exist only in fragments, but there are so many references to heroes that it is clear that there was a vast body of traditions surrounding them, known to the Anglo-Saxons and to the kindred Germanic nations of north-western Europe. The Vikings continued the heroic tradition, and added to the stock of stories and poems by their own exploits in many parts of Europe and beyond.

One of their greatest heroes was Sigurd the Volsung, who is commemorated on carved stones in both the British Isles and Scandinavia. He slew a dragon and won the gift of secret knowledge together with a mighty treasure, but the gold brought a curse along with it, and he was slain by his brothers-in-law in the course of a feud which he was powerless to prevent. Sigurd was the son of another mighty hero, Sigmund, and the tragic history of this family, many of whom went courageously to their deaths fighting against overwhelming odds, is a stirring one even in the comparatively late form in which it has reached us, in the *Saga of the Volsungs* and a number of poems in Old Icelandic which deal with separate incidents and characters from the extensive *Volsung* cycle of stories.

These tales illustrate the importance of women in heroic tradition. Sigmund's sister Signy dared and suffered much to avenge her father and brothers whom her husband had treacherously killed. Sigurd's ill-fated wife Gudrun and the proud Valkyrie Brynhild, whom he reached by riding through a wall of fire to awaken her from her enchanted sleep, are two unforgettable figures who inspire the finest poems in the Icelandic collection. Brynhild slew herself at Sigurd's funeral, while Gudrun lived on to see tragedy repeated among other members of her family. The story of the Volsungs also inspired the Middle High German epic, the *Nibelungenlied*, in which Sigurd and Gudrun appear as Siegfried and Kriemhild, and which later still won new fame in the operas of Wagner (see NIBELUNGENLIED).

Celtic Britain also had its heroes. Early Welsh poems from medieval times have many references to the mysterious King Arthur (see ARTHUR), whom scholars have sought to identify with a leader who fought against the Anglo-Saxon invaders at the close of the Roman period, and whom they have attempted to place in many different areas of Britain. Around King Arthur and his band of famous warriors a rich body of poems and stories developed in Brittany, France and medieval England, in which many of his celebrated followers had links with the otherworld, rode on strange quests and encountered supernatural adversaries. The most haunting and mysterious of these heroic tales are those which are concerned with the quest of the Grail, in which Christian mysticism is mingled with ancient symbols of Celtic mythology (see GRAIL).

The heroes of Ireland, of whom Cu Chulainn and Finn are two of the most famous (see CU CHULAINN; FINN), are remembered in a large collection of prose stories in early Irish, which extend over a long period and are believed to contain elements from pre-Christian times. In these Irish sagas and in the Welsh tales of the *Mabinogion* about Arthur and other heroes (see MABINOGION) there is a strong element of the fantastic and the marvellous, so that the atmosphere differs from that of the Homeric and Germanic heroic stories.

Later still, romantic tales about Arthur and his knights developed in the form of the *Chansons de geste* in France, which in turn influenced English medieval literature. Another celebrated band of heroes were the knights of the Emperor Charlemagne, who appears as a warrior-leader, differing considerably from the ruler known in historical records, and whose influence in this guise lingers on in the folk drama of several countries. A short epic in medieval French known as the *Chanson de Roland*, composed in the 11th century, tells of the heroic fight of one of Charlemagne's heroes against the Saracens, and in the next century a group of Spanish poems, the most famous of which is the *Poema de mio Cid*, deals with the heroes of Castile.

From eastern Europe there is a group of narrative poems in Russian, the *byliny*, dealing with the early heroes of Kiev and Novgorod and the later Cossacks. Some of

Even in modern times, heroic legends can spring up in societies which are 'engaged in fighting and conflict on a local scale, the kind of fighting that gives rise to acts of heroism and personal tragedy.' The Mexican revolutionary Zapata (*far left*), murdered in 1919, turned in legend into a modern Robin Hood. Adulation of Che Guevara (*left*), revolutionary leader and guerilla fighter, reached the proportions of a hero cult among young people who longed to identify themselves with his actions and ideals. The fame of Nelson, greatest of all British naval heroes, killed at the moment of his supreme triumph at Trafalgar, rose to such a pitch that Benjamin West painted him being carried up to heaven like the saints and martyrs of earlier centuries (*right*)

Michael Holford

these heroes are kings or warrior-leaders, and some famous outlaws. The poems concerning them were never written down, but were mostly collected from peasant reciters in the 19th century, who still held their audiences enthralled with tales of these old heroes.

Heroic poetry is by no means confined to ancient civilizations, or even to the medieval past. In the last 100 years a great deal of narrative poetry about the exploits of heroes has been collected from the Tartar people of Asia, while the Yakut of Siberia, the Ainu of northern Japan, and various tribes in Arabia have continued to compose poems of this kind up to modern times. So too have a number of African peoples, such as the Galla of Ethiopia, the Touareg of the Sahara and the Zulu of South Africa. The North American Indians have a wealth of heroic stories, including many concerning heroes who were also shamans or magicians, and whose adventures took them into the supernatural world. Another extremely rich collection of poetry and tales was collected in the course of the last century from the Polynesian islands of the Pacific. These deal with heroes of the past, with voyages of discovery in the southern ocean, inter-tribal warfare and family feuds, and also with heroes who journey into the otherworld, and visit the land of the dead.

It is clear that providing that there is a live tradition of poetry and story-telling which ensures that great deeds are remembered, recorded and retold many times, tales of heroes can spring out of any society which is engaged in fighting and conflict on a local scale, the kind of individual fighting that gives rise to acts of heroism and personal tragedy. This is the soil of heroic literature, and out of it can develop great cycles of poems and sagas, and even epic works of enormous length and scope. Historical characters and events come to be drawn on a scale larger than human, and the heroes grow into figures which bear comparison with the great names of antiquity.

The revolt of the Slavs against the Turks in the early 19th century gave rise to much heroic poetry in Yugoslavia, while in western Sumatra the long war against the Dutch East India Company also produced many poems. The composer of one of these died as recently as 1897. Similarly the 1917 Revolution in Russia inspired a number of poems in which Lenin was presented as a hero in the old tradition, and described like a hero of the past.

Brief Life and Lasting Glory

The inspiration behind heroic literature may be a national struggle for freedom, individual deeds of war or adventure by an outstanding individual, or the exploits of a leader and his band of followers. These range from Alexander the Great and the Emperor Charlemagne to Robin Hood, the outlaw of Sherwood Forest in the time of the Plantagenets, who was commemorated in a number of ballads and who still inspires countless tales of adventure for the young (see ROBIN HOOD). In America there are Davy Crockett and other figures who were outstanding among the early American settlers at a time when they were establishing their frontiers and pushing westwards into hostile Indian territory.

Magic and the supernatural enter constantly into heroic literature, and the heroes have many adventures in the otherworld. Maui the Polynesian hero climbs a huge tree which leads him into a world above the clouds; Sigurd rides through a wall of fire to rescue Brynhild; with the help of Hermes, Perseus strikes off the head of the terrible Gorgon in order to rescue Andromeda from the monster.

The end of heroes is often tragic and untimely: Achilles dies in battle, choosing a brief life and lasting glory rather than to live long without great achievements;

Samson pulls the pillars of his enemies' hall down upon himself and perishes together with the multitude whom he destroys; Ragnar Lodbrok the Viking leader dies in a snakepit defying his enemies with a laugh; Sigurd dies by the swords of his kinsmen because he cannot keep faith with both Gudrun and Brynhild. It is for their deaths above all that the heroes are remembered, and these are in themselves so memorable that the tales remain moving and effective even when retold for children in a style and language far removed from that of the original tradition.

Sometimes the hero attains the height of a demigod. He may, like King Arthur, be borne living into the otherworld, so that legends of his return live on as vigorous folk belief. Gawain is represented in the Arthurian tales as a noble Christian knight, but he has certain aspects which have led to the suggestion that they represent memories of an ancient Celtic divinity, while Cu Chulainn shows such supernatural strength and rage as to reach the proportions of an awesome deity.

It has been pointed out with some truth that in many different cultures the pattern of heroic legend may be seen as a departure from the everyday world, through dangers, trials, and initiation to the acquisition of a great and lasting treasure, which may take the form of wealth beyond reckoning, a radiant bride, or the gift of inner wisdom. The hero, whether he be king's son, warrior-leader, saint or semi-divine being, blazes a trail for the less adventurous to follow. He is a kind of shadow of the hero-god of the great religions of the world, and such tales should be seen not as an escape into the world of fairy tales but as a source of deep wisdom. This could account for the wide distribution and long life of heroic literature: the hero is a concept necessary for the full development of man's mind and spirit.

HEXAGRAM

A HEXAGRAM made of two triangles, one superimposed on the other, is used in European magic to master spirits and to banish evil influences. The hexagram's two triangles, one pointing up and the other down, combine 'above' and 'below', and so it is a symbol of man as God. It also contains occult power because it combines male (the triangle pointing up) and female (the one pointing down). These triangles are the symbols for fire and water, and in alchemy the hexagram may stand for distillation or sometimes for the Philosophers' Stone itself, which some said was made of fire and water.

The Star of David (in Hebrew *Magen David*, 'David's shield') is much the best known use of the hexagram as a symbol but its origin is obscure. There is no reference to it in the Bible or in Jewish rabbinical writings, and though it has been found in some early Jewish synagogues and graves, it has been found more often in non-Jewish contexts. By at least the 12th century it was being used on Jewish amulets intended to attract good luck and ward off misfortune. It does not seem to have become distinctively identified with Jewry until after the 17th century. It was adopted by the Zionist Organization at the First Zionist Congress, in 1897, and has now been incorporated in the flag of Israel.

Star of David above the doorway of a house in Galilee

Hieroglyphs

Or hieroglyphics, a system of picture-writing: literally, in Greek, 'sacred carvings', the picture-writing on the walls of Egyptian tombs and temples, which the Egyptians called 'the speech of the gods', who invented it; the symbols were believed to have magical powers.

See ALPHABET.

Hierophant

One who reveals sacred things, from the title of the chief priest of Eleusis who displayed the holy objects in the main ceremonies of the Mysteries: in occult societies often the title of the official who presides over initiation ceremonies: name given by occultists to the card of the Tarot traditionally called the Pope.

See ELEUSIS; TAROT.

Scala

High Gods are generally identified with the sky, and their attributes are often associated with the weather; Zeus, the supreme deity of the Greeks, was armed with thunderbolts which he used against the Giants when they attempted to overthrow the gods: painting by Perin del Vaga

Yahweh of the Old Testament, Zeus of the ancient Greeks and the sky gods of primitive belief are all examples of the High God, a supreme being who is the lord of life and death

HIGH GODS

AN OMNIPOTENT and omniscient creator god, living in, or more often identified with, the sky, is known as a 'High God'; the term appears to have been coined towards the end of the last century by the Scottish anthropologist and folklorist Andrew Lang. In a chapter of his book *The Making of Religion* (1898) entitled 'High Gods in Low Races', he points out that if the evidence is to be trusted, many pre-literate peoples believe in a Supreme God in the sky, a being who takes precedence over lesser gods, ghosts and demons.

Lang could not imagine that this belief in a High God could have 'evolved out of the maleficent ghost of a . . . medicine-man' but did not go so far as to suggest that religion therefore originated in some primeval monotheism, from which it degenerated into animism. 'Both elements,' he wrote, 'are found co-existing, in almost all our races, and nobody, in our total lack of historical information about the beginnings, can say which, if either, element is the earlier, or which, if either, is derived from the other.'

At the time, Lang's views were largely ignored by the scholarly world as just the day-dreams of a dilettante, but the work of a number of later scholars, among them W. Schmidt in Austria, R. Pettazzoni in Italy and G. Widengren in Sweden, has confirmed the essential correctness of his analysis. Almost all primitive races do in fact have some belief in a High God; evidence of such belief can be found among primitive societies in Australia, Africa, America and Asia.

It must be emphasized however, that nowhere is the belief in a High God dissociated from belief in lower gods and other spiritual beings; accordingly, the gods of primitive man normally take on the appearance of a hierarchy. The High God is supreme, all-powerful, omniscient, the lord of life and death; but since he is so powerful and so remote, it is usually necessary to approach him through his lesser servants. Frequently in practice, his very remoteness means that he receives no particular worship, the people preferring to concern themselves rather with winning the favour of his emissaries. In extreme cases, it may be proper to speak of him as a *deus otiosus*, 'a resting god', who has deliberately withdrawn into his inaccessible heaven away from human ken.

Lord of the Elements

Widengren has pointed out that the High God is master of human destiny, but that he is above good and evil. He may be regarded, more tangibly, as both good and evil, or at least as completely unpredictable; the aspects of good and evil may become virtually separate deities, or even come to be regarded in myths as his 'sons'. In some cases the High God, particularly as Creator, may be regarded as both male and female, a mythological expression of the idea that the High God contains within himself all contradictions, and is beyond all such this-worldly distinctions.

Since the High God is identified with the sky, it is only natural that celestial and atmospheric phenomena should be seen as evidences of his working. These include sun, moon and stars, which may be regarded as the god's eyes, or worshipped separately as independent, though subordinate, deities; and storm, wind, rain, thunder and lightning, which may again be attributes of the High God, or may take on independent existence within a separate sphere between heaven and earth.

'Piler of Clouds'

So it is, for instance, that many of the attributes and epithets of the Greek Zeus, such as *keraunios*, 'lord of lightning', and *nephelegereta*, 'piler of clouds', have to do with the weather, while others refer to his character as giver of fertility, or to his authority over the fates and the lives of men. Similar characteristics may be observed in ancient Roman religion, where Jupiter, the parallel of Zeus, is known as *Iuppiter Fulgar*, 'lightning', *Iuppiter Tonans*, 'thunder', or *Iuppiter Pluvialis*, 'rain'.

In the Old Testament, Yahweh exhibits most of the characteristics of a High God; he rules the tempest and the hurricane; he 'sits enthroned over the flood' (Psalm 29.10); he gives grain, and wine, and oil; the farmer is taught his business by God; and of course he created earth, sky and the heavenly bodies, as well as man. 'I made the earth, and created man upon it; it was my hands that stretched out the heavens; and I commanded all their host.' (Isaiah 45.12). Yahweh is lord of fate, and his decrees are not to be questioned: 'I will be gracious to whom I will be gracious, and will show mercy on whom I will show mercy' (Exodus 33.19).

Although in cases such as this, the work of creation is entirely carried out by the High God, in other primitive societies it was held that the world in its present form is rather the work of some subordinate being. This pattern is clearly seen in the religion of the North American Indians, where there are many High Gods, the Algonquin Kitci Manitou, the Pawnee Tirawa-Atius, the Sioux Wakonda or Wakan Tanka and the Winnebago Earthmaker, but where the Supreme Being is not thought to intervene directly in human affairs.

Old habits of thought die slowly, and it is still common to find scholars and others who regard the figure of the High God as a relatively late development in the history of religion. Close study of the evidence reveals, however, that this is very far indeed from being the case. Indeed, man's earliest religious experience may conceivably have been his sense of standing under the power and protection of the over-arching sky. Whether or not this is the case, the figure of the High God is now recognized as being almost universal in the religion of early man. What the result will be for the general theory of religious evolution it is yet too early to say.

HILDEGARD OF BINGEN

KNOWN AS the 'Sybil of the Rhine', Hildegard, Abbess of Rupertsburg, was one of the most remarkable women of the 12th century. She belongs to the tradition of the great German mystics, in company with Eckhart, Suso and Tauler. She was born in 1098 at Böckelheim in the Rhineland, and at the age of eight was entrusted by her parents to the care of Jutta, a woman of noble birth, who was living as a recluse next to the Church of St Disibod near Hildegard's home.

Hildegard took the veil at the age of 15 and joined the Benedictine community founded by Jutta. It was at this time that she began to have the visions and prophecies and other phenomena that were to continue for the rest of her life.

For many years her life in the convent was unremarkable so far as external affairs were concerned. In 1136 Jutta died and was succeeded as prioress by Hildegard. Her community had grown too large for its house and she found it necessary to move it to another at Rupertsburg, near Bingen. This was not accomplished without opposition from the monks of the neighbouring monastery of St Disibod which owed some of its importance to the convent and Hildegard's growing reputation as a seer. However, she managed to overcome the opposition and the move took place between 1147 and 1150.

Hildegard wrote hymns and anthems, a morality play and a great number of homilies to be read to the nuns in the chapter house. She invented a language that was a mixture of low Latin and German, she wrote the lives of St Disibod and St Rupert, and conducted a voluminous correspondence, most of it being in the nature of allegorical treatises and prophecies. She wrote to kings and popes, bishops and abbots, often upbraiding them for the abuses rife in the Church at that period of its history.

Despite her chronic ill-health she journeyed about the Rhineland between 1152 and 1162, founding a convent at Eibingen near Rudesheim, visiting monasteries and convents and rebuking their inmates in no uncertain terms when she found them failing to observe their Rule. And she contrived to find time to write, among other things, on natural history and medicine, even dealing with morbid psychology and pointing out that sometimes physical ills upset a man's reason. This makes people think that a man is possessed of the Devil, but it is not so.

At the end of her life Hildegard was in trouble with the Church authorities at Mainz regarding the burial in the convent cemetery of a young man who had been excommunicated. As a result, her convent was put under an interdict for a time, and the difference was resolved only a short time before her death. She was now exceedingly infirm; she could hardly stand and had to be carried from place to place. Right to the end she was counselling her nuns and many others, by word of mouth and by letter. She died on 17 September 1179. Although attempts were made to canonize her they were never successful, but she is honoured as a saint in some parts of the Rhineland.

From an early age Hildegard was subject to visions and other phenomena; she seems to have foretold the future, especially when rebuking ecclesiastics, and prophesied the terrible things which would happen if they did not amend their lives. Her visions and her accounts of them, particularly in her principal work *Scivias*, an abbreviation of *Nosce vias Domini*, 'Know the ways of the Lord', have a Blake-like quality about them, more especially in the use of symbols and images. She has also been compared with Dante. In many of her visions a prominent feature is a point of light, or a group of such points, which shimmer and move, and are most often interpreted as stars or flaming eyes. Often the lights give the impression of working, boiling or fermenting that is described by so many visionaries from Ezekiel onwards.

A great deal of her writing, particularly in *Scivias* and her more mystical treatises, may well be an early example of what nowadays is called automatism. Nevertheless, it is true to say that Hildegard certainly thought herself inspired by heaven.

The German mystic, Hildegard of Bingen receives the light from heaven: illustration from the 12th century *Wiesbaden Codex*

WALTER HILTON

A MYSTICAL WRITER in the great tradition of English devotional literature, Walter Hilton was one of a group of 14th century English mystics who included Richard Rolle, Julian of Norwich and the anonymous author of the *Cloud of Unknowing*. All that is known of him is that he lived during the 14th century, that fairly late in life he joined the order of Augustinian canons at Thurgarton in Nottinghamshire, and that he died in about 1395.

Of his writings there are three that can be attributed to him without doubt, and several others which are probably his. His major work is the *Scale of Perfection*, first printed by Wynkyn de Worde in 1494. The *Epistle to a Devout Man in a Temporal Estate*, also known as *Epistle on Mixed Life* (1506), and *The Song of the Angels* (1521), are the two other works which were certainly written by him.

Among those attributed to this writer at one time was the *Imitation of Christ* which, as almost everyone now agrees, was written by Thomas à Kempis. Hilton's supposed authorship of it can probably be explained by the fact that a manuscript in Latin and English called *Musica Ecclesiastica* was in circulation in the 15th century soon after Hilton's death. The first three sections of this manuscript are identical with the first three books of the *Imitation*. If, as seems probable, the *Imitation* first reached England anonymously, when it was translated into English it was naturally attributed to the best-known mystical writer in English.

Walter Hilton is known to have been friendly with and influenced by the Carthusian monks, whose priory at Beauvale, founded in 1343, was near Thurgarton; his teaching reflects therefore something of their traditions. In any case it is not surprising that it should do so for Hilton was in the mainstream of the Alexandrian tradition, as represented by Dionysian mysticism, which had begun to spread throughout Europe in the Middle Ages (see DIONYSIUS THE AREOPAGITE). Hilton also reflects some of the ideas of the author of the *Cloud of Unknowing* and it is hardly surprising that this work too has been ascribed to him.

The *Scale of Perfection* is a remarkable and valuable treatise on the spiritual life; it has been called a guidebook for the journey to the spiritual Jerusalem which Hilton describes as 'contemplation in perfect love of God'. Like all the 14th century school of English mystical writers, and unlike the Rhineland and Flemish mystics who are speculative, Hilton is severely practical. He is writing for an anchoress, a female recluse, and he takes it for granted that her goal is to strive for contemplation which he described as the restoration, the 'reforming', of the image of God in man.

Before the Fall man was in the image of God; the three powers of man's soul – memory, understanding and will – were directed primarily to God. As a result of Adam's sin man fell from this happy state 'into forgetfulness and ignorance of God, and into a monstrous love of himself'. Through Christ's Passion and death man can be restored to the image of God fully only in heaven, partially here on earth. This partial restoration may be in faith only, when a man is in a state of grace; or in faith and feeling, when by the power of the Holy Ghost man is aware of the working of grace in him. To reach this state is the object of the contemplative life.

Contemplation is reached by the action of God in the soul; and Hilton goes on to speak of the effects that it produces in the soul. The distinguishing marks of the book are beauty of thought and simplicity of expression and homely and effective imagery; although it is concerned with an advanced state of the spiritual life it is full of practical guidance.

Hilton's *Epistle to a Devout Man in a Temporal Estate* has some affinities with the *Introduction to a Devout Life* by St Francis de Sales (see FRANCIS DE SALES). It contains spiritual guidance and counsel for a religious man of wealth and social position, showing how the activities that are inseparable from his state of life may be pleasing to God, and used as a means to inflame desire for him and for the spiritualization of ordinary life. The *Song of the Angels* is a mystical treatise dealing with the action by God on the soul of the contemplative, and the spiritual consolations granted here on earth to the soul that is 'in perfect charity and purified by love'.

Hilton, like the other English mystics of the 14th century, was writing before Ignatius of Loyola, Teresa of Avila and John of the Cross had schematized methods of mental prayer (see TERESA OF AVILA; JOHN OF THE CROSS). So his approach is simpler; for him the basis of prayer is what has come to be known as 'vocal' prayer, as distinct from 'mental' prayer. Anything beyond this he regards as inspired or contemplative, at least to some degree.

Lastly he is practical. Compared with the rather fearsome programmes of physical penance, fasting and other hardships recommended by some of the mystics and spiritual writers of his period, Hilton's advice is strikingly sane. 'Moderation is best' he says.

'Hinduism has always been mystical to its core, since it has always taught that by Yogic techniques man can realize here and now the eternal and divine within himself. So immanent is the Deity that to claim to be God is quite natural since, in some sense, everything is God'

'HINDU' is a Persian word and it means simply 'Indian'. Thus for the Moslem invaders of India the 'Hindu' religion was identified with the Indian people. It was the national religion of India, just as Judaism is the national religion of the Jews. The Indians themselves, however, never refer to their religion as the 'Indian' religion: rather they call it the *Sanatana Dharma*, the 'eternal *dharma*', distinguishing it thereby from all other religions, which have known founders and are therefore rooted in history. Hinduism is 'eternal and ageless' (*Sanatana*): it has no known founder and is considered to have existed for all time. But this does not mean that its forms do not change in the course of time: the essence is changeless but the forms in which it expresses itself are ever-changing. It is the religious expression of the very stuff of Nature and the Divine as the Hindus see them – perpetual change seen against a changeless and timeless background.

Hinduism is also a dharma, a word which has a great variety of meanings. It is derived from the root *dhr* which means 'to hold together' – something, therefore, that gives coherence to what appears to have none. Etymologically it is connected with Latin *firmus*, 'firm', and *forma*, 'form', the abiding form of things that makes them as they are and not otherwise. In this sense it is 'law', both the eternal law that governs Nature and the moral law that rules or should rule among men: it is law, religion and righteousness, the norm by which men live in the wider context of Nature and the universe. It is not something man-made but the principle that governs all things and to which the gods themselves are subject.

'The gods' because Hinduism is a polytheistic religion, but a polytheism that is also in some sense a monotheism. This sounds paradoxical but it is not really so, for even in the earliest times the gods are only manifestations of an immanent and unitary principle which is the ground of the universe – a principle that is at first regarded as being an impassive absolute but which may also appear as a personal God.

The Veda

Although Hinduism has no founder it has, like all the 'higher' religions, a body of sacred literature. This is called the *Veda*, a word meaning 'wisdom' or 'knowledge'. The Veda is a vast collection of sacred texts containing material that seems to have little coherence, for its earliest strata which are frankly polytheist seem to be quite different from the later which are frankly pantheist (holding that God is in everything). It is the latter period, however, that is important, for it set the tone once for all for the later development of this highly complex religion.

There are three strata within the Vedic canon: the *Samhitas*, the *Brahmanas* and the *Upanishads*, succeeding each other in time and each expressing a different point of view. In the *Samhitas* we meet with a polytheism that is recognizably related to that of the Latins and Greeks, but more clearly so to the religion of India's neighbours the Iranians, who share many of the Indians' gods. The *Samhitas*, usually called simply the 'Veda', were originally three in number, and they are composed of hymns extolling one or other of the gods who make up the Vedic pantheon. These hymns were the accompaniment of the all-important sacrifice, the function of which was to mediate the good things of this world to man. The gods were real and powerful, and the sacrifice was the means by which contact was established between them and man to the mutual advantage of each. Through the sacrifice man gave gifts to the gods so that the gods might give man gifts in return – prosperity, abundance of sons, victory in war, and so on: 'for sustained by sacrifice the gods will give you the food of your desire. Whoso enjoys their gift yet gives nothing in return is a thief, no more nor less,' as the *Bhagavad Gita* says. By sacrifice too man enters into communion and fellowship with the gods: he partakes of their nature and thereby of their immortality.

In the second stratum of the Vedic canon, the *Brahmanas*, sacrifice becomes all-important. It is the reflection of the world-process itself, and its correct performance assures the regular working of the cosmic process. In a sense it *is* the cosmic process, and since the gods themselves are dependent

Liberation from Life's Pigsty

In Hindu mythology there is a story of Indra, king of the gods, who once became a pig and lived very happily in his sty with his family. Missing their king, the gods came down from heaven and said: "O Indra, you are king of all the gods, why do you wallow in this mire?" And Indra replied: "Leave me alone. I am quite happy here. Why should I care for gods and heaven when I have my family?" Being at their wits' end, the gods finally slew Indra's sow and all the little pigs; seeing them all lying dead, Indra began to wail and mourn. Whereupon the gods ripped open the pig-body of their king and Indra came out, and laughed at the hideous dream he had had. He wondered how he ever could have been happy in that pig-life, even to the point of wanting the whole world to share in it!

Man in his ignorance clings to his limited consciousness and the surface life of his wakeful state. Yet he is not exactly satisfied, for there is always a sense of lack and of unfulfilled desires as long as he remains within the boundary of his limited consciousness. When his discrimination ripens he begins to realize the vanity and emptiness of this prolonged dream – the so-called normal consciousness – and there arises in him a longing for God, for the abiding Reality behind the changing phenomena of life. This longing has to be intensified. Sri Ramakrishna used to give the illustration: a disciple went to a teacher and asked to be taught the knowledge of God. The teacher remained silent. When the disciple had repeated his request many times, the teacher took him to a river, and suddenly taking hold of him, held his head under water for a long time. When he let go he asked him how he had felt while under the water. As soon as the disciple could speak he said, "O for a breath of air!" Then the teacher said, "When you can long for God as intensely as you longed for air, you will find Him."

Swami Prabhavananda 'God in Everything' (in C. Isherwood ed. *Vedanta for the Western World*)

on this process, the sacrifice now takes precedence over the gods who *must* therefore do what the sacrifice demands of them. The gods are thereby demoted and become little more than the servants of the sacrifice and of man who manipulates it. The stage is now set for the third stage in the Vedic development, the stage represented by the *Upanishads*.

In the course of time the supreme efficacy of the sacrifice came to be demoted: the supposedly infallible magic no longer seemed to work, for whatever the sacrifice might bring about, it could not satisfy Indian man's deepest desire, his desire to transcend the world of flux and to win for himself immortality. The old religion of the gods had already passed away in favour of an all-pervasive and all-powerful sacrifice. And now, in its turn, the sacrifice too must pass away. External religion has proved a broken reed: man must turn his glance within himself, for it is only there that he can discover the immortal principle which at the same time sustains the whole dharma of the universe.

This is the crucial turning-point in Indian religion. The ancient polytheistic heritage which the Indians had shared with their sister Indo-European peoples is now definitely put behind them, the gods surviving only as superior beings, differing from men in length of days and power but subject, like men, to the relentless wheel of birth and death, re-birth and re-death. The early Indians did not believe in reincarnation but believed that men lived only once, being rewarded at death by a life of bliss in heaven with the gods, if they had lived a good life, or by punishment in hell if they had done evil. This uncomplicated belief they had shared with the Iranians. But now all this was to change.

We can only assume that the original inhabitants of India, whom the invading Aryans conquered, held religious beliefs totally different from those of their conquerors; and, as is so often the case, the religion of the conquered utterly transformed or replaced the religion of the victors. So it must have been in India; for it seems clear that the Dravidians, as the native inhabitants are called, must have believed in reincarnation with a total belief; for, from the time of the *Upanishads* on this belief becomes ineradicably ingrained not only among what we may now call the orthodox Hindus, but also among the Buddhists and Jains who split away from them. So strong was this belief that it would be wrong to call it a dogma. It is much more than this; it is accepted as a self-evident fact of existence that no sensible person would query. And it is this that in part accounts for the totally new perspective of the *Upanishads*.

A famous episode from the *Ramayana*: the demons of Lanka set fire to the tail of the monkey god Hanuman when he came to spy out their defences, but he, jumping from building to building, set the enemy citadel ablaze before making his escape

Michael Holford

The Grievous Burden

But in part only: for throughout the earlier Vedic literature a tendency had developed which tended to identify everything with an all-embracing Whole: the plurality of gods were seen to reflect one single reality and the sacrifice was thought of as identical with the world-process or at least as a reflection of it. One thing was generally agreed and that was that life in its endless repetitions was a burden too grievous to be borne and that the one thing needful was somehow or other to put a stop to it forever, to break away from it and so to become free. But how?

The Buddha who appeared in the 6th century BC claimed to have found the definitive answer. The world of flux in which we live, to which we return and from which, apparently, we cannot escape, is by its very impermanence synonymous with suffering. The cause of suffering is desire. Find a way of life which eliminates desire, and you will have won salvation. But salvation is not at all what Christians understand by that word, but rather total liberation from the shackles of earthly life which tie us remorselessly to impermanence and pain. The way of life which leads to the transcendence of earthly life as we know it the Buddha claimed to have found: he called it the Noble Eightfold Path, and it led one to a type of existence totally distinct from the life we know, a state called Nirvana, which means the extinction of desire and therewith of all becoming, of all coming-to-be and passing away. Nirvana is pure impassivity and impassibility, a timeless citadel to which the seeming pleasures and real sufferings that bedevil our life in time have no access. Between the two there is a gulf fixed and man's goal is to pass, by dint of much religious effort, to the stable and inviolate state of Nirvana (see BUDDHISM: NIRVANA).

This was the Buddhist solution but it was not the way of the *Upanishads*. The Buddhists were not interested in any Absolute on which the world of relativity might depend: they were interested only in escaping from the relative world altogether. The Hindus were more metaphysically minded; above all they wanted to know what was the changeless principle that held the changing world together and gave it coherence.

'What is it on which the worlds are woven, warp and woof?' 'Who is it, abiding in the earth, who is other than the earth, whom the earth does not know, whose body is the earth, who controls the earth from within?' These were the kind of questions they were asking. This unknown Something they called Brahman (which originally meant 'sacred utterance' or 'sacred action') or Atman (originally meaning perhaps 'breath' but very soon settling down in the meaning 'self'). Their answers were at first perhaps rather naive: it was food, or it was breath, mind, understanding, space or joy. None of these answers, however, seemed satisfactory; for when all was said and done, this eternal Something could indeed by experienced, but it could not be described. 'This Self – what can you say of it but "No, no!" It is impalpable, for it cannot be grasped; indestructible, for it cannot be destroyed; free from attachment, for it is not attached to anything, not bound. It does not quaver, nor can it be hurt.' Whatever it is, it is the timeless and spaceless principle of eternal Being which indwells the heart of man and which envelops and exceeds the whole physical universe (see BRAHMAN).

The account of Brahman in the *Upanishads* is a brave attempt to put into words an essentially mystical experience which transcends verbalization. It is what is sometimes called 'cosmic consciousness' which, in the words of a modern Canadian author who had the experience himself, shows 'the cosmos as entirely immaterial, entirely spiritual and entirely alive, it shows that death is an absurdity, that everyone and everything has eternal life; it shows that the

Shiva and Vishnu each appears as supreme God in Hinduism *Left* Shiva with his wife Parvati and sons Ganesha and Karttikeya, the elephant-headed god and the six-faced god of war; Shiva and Ganesha are stringing together the skulls of the dead, for Shiva in one of his aspects presided over cremation grounds *Above* Vishnu and his wife Lakshmi riding Garuda; besides acting as the chariot of Vishnu, Garuda, half man and half bird, was king of the birds and the enemy of serpents *Right* Vishnu is worshipped particularly in his eighth reincarnation as the handsome, dark-skinned Krishna, who inspired passionate desires by the sweet music of his flute; the love of Krishna and the milk-girl Radha, celebrated in hundreds of poems and paintings, is sometimes taken to represent the union of the soul with its God

universe is God and that God is the universe, and that no evil ever did or ever will enter into it.' This is absolutely true of the dominant thought-pattern of the *Upanishads*: the man who has realized himself as Brahman has passed beyond good and evil. Being the All and at one with the principle that keeps the All in being, he is invulnerable because he is outside time and cannot be affected by what takes place in time.

> Those who see all beings in the Self
> And the Self in all beings
> Will never shrink from it.
>
> When once one understands that in oneself
> The Self's become all beings,
> When once one's seen the unity
> What room is there for sorrow?
> What room for perplexity?

These passages are typical of the pantheism of the *Upanishads*. In the state they describe, all dualities, all seeming discords, disappear into a perfect harmony grounded in the One of which all so-called created things are only imperfect appearances. This is and remains the essence of Hinduism: what is divine and eternal in the heart of man is the same as the divine and eternal which pervades all Nature. If the essence of God is pure Being, then this is equally true of the essence of man. Since both are Brahman, it is possible to say that both are God. 'This finest essence – the whole universe has it as its Self: that is the Real: that is the Self: that *you* are.'

Here there is no attempt to separate the eternal from the temporal, the relative from the Absolute, for the 'All' – the universe – is at the same time the One, and by realizing the One Brahman in himself man realizes himself as God. This is the main tenor of the *Upanishads*, but since the Hindus were and are born metaphysicians, they were not prepared to let this pantheistic mystery be; and so in the later *Upanishads* two divergent trends develop, one 'monistic' and the other 'theistic'. The monistic tendency is represented by the *Mandukya Upanishad*, the 'theistic' by the *Svetasvatara*.

Following up earlier Upanishadic ideas, the *Mandukya* speaks of a 'fourth state' in which all is *absolutely* One, static and eternal. This is 'conscious of neither within nor without, nor of both together . . . one with whom there is no commerce, impalpable, devoid of distinguishing mark, unthinkable, indescribable, its essence the firm conviction of the oneness of itself, bringing all development to an end, tranquil and mild, devoid of duality, such do they deem this fourth to be. That is the Self: that is what should be known.'

This is the classical text on which the philosophy of absolute monism of Sankara and his school was to be based. It is a radical departure from the dominant Upanishadic position in which Brahman is seen as the One manifesting itself in the many: here the many are simply eliminated as being purely illusory. Only the One remains, and that is the *real* man and the divinity beyond God – God seen as creator and sustainer of the universe being, in the last analysis, as unreal as the universe he sustains. This absolute monism has dominated Indian philosophy from Sankara, who lived in the 9th century, up to the present time; but it has not dominated Indian religion, as indeed it could not, since it abolishes God as being ultimately unreal.

The Personal God

On the other hand, through the *Upanishads* a theistic movement had been developing which tended to make a distinction between the 'highest' Brahman, now called the 'Lord', and the individual 'selves' who had realized themselves as immortal and eternal. The 'Lord' who is at the same time the highest 'Self' of all things is now

'For the protection of the good, for the destruction of evil-doers, for the setting up of the law of righteousness I come into being age after age'

seen to transcend and comprise not only the universe but also all individual selves. The totality of existence is compared to a wheel, and of this wheel the Lord is both the hub and the rim whereas individual 'selves' are the spokes that connect the two: they are inseparable from God but they are not identical with him.

Brahman in the *Upanishads* was the 'Real of the real', transcending and indwelling both the eternal and the temporal. In the *Svetasvatara Upanishad* this supreme position is assigned to a personal God – the ancient Vedic god Rudra, who is now also referred to as Shiva (or Siva), the 'Mild'.

In the *Upanishads* Brahman is usually thought of as an impersonal Absolute, but sometimes he appears as a personal God. In the *Svetasvatara Upanishad* he or it is identified with the Vedic god Rudra. This *Upanishad* and the *Bhagavad Gita* complement each other, for in both a highly personal God is raised to a supreme eminence, higher than Brahman, the principle of eternity itself. In the *Svetasvatara* the God is Rudra-Shiva, in the *Gita* it is Vishnu incarnate as Krishna. Neither god was prominent in the earlier literature, and it still remains rather a mystery how these two gods finally emerged as God with a capital G. Each has his own characteristic mythology, but each is for his own devotees the supreme Being, both Brahman as eternal Being and the God from whom the universe emanates, by whom it is sustained and into whom it dissolves. Though Brahman may be both the eternal and the temporal, the great God Shiva rules over both these aspects of it.

> In the imperishable, infinite city of Brahman
> Two things there are –
> Wisdom and unwisdom, hidden, established there:
> Perishable is unwisdom, but wisdom is immortal:
> Who over wisdom and unwisdom rules, he is Another.

The *Svetasvatara Upanishad* is important because it exalts the personal God Shiva over both the perishable and imperishable aspects of existence. The destiny of the individual self which is a 'part' of God in some sense, however, still remains isolation or entry into Brahman (that is, eternity), not union with the personal God. As yet there is no idea of a real mystical *union* in and through love which is the core of the experience of the Christian mystics. All that will change in the *Bhagavad Gita*.

The army of the Kauravas clashes with the forces commanded by Abhimanyu, the son of Arjuna; the heroic wars between the Kauravas and their cousins the Pandavas form the subject of the immense Indian epic, the *Mahabharata*

British Museum

A Religion of Love

In the *Bhagavad Gita* the supreme God is Vishnu, and he is incarnate in the form of Krishna (see BHAGAVAD GITA). The *Gita*, unlike the *Upanishads*, does not form part of the Veda, and theoretically it does not enjoy canonical authority. Its supreme importance was, however, acknowledged from very early times and not only has it been commented on by all philosophers of note, it has also been and remains a popular classic, which the more abstruse *Upanishads* have not. The reason is that it introduces an entirely new element into Hinduism, the element of love. For Vishnu, in his incarnation as Krishna, is above all a God of love, and the ideal becomes intimate union and communion with the incarnate God, both in his timeless essence and in his ceaseless beneficent activity in the world of action.

As in the *Svetasvatara Upanishad* God is Lord of the perishable and imperishable alike. The 'perishable' is identical with matter, and matter, though controlled by God, nevertheless does act as a barrier and a veil. Hence it is first of all necessary to divest oneself of matter and to realize one's own eternity, if one is to commune with God who is the source of both eternity and time. To 'see oneself in all beings and all beings in the self' is then only a preliminary to seeing all beings in God and God in all beings, and to realizing that this cosmic vision is to see everything with God's eyes, not with one's own. This makes the immortal timeless 'self' realize that he is not an independent unit but wholly dependent on God. This gives rise to a deep love of God and intimate communion with him, for the self or soul now realizes that this personal God, Vishnu-Krishna, is 'the base supporting Brahman – immortal Brahman which knows no change – supporting too the eternal law of righteousness and absolute beatitude'. By realizing one's own timeless immortality one becomes Brahman, and 'once a man has become Brahman, with self serene he neither grieves nor desires; the same to all contingent beings he gains the highest love and loyalty to me (Krishna is speaking). By love and loyalty to me he comes to know me as I really am, how great I am and who; and once he knows me as I am, he enters me forthwith.' And just as the liberated soul enters into God in an ecstasy of love, so does God love him in return.

This is the significance of the *Bhagavad Gita:* it exalts the personal God above Brahman seen as principle of eternity, and it shows that God is a God of love, identical with you in so far as you have Being, but separate from you in so far as he is the object and subject of love. After the *Bhagavad Gita* popular Hinduism becomes predominantly a religion of love.

Vishnu and Krishna

In the canon of the Veda the gods Vishnu and Shiva (Rudra) played a very minor part. Just how and when they rose to supreme eminence we do not know, but each of them appears as the Supreme Deity by the time of the *Mahabharata* (? 300 BC – 300 AD). At first there is rivalry between them, but later, as is usual in Hinduism, they coalesce, each being regarded as the 'personal' form of the Absolute. Thus Hindus tend to be worshippers of Vishnu or Shiva.

As the supreme God, Vishnu becomes incarnate from time to time, 'for whenever the law of righteousness withers away and lawlessness arises, then do I generate myself on earth. For the protection of the good, for the destruction of evil-doers, for the setting up of the law of righteousness I come into being age after age.' In fact Vishnu is worshipped not so much in himself as in his two principal incarnations, Rama and Krishna. Rama is the hero of a great epic, the *Ramayana*, and he is the model of ethical and chivalrous man – obedient to his parents, devoted to his wife, affectionate to his family, impatient of evil, brave, chivalrous and courteous. He is God incarnate as morality.

The Krishna of popular religion is not the Krishna of the *Bhagavad Gita* but the

R. K. Singh

The lofty metaphysics of the Vedas has been overlaid by the worship of countless idols, though these may be explained as different manifestations of the divine unity *Left* Jewelled image of Hanuman *Above* Guardian deity from Nepal *Right* Surya the sun god, who with the weather god Indra and the fire god Agni formed a triad of ancient Vedic gods *Far right* Many-armed image of Shiva, garlanded with flowers and riding a tiger; an extremely complex deity. Shiva was a god of both asceticism and sexuality

Krishna who develops in the later literature, notably in the *Bhagavata Purana* dating from about the 9th century AD. Much more than Rama he is the object of the devotee's passionate love. Pre-eminently he is worshipped as a ravishingly handsome young cowherd who seduces the wives and daughters of the local cowherds with the sweet tones of his flute. He arouses passionate love in them and incites it the more in that from time to time he hides from them only to give himself more fully to them later. Sexual union is here used to represent the union of the soul with God.

This has sometimes shocked Protestant missionaries, but we find precisely the same phenomenon in the Christian mystical tradition, in which the Song of Songs, a clearly erotic poem which somehow or other found its way into the canon of the Old Testament, serves as a text on which to hang the most exalted conceptions of God's love for man. This does not, however, prevent the Krishna cult from degenerating at times into pure emotionalism, a frenzied ecstasy for its own sake. Then the devotee imagines that he or she is Radha, Krishna's beloved concubine, and gives himself or herself up to him in total self-immolation; for in its relationship to the Deity the soul is always female, God the male.

Shiva and Shakti

Shiva is an altogether more austere deity. He is an extraordinarily complex figure, for he is both the model of all Yogins and ascetics and the ithyphallic God who delights in the worship of his erect phallus. As ascetic he is eternally at rest (the static 'Imperishable' of the *Upanishads*), 'isolated' and rapt in the contemplation of his own unfathomable Being, while in his phallic capacity he is eternally productive of forms. In him the infinite (the male principle) and the finite (the female) meet, and in him all the opposites are reconciled. In mythology Shiva has a consort variously called Uma, Parvati, Durga or Shakti (Sakti). In theology this consort, appearing in the form of Shakti, represents the divine creative power, very like the Christian Logos, that 'through which all things are made'. And so it is said that 'Shiva begets Shakti and Shakti gives birth to Shiva. Both in their happy union produce the worlds and souls. Still Shiva is ever chaste and the sweet-speeched Shakti remains ever a virgin. Only sages can comprehend this secret.' The soul in its relationship to Shiva through Shakti must again play the part of the female, abandoning itself wholly to the divine lover just as the individual 'self' is merged in the personal God in the *Bhagavad Gita*.

Sometimes, however, the divine Shakti is worshipped to the exclusion of Shiva; for in this scheme of things Shiva is forever immersed in Yogic trance and is therefore deaf to the prayers of men and unaware of their needs. Shakti, on the other hand, is creative force and destructive power, an intensely living Goddess and in her destructive aspect very much to be feared. In Bengal bloody sacrifices of goats are still offered to her in her terrible form of Durga, but this does not prevent her from being the object of intense and passionate devotion, for she is above all things the Mother and, despite all appearances to the contrary, really devoted to her children. The worship of Shakti in its so-called Tantric form (see TANTRISM) has always offended the puritanism of Anglo-Saxon missionaries; for her devotees of a later time would re-enact physically the ideal union of Shiva and Shakti, of the male and female principles in the One, by combining the strictest control of the senses with the sexual act itself. In this close embrace the cosmic unity is realized; the distinction between liberation and creativity, between eternity and time is transcended; and controlled sexuality is seen to reflect the Unity in diversity of cosmic existence.

Such practices, however, were aberrations from the norm of *Bhakti*, as the cult of loving devotion to a personal God was called. More typical are the hymns of the devotees of both Shiva and Vishnu in South India

British Museum

William MacQuitty

which not only breathe a spirit of total self-abnegation but also a sense of deep unworthiness that is truly reminiscent of Christianity at its best. Two examples must suffice: both are addressed to Shiva.

> Thou gav'st thyself, thou gained'st me;
> Which did the better bargain drive?
> Bliss found I in infinity;
> But what didst thou from me derive?
> O Shiva, Perundurai's God,
> My mind thou tookest for thy shrine:
> My very body's thine abode;
> What can I give thee, Lord, of mine?

Or again we find a sense of deep guilt and inadequacy in the face of the divine majesty:

> Evil, all evil my race, evil my qualities all,
> Great am I only in sin, evil is even my good.
> Evil my innermost self, foolish, avoiding the pure:
> Beast am I not, yet the ways of the beast I can never forsake.
> I can exhort with strong words, telling men what they should hate,
> Yet I can never give gifts, only to beg them I know.
> Ah! wretched man that I am, whereunto came I to birth?

So far we have been dealing with Hinduism as a religion of mystical salvation; and this is right, for the goal of life is *moksha*, 'liberation' from the bonds of earthly life though not necessarily from earthly life itself. This 'liberation' can be experienced either as 'cosmic consciousness' or as a personal God in an act of pure love. In any case 'liberation' is the consummation of the four legitimate aspirations of man. The other three are, in ascending scale: *Kama*, 'pleasure', *Artha*, 'the acquisition of wealth' and *Dharma*, 'righteousness'.

Four Stages of Life

In Hinduism there is room for everything – for the sexual adept described in the *Kama-sutras* as much as for the fiercest ascetic. There are endless discussions on the relative merit of *Kama*, *Artha* and *Dharma*; and although it is generally agreed that dharma, or the quest for righteousness, is the highest of the three, since it alone can create a condition of soul that fits it for 'liberation', the other two are nonetheless legitimate activities and should not be shunned by people who have a natural bent that draws them either to the satisfaction of their desires or to the amassing of a fortune. Indeed from the earliest times Hindu society was divided up into four main classes which roughly correspond to the four legitimate aspirations of man (see CASTE). Thus, men are not born equal, and this for the obvious reason that one's class or caste in this life depends on one's *Karma* in previous lives – on the good and evil deeds that have piled up to one's profit or loss throughout millennia of successive incarnations (see KARMA). What you have sown in previous lives you reap in this one. This is the automatic way of the world and there is no injustice in it.

No doubt the four great classes existed in all their purity in ancient times but very soon a full caste-system developed, each caste being governed by its own rules, particularly as regards marriage and diet. In addition to the ideal four-class system, which very soon ceased to have any relation to the social reality, the law-books laid down a fourfold way of life which members of the three 'twice-born' classes were theoretically supposed to follow. On attaining the age of reason and being invested with the sacred thread (a rite symbolizing his second birth), the now 'twice-born' youth was supposed to leave his home to study the scriptures with a Guru (spiritual director). To this Guru he owed absolute obedience and he had, moreover, to lead a life of complete chastity. Once he had become proficient in the scriptures he was to return home, take a wife, raise a family and, if possible, make a fortune. To his wife and family he would then be as a god and his wife in particular would owe him absolute obedience. The man was entitled to as many as four wives, but no woman could have more than one husband. There was no question of equality between the sexes.

This second stage of life is called that of a householder. It comes to an end when the householder 'sees that wrinkles are beginning to appear and that his hair is growing grey and when his sons are themselves fathers of sons'. At this point he should enter the third stage, that of a 'forest-dweller'. With or without his wife he retires to the forest where he lives on fruit and roots, wearing only a skin or tattered garment. He spends his time meditating on the *Upanishads* and chastising his body in

Bathing in Ganges

Little bands of men and women who had travelled here together from their villages, some of them very old with skin like crumpled parchment, the women singing sadly but triumphantly, lurched barefooted across the silt towards the pragwals, evil-looking men who performed their duties with an air of patent cynicism, in contrast with that of the pilgrims themselves who wore expressions of joy. They had all been shaven with varying degrees of severity in the barbers' quarter: women from the south and widows had had their head completely shaven; the men were left with their chhotis, the small tufts on the backs of their skulls, and those who had moustaches, but whose fathers were still alive, had been allowed to retain them; natives of Allahabad were allowed to keep their hair; Sikhs gave up a ritual lock or two. At one time the hair was buried on the shore of the river; now it was taken away and consigned to a deep part of the Ganges downstream. Like pilgrims everywhere they were not allowed much peace . . . policemen and officious young men wearing arm-bands tried to move them on, but they were in a state bordering on ecstasy, and were oblivious to everything but the river which they had come so far to see, bathe in and perhaps to die by this very morning; for some of them were so decrepit that it seemed impossible that they could survive the sudden shock of the immersion.

The women dressed in saris, the men in loin-cloths, they entered the river, dunking themselves in it, drinking it, taking it in their cupped hands and letting it run three times between their fingers with their faces towards the still invisible sun. Shivering but happy and, if they were fortunate enough to possess them, dressed in clean clothes, they allowed the pragwals to rub their foreheads with ashes or sandal wood and make the tilak mark. They offered flowers and milk to the river, and those who had never been there before bought half-coconuts from the pragwals and launched the shells filled with marigolds on the water, which were afterwards appropriated by the pragwals to be sold again.

Eric Newby *Slowly Down the Ganges*

preparation for the fourth and last stage, that of a fully-fledged Sannyasin (one who has finally renounced this world). He has now discharged his three 'debts'; he has absorbed the teaching of the Veda, has reared up sons to continue his line, and has offered sacrifice according to his ability. Still in the world though not of it, he is now ready to put aside for ever the fetters that bind him to death and re-birth.

The four classes of society and the four stages of life were supposed to be the framework within which society functioned. In practice the classes split up into and absorbed a vast variety of castes and sub-castes, each forming a self-contained social unit. The religious ideal for all remained 'liberation' but for the masses this always remained an infinitely distant ideal, for 'among thousands of men but one, maybe, will strive for self-perfection, and even among these Yogins who have won perfection but one, maybe, will come to know God as he really is.' This is not for the common run of men, who must pile up good Karma or 'merit' by the strict performance of their caste-duty, by performing the daily domestic rites, by frequenting the local temple, by pilgrimage to holy places, by being lavish in their gifts to Brahmins. Then at the end of countless incarnations they will have acquired sufficient merit to be reborn in the 'family of men well advanced in Yoga, possessed of insight.' But even so 'such a birth as this on earth is exceedingly hard to obtain.'

Reform and Renewal

The rise of the *bhakti* sects added a new dimension to Hindu spirituality but it did not threaten in any way the rigid social structure based on caste. Successive Moslem invasions from the 7th century on were quite another matter. Islam is of its nature a proselytizing religion, and with the conversion of the Central Asian Turks it became aggressively so. Conversions were effected *en masse* both by force and, more often, by consent, for conversion could only mean social improvement and emancipation for the lower castes and above all for the outcastes who were regarded as little better than animals. Hinduism's reaction to this stranger in its midst was to turn in upon itself; for Hinduism has always been mystical to its core, since it has always taught that by Yogic techniques man can realize here and now the eternal and divine within himself. So immanent is the Deity that to claim to be God is quite natural since, in some sense or other, everything is God. Hence the utterly transcendent Allah of Moslem orthodoxy held out no appeal for the Hindu. On the whole the new Moslem rulers did not interfere with his customs nor were they given to righteous indignation.

With the advent of the British and the Protestant missionaries who came in their wake things were very different. The missionaries were nothing if not stern moralists. To them the burning of widows, child marriages, and the treatment of the outcastes were an intolerable scandal, and they did not mince their words. However tactless they may have been, they did at least succeed in arousing a social consciousness among the Hindus which had been noticeably lacking before. In the first flush of their optimism the missionaries had hoped that the conversion of India might be in sight. They reckoned without the Hindus' endless capacity to adapt and absorb alien ideas. Conversions were few, largely because conversion meant a complete break with the family and the caste into which the family was compactly built, and so with the whole fabric of Hindu society. Hinduism, on its side, was quite happy to absorb whatever of Christianity it found to its liking.

Christianity entered India as the religion of a conquering and technically vastly superior race. The missionaries were well aware of this and regarded Hinduism as a hideous hotch-potch of idolatry and superstition, making no effort to penetrate to its inner core, let alone to assess its spiritual value. Among the educated Hindus some were indeed converted to Christianity. Others who realized that the strength of the British lay in their superior technocracy and perhaps also in the democratic principles they practised at home, not in their Christianity, abandoned religion altogether, while yet others sought to absorb the Christian ethic as preached in the Sermon on the Mount into Hinduism itself.

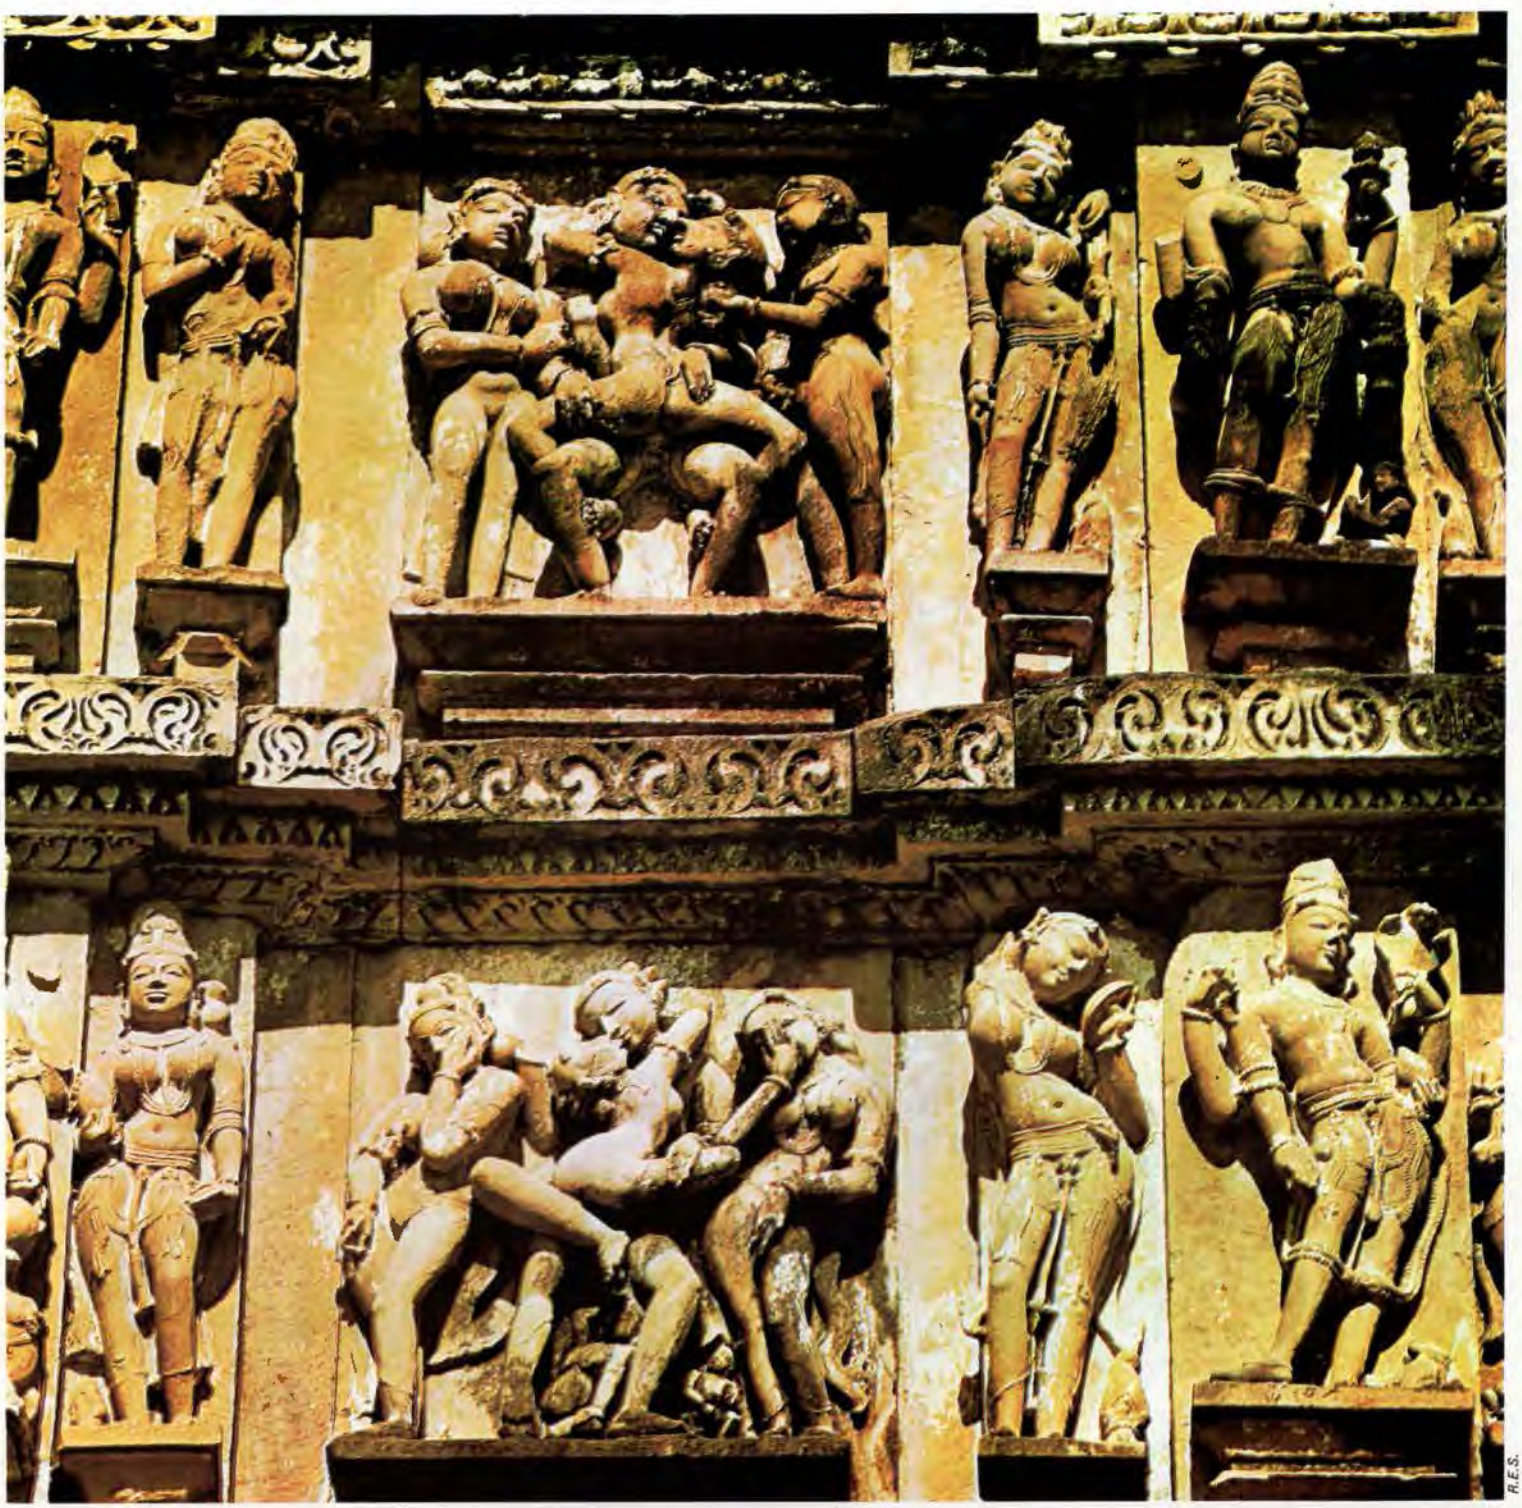
The various reformist Hindu sects of the 19th century and after oscillated between a policy of absorption and of reaction. The first of them, the Brahmo Samaj founded by Ram Mohan Roy, was as iconoclastic as its Protestant mentors. It turned its back on all the specifically Hindu rites and modelled its ritual on Protestant services. Though it had a certain success among the elite, it did not succeed in striking any deep roots and was in any case riddled with schism from the beginning.

Quite different was Dayananda's Arya Samaj; for while being quite as inimical to the corruptions of the Hinduism of its day, it did not look to Christianity for inspiration but to the most ancient stratum of the Veda as interpreted by Dayananda himself. With the Arya Samaj, Hinduism for the first time took the offensive against the imported creeds, Islam and Christianity. Its aim was both to reconvert those who had embraced Christianity and Islam, and to integrate the untouchables into its own form of Hinduism if not into orthodoxy itself.

Ramakrishna and Gandhi

Of more importance was the movement started by Ramakrishna Paramahamsa, and continued by Swami Vivekananda. The purely religious impetus was supplied by the first, the drive and organizing ability by the second. Ramakrishna was a charismatic personality and a visionary. He studied under every kind of Guru and even joined in the religious life of the Moslems and Christians. He continually had visions of the Divine Mother, to whom he remained passionately devoted; or again, imagining himself to be Radha, he would experience the presence of Krishna too. When among Moslem mystics he had a vision of Mohammed and study of the Christian Gospels duly induced a vision of Christ. The great variety of his religious experiences convinced him that all religions must be true, all being but different paths leading to the one goal which is to realize the absolute oneness of all things in the One Brahman. Hence, after he had himself realized his own oneness with Brahman, his aim was to induce this state in others too. He was not interested in good works as such. 'By these philanthropic activities,' he said, 'you are really doing good to yourself. If you can do them disinterestedly, your mind will become pure and you will develop love of God. As soon as you have that love you will realize him.'

Ramakrishna above all had the gift of spontaneity: he had no talent for organization nor did he see himself as the head of



R.E.S.

Above **Eroticism has an accepted place in Hindu religion and many temples contain a lingam, or phallic symbol, or are covered with frankly erotic carvings**

Following page **The most notorious carvings are those on the walls of the now ruined sun temple on the east coast at Konarak, also called the Black Pagoda; according to the Moslems it was an accursed place where sinister and licentious rites took place**

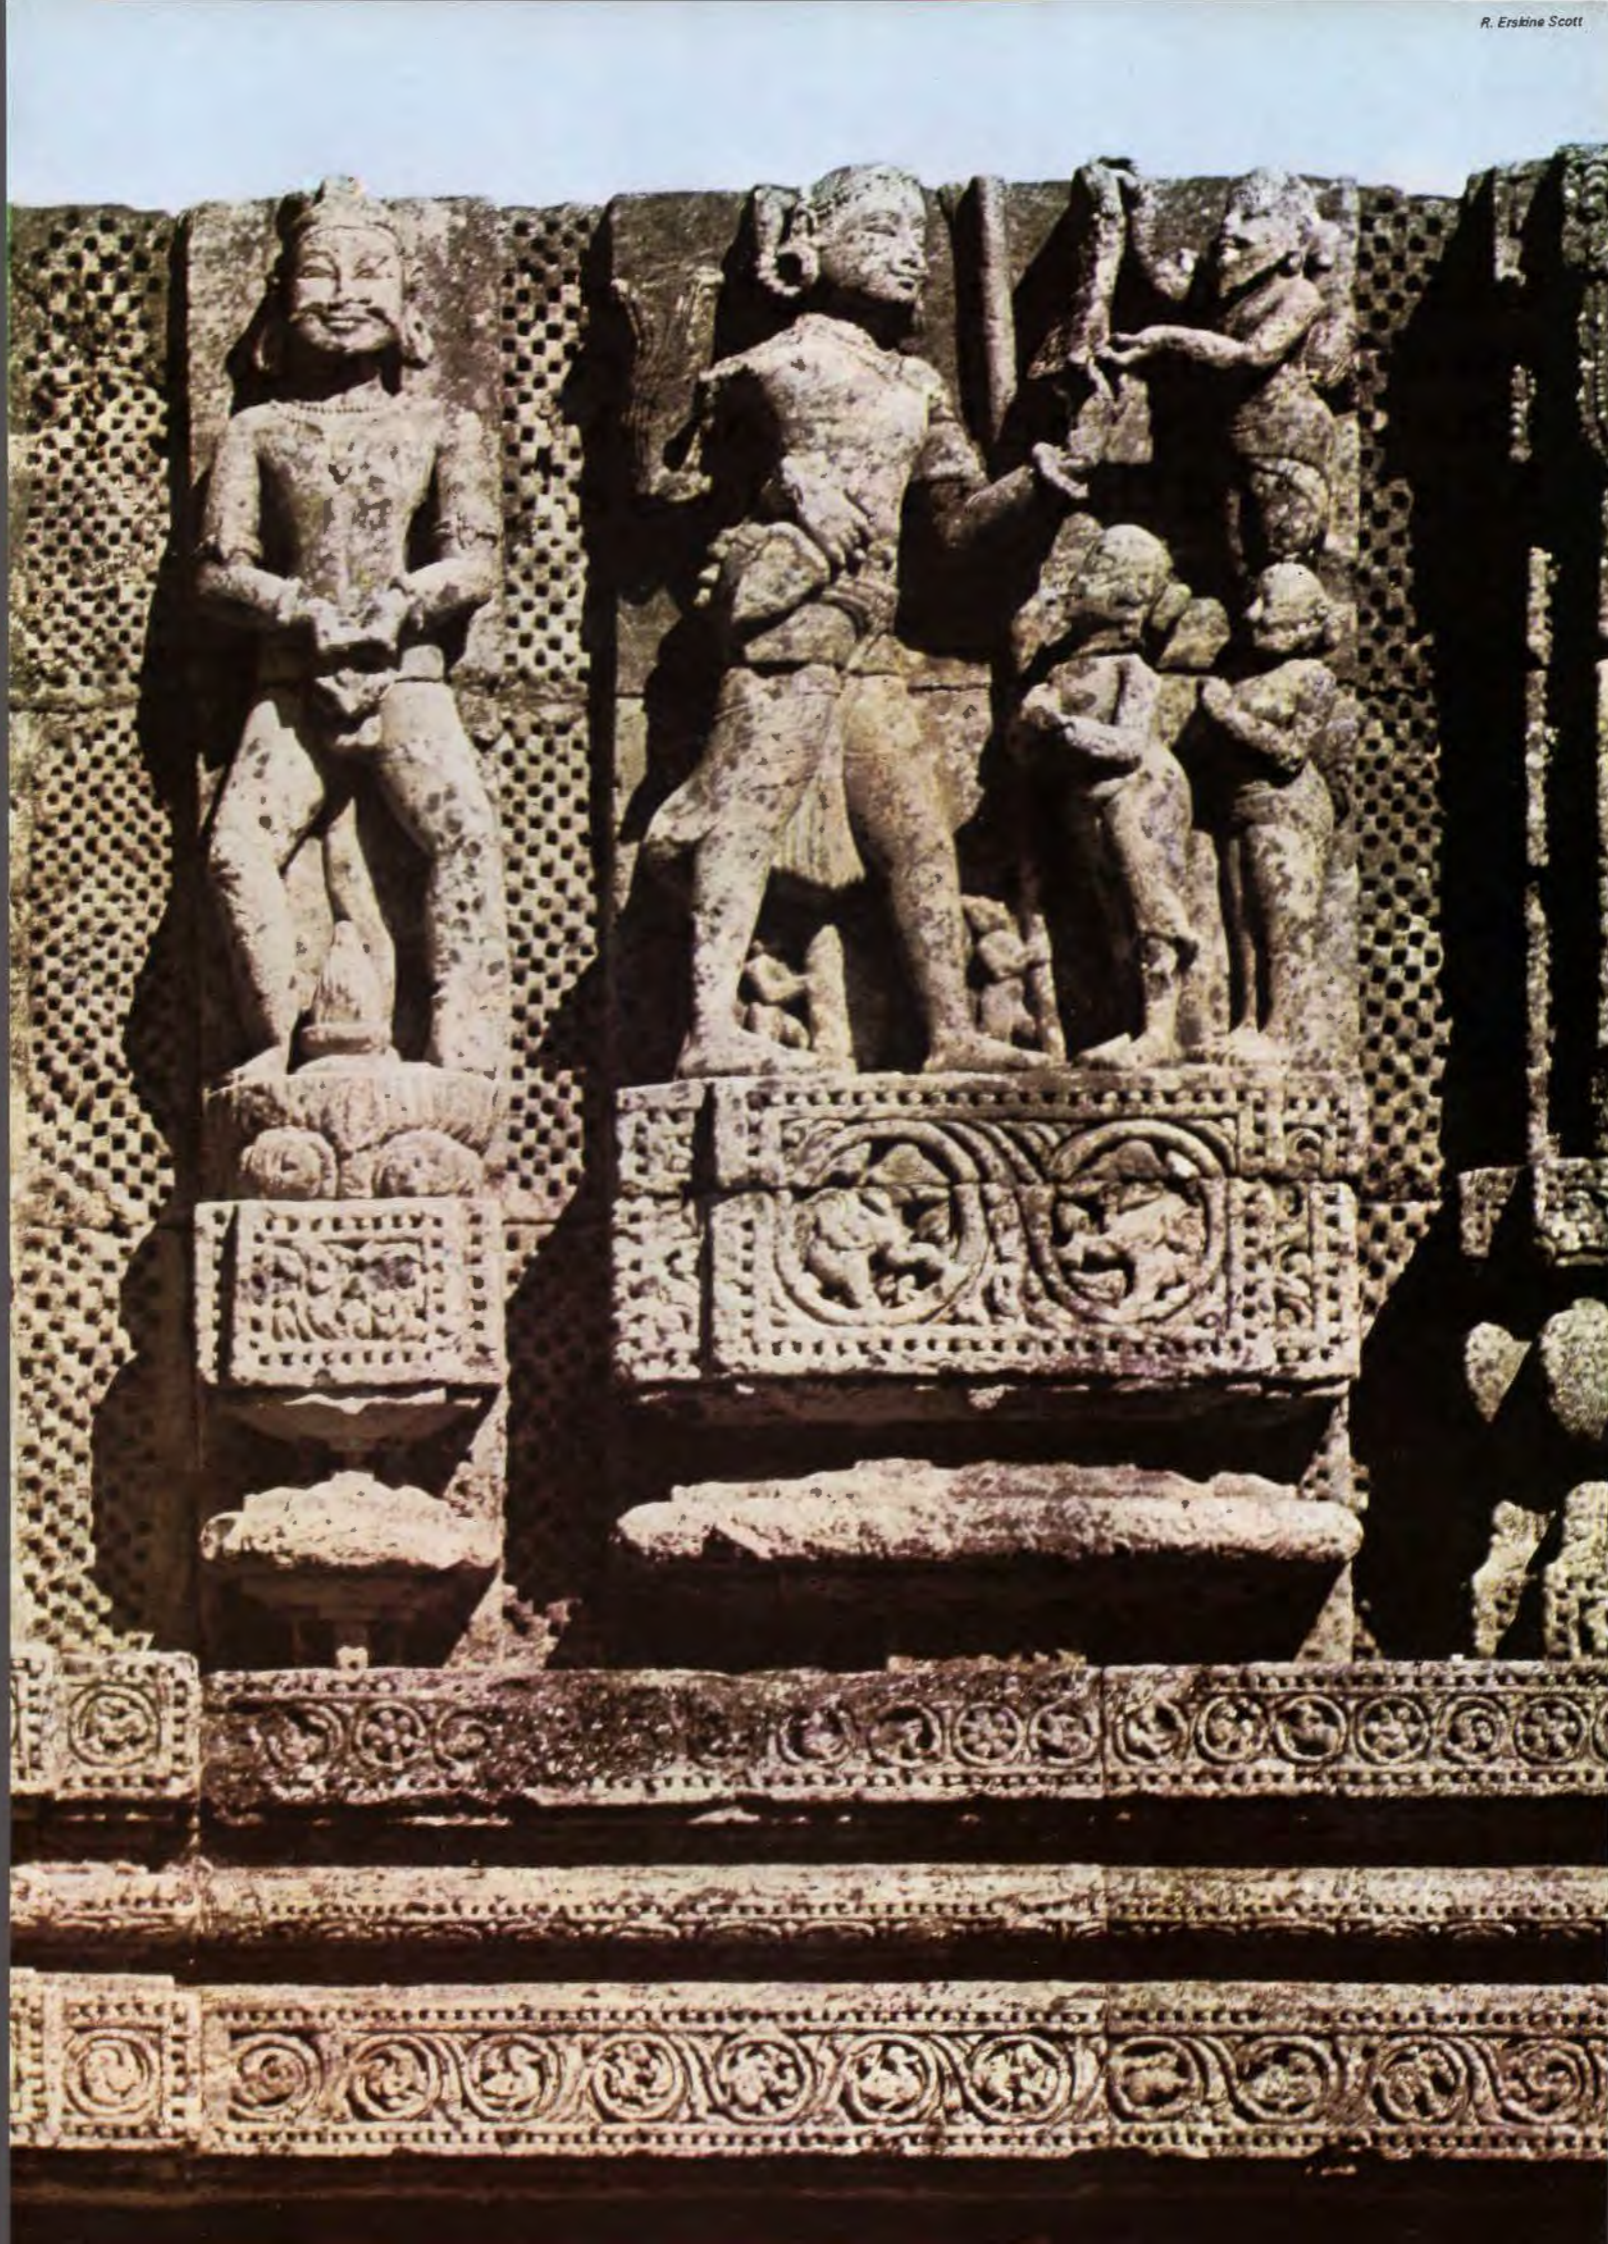
a movement. Vivekananda, whom he made his spiritual heir, not only had a most incisive personality but had also great administrative gifts. At the first session of the World Parliament of Religions at Chicago in 1893 he spoke of himself as belonging to the 'most ancient order of monks in the world' and of his own religion as the 'mother of religions'. Although he said, 'We accept all religions as true,' and although he condemned proselytism of any kind, this did not prevent him from founding Ramakrishna centres in America and Europe, many of which have been extremely successful; for it is the Ramakrishna Mission which has spread the 'gospel' of Hindu monism ('all things are one') in the West and which has made such distinguished converts as Aldous Huxley, Gerald Heard and Christopher Isherwood.

In the West the Ramakrishna Mission has concentrated on disseminating its own inward spirituality, thereby challenging conventional Christianity on its home ground. In India itself, however, it has concentrated on doing in a Hindu spirit what the Christian missions had done before to the shame of Hindu orthodoxy: it has sought to clothe the naked, feed the poor and instruct the ignorant. Both in India and the West it is still very much alive.

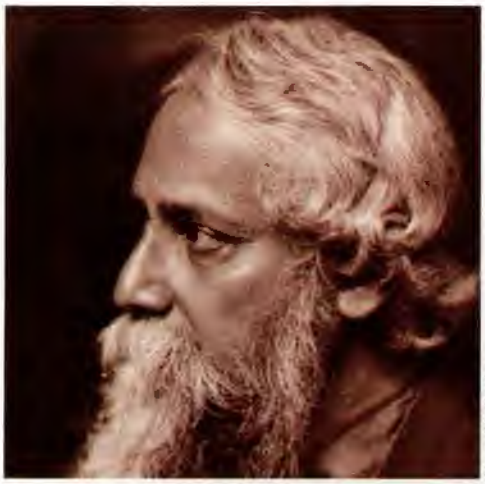
The Ramakrishna mission gave back to Hinduism that confidence which in its first confrontation with Christianity it had so grievously lost. There were to follow many other individual propagandists of this new form of Hinduism, men like Rabindranath Tagore, Sri Aurobindo and India's distinguished ex-president Sir Sarvepalli Radhakrishnan, but without any doubt the greatest and the most influential of them all was Mahatma Gandhi.

Seeing himself always as an orthodox

R. Erskine Scott

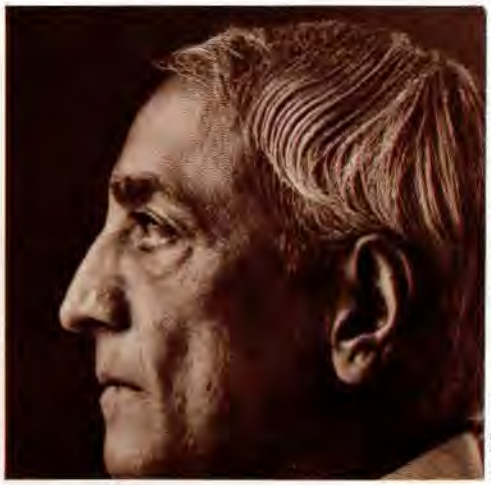


Gandhi did not hesitate to absorb into his own religion what he considered to be best in Christianity and Islam for, like Ramakrishna, he believed that all religions are true



Mansell Collection

Bristol Museum and Art Gallery



Cecil Beaton

The past century has seen considerable interaction between Hindu and Western ideas *Opposite* British lions baffled by the saintly Gandhi, who sits calmly at his spinning wheel; though a devout Hindu, Gandhi acknowledged his debt to the New Testament *Left* Rabindranath Tagore, poet, author and mystic, and winner of the Nobel prize for literature in 1913, helped to make Indian thought better known in the West *Centre* Ram Mohan Roy, 19th century founder of a Hindu sect which modelled its ritual on Protestant services *Right* Krishnamurti was hailed as a new messiah by Annie Besant; occult movements like the Theosophical Society found much that was congenial in Indian mysticism *Bottom* Maharishi Mahesh Yoga, the guru whose teachings attracted the Beatles

Hindu (for none exceeded him in his reverence for the cow) Gandhi nonetheless attacked orthodoxy in some of its most firmly entrenched positions. Unlike Tagore and Radhakrishnan he was not primarily interested in Hindu mysticism, for intellectually he was quite as dependent on the Sermon on the Mount and on Tolstoy as he was on his own beloved *Bhagavad Gita*. Rather, he was interested in putting into practice what he conceived to be the true Hindu dharma here on earth. If his own interpretation of the dharma conflicted with Scripture so much the worse for Scripture.

Acceptance of Untouchables

'My belief,' he said, 'in the Hindu Scriptures does not require me to accept every word and every verse as divinely inspired . . . I decline to be bound by any interpretation however learned it may be, if it is repugnant to reason and common sense.' His God is not the impersonal Brahman of the philosophers. God, rather, 'is Truth and Love; God is ethics and morality; God is fearlessness; God is the source of Light and Life, and yet he is above and beyond all these. God is conscience.' God is, in fact, Gandhi's own Inner Light, and the weapons he will choose against evil will therefore be truthfulness, non-violence, courtesy and love. The supreme evil in Hinduism was, he thought, untouchability, and against this he directed all his moral force; and so great was his prestige that for the first time in history the orthodox were forced to open their temples to these 'people of God', as Gandhi in his deep compassion named them.

Gandhi saw himself as a Sannyasin and lived as one; but it was not the world that he renounced, but the evil that is endemic in the world – desire, anger, avarice and sloth – and it was his fervent desire that India should renounce them too, so that she might be liberated not only from the British but also from all the petty egoism that is inseparable from fallen man. He wished to be all things to all men and did not hesitate to absorb into his own religion what he considered to be best in Christianity and Islam for, like Ramakrishna, he believed that all religions are true. The resulting fusion he offered back to the Indian people as their true dharma, changed it is true, hut the eternal dharma still.

Gandhi came not to destroy but to fulfil. Thus despite the Brahmins' defence of untouchability he never attacked the Brahmin priesthood as such, for it was the one cement that held Hinduism together. So too he saw nothing amiss in the veneration of idols or in the near-worship of the cow (see COW), much less in the immemorial rites in home and temple through which Hinduism transmits its own feelings of the Divine to its most humble adherents. The abuses, of which untouchability was by far the worst – 'the ineffaceable blot that Hinduism today carries with it' – had to be done away with; but the core of the Hindu religion and the religious structure that enshrined it had to be maintained. And for Ghandi the core of Hinduism was contained in the first verse of the *Isa Upanishad*:

> All this that we see in this great universe is permeated by God.
> Renounce it and enjoy it.
> Do not covet anybody's wealth or possession.

Indeed if Hinduism in all its manifold forms has a single message it is this: since all things are permeated by the Divine, renounce all that prevents you seeing this, renounce all egoism and all sense of separateness, so that you may return to what you have renounced but with a benevolent detachment that will enable you to benefit your neighbour spontaneously, not as self-imposed duty. 'Renounce and then enjoy.'

Picturepoint

The Jews and, later, the Christians believed that in the events of history could be seen the guiding hand of God

HISTORY

BECAUSE RELIGION is concerned with the nature and destiny of man, it has to take some account of his past. Most religions have creation myths which provide an explanation of how and for what purpose mankind was created. Some include a kind of legendary history recording the invention of the fundamental arts of civilization.

Of all the religions of mankind two have become so involved with history, or rather with a peculiar version of it, that they derive their distinctive character from this involvement. They are Judaism and Christianity. Their bracketing together is not accidental; for Christianity took over and expanded the Jewish view of 'history'. 'History' in this sense does not mean an objective record of past events; it is rather a presentation of the past, interpreted according to a peculiar belief in divine activity.

The Jewish view of history finds expression throughout the whole of the Old Testament. Sometimes it is presented in the form of historical narrative, as in the books of Genesis or Exodus; sometimes it inspires the outlook of the writing concerned – as, for example, the prophetic books or the Psalms. Its theme is simple, though strange. It is that the god of Israel, Yahweh, had promised Abraham, the nation's first ancestor, that his descendants should possess Canaan and dwell there as his Holy People. To fulfil his promise, Yahweh guided events over many centuries until Israel was successfully settled in Canaan.

Its theme opens in Genesis (chapter 12) with Yahweh's first promise to Abraham. Then follows a series of narratives recounting the fortunes of the first four generations of Israel's ancestors: Abraham, Isaac, Jacob and his sons. Jacob's 12 sons become the founders of the 12 tribes of Israel. Their descendants grow into a nation in Egypt but are reduced to slavery by the Egyptians. The narrative continues with Yahweh's marvellous deliverance of Israel from Egypt, under the leadership of Moses. Eventually the divine promise is fulfilled: Israel, Abraham's descendants, conquers Canaan and settles there.

Israel's conquest of Canaan was a historical fact. Scholars also agree that the Exodus from Egypt had some basis in fact. But the biblical writer interprets these facts as due to the providence of Yahweh. That is not all. He prefaces his account of Israel's ancestors and the Exodus with a record of mankind's history from the Creation to the birth of Abraham.

A conspectus of the past is therefore provided from the Creation to Israel's settlement in Canaan, which demonstrates Yahweh's control and guidance of events. This providential interpretation of history so firmly established itself in the Jewish mind that it coloured the whole of the Jews' subsequent outlook on world affairs. As later Hebrew literature shows, in the darkest hours of misfortune the Jews continued to believe that as Yahweh had guided past events for their ancestors, so he was still working in world history for the ultimate vindication of his Chosen People. From the 2nd century BC this belief became embodied in the Messianic hope – that Yahweh would eventually send his Anointed One to deliver Israel.

Christianity was in origin a Jewish Messianic movement. It therefore took over the traditional Jewish view of history, merely adjusting it to its belief that Jesus was the promised Messiah. But after the destruction of the Jewish national state in 70 AD, Christianity was freed from its involvement with Judaism and became an independent religion with a world-wide mission. This new situation required a fresh assessment of Christianity's relation to Judaism. It also made defence necessary against pagan criticism that Christianity was a dangerous upstart religion; for antiquity was considered a necessary attribute to give a religion respectability.

The need was met by developing an idea formulated earlier by St Paul. It was that the Church was the true Israel. That the Jews, by rejecting Jesus as their Messiah, had forfeited their divine heritage, which

The Israelites safely cross the Red Sea, while their Egyptian pursuers drown; the story of the Exodus was taken by the Jews as evidence of God's special care for their race

British Museum

had passed to the Christians. Hence, the claim was made that Christianity had its roots far back in history – indeed back in God's original promise to Abraham. The Hebrew scriptures were also claimed as the Church's rightful legacy and designated the Old Testament, as distinct from the later Christian writings called the New Testament. The two were embodied in the Christian Bible as documenting successive phases in God's plan of salvation.

On this basis Christian theologians worked out an impressive philosophy of history. They interpreted the past, from the Fall of Adam, in terms of the operation of God's plan to save mankind from the consequences of the primeval Fall. According to them, the first stage of the divine plan is described in the Old Testament. This stage was a preparation for the incarnation of Jesus, the Son of God, as the Messiah of Israel and Saviour of mankind. The Church had been founded, after the Ascension of Jesus, to mediate the fruits of his salvation to mankind. The world would continue until the second coming of Christ. Then all the dead would be resurrected and the Last Judgement would be held.

This Christian philosophy of history has left its stamp on our chronology. We divide the stream of time into two eras, so that years are designated either BC (Before Christ) or AD (Anno Domini – in the Year of our Lord). The latter designation was introduced in the 6th century, the former in the 18th century. It has also left its impress upon our minds. The Western peoples, brought up for generations on the idea that 'God is working his purpose out as year succeeds to year', identify the passage of time with the development of purpose. We expect history to have a meaning.

Western thought differs in this respect notably from Eastern thought, which has been influenced profoundly by Hinduism and Buddhism. For these religions regard history as the repetitive pattern of illusory phenomena in a perpetual cyclical movement. History can therefore have for them no abiding significance nor inspiring purpose.

S. G. F. BRANDON

A number of Hittite myths show a Babylonian origin, while others are paralleled in the legends of the Greeks. But much remains obscure about the religion of this ancient empire

HITTITES

GERMAN EXCAVATIONS since 1907 within the walls of an ancient city on a hillside near the Turkish village of Boghaz Koi in Asia Minor (Anatolia) have revealed the existence of a kingdom which had that city as its capital and which lasted from about 1700 to about 1200 BC. It was called 'the Land of Hatti', its capital was Hattusas, and its people are known as the Hittites, by reason of the undoubted, though remote, connection of the name Hatti with the Hittites, or sons of Heth, mentioned in the Bible. During those five centuries the rulers of Hattusas extended their dominion over populations speaking languages different from their own. One of these was the Hurrians, whose centre was in upper Mesopotamia and whose name is also reflected in the Bible in the form 'Horites'. Our present knowledge of Hittite and Hurrian religion and mythology is due entirely to the German excavations at Boghaz Koi, which have brought to light thousands of broken clay tablets inscribed in the cuneiform script, once the royal archives of the Hittite kings. The archives of the Hurrians themselves have not been found.

Land of 600 Gods

The Hittite texts present us with a bewildering number of divine names. This is mainly because not only each linguistic area within the Hittite empire, but each individual cult centre had its own names for its deities, though they might have similar attributes to those in other places. For example, the weather god was Tarhun in Luwian (and probably in Hittite), Taru in Hattic, Teshub in Hurrian; the sun god was Istanu in Hittite, Estan in Hattic, Tiwat in Luwian, Tiyat in Palaic, Shimegi in Hurrian. Some 600 names have actually been counted. The basic type to which a deity belonged is often shown by the word sign with which his name is written, meaning sun god, weather god, moon god and so on. Otherwise it may be deduced from a description of his cult statue or emblem, from his association with other gods of the same type, or from allusions to his sphere of activity in prayers, myths or other texts. But in many cases the texts give no information about the deity's attributes, so that he or she remains a mere name to us.

The Hittites themselves occasionally recognized an identity, as when we read in a prayer: 'Sun goddess of Arinna, my lady, queen of all countries! In the Land of Hatti thou givest thyself the name "sun goddess of Arinna", but in the country which thou makest a land of cedars (Syria) thou givest thyself the name Hebat.' But when listing divine witnesses to a treaty with a vassal-king they would include not only the sun goddess of Arinna and of Hebat as distinct deities, but also the gods and goddesses of the individual cult centres, even though they might not have distinct names.

The State Cult

The great goddess of Arinna (which has not been located) was exalted as patroness of the state. Her name in Hattic was Wurusemu, but the Hittites appear to have addressed her under the epithet Arinnitti. She is always called a sun goddess, but there are indications that in origin she may have been a deity of

Sonia Halliday

Procession of priestesses from Carchemish in Upper Syria; Hittite influence remained strong in this area for many centuries, while the influence of Mesopotamia is in turn apparent in Hittite mythology

the underworld, her solar attributes being secondary. The king and queen were her high priest and priestess, and in this state cult her husband was the weather god of Hatti, a great figure who bestowed kingship, brought victory in war and might represent the nation in its dealings with foreign powers: thus a treaty with Egypt is said to be for the purpose of 'making eternal the relations which the sun god of Egypt and the weather god of Hatti have established for the land of Egypt and the land of Hatti.' This national weather god is probably the original sky god of the Indo-Europeans, akin to Zeus and Jupiter, brought in by the immigrants who introduced the Indo-European Hittite language into Anatolia in the 3rd millennium BC, and married to the indigenous mother goddess. The weather god of another city, Nerik, was made their son, and they had daughters named Mezzulla and Hulla and a granddaughter, Zintuhi.

Among the deities of the state cult must also be numbered the spirits of past kings and queens, who received regular offerings. 'Became a god' is the normal euphemism for 'died' used by the Hittites when referring to kings.

During the later years of the Hittite kingdom the state cult came under strong Hurrian influence. It was at this time that the sun goddess of Arinna and the weather god of Nerik were identified with the Hurrian Hebat and her son Sharruma. Finally, at a holy place near the capital, now named Yazilikaya, a rocky outcrop forming a natural open chamber was adorned with a series of figures in relief representing a national pantheon. The central group is recognizable as the family of the sun goddess, but the names in Hittite 'hieroglyphs' attached to each deity, including the central group, are those of the Hurrian pantheon. It therefore appears that by the end of the Hittite period, in the late 13th century BC, the Hittites had achieved a measure of unity of worship.

The Hittite mythological texts are, on the whole, poorly preserved, and consequently any account of Hittite mythology must necessarily be incomplete. It seems, however, that in Anatolia itself mythology remained on a rather primitive level. The most elaborate myths preserved in the Hittite archives are either of Hurrian origin or are simply Babylonian myths transmitted to the Hittites by the Hurrians. In the latter class (though it is legend rather than myth) is the Babylonian *Epic of Gilgamesh*, of which there is even a fragment in the Hurrian language. Even where the gods or heroes in these myths are ostensibly Hurrian, they can often be recognized as ancient Babylonian or Sumerian deities under a garbled 'Hurrianized' name. These tales appear to be recorded simply as works of literature. They are of considerable interest on account of features in them which reappear in Greek mythology.

The myth 'Kingship in Heaven' tells how the kingship was held by a series of gods for periods of nine years. Alalu is defeated by Anu and sent down to the underworld; Anu in turn is mutilated and defeated by Kumarbi, who is apparently overthrown by the weather god Teshub. Anu is the Babylonian sky god; the conception of former generations of defeated gods who were banished to the underworld also derives from Babylonia. But Teshub and Kumarbi are Hurrian gods. The myth closely resembles the *Theogony* of Hesiod, where the sequence Uranus-Cronus-Zeus corresponds to Anu-Kumarbi-Teshub.

The king and queen acted as high priest and priestess to the sun goddess of Arinna, patroness of the state, and were both deified after death ***Above*** **Hittite king from Malatya in Anatolia** ***Right*** **Wife and child of the king leading an animal**

A Monster of Stone

The longest mythological poem is entitled 'Song of Ullikummi'. It has a similar theme and tells of a plot by Kumarbi to replace Teshub as king of the gods by a stone monster named Ullikummi, whom he begets for the purpose.

> Kumarbi takes wisdom into his mind
> and an evil spirit as enemy he raises . . .
> At Cool Pond a great Rock is lying;
> her length is three leagues,
> but her width which she has below is one and a half leagues.
> His mind sprang forward,
> he slept with the Rock
> and his manhood flowed into her.

After a considerable gap the Rock bore a child, Ullikummi, who was made of stone. The child was taken to earth and placed on the shoulder of Upelluri, a giant like the Greek Atlas, who supported heaven and earth. Here he grew up in the sea, which only came up to his waist. The sun god saw him and went to report the matter to Teshub, who with his brother Tashmishu gave battle. At first they were unsuccessful and the Stone even came to overshadow Teshub's town Kummiya. Tashmishu reported to Teshub's wife, Hebat, that her husband would have to give up his throne, a message which almost caused her to fall off the roof where she was standing. But Tashmishu and Teshub decided to consult the wise god Ea, who in his turn went first to Enlil and then to the giant Upelluri. Upelluri's reply was as follows:

> When heaven and earth were built on me
> I knew nothing (of it).
> And when they came and cut apart heaven and earth with a "cutter"
> that too I knew not.
> Now something is hurting my right shoulder,
> but I know not who he is, that god.

When Ea heard these words, he had only to turn Upelluri's right shonlder and there was the Stone standing on it. But Upelluri's words had given him an idea. He ordered the 'former gods' in the underworld to produce the ancient tool with which heaven and earth had once been cut apart. With this he severed the Stone from Upelluri and so destroyed its power. Teshub went out to battle again, and though the end of the story is lost, we may be sure he emerged victorious.

This tale too has its parallel in the Greek story of Typhon. The reference to the

Sonia Halliday

building of heaven and earth in one piece on the shoulder of a giant and their separation by cutting is the only surviving hint in the Hittite records of a creation myth.

The myths associated with Anatolian – mainly Hattic – deities are much simpler and more primitive. The 'Slaying of the Dragon' is said to have been recited at a great annual festival called *purulli* and is connected with the Hattian city Nerik. The weather god and the dragon fought together and the weather god was defeated. According to one version, he then appealed to the other gods for help and the goddess Inaras planned a ruse. She invited the dragon to a feast, with barrels of every kind of drink. The dragon came up with his children and they became so drunk that they could not go back to their hole. So the goddess's human assistant was able to tie them up, and the weather god came and killed the dragon.

According to another version of this myth, when the dragon and the weather god fought, the dragon not only defeated the weather god but incapacitated him by gaining possession of his heart and his eyes. The weather god then begot a son by the daughter of a poor man. When this son grew up he took as bride the daughter of the dragon, and his father told him to ask for the stolen organs on entering his bride's home. The demand was instantly met, and the weather god, fully restored, went out to battle again; he succeeded in defeating the dragon, but his son took the part of the dragon and was killed with him.

Myth of the Missing God

Several myths about Anatolian deities belong to a type which we may call for convenience 'the Myth of the Missing God'. They tell the story of a god who disappears and thereby causes a blight on earth, the search for the missing god, his eventual return, and the restoration of health and vigour to the world. In one such myth the weather god withdraws in anger and the search is conducted by the sun god (whose messenger is an eagle), the father of the weather god, his grandfather and his grandmother Hannahanna. In another it is Telipinu, son of the weather god, who is angry, and the gods who search are the sun god, the weather god and Hannahanna, the grandfather being omitted. In both these versions the missing god is found by a bee sent out by Hannahanna. In another similar story the sun god and Telipinu are missing, not from anger, but because they have been seized by Torpor, a demon who has paralysed all Nature. All these myths are accompanied by a magical ritual, the purpose of which is to attract the god back into his temple and to remove some misfortune which his absence is thought to have caused. They are 'ritual myths', recited to enhance the effect of the ritual. In no case is the ritual connected with the seasons. Such magical rituals are in fact common in the Hittite archives.

Other fragments of mythology are found embedded in rituals. One text tells how the moon fell down from heaven and how the weather god sent storms and wind after him to frighten him. Another has a passage describing how an eagle found two goddesses of the underworld in a forest holding spindles and spinning long years for the king – forerunners of the Greek *Moirai*, Roman *Parcae* and Germanic *Norn* (Fates).

The underworld contained, beside the dead, an older generation of defeated gods and some others, such as the Fates just mentioned. Its ruler was Lelwanis, whose gender is uncertain and who seems in some way to be identical with 'the sun god of the earth' and even with the sun goddess of Arinna in some passages.

'Come Back Into Thy Temple'

The Hittites regarded their relationship with the gods as one of servant and master. 'If a servant has anything on his mind,' prays King Mursilis, 'he appeals to his master and his master hears him and takes pity on him and puts right what is troubling him. And if a servant has committed an offence and confesses his guilt before his master, his master may do with him whatever he pleases; but because he has confessed his guilt before his master, his master's spirit is appeased and his master will not call that servant to account.' But a well-intentioned master might still be capricious, and would have his own interests to attend to. 'Now if, honoured Telipinu, thou art up in heaven among the gods, or if thou art gone to the sea or to roam in the mountains, or to battle against an enemy country . . . come back again into thy temple.'

A god must be fed, tended, appeased, flattered. His actions, even when attending to his duties, might not always be wise and might entail unforeseen consequences; it would then be the duty of his faithful servant to point this out to him, so that he might correct his mistake.

If, however, misfortune comes as a punishment for sin, it will not be lifted until the sin has been confessed and expiated. Possible causes of divine anger would be brought to light by questioning the priests or by searching the records. It was then necessary to find out by divination which particular offence was the cause of the present misfortune. 'Now, O gods, whatever sin you see . . . let the old wives, the seers, or the augurs determine it, or let men see it in a dream.' The 'old wives' practised a form of divination by throwing dice; the seers were the experts in the ancient science of haruspicy (inspection of the entrails of the sacrificial victim); the augurs took the omens from the movements of birds. The omens, being either favourable or unfavourable, would give an answer 'yes' or 'no'; in this way, by a lengthy process of elimination, it was possible to discover the precise offence which required expiation. The records of these questions and answers (the latter in technical and barely intelligible language) are among the longest and most numerous tablets in the archives.

Though 'the filthy practice of dressing up like a horse' was for centuries condemned by the Church, hobby-horses are still to be found from the west of Ireland to Sarawak

HOBBY~HORSE

A PERSON who 'rides his hobby-horse' is one who dwells obsessively on his own special interest. But the original hobby-horse was a man who appeared at certain seasons in the guise of a horse, sometimes in the company of dancers and other characters.

A primitive form of hobby-horse is made from a pole on which is fixed a horse's head, sometimes made of wood but often a real horse skull. This is known as the skull-and-pole type of hobby-horse. The skull is cleaned of flesh by burying it for several months; it is sometimes painted and the bottoms of glass bottles are inserted in the eye sockets. The man carrying the pole is shrouded in a sheet so that the horse seems to be rearing.

The hobby-horse is mentioned again and again in early ecclesiastical and civic prohibitions as appearing at house doors during the Saturnalia and the Calends of January. The skull-and-pole type was frequently accompanied by a stag and a calf made in the same way. The Bishop of Barcelona speaks of a stag-maker in 370 AD; this is the earliest mention of the custom. He was followed by St Augustine (354–430 AD) who forbade the 'filthy practice of dressing up like a horse or a stag'. Through the centuries these pagan animal masks continued to be forbidden.

The Tourney Horse

Some time before the 16th century, when the hobby-horse started to take part in masques and entertainments, he began to appear in the form of a man riding a horse – the tourney horse. It is in this form that he is now usually to be seen at his seasonal outings, although the more primitive skull-and-pole type has by no means died out. This heavy tourney type of horse required all sorts of adjuncts – a sword for the man, a pair of false legs in stirrups or dangling free, and many trappings and decorations.

Great Britain keeps alive some remarkable hobbies, notably the Padstow Old Hoss, which comes out regularly on May Day and attracts crowds of local Cornish folk and visitors from much further afield. He is made of a round frame about five feet wide covered with black tarpaulin, with a smallish horse-head in front and a tail at the back; the effect is more like a round dining-table than a horse. The man wearing the frame has a tall pointed cap, and a strange painted face mask with whiskers and a red tongue hanging from the mouth; that is, the figure

Above **The Padstow Old Hoss, with his round frame covered with black tarpaulin, draws crowds of Cornish folk every May Day** ***Centre*** **The tourney hobby, in the shape of a horse with rider, had made its appearance by the 16th century** ***Below*** **The hobby-horse was well known for foolery and 'horse play' – a tradition continued by the comic horse of pantomime**

riding the horse is a horse as well. Another character, the Teaser, dances backwards directing the Hoss with his curious padded sceptre. Both Teaser and Hoss dance beautifully a series of small rapid steps. The Hoss pursues and catches women and girls under his 'cloak' (his round body) and this is considered a powerful fertility action.

The Minehead Horse, another hobby of the tourney type, is still larger, but oblong. The man wears a tall pointed cap and a metal mask. The horse body has lost its head, but boasts a long rope tail in which niggardly onlookers are wound up. They can be swung off their feet and 'booted', that is, beaten ten times with a boot carried for the purpose, while the blows are counted aloud.

The Cheshire horses appear at All Souls (2 November) after the Soulers have given their mummers' play. The hobby-horse, sometimes called Dicky Tatton or Old Ball, then appears with his Driver or Jockey and is sold. He then shakes himself to bits at the feet of his new owner.

Glass-Eyed Mari Lwyd

The best known skull-and-pole type of hobby-horse, with glass bottle bottoms for eyes and a pair of old gloves for ears, is the Mari Lwyd, the famous horse of South Wales. He is beautifully decked out with ribbon and horse-bells, and appears at midwinter, rearing and plunging in the dark street, while the party accompanying him holds a singing contest with the inhabitants of whichever house they visit. Each side improvises a verse. If the householders give out first they must admit the horse and give refreshments all round. If the Mari Lwyd gang is at a loss first they have to retire and try their luck at another door. Once admitted, the horse teases and nudges the girls and, neighing, pretends to bite them.

The Mari Lwyd is accompanied by a Sergeant, a Merryman who is the fiddler, and a couple now called Punch and Judy who may be recognized as the figures known throughout Europe as the fool and Old Woman. The latter is a man dressed as a woman, carrying a broom. These characters often blacken their faces for a disguise.

This type of Mari Lwyd is known in Glamorganshire and Carmarthenshire and is still being made. Another, very rare, type was made from a square of canvas stuffed with straw, sewn up to form a head and snout; it could be made to move about on a pitchfork stuck into the stuffing.

The Great White Horse of Kerry in Ireland was a skull-and-pole creature eight feet high, the man carrying it being covered with the usual white sheet. He came out at midsummer, chased the women and jumped the midsummer fires. This was a rite in honour of the sun and to promote increase of every useful kind.

Continental Horses

In France the hobby is called *le cheval-jupon*. The most celebrated dancer is the Zamalzain in the Soule province of the French Basque country, who is accompanied by a whole company of dancers, singers and musicians. On the Spanish side of the Pyrenees are other Basque hobby-horses. There is a very primitive one at Lanz in Navarre, connected with a giant; at Pamplona there is a Zaldiko-Maldiko (horse-mule) which lashes out with a fool's bladder; also in Navarre two stuffed hobbies, heavy and difficult to manipulate, are brought out at a local feast. There are many hobbies, 'cavallets' and 'wild mules' in Spain and Portugal which take part in processions, but processing seems to have detracted from their more ancient ritual character.

Belgium has hobbies of all shapes and sizes. Few of these carry out ritual acts, but they frequently accompany processions. A hobby-horse representing Cheval Bayard, a giant horse of legend, carries the four sons of Aymon on his back high above the crowds in various festival processions.

In Switzerland, hobbies recite carnival verses outside houses, loudly whinnying to the girls. The Schimmel, the white horse of Upper Murthal in the Austrian Alps, follows a troop of carnival runners calling in high falsetto voices, whose leader cracks a long Alpine whip. When these bringers-in of spring have run off to their next place of call the Schimmel appears and is put up for sale, as amongst the Souler-Mummers in Cheshire villages. If anyone is foolish enough to buy him, the white horse shakes himself to pieces at his new owner's feet.

On the Slovenian side of the Alps lives Rusa, an inoffensive hobby though his head and neck are covered with porcupine quills. Sometimes he is accompanied by terrifying human maskers of strongly Alpine influence. Like nearly all hobby-horses, Rusa is a seasonal horse: he helps to bring in the spring and must be paid for his services.

In Bohemia hobby-horses are so large that three men hide beneath the cloth, while another rides. In the same region, and around Brno in Moravia, a horse-head carved in wood is carried on a stick at the head of wedding processions. The general name for these heads is the Klibna, said to mean Mare; they tend to be comic rather than frightening. Sometimes accompanied by goat-maskers, they come out during carnival; occasionally they appear on St Nicholas's Day (6 December). They too bring in the spring and fertilize farm stock, not forgetting the women and girls who, screaming, join in the kitchen skirmishes with annual zest.

Poland too owns hobbies round about Cracow; one celebrated one which appears in early summer on Corpus Christi Day in a suburb of that town is said to commemorate a victory over a Tartar invasion. The horse rider is supposed to be dressed as a Tartar. The hobby rushes through the streets and lies down for a few minutes on the steps of the bishop's palace; this may signify a momentary death.

Village Comedy

The hobby-horse is known far beyond Europe, providing an important link in Indo-European tradition. In southern India at Madura, a village comedy is enacted in which a woman – really a man dressed as a woman – is robbed as she sleeps, even to the pillow beneath her head. Two hobby-horses appear, one takes the woman as his own and refuses to let anyone come near her. These horses go to weddings, as in many European regions.

Sometimes musicians give chase to the horse, who at last allows himself to be caught and dances with his captors. Near Mysore, the horse prances on stilts, and halfway through the performance sheds his outer garment and appears as a woman. Yet another hobby makes his own horse's head on the spot, cut out of an areca palm; attendants of the local deity sit on the ground and the horse prances round them, finally falling into a trance. Here the horse ritual has been combined with the local religion.

Beautifully plaited rushes form the hobbies of Sarawak, and the ritual animal-masker is a well-known figure in China.

VIOLET ALFORD

Mary Evans Picture Library

Hogmanay

Name for New Year's Eve in Scotland and parts of the north of England; the departure of the old year and birth of the new is celebrated with much feasting and drinking; children go from door to door singing songs and asking for cakes, small gifts and coins; also the occasion for the custom of First Footing.

See FIRST; NEW YEAR.

Holda

Germanic sky goddess, sometimes also a fertility goddess or goddess of the hearth; she was commonly the leader of the Wild Hunt which rode on stormy nights; snow was caused by Holda shaking her feather bed, while rain fell when she washed her veil; in Germanic folklore she became identified with the Queen of the Elves and was also associated with witches, herself appearing as an old, witch-like woman; Grimm's fairy tale *Frau Holle* (an alternative name for Holda) repeats many of the motifs of earlier legend.

HOLINESS MOVEMENT

AFTER CONVERSION, the man who was saved might seek and obtain a second blessing, by which he might be entirely sanctified. This was a doctrine widely current among Protestant evangelicals in the 19th century. The more extreme maintained that sanctification was instantaneous, some of them asserting that after sanctification a man could not sin and was perfect; while the moderates believed that this second blessing, of the Holy Ghost, led to a gradual cleansing of the heart.

Although the Holiness movement is a 19th century phenomenon, and continues to be significant in the 20th, its roots go much further back. As the name suggests, Holiness owed much to Pietism, which laid emphasis on leading an exemplary moral life in conformity to religious commitment and, if need be, in dissociation from the world. Pietism had developed among some of the Lutherans, of whom the German Count Zinzendorf (1700-1760), patron and leader of the Herrnhut community of Moravian Brethren, was the most important to the development of Holiness ideas.

Zinzendorf emphasized the doctrine of grace and the encompassing love of God; and it was from the Moravians that John Wesley acquired in the 1730s confirmation of his own teachings about the holy life, and at their hands that he underwent a profound 'heart-experience'. Wesley had had his own Holy Club whilst at Oxford, and lay societies emphasizing the holy life had existed in England in the late 17th century; but the idea of holiness touched off by a distinct experience and as a second blessing appears to stem from this time. Wesley's theology taught that man could obtain assurance of salvation, and that this condition of assurance was associated with leading a sanctified life that manifested holiness of heart. Although this emphasis on holiness was a central part of Wesley's theology, many Methodists paid less heed to it as time went by. There were always a minority, however, who emphasized holiness. Particularly in the United States, small groups met, from the 1830s onwards, to seek the experience of sanctification.

A State of Perfection

Another stream of theological thinking in the United States contributed to the Holiness movement. This had Presbyterian origins, but became fully convergent with Methodist Holiness ideas in the sermons of Charles G. Finney. Finney believed that through the power of the Holy Spirit men might reach a state of perfection similar to that of Adam before the fall.

Perfectionist ideas had also arisen independently in various parts of New England, where some of their advocates had preached that, since they were sanctified and could not sin, whatever they did was, by definition, not sin. The irregularities occurring among them and the advocacy of sexual communism by the Perfectionist, John Humphrey Noyes, created profound distrust of Holiness ideas among the general public.

During the 1860s increasing numbers of Methodists met to cultivate Holiness experience and to seek the second blessing. The Methodist churches generally distrusted this development and tension arose between Holiness advocates and other Methodists. The growing appeal of Holiness may be associated with the shift, particularly marked in revivalism, from 'hell fire' preaching to increased emphasis on the love of God, who was now presented less as a punitive Jehovah and more as a benevolent being eager to love all mankind.

It is important to emphasize that this Holiness belief in the action of the Holy Ghost at the second blessing, and the expectation that 'the fire would fall' and give rise to intense emotional expression, is quite distinct as a theological idea from that which arose in the early 20th century among the movements that came to be known as Pentecostal. Holiness advocates used very similar terminology to that which the Pentecostalists employed later on, and the more extreme groups expected manifestations of Holy Ghost power, but their expectations were much less precise than those of the Pentecostalists. Holiness people did not assert that the gifts of the Spirit (as described in 1 Corinthians, chapters 12-14) were in operation in their own times; they did not produce theological justification for speaking in tongues and uttering prophecy, and did not suggest that these phenomena should occur in their church services.

Many Holiness advocates were anxious to remain in their previous church fellowships, and this was generally the position favoured by the revivalists. Most of them were not originally interested in starting new sects, against which their general evangelical position strongly disposed them. In England, many evangelicals in the Church of England and in the Noncomformist denominations were attracted to Holiness ideas, from the time of the second evangelical awakening in 1857, and as a result of campaigns brought to Great Britain by Dwight L. Moody in 1873 and 1883, but most of them continued in their existing fellowships.

The Salvation Army

Most important of all the British developments that were influenced by the Holiness movement was the Salvation Army. Its founder, William Booth, had been a Methodist New Connection preacher who struck out on his own. He accepted Holiness ideas and rejoiced when 'the fire fell' at his meetings. Salvationism, however, is a many-sided movement and its development cannot be wholly accounted to Holiness teachings.

In the United States, where many Holiness groups among Methodists were organizing camp meetings and prayer meetings, church officials grew more and more hostile to these minorities that professed superior

Chris Barker/Victoria and Albert Museum

Holiness ideas flourished in the periodic religious revivals of the 19th century. Emotional behaviour when 'the fire fell' was easily ridiculed by contemporaries

blessing and affected more holy attitudes in everyday life. The more radical groups provoked unfavourable public notice, and their severe attitude to tobacco, jewellery, musical instruments and adornments of dress disturbed the less rigorous rank-and-file of Methodists. Perhaps no less important was the disregard that Holiness preachers paid to denominational boundaries which was a more explicit challenge to ecclesiastical officials.

Church of the Nazarene

When separate and independent sects did emerge, some of them took the title 'Pentecostal', and one of the largest amalgamations, finally effected in 1907, took the name Pentecostal Church of the Nazarene. In 1919, in order to distinguish themselves from the 'tongues movement', as they called the later Pentecostalists, these Holiness believers dropped the word 'Pentecostal' from their title. This body became one of the largest Holiness sects, with thousands of adherents all over the United States, and a small following in Britain.

Holiness sects are numerous in the United States, and there are a number in Britain. Some consist of no more than one local congregation. Some continue to emphasize freedom of worship, and are 'Holy Rollers'. Others, such as the Church of the Nazarene, have adopted a more staid evangelical form of worship. Yet others have retreated into an introverted cultivation of holiness. Some remain vigorously evangelical, but others have adopted a more élitist position – always a possible interpretation of ideas of a second blessing and entire sanctification. Many Holiness groups have remained disdainful of ecclesiastical organization, regarding Holy Ghost power and the sanctified life as all that men need for life and worship. Although there has been a very considerable effort in the mission field, some groups have become somewhat inward-looking and are indifferent to the recruitment of what they sometimes call 'joiners'.

(See also HOLY ROLLERS; PENTECOSTALIST MOVEMENT.)

BRYAN WILSON

The praises of the holly and the ivy are sung in many carols. But even in pre-Christian times these plants were valued for their magic power and their ability to keep off evil

HOLLY AND IVY

TWO EVERGREEN TREES, the holly and the ivy, are regularly linked together. Both are inseparably associated with Christmas, and everyone knows the carol celebrating

> The holly and the ivy
> When they are both full grown . . .

There is a less well-known one in which it is said:

> Christmastide
> Comes in like a bride,
> With holly and ivy clad.

Ivy is the more ancient plant, mythologically speaking, first of all in connection with the god Dionysus, who was born after Zeus had bedded Semele, daughter of Cadmus, King of Thebes. Zeus's wife Hera, in the guise of a nurse, suggested to Semele that she should ask Zeus to unveil himself to her. But when he did the divine flames consumed her, and would have killed the unborn child but for a sudden growth of ivy. Zeus placed the infant in his own thigh until it was ready for birth. Another version of this legend makes Semele abandon the infant under an ivy bush. *Kissos* or *cissos*, the ancient name for ivy, was supposed to have been Dionysus's earliest name. Kissos in another legend is the name of a nymph who danced with such abandon at a Dionysian feast that she collapsed and died of exhaustion before the god; he, grieving at this untimely death, changed her into ivy.

Dionysus (also called Bacchus) was often portrayed with an ivy wreath on his head, and the plant is mentioned in many of the legends associated with him. There was a Dionysus ivy in the Attic town of Acharnae (as there were other trees elsewhere linked with Dionysus as god of trees). Plutarch records that the Bacchae ate ivy and that the resulting intoxication gave rise to their 'inspired fury' (although ivy was later supposed to diminish drunkenness). If the priests of Jupiter even touched ivy this was thought to put them into a prophetic trance.

From its association with Bacchus, god of wine – a reputed source of inspiration – ivy became a suitable plant for a poet's crown; Virgil thought it should be accorded to woodland or bucolic poets rather than urban ones. At one time ivy was the recognized wreath-plant for victors in the Isthmian games held at Corinth, and ivy crowns were also presented at a Spartan festival honouring Hyacinthus. At Greek wedding ceremonies, a wreath of ivy was given by the priest to the newly married couple since – presumably because of its twining propensities – ivy is an ancient symbol of fidelity.

Sign of a Tavern

Again reflecting its association with Bacchus, ivy was used by the Romans to signify a wine shop; it was either trained over a booth, made into a 'tavern-bush' on a wooden frame, or hung in a bushy mass on the tavern door. The custom was introduced into northern Europe and there are allusions to it in later literature. Thomas Nashe, in his comedy *Summer's Last Will and Testament* of 1600, speaks of 'Green ivy bushes at the vintner's doors', and it is from this practice that we get the expression 'good wine needs no bush', meaning that a good commodity needs no advertisement. It occurs at the end of *As You Like It* when Rosalind says, 'If it be true that good wine needs no bush, 'tis true that a good play needs no epilogue.'

Mary Evans Picture Library

Holly, associated with Christmas since the time of the Roman Saturnalia, forms a fitting crown and sceptre for Father Christmas himself

Despite these associations with the tavern, ivy has an ancient reputation as a preventer of intoxication. Pliny recommended a brew of ivy berries before a drinking bout, and there are later recipes for vinegar in which ivy berries had been steeped, to be taken before drinking, and a preparation from ivy leaves, to be taken afterwards to prevent a hangover. Cato wrote that one could cure drunkenness by taking wine in which ivy leaves had been steeped, and the use of a cup made of ivy wood was also recommended. In the 17th century, wine was thought to prevent infections if it had stood in an ivy-wood container. More specific folk remedies recommended the leaves, prepared in various ways, to treat corns, serve as an eye lotion and cure skin rashes and running nose in a cold; powdered ivy berries were recommended against plague and an ivy wreath to prevent baldness. These suggestions are all rather curious, because ivy is somewhat poisonous.

Protection against Evil

Holly and ivy were plants of magic power and were used as a protection against evil long before Christmas was celebrated. In Roman times any sacred fire was best started by rubbing together a piece of ivy and one of bay wood. Ivy growing on a house protected it against witchcraft and other evil, and if it withered or fell off this was a sure sign of misfortune to follow; in Wales it was supposed to mean that the house would somehow pass into other hands. In Scotland small wreaths of ivy, sometimes combined with mountain ash and honeysuckle, placed over the entrance to a byre and under the milk containers protected the animals and their produce. German cowherds made ivy wreaths for their cattle when they led them out to the spring pastures for the first time. In France ivy was often included as one of the protective herbs of St John (see ST JOHN'S WORT).

Holly was likewise protective in ancient times. Pliny describes its value planted near

a house, to keep away lightning, spells and evil. He went on to suggest that it had power over animals: if a branch were thrown at any creature it would cause it to lie down and obey the thrower. He also believed it would protect agaiust poison, and that its flowers would freeze water.

Saturnalia Decorations

Holly and ivy presumably first came together as decorations in the Roman Saturnalia, the midwinter festival which the *Oxford Dictionary* describes as 'a time of general unrestrained merrymaking, extending even to the slaves': it was in fact a celebration of the equality between human beings which was supposed to have existed in the reign of Saturn. It was also a time of exchanging presents, and it was customary to decorate rooms with various evergreens. This practice doubtless derived from a very ancient custom of gathering green branches at the winter solstice as part of the magical rites which ensured the rebirth of crops and other vegetation in the spring.

When the early Christians decided to celebrate the birth of Christ at midwinter they continued to decorate their houses in this way. As time went on the Saturnalia languished, but the Christians continued to use evergreen decorations at the midwinter festivities, besides keeping up other ancient customs such as the use of mistletoe.

Early Christians may have encouraged the use of holly by calling it Holy Tree, an easy corruption, as an alternative to trying to crush an ancient practice. The word holly, incidentally, derives from Norse *hulfre*, which Chaucer wrote *hulfere*. Holly was quite recently used in Italy, with other plants, to deck mangers in commemoration of the infant Jesus's first bed. Ivy, however, with its vinous links, was frowned upon as a church decoration and was only thought fit to be placed in doorways.

The holly leaf, being normally prickly, could be thought of as repelling enemies: it was thus considered a protection at any time. The red of its berries provided extra protection, and the combination of leaves and berries was especially effective against the Evil Eye. The Christians linked the spiny leaves and red berries with the Crown of Thorns and the drops of blood it caused. It was naturally unlucky to injure holly.

One curious and rather unpleasant custom was still carried out about 150 years ago at Tenby, Pembrokeshire. Men and boys went out 'holly beating' on Boxing Day, which meant striking any girls they met on the arms with holly branches.

A pleasanter custom links the holly with 'First Footing', still carried on in Scotland and the North of England. First Foot is the ritual good luck bringer: the first visitor on New Year's Day, he arrives soon after midnight, bringing bread, coal and salt, which symbolize adequate food, warmth and money for the household in the coming year (see FIRST). He also carries an evergreen branch, often a holly, as a token of life. If he does carry a holly bough it has to be male holly: female holly would bring bad luck. Male holly is traditionally, though erroneously, thought to have prickly leaves and 'she-holly' smooth ones.

Holly Bears the Crown

Ivy is as magical and protective as holly, being used especially to protect farm animals and produce, while holly protects the house. In spite of this, ivy has become subordinate to its partner. We know from the carol that

> Of all the trees that are in the wood
> The holly bears the crown.

In a medieval poem the same theme occurs:

> Then spake holver (holly) 'I am fresh and jolly;
> I will have the maistry (mastery)
> In lands where we go.'

However, one should certainly include ivy in the Christmas decorations, because it brings luck to women. Moreover it has many qualities, as another carol tells:

> The most worthy she is in town;
> He that sayeth other do amiss;
> And worthy to wear the crown:
> *Veni, coronaberis.*
>
> Ivy is green, with colours bright,
> Of all trees best she is,
> And that I prove will now be right.
> *Veni, coronaberis.*

It was supposed to be unlucky to bring holly, ivy and all other Christmas greenery indoors before Christmas Eve or to discard them before the end of the festivities; to do the latter would be to throw away prosperity and possibly cause a death in the household. Originally greenery was left until Candlemas (2 February), the feast of the Purification of the Virgin Mary and the original end of the Christmas period. Nowadays Twelfth Night (5 January) is the accepted time.

In some districts it is considered desirable to burn the greenery; in others bad luck would follow this. In every case it is unlucky to burn the greenery while it has any life in it, especially the holly. A sprig of holly can be preserved, for it will bring good luck to the house all the year round. It is unlucky to crush a holly berry underfoot or to bring indoors a sprig in flower.

There are a number of minor myths connected with these two plants. Leaves of a she-holly placed under their pillows assisted North country girls and boys to dream of their future consorts. Nine leaves had to be collected at midnight on a Friday and tied with nine knots in a three-cornered handkerchief. The charm would only work if no word was spoken until the following dawn. Holly was used in the 'witch's chain' of holly, juniper and mistletoe berries, linked with acorns and wound around a branch, which was burnt with due ceremony by three unmarried girls. As the last acorn went into the flames each girl would see an image of her future husband or, if doomed to remain single, a coffin.

Ivy also had its uses in divination. In Oxfordshire, if a girl put an ivy leaf in her pocket, the first man she met would surely wed her even if he was already married. In Scotland the leaf was put into the girl's bosom while she said this verse:

> Ivy, ivy, I love you.
> In my bosom I put you.
> The first young man who speaks to me
> My future husband he shall be.

Fortunes could also be told with ivy. If an ivy leaf, placed in water on New Year's Eve, was still fresh on Twelfth Night, the year ahead would be favourable. If black spots formed, illness was certain, its seat depending on the part of the leaf affected; spots all over meant death within the year. In Herefordshire the formation of a coffin-shaped mark on a soaked leaf denoted death. It was lucky to dream of ivy, for this foretold happiness.

In the language of flowers holly stood for foresight and ivy, not surprisingly, for fidelity and marriage. A sprig of ivy with tendrils meant 'assiduous to please'.

A. J. HUXLEY

Holy

Sacred, set apart: the term is commnnly applied to the divine and what belongs to the divine; also applied to human beings who are reverenced for their religious devotion or pious life.

Sonia Halliday

Holy Ghost

Or Holy Spirit: the third person of the Trinity, represented in Christian art by a white dove; generally thought of as divine energy active in the world, seen first in the spirit of God or *ruach* which inspired prophets and heroes in the Old Testament; the Holy Ghost plays a much greater part in the New Testament, being particularly connected with Christ's birth, baptism and temptation, and with the events of Pentecost.

See BREATH; DOVE.

British Museum

Generally simple people with few emotional outlets, the Holy Rollers make religious meetings the occasion for hysterical outbursts and violent paroxysms of leaping, jerking and rolling on the ground, sometimes for hours at a time

HOLY ROLLERS

NO RELIGIOUS GROUP describe themselves as Holy Rollers. The term has, however, been widely used, certaiuly since the middle of the last century, to designate religious congregations where emotional display is encouraged and violent physical activity is not ouly socially approved but taken as evidence of the power of the Holy Ghost. Although such groups are known in Britain, they are much more common, and the term is more widely used, in the United States.

The Holy Rollers belong to the revivalist tradition of the American frontier, where itinerant preachers would call men to redemption by vigorous depictions of hell fire awaiting all those who were not saved. At the camp meetings common in the 18th century in Kentucky, Tennessee and other frontier states, preachers judged their success by the numbers 'slain' for the Lord—caused to drop in a swoon-like state to the ground. Groaning and weeping were common, and various kinds of paroxysm, such as jerking, were well-known; commentators wrote of men, convicted of their state of sin, shrieking, bounding about 'like live 'fish out of water' or rolling on the ground for hours at a time. These acrobatics, from which the name of Holy Roller is derived, were generally explained as the result of anguish for sinful lives rather than as ecstasy at the prospect of eternal bliss.

Revivalist Origins

The Great Revival in Kentucky at the end of the 18th century gave rise to perhaps the most sustained and widespread outbreak of these phenomena in Western history. Camp meetings were frequent and the revival spread over a wide area, leaving a strong imprint on the style of religion in the Mid-West. Revivalism continued intermittently throughout the 19th century in these areas; it provided both dramatic relief from the rigours of everyday life, and prospects of assurance in a society that gave rise to many hazards and uncertainties. Among a rural, unsophisticated public, lacking both a stable tradition and the example of better educated classes, the excesses of the revivals were to be expected. Various groups operated on the fringe of the early revivals, and may have stimulated their emotionalism: such were the Shakers, whose name derived from their practice of trembling vigorously when seized by the Spirit, The principal preachers in the Kentucky Revival, however, were Methodists and Presbyterians.

The tone of revivalism became more restrained as the 19th century advanced, particularly among the better established denominations. After the 1820s, the Presbyterian revivalist Charles G. Finney discouraged the writhing and rolling that had occurred at his early meetings. The evangelist Dwight L. Moody, who was active in the 1860s and '70s, also disavowed excessive emotionalism.

Outside the orthodox denominations, however, holy rolling continued, particularly in backwoods areas in Kentucky and neighbouring states where the ecstatic revivalist tradition persisted. In recent decades these phenomena have usually occurred in locally-run assemblies that are unattached, or only very loosely attached, to any larger organization. Doctrine is evangelical and fundamentalist, often of a crude variety, and the principal interest is in the shared experience of seeing 'the fire fall', as the onset of emotional and hysterical behaviour has often been termed. Spontaneity in worship is highly prized, but inhibitions are often released in such meetings by the repetition of particular phrases shouted in invocation or praise. 'Jesus', 'Come Lord, come' are typical phrases, but others, such as 'Blood', also occur.

Backwoods Congregations

Holy Roller congregations have been drawn almost exclusively from the poor and uneducated of rural areas, from people whose lives are often emotionally barren except in early childhood and in early motherhood, and whose emotional control is little developed. Women predominate in such meetings, and some accounts suggest that they often outnumber men by two, three or even four to one. The sanctioning circumstance of a meeting called in God's name, which enables the congregation to experience emotions otherwise socially inhibited, and at the same time to enjoy the status of becoming a vessel for the Holy Ghost, or a sinner redeemed by God's love, readily calls forth abandoned behaviour. The force of suggestion and of imitation is evident in such meetings, but there can be no doubt that those engaged do experience sensations that they interpret as a great infusion of power, usually attributed to the Holy Ghost.

In this, some difference will be noted between the interpretation given to rolling at revival meetings, and the justifications that are offered for the bodily exercises encouraged in the Holy Roller assemblies. At revivals, the individual was being convicted of sin, and his behaviour was seen either as a punishment, as a manifestation of mental anguish, or even as the effect of the exorcism of evil from his body. At the meetings of extreme Holy Roller sects, whilst an individual may writhe in anguish at the recollection of sin he is, in such an assembly, theoretically already a saved person. His bodily exertions therefore tend to be regarded as the 'in-filling' of the Holy Spirit, and are interpreted as confirming his redemption, rather than as redemptive. Holy Rollers themselves, however, are not usually sophisticated about doctrinal distinctions, and both interpretations are sometimes current.

Although Holy Roller congregations are

Ronald Sheridan

A vigorous display of holy rolling by American visitors in front of the tomb of Christ in Jerusalem

not concerned with formal doctrinal justifications for their behaviour, their thinking was influenced by the Holiness Movement (see HOLINESS MOVEMENT), with its emphasis on the second blessing of sanctification and the accompanying experience of the 'latter rain' (of which mention was found in Joel 2.23 and James 5.7), when it developed in the latter half of the 19th century. Many of the more extreme Holiness preachers were themselves intense believers in Holy Ghost power, and that power was only evident when their congregations made it manifest. They prayed for the 'holy dynamite', and some of them became much more preoccupied with vigorous emotional expression than with the sanctified life and 'heart-cleansing' that were emphasized in more sophisticated Holiness theology.

'Speaking with tongues': under the impact of Pentecostal teaching, which encouraged such emotional behaviour, all forms of holy rolling became more common

Camera Press London

Fire from Heaven

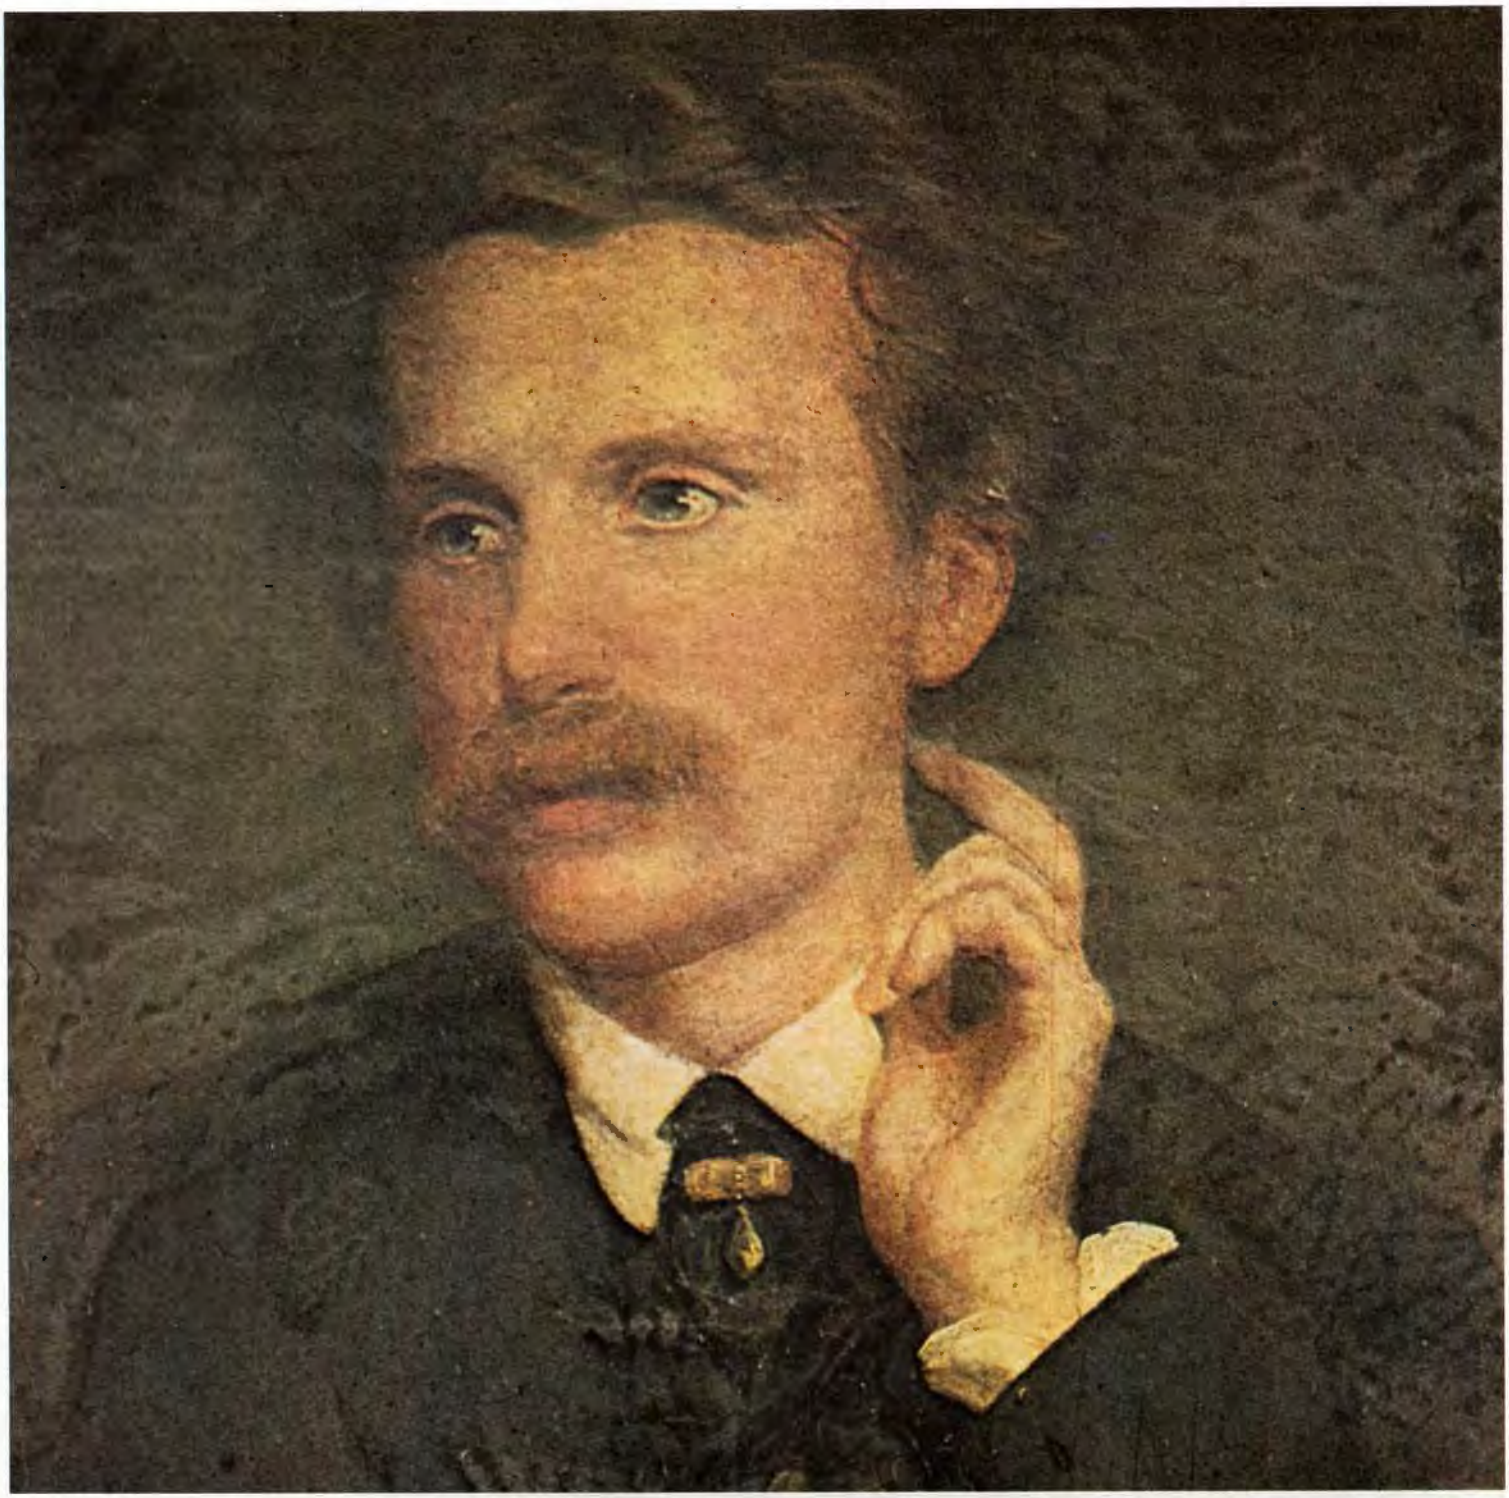
Holiness churches – not all of which were by any means to be identified with the Holy Rollers – became natural contexts for the acceptance of Pentecostal ideas and practices, when these were formulated in the early 20th century (see PENTECOSTAL MOVEMENT). Pentecostalism did more than pray for the 'fire to fall'; it regarded the first experience as a person's 'Holy Ghost baptism', and thereafter, by its teaching of the continued operation of the gifts of the Holy Ghost (speaking in unknown tongues, interpreting tongues, prophecy, discernment of spirits), it provided a continuing justification for highly emotional behaviour at meetings for worship. Men could now be on fire for God and believe that their behaviour was entirely prompted by the Holy Ghost. In the first couple of decades of the 20th century, under the impact of Pentecostal teaching, all forms of holy rolling became more common. In time, as properly organized Pentecostal denominations arose, a pattern of Church order was evolved in which the gifts of the Spirit were given a more defined and circumscribed place, and holy rolling disappeared from the better established churches of the more respectable Pentecostal sects, although it continued, as it does to this day in backwoods areas.

It has been noted that recruits to Holy Roller and other highly emotional sects are frequently people experiencing 'cultural shock'. This may arise in areas where the inhabitants have come to feel their cultural isolation or backwardness in relation to metropolitan centres. Or it may arise among migrants from rural areas experiencing the disturbance of encounter with urban values and the anonymity of urban life. Holy rolling appears, in these cases, to be a spontaneous expression of anxiety and demand for reassurance.

People referred to as Holy Rollers are generally gathered in independent local congregations: centralization has tended to curb emotional behaviour. Many of these local congregations refer to themselves simply as 'Baptist' or 'Holiness' churches, particularly among the poor whites of the southern and border states in the United States, and among American Negroes. Some of these independent groups have slowly become associated with each other, but the emphasis on freedom of worship has prevented the development of powerful central control. Where some co-ordination has been established, titles such as 'The Church of God' have been adopted in an attempt to emphasize the absence of human patterns of organization.

One such group, which arose in Tennessee and North Carolina in the 1890s, was the Church of God (Tomlinson), so named after its first superintendent. This movement fragmented on a number of occasions, and subsequently claimed to be the first established Pentecostal denomination. The movement divided again at the death of its founder, one group following Milton Tomlinson as the Church of God of Prophecy, a sect with a considerable following in the West Indies and among West Indians in Britain; the other followed his brother, Homer Tomlinson, who claimed (perhaps exaggeratedly) 75,000 followers in the 1960s and who, in his later years, crowned himself 'King of All the Nations of Men'. Although the larger Holiness sects have rejected those forms of behaviour common among the groups from which they grew, some of the smaller bodies, which often have bizarre names, maintain the freedom of worship in which holy rolling occurs.

BRYAN WILSON



Camera Press London

One of the most celebrated mediums of all time, D. D. Home displayed his gifts before emperors and peers, poets and scientists; despite the closest scrutiny of his demonstrations, he was never discredited

D. D. HOME

ON 21 NOVEMBER 1867, the Earl of Dunraven was sitting at a polished mahogany table in the dining-room of his London house. The table, covered with a green cloth, was described as very heavy, one which required considerable force to move at all; it was seven feet long by five wide. Beneath it was a Turkey carpet. Dunraven's son, Lord Adare, 24 years of age and wearing a monocle, was sitting at one end of the table, and a Miss Gallwey was at the other. Dunraven sat at one of the sides and opposite him was Daniel Dunglas Home (pronounced Hume), the famous spiritualist. Home, red-haired, tall, gaunt, tubercular, was 34 years old and at the height of his fame and powers. Suddenly, in the midst of the light conversation (which Home preferred to silence) raps were heard on different parts of the table, a sign that the spirits were present. Then the table vibrated very strongly with uniform and powerful vibrations. Dunraven was astounded when the table suddenly moved a foot at right angles of Home in the direction of Adare; then, reversing, it moved towards Miss Gallwey who cried out, 'May I stop it?' Home replied, 'I don't think you can.' 'Yes, I can', said Miss Gallwey, pressing her hands forcibly against the table edge. But she was mistaken. Her hands fell back and the table leapt a foot towards her. Dunraven saw another, and smaller, table in the room move by itself towards Home.

This was one of the 78 seances of Home's which Adare and others witnessed between 1867 and 1869; they were recorded by Adare (or by Dunraven) and published in 1870 for private circulation under the title of *Experiences in Spiritualism with Mr. D. D. Home*. Dunraven, who died the following year, supplied an introduction.

The most famous of these seances took place after dinner on 16 December 1868

at Adare's rooms at 5 Buckingham Gate, London. There were four persons present: Lord Adare and Lord Lindsay, Home and Captain Charles Wynne. They all sat round a table in a small room. Home went into a trance and the spirit of Adah Menken, an actress who had died in the summer of that year and whom both Adare and Home had known, spoke through him. A chair moved by itself from the wall to the table and came to rest between Wynne and Home. Wynne said he felt there was someone sitting in the chair. Lindsay was more certain; the chair was occupied, he said, by someone who was leaning his arm on Wynne's shoulder. Doubt on this matter was due to the room being in darkness. Home got up from the table and began to walk about the room. He was both raised in the air and elongated (to what extent we are not told). He then said, 'Do not be afraid, and on no account leave your places', and went into the passage. Lindsay exclaimed, 'Oh, good heavens! I know what he is going to do; it is too fearful.' 'What is it?' demanded Adare. 'I cannot tell you; it is too horrible!' But he told them nevertheless: Home was going to float out of one window – they were on the third floor – and in at the next, the two windows being on opposite sides of a triangle and seven feet apart. They heard Home enter the next room and open the window. A few moments later, Home reappeared, standing upright outside the window of the room he had left in the ordinary way; he opened the window and re-entered the room. Adare went into the other room to shut the window; to his surprise he found that it was opened only a foot. He asked Home how he had managed to squeeze himself through. 'Come and see' said Home. They returned to the other room and Home told Adare to open the window as it was before. Adare did so. 'Stand back,' said Home, and without ado went through the window again, head first, rapidly, horizontally and, as far as Adare could judge, rigidly. This time Home returned to the same room, feet first. 'It was so dark,' commented Adare, 'I could not see clearly how he supported himself.' Adare asked Lindsay how he had known what Home was going to do. Lindsay replied that the spirit of Adah Menken had told him, had whispered into his ear in an unearthly voice, a voice which to him was not human. Home, coming out of his trance, was greatly agitated, and said he felt as if he had gone through some fearful peril.

Embarrassing Powers

Other manifestations occurred that evening: tongues or jets of flame were observed to proceed from Home's head; all of them heard noises as if a chirping bird was flying about the room; a great wind was both heard and felt as it rushed through the room. Adare described the moaning, rushing sound as the weirdest noise he had ever heard. Home, falling again into a trance, broke into speech in an unknown tongue.

Many years later, in 1924, Lord Adare, now the fourth Earl of Dunraven, allowed his *Experiences in Spiritualism with Mr. D. D. Home* to be republished by the Society for Psychical Research. He added a preface in which he stated that his belief in the genuineness of the phenomena had remained unshaken and that he had not continued the experiments only because he had other things to do and the study of the occult was not really congenial to him. Furthermore, he had found that, beyond a certain point, there was no progress in the manifestations, the phenomena were all of the same kind, mainly physical, 'designed apparently to prove that some force or forces other than physical, as we understand it, could be made to operate on inanimate objects.' He had seen a great deal of Home during 1867-9, had travelled abroad with him, slept in the same room with him and even in the same bed. He said Home was proud of his gift but not happy about it for he could not control it and at times it involved him in embarrassing situations.

While *Experiences in Spiritualism* was in the press, the celebrated scientist, William Crookes (see CROOKES), began to grow convinced of the genuineness of Home's powers. On one occasion the table round which Crookes, Home and others were sitting with linked hands rose six inches in the air and floated about. This stirred them to sing 'For he's a jolly good fellow.' 'After that,' wrote Crookes in a letter to Dr Huggins, 'D. D. Home gave us a solo – rather a sacred piece – and almost before a dozen words were uttered Mr Herne was carried right up, floated across the table and dropped with a crash of pictures and ornaments at the other end of the room. My brother Walter, who was holding one hand, stuck to him as long as he could, but he says Herne was dragged out of his hand as he went across the table.'

Crookes observed of Home's singing that it appeared to drive off low influences and conjure up something more elevated; for at the conclusion of 'For he's a jolly good fellow', a very sweet spirit voice, high above the table, remarked 'You should rather give praise to God.' While they were all holding hands, an accordion was lifted by spirit force above the table; it floated about the room, came within inches of their faces, playing exquisite music all the while. Crookes concluded his long letter to Huggins by asking him to be careful to whom he showed it, because he did not want to be shut up in a lunatic asylum or turned out of the society of men of science. On another occasion Crookes recorded having seen Home handling red-hot coals 'as if they had been oranges'.

Bell that Rang Itself

Home was born at Currie, near Edinburgh, on 20 March 1833. His father, who called himself Humes, was apparently an illegitimate son of the tenth Earl of Home. At the age of nine, Home was taken by an aunt to America; and by the time he was 17 he was competing in the States with the famous Fox sisters, Margaret and Katie, in the production of spirit raps which

Peter Larsen

D. D. Home was fond of music and his accordion was frequently present at seances; sounds would issue from it when there was no visible sign of a player

inaugurated the modern Spiritualist movement. He had no difficulty in deciding the choice of a career.

In March 1855, aged 22, he arrived back in Britain and put up at a hotel in Jermyn Street, London, the proprietor of which, William Cox, was sympathetic towards Spiritualism and occultism. Home immediately rewarded him by letting him see two decanters where previously there had been only one.

A seance was speedily arranged in the hotel at which Cox, Home, Lord Brougham and the scientist Sir David Brewster were present. According to Brewster, the table shuddered and 'a tremendous motion ran up all our arms'. Unaccountable rappings were heard all over the table, which actually rose up, apparently of its own accord, when no hand was upon it. Sir David was impressed, and still more so when a hand-bell, its mouth on the carpet, 'actually rang when nothing could have touched it'.

During the same year, a certain William White took Home in a hansom cab from his lodgings in Jermyn Street to the house of a gentleman in Islington. White described Home as a pale, consumptive-looking young man. When they arrived, they were shown into the dining-room where 12 gentlemen were waiting for them, most of whom were strangers to Mr White. Home had never seen any of them before and he was taken aback, remarking that large and mixed companies made manifestations extremely difficult to achieve, 'but we cannot now do better than try'.

The blinds were drawn but the room was well lit by candles. They all sat round a long dining-table. Home told them to place their hands on the table and talk freely. Within five minutes raps were heard on the table, the walls, the floor. 'Will the spirits kindly rap here?' asked Home. They promptly obliged with a rap or two on the table in front of him; other guests asked for, and received, their complement of raps. A small hand-bell was set on the floor and shortly began tinkling.

Home asked for an accordion. There was not one in the house but a servant went next door and returned with a concertina, which Home said would do. He placed it on the floor under the table and in a short while it began playing by itself, Home's hands being above the table.

Mr White observed that the gentleman sitting opposite him had his face bathed in sweat. He spoke to him and he replied that his hand had been repeatedly grasped in the affectionate manner in which his dead father used to grasp it. Then White saw a boy's hand on the breast of the sweat-covered gentlemen opposite. 'I saw it', he wrote, 'as distinctly as if it had been a hand pushed through a door.' Suddenly there was a scream, and one of the gentlemen jumped up from the table in alarm. The mystic hand had moved along the table and laid itself on his forehead.

Soon Home was the talk of the town, and carriages began to arrive at his lodgings in Jermyn Street to convey him to the houses of the nobility. The novelist Sir Edward Bulwer Lytton (see LYTTON), entertained

Mary Evans Picture Library

During seances, objects floated about the room and hand-bells rang, but most dramatic of all were the occasions on which D. D. Home levitated, seemingly effortlessly: illustration from Louis Figuier's book *Physical Science*

him at Knebworth in Hertfordshire. To Bulwer Lytton's satisfaction, Home called up the spirit that had influenced him to write his famous occult novel *Zanoni*. Bulwer Lytton talked of Home to his friends the poet Robert Browning and his wife who, shortly afterwards, met Home in the house at Ealing of a retired solicitor, John Snaith Rymer. The table shuddered and at Home's request the evoked spirit seized a garland of flowers and, to Elizabeth Barrett Browning's delight, placed it on her head. In a letter to her sister, Henrietta, she wrote that she had heard raps, had seen the table move, and been touched by the invisible. She described the mystic hand that had placed the garland on her head as snow-white, beautiful and of the largest size. And she had raised her glass to see better other hands which, as far as she could judge, were coming out from under the table. She reported the opinion of Robert Lytton, the son of Sir Edward, that they rose from *out of the wood* of the table. Finally, a spirit hand elongated to two yards over the table and floated out of the window.

Seance Before an Emperor

Robert Browning was neither impressed nor pleased; he regarded the whole business as a cheat and an imposture. A few days later when Home and Rymer called on him, he pointed in a rage to the way out and said to Home, 'If you're not out of that door in half a minute, I'll fling you down the stairs.' Before Home departed, Mrs Browning (according to Home) placed both her hands in his and said in a voice filled with emotion, 'Oh, dear Mr Home, do not, do not blame me. I am so sorry but I am not to blame.'

Disagreement between the Brownings over Home was total and while Elizabeth Barrett was talking and writing excitedly and appreciatively about Home to her friends, Robert was composing his long satiric poem, *Mr Sludge, the Medium*, which was intended to demolish Home for good but which has only helped to keep his memory green.

> Now, don't, sir! Don't expose me! Just this once!
> This was the first and only time, I'll swear –
> Look at me – see, I kneel – the only time,
> I swear, I ever cheated, – yes, by the soul
> Of Her who hears (your sainted mother, sir!)
> All, except this last accident, was truth.

Meanwhile, Home continued his incredible progress and not even the opinion of Charles Dickens, who called him a ruffian and a scoundrel, stopped him. In 1857 he was demonstrating his powers in the Tuileries before Napoleon III. At his first seance there, it seemed to Home that the entire court were present and he had to explain to the Emperor and Empress that a seance was not a theatrical performance. His Majesty ordered the room to be cleared, leaving only a small circle. Home soon got the table rising from the floor. During the third seance, he materialized a hand which seized a pencil and wrote the one word 'Napoleon'. The Emperor declared it to be Bonaparte's veritable signature.

Home did not charge fees for his services although he accepted gifts of jewellery. He was never discredited. The question of how he did it has remained unanswered to this day. Speculation is endless. The only clue left today is Home's handwriting. What powers, if any, does it reveal? If it is possible to control matter magically, that is, to transfer one's psychic force to matter till matter moves, then Home (graphologically considered) was the person to do it. He was certainly inflated enough; and the great men of his age, from the Tsar and the Kaiser and the French Emperor to Lord Adare, who sat before him, provided the terrific stimulus he required. He would not perform for anyone. From time to time he complained that the power had left him, and he was incapable – not the words of a charlatan or a trickster who can always perform until he is found out. He exploited himself ruthlessly; there was nothing to hold him. Like a priest in a fertility cult, he moved his psychic force into the table and made it vibrate and rise. The heaviness of the table had nothing to do with it; and he made himself immune to pain when he picked up red-hot coals. Those who do not believe in the powers of the psyche but only in the power of matter, unable to find a satisfactory explanation, are driven to dispose of the awkward facts by the hypothesis of mass hallucination or deception.

Homoeopathy is based on the theory that human beings have within themselves a healing force which the physician must stimulate rather than interfere with. Drugs producing the same symptoms as those from which the patient is suffering, are administered in minute doses: Nelson's homoeopathic pharmacy in London

The principle of 'like cures like', which has parallels in magical practice, underlies homoeopathic medicine, in which infinitesimal doses of drugs derived from plants, spider venom, gold and many other natural sources have been found to assist the body to heal itself

HOMOEOPATHY

LIKE MANY BRANCHES of fringe medicine, homoeopathy was introduced, developed and made popular by one man: Samuel Christian Friedrich Hahnemann. Born in 1775 in Meissen in eastern Germany, the son of a decorator of porcelain, he was educated at a provincial school as a charity scholar. As a young man he showed an early talent for languages, and was a school teacher for a while before starting off on a medical career at Leipzig University.

For a couple of years or so he studied in a rather dilatory fashion, moving to Vienna where he met the Austrian physician F. A. Mesmer, who at this time was trying unsuccessfully to establish the validity of his unorthodox theories before the critics of a special commission (see MESMER). One of Hahnemann's biographers tells us that the aspiring young doctor was influenced, to his detriment, by Mesmer's 'transcendental absurdities'. In any case the future father of homoeopathy was clearly at this time at loggerheads with orthodox medicine, which he stated 'knew no treatment except to draw from diseases the injurious materials that are assumed to be their cause. The blood is made to flow mercilessly by bleedings, leeches, cuppings, scarifications, to diminish an assumed plethora which never exists'. Eventually, after working as a translator and a librarian, Hahnemann qualified as a doctor in 1779.

During the next few years, however, the young physician enjoyed little success as a doctor, although he made several attempts to set himself up in practice in various small towns and villages in southern Germany. In 1806, having had, it has been stated, 'less practical experience of acute disease than any physician', he published his pamphlet, 'Medicine of Experience', that was to be the forerunner of all his subsequent writings on homoeopathy.

Hahnemann was now over fifty. Like many of his contemporaries he deplored the crudities of medicine and surgery that were practised in the early days of the 19th century – so much so, we are told, that he formulated his own system of medicine. He came to believe that human beings have within themselves a healing principle, and that the physician's task is to discover and if possible remove the cause of the trouble; and at the same time to stimulate rather than to interfere with the body's own vital healing force. To this day, it is a keystone of homoeopathy that the whole patient should be treated and not simply his disease.

Bark and Spider Venom

Exactly what gave Hahnemann the vision to develop the system of medicine which he christened homoeopathy (from the Greek *homios*, like, *pathos*, suffering) remains in doubt. Sir John Weir, the celebrated homoeopathic physician, opined that the idea was sown in his mind when he was translating Cullen's *Treatise on Materia Medica* – on the medical action of Peruvian bark or cinchona, from which quinine is derived. Hahnemann had read of its medical use as a cure for malarial fever and he took a little of this bark himself. When this had the effect of producing a fever in him, Hahnemann immediately came to the conclusion that Peruvian bark both caused fever in a healthy person and cured it in one already suffering from this complaint; and therefore all diseases can be cured from compounds that produce their common symptoms; this principle differed radically from that underlying orthodox or 'allopathic' medicine, which aims to cure diseased action by inducing action of a different kind.

Hahnemann explained his principle, which is basic to all homoeopathic practice, on a more metaphysical plane in his *Organon of Rational Healing* (1810). 'Homoeopathy . . . can easily convince every reflecting person that the diseases of man are not caused by any substance, any acridity, that is to say any disease matter, but that they are solely spirit-like (dynamic), derangements of the spirit-life power (the vital principle), that animates the human body. Homoeopathy knows that a cure can only take place by the reaction of the right force against the rightly chosen remedy that has been ingested, and that the cure will be certain and rapid in proportion to the strength with which the vital force still prevails in the patient.'

Hahnemann, having stated his claims, vigorously set about proving them. This 'proving' was initially carried out on himself and his friends, healthy volunteers who took Hahnemann's medicines in order to reveal their pharmacological qualities. Instead of using drugs in the dosages prescribed by orthodox medicine, he tried them out in incredibly small dilutions until an effective homoeopathic *materia medica* was elaborated. Remedies were gradually derived not only from plants and herbs but from animal and mineral substances such as bee stings, snake and spider venom, gold and even sand; these substances, many of which were reputedly poisonous, were prepared in a special way to gain maximum efficacy and protect the patient from side-effects. Today more than 2000 homoeopathic remedies are known, although a much smaller number is in common use.

One of the most difficult things to understand about homoeopathic medicine is, of course, how such minute doses of drugs can have any effect at all upon the human frame. Homoeopathic medicines were 'attenuated' to dilutions of one millionth of a grain in many cases, following Hahnemann's paradoxical discovery that less of a substance could be more effective and that the more dilute the similar remedy, the more active it was. This did not prevent one eminent critic from saying that the only advantage he could see in the new medical belief was that the whole of its *materia medica* could be carried about in your waistcoat pocket.

Outcry from the Chemists

Nevertheless, homoeopathy flourished, and its motto *Similia Similibus Curantur* (like cures like), spread like wildfire. Of course there was violent and organized opposition both from the medical profession as a whole, and from the chemists who saw their business in jeopardy. If such minute doses of drugs were necessary to cure disease, what would become of their profits? Eventually, however, it was realized that as the homoeopathic pharmacopoeia, or official drug list, increased in complexity there was ample room for the specialist homoeopathic chemist, and so pharmacological opposition gradually decreased.

The new system of medicine was introduced into Britain by Dr Frederick Foster Harvey Quin, in face of almost hysterical medical opposition. The effect of anti-homoeopathic propaganda, however, probably helped to publicize the new faith.

Another advantage was that Dr Quin enjoyed very influential patronage. As personal physician to the Duchess of Devonshire and to Prince Leopold, uncle of Queen Victoria, he rapidly established homoeopathy's cause within the Royal Household. He also influenced literary circles, as a close friend of Dickens and Thackeray. At last Quin established the first homoeopathic hospital in London's Golden Square in 1850.

Quin's influence was so great during the middle of the 19th century that he was able to press Parliament to secure an amendment to the Medical Registration Bill, which provided that homoeopathic medicine could be practised by medically qualified practitioners. This was a remarkable achievement despite violent opposition, especially from the Royal College of Physicians.

Medical opinion of homoeopathy was influenced favourably in a general sense by studies made some ten years previously, in 1848, when homoeopathic treatment for cholera, then a common disease, was compared with orthodox treatment. To the surprise of many doctors the homoeopathic method appeared to be much more effective. Only a third of the patients died, compared with two thirds treated conventionally. Such a claim, however, only stimulated orthodox practitioners to collect other statistics that compared orthodoxy with homoeopathy, and it was soon pointed out that in general hospital studies (apart from cholera), orthodox medicine was winning hands down.

Typical was a study made in 1842-3, in which the death rate at Fleishmann's Homoeopathic Hospital in Vienna, which claimed an overall mortality for all diseases treated of 6.26%, was compared with the Edinburgh Infirmary, where the overall mortality was 11.9%. Although an apparent victory for homoeopathy, on closer examination it becomes obvious that at the Vienna hospital a high proportion of the patients admitted had non-fatal complaints, like neuralgia, gout, shingles and chickenpox. At the Edinburgh Infirmary, however, 'very dangerous diseases' were over four times more common.

By now, of course, homoeopathic practice was becoming much more varied and perhaps less as Hahnemann would have liked to see it – a point made by Sir Benjamin Brodie, an eminent Fellow of the Royal Society, and surgeon to King George IV, in a letter written to *Frazer's Magazine*. He complained that, 'Hahnemann treats the subjects in one way, Dr Curie in another, and Mr Sharp (another well known homoeopathist) in another way too.' There seems little doubt that this was substantially true.

Medicine of the Elite

Nevertheless, homoeopathy grew in popularity, especially among the elite. In 1841, Dr Harris Dunsford, dedicated a book, 'with permission', to Her Majesty Queen Adelaide, and regaled his readers with stories of the glory of homoeopathic medicine's success among the nobility. It was not really until the turn of the century that this branch of medicine began to lose ground in Britain, although Sir John Weir still treated Royalty, including Queen Mary and later King George VI, together with a most fashionable practice.

Press Association

Left **Samuel Christian Friedrich Hahnemann, founder of homoeopathy, was an unsuccessful doctor who eked out a meagre living by translating scientific books. When he was over 50 he began to publicize his new theories and he died a millionaire** ***Above*** **Dr Margery Blackie, Physician to the Queen, is one of the many modern doctors in Britain who regularly practise homoeopathy**

In all probability the spectacular successes of 20th century orthodox medicine partially sealed the fate of the homoeopathic physician, although homoeopathic doctors work to this day within the framework of the National Health Service. As Brian Inglis points out in his *Fringe Medicine*, the difficulty has always been to prove that the infinitesimally small dosage used in homoeopathic medicine works.

But there were other factors that seem to have reduced the influence of the homoeopath. In all probability the aura of the aristocracy that hung over its early practice for so long – an aura which is symbolized today by the Queen's personal appointment of a homoeopathic physician, Dr Margery Blackie in 1969 – has eventually diminished its appeal as far as the average man and woman in the street were concerned. Then again, to be really effective, homoeopathy needs time to work, time indeed for Nature to be stimulated to produce a cure. The pharmacological revolution produced rapid, intensive 'miracle' cures for illnesses that many people remember near relatives dying of, or at the very least being very ill with. This new quick-acting, almost 'press-button' medicine was therefore attractive, and appeared vastly superior as far as the ordinary man was concerned to Hahnemann's minute doses of medicines and vast doses of patience and faith.

Although homoeopathic medicine was free to march side by side with its orthodox counterpart in the 20th century, there has been a distinct lack of enthusiasm for it within the inner sanctum of fringe medicine. Dynamic leaders, of the calibre of Hahnemann and Quin are notably absent from the modern scene. Although under the National Health Service Act of 1948, the existing homoeopathic hospitals in the United Kingdom were officially recognized, and in 1950 the Faculty of Homoeopathy Act was passed to enable qualified medical men and women to take a diploma in the 'Knowledge and Practice of Homoeopathy', response has been poor. Perhaps in embracing the orthodox, and insisting that its practitioners qualify in allopathic medicine first, homoeopathy has hastened its own decline. Once qualified, the young doctor is usually too busy climbing his own professional ladder of promotion to bother very much about strolling down a by-road of medicine.

It does not seem likely, however that this branch of medicine will ever be entirely absent from the medical scene. Although orthodox medicine has enjoyed many victories, of recent years there has been ever-growing evidence of iatrogenic (drug-induced) disease. The side effects of therapeutic doses of some potent drugs in the allopathic practitioner's therapeutic armoury can be devastating, and even lethal. Sometimes indeed, the patient has a heart-searching decision to make – to continue with orthodox treatment at risk of side-effects of the drug that helps them or to stop taking the drug and perhaps become ill again. Apart from the hazard of side-effects involved in allopathic treatment, there is also the acknowledged risk, while large quantities of potentially addictive drugs are manufactured and prescribed, of drug addiction; a misuse which is never remotely possible in homeopathic practice. Outside Britain, the advantages of homoeopathy are widely recognized on the Continent, and in recent years Russian scientists have examined the scientific basis of Hahnemann's theories.

Exactly how Samuel Hahnemann would react to the place that homoeopathy holds in the modern world it is impossible even to guess. When he died in Paris in the year 1843, it must have been with a feeling that his work had been an unqualified success, for he was a millionaire.

Homosexuality

Danish National Museum

Among some peoples, one of the distinguishing marks of a shaman or medicine-man: the Algonquin Indians believed that those showing homosexual tendencies, because of their abnormalities, were closer to the spirit world than ordinary men and could therefore act as intermediaries: Navaho shamans sometimes thought of themselves as magically transformed into women and often dressed in women's clothing.

See ALGONQUIN INDIANS; SHAMAN.

HOMUNCULUS

THE MAN-MADE MAN of ancient and medieval alchemy, the homunculus, is the forerunner of the test-tube baby of modern scientific experiment and speculation. The first recorded dream of an artificial man appears in the work of the alchemical writer Zosimus, an Alexandrian Greek of the 3rd or 4th century AD, who describes a vision he had of the transmutation of metals, in which a homunculus changed successively from copper, to silver and then to gold, the process being helped by burning the blood and bones of a dragon. At about the same time, a Christian writer accused the 'arch-heretic and sorcerer' Simon Magus of making an artificial man with an instrument resembling a cupping glass. Here again, the homunculus passed through several stages, the spirit taken from the body of a dead boy being changed successively to air, water, blood and finally flesh. Simon also had the power of changing the homunculus back to air.

It is possible that the medieval alchemists knew something of these ancient traditions. One of the first to have the manufacture of a homunculus attributed to him was Arnold of Villanova (c 1238 – c 1313), a famous alchemist, astrologer and court physician in his own day. If Arnold really did make any experiments in this direction, they may have been linked with his long search for a medicine which would rejuvenate man in body and soul, and with his belief that the aim of alchemy was to transform the natural elements into something more spiritual and more divine.

The most detailed instructions for the manufacture of a homunculus are to be found in the writings of Paracelsus (1493-1541), a life-long student of magic and the supernatural, whose researches led him into anthropology, medicine and alchemy (see PARACELSUS). In his recipe for a homunculus, Paracelsus says that a man's semen must be put into a hermetically-sealed retort, buried in horse manure for 40 days, and 'magnetized'. During this time, it begins to live and move, and at the end of the 40 days it resembles a human form, but is transparent and without a body.

The homunculus must now be fed daily with the 'arcanum' (hidden mystery) of human blood, and be maintained at the constant temperature of a mare's womb, for a period of 40 weeks, and it will grow into a human child, with all its limbs developed, as normal as any child born of woman, except that it will be much smaller. 'It may be raised and educated like any other child,' Paracelsus adds, 'until it grows older and is able to look after itself.' The secret of how to make the homunculus was known to the ancient philosophers or miracle men, some of whom were themselves said to have been begotten by the process, but this is 'one of the greatest secrets, and will remain a secret until the end of days, when everything will be made known.'

It is likely that it was not mere morbid curiosity which prompted these experiments of Paracelsus, as the semen and blood mentioned were regarded as carriers of the *pneuma* or soul-substance, and as such represented the *materia prima*, or elemental matter of which, in alchemical theory, all substances were ultimately composed.

An early test-tube baby? Our knowledge of attempts to make a homunculus stem from folktales and alchemy

Similar experiments were reported by one of Louis XIV's physicians, Borel, who also conjured a human form, which emitted bloody rays of light, from distilled blood. The physician and mystical philosopher Robert Fludd (see FLUDD) also distilled blood, and claimed to have removed a human head, complete with face, eyes, nose and hair, from the retort after he had heard a frightful noise coming from it.

A story which through various film versions has become known to a wide public, is Mary Shelley's *Frankenstein* (1818), 'an adolescent's version of the eternal story of Man's attempt to create human life' (as Richard Church characterizes the novel), which owed its immediate inspiration to a conversation between the poets Byron and Shelley about the experiments of Dr Darwin (the grandfather of the author of *The Origin of Species*), who preserved a piece of vermicelli in a glass case until it began to move of its own accord. 'Perhaps,' wrote Mary Shelley in the introduction to her story, 'a corpse would be re-animated . . . perhaps the component parts of a creature might be manufactured, brought together and endued with vital warmth.' The Count Frankenstein of the story, had developed his own interest in natural science through reading Paracelsus and other alchemists.

In 1873, Dr Emil Besetzny published an elaborate account of ten homunculi generated in bottles by a certain John Ferdinand, Count of Kufstein in the Tyrol, in 1775, with the aid of an Italian mystic and Rosicrucian, the Abbé Geloni. This account purported to be based on a collection of Masonic manuscripts and on the diary of the Count's butler. Whether stories of this sort were circulating in Europe at the time Mary Shelley wrote her story (in Switzerland) and whether she also heard them cannot be known for certain, but it seems not unlikely. The homunculus belonged, by the beginning of the 19th century, to a double tradition, a literary one partly based on folktales and a pseudo-scientific one based on alchemy. In our own time, these two strands are represented by science fiction and horror films on the one hand, and test-tube fertilization and genetic experimentation on the other. The homunculus, it seems, has a future even more interesting than its curious past.

The period immediately after marriage is still known as the honeymoon, an indication of the ancient association with fruitfulness of this first sweetener known to man, which also figures in magical and witchcraft practices

HONEY

AS A FEATURE of human experience, honey is as old as language, perhaps even older. The Chinese, Sanskrit and ancient Greek words for it have a common root from which the English word mead also derives, and one of the earliest paintings in existence, a rock painting from a cave near Valencia in Spain, shows men gathering honey in a basket.

For many thousands of years, honey was the only sweetener known to man, and it was also the first means of making an intoxicating drink. It is no wonder, therefore, that the ancient Babylonians swore solemnly by the honey god, or that in the *Rig-Veda* honey and *soma* drip from the fig tree that represents the universe.

In the belief of more than one ancient people, honey is abundant in holy or divine places: in the book of Exodus, the God of Abraham promises the elders of Israel that he will bring them to a land flowing with milk and honey. In Jewish tradition, the Messiah feeds the pious in heaven with honey and manna, and in a number of medieval mystical prayers, Christ himself is addressed as the honeycomb.

In keeping with its sacred character, honey was poured in offerings and libations, and in many places played a part in rites connected with birth, marriage and death. In Babylonia, honey was frequently offered to the gods Marduk and Ishtar in order to secure their help against witchcraft, and the fact that burnt offerings of honey are specifically forbidden in the Old Testament (Leviticus 2. 11) shows that the custom must have been prevalent at some time among the ancient Hebrews. Indeed, the association of honey with a sacred offering lingered on into early medieval times. The Synod of Auxerre (585 AD) expressly forbade the consecration of wine mixed with honey, and a Synod of 692, the offering of milk and honey at the altar.

According to a manual of ancient Vedic law, a newly-born boy is to be fed with honey and butter, and his lips touched with a golden spoon; and Isaiah comforts King Ahaz with the sign of the child Immanuel, to be born of a virgin, who shall eat butter and honey, 'that he may know to refuse evil and choose the good.' In Greek mythology, the infant Zeus is hidden by his mother Rhea, in a cave on Mount Dicte, which is full of sacred bees, and fed on honey and goat's milk.

Symbol of Fruitfulness

In some parts of India, honey is still given to the bridegroom on his wedding day, a survival from the ancient custom of offering honey at the wedding sacrifice, chiefly to propitiate evil spirits. In Croatia it was the custom to smear the threshold with honey as the bride entered the groom's house, and to give the bride a jar of honey, and similar customs have been observed elsewhere. In southern Germany, beehives were at one time festively decorated at a wedding, so that bees and men could rejoice together.

In his account of the life of the Thonga, a South African tribe, Henri Junod reports that during the betrothal a suitor was not allowed to eat honey on his first visit to his girl's parents, 'because honey slips away like a fish, and the girl might also slip through his hands.' When the man is married, he must refrain from eating honey with his wife for a year, until she has given birth. He may eat it in the bush, but must not leave any traces of it on his hands, in case his wife notices, and runs home. The origin of this taboo is obscure, though it may be related to the beliefs about honey's magic powers at weddings – and on honeymoons – in other parts of the world.

Honey is a widespread symbol of fruitfulness in love and marriage, and has a long history even as an aphrodisiac. The ancient Greek doctor Hippocrates, the 'father of medicine', recommended ass's meat and milk with honey as an aphrodisiac, and honey was a favourite food for this purpose in the harems of imperial Istanbul. It was also used in the love potions of the southern Slavs, and in other parts of Europe mixed in cakes intended to be eaten by the boy or girl whose love one hoped to win. It is reported that the Magyars used to smear the sexual organs

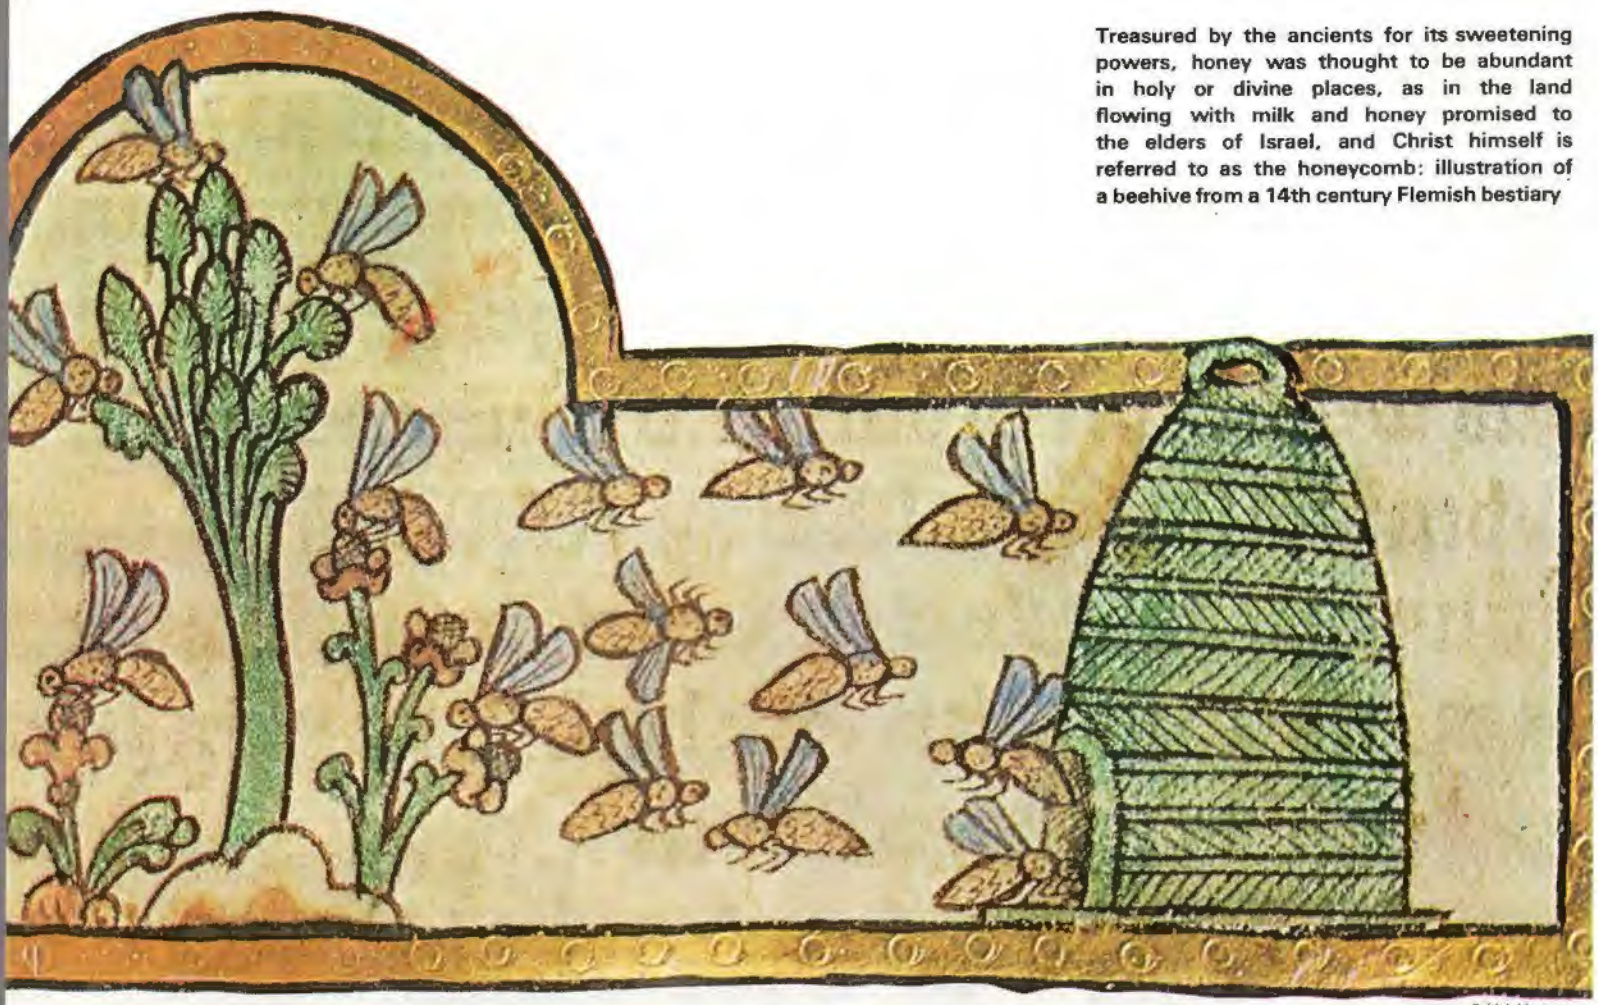
of young girls and boys with honey, to ensure their greater popularity with the opposite sex, and in some parts of the Balkans it was the custom to smear the bride or the groom's face with honey.

Though less common than the association with birth and marriage, there is also a connection in some religious rites between honey and death. In the great Vedic funeral hymn, the priests are commanded to pour an offering of honey to Yama, the god of death, and in another ancient Indian ritual, the bones of the dead were placed in an urn filled with curds and honey. Corpses were sometimes cleaned with honey, or, in ancient Egypt, preserved in it. At the funeral of Patroclus, the friend of Achilles, in the *Iliad*, oil and honey were placed in jars near the pyre, the intention, being perhaps that a man might enjoy in the next world what had given him pleasure in this. In the same way, it was once the custom in Russia to place a cup of honey by the corpse at a funeral, or to reserve a honey cake for the dead person at the funeral feast. This custom may also have derived from the very ancient belief that honey was effective in keeping malignant spirits at bay.

In fact, the offering of honey to the spirits of the dead appears to be one of the oldest of all cults, and mead was sometimes poured into the ground for the departed man to drink. Although the custom must be thousands of years old, its earliest mention in literature is probably in the *Odyssey*, where the witch Circe tells Odysseus to dig a trench and pour mead, wine and water into it, in order to call up the spirit of the blind seer Teiresias.

From its use in these libations to the dead, honey came to be used also in magic. In Silesia, it was used in the preparation of a magic decoy fox used by huntsmen: the honey in this case had to be found at midnight and carried over three boundaries between properties. Honey is mentioned in the records of a witches' trial in Switzerland in 1499, as an instrument of black magic which afflicted whomsoever tasted it with the death

For many thousands of years, honey was the only sweetener known to man, and it was also the first means of making an intoxicating drink: *The Discovery of Honey*, a painting by Piero di Cosimo, late 15th century



Treasured by the ancients for its sweetening powers, honey was thought to be abundant in holy or divine places, as in the land flowing with milk and honey promised to the elders of Israel, and Christ himself is referred to as the honeycomb: illustration of a beehive from a 14th century Flemish bestiary

British Museum

agony. Witches were also supposed to be able to steal honey by magic means, as they could milk, and three years' severe penance were imposed on offenders. It was also debated in the Middle Ages whether it was right to eat honey from bees which had stung a man to death. Conversely, it was believed in some parts of Southern and Central Europe, that honey must not be given to anyone who was suffering from a serious illness as this would cause the bees to die.

More frequently, however, honey was revered for its healing properties. Sick people were exorcized in the name of honey in ancient Babylonia, and the custom of offering milk and honey to the demons of disease lingered on, for example in the Balkans, until comparatively recent times. Honey does, in fact, have antiseptic properties, and its quality of being rapidly digestible makes it an ideal source of energy, not only to invalids, but to healthy people as well. These properties were recognized in very ancient times, and in the Egyptian medical papyri, in particular, honey frequently figures in prescriptions. The so-called virgin honey (the first pure honey drained from the comb without heat or pressure) has always been especially valued for its medicinal powers, particularly as an ophthalmic remedy.

So strong is the appeal of honey to the imagination of unsophisticated folk, that even dreams of honey are invested with a peculiar significance. To dream of honey is a sign of unexpectedly overcoming a difficulty, and it also promises cleverness, because the bees have been so clever in making it. If a king dreams of breaking a honeycomb and eating from it, it means his people will bring him happiness and wealth, but if an ordinary man dreams that he has been given honey when he did not have any, it means he will lose his wealth. In the Indian *Book of Dreams*, to dream of eating honey is a bad omen, and there are superstitious beliefs that show a dread of honey recorded from several places—for example, that it is fatal to eat honey without getting the mouth and hands smeared. But these beliefs about the harm honey may portend are no more than the reverse side of the universal love of and reverence for honey on the part of a mankind ever grateful to the substance that first sweetened earthly life.

Hood

A covering for the head, consequently a symbol of being apart from the everyday world; a cowl is the hood worn by some orders of monks: a hood which completely envelops the head, and so masks the individual personality of the wearer, may be a symbol of penitence (see CHRISTIANITY; EASTER); or it may be intended to terrify, like the hoods of the Ku Klux Klan.

Transworld Feature Syndicate

Hoodoo

A form of popular magic practised by the Negroes of the southern United States; it has many features in common with Voodoo as found in Haiti, and both are thought to have been imported by Dahomey slaves from West Africa: magic charms known as hoodoo hands are variously used to bring the wearer good luck, or, directed against an enemy, to cause sickness, ruin, and even death: in modern American usage, hoodoo signifies bad luck.

HORNS

The outstanding courage and virility of the male horned animal led man to adopt the horn as the emblem of manhood; the gods themselves were frequently depicted as horned in ancient times. In Celtic religion the role of horned animals was of special importance; and in an old fertility dance which has survived into this century the dancers wear reindeer horns

A CHALLENGE to man's strength, horned creatures have been both feared and admired by him for millennia. Living in herds they presented an ideal source of food to our hunting ancestors, yet such herds were protected by one or a few dominant males which, when attacked, responded ferociously. Horned males will generally fight to the death against other species, even when severely injured, rather than retreat back into the herd. This savage and completely fearless behaviour even in the face of insuperable odds must have deeply impressed man throughout history as a hunter.

Male horned animals have an additional characteristic that won the attention and admiration of man: their exuberant sexuality. By the Neolithic Age, when man had begun to have some understanding of the male role in procreation, it must have became obvious to him that only a very few bulls or rams were necessary to impregnate an entire herd of female animals. Since strength, courage and sexual power were the primary male virtues in human society, it is little wonder that man constantly used bulls and rams as yardsticks for measuring his own worth. Nor is it difficult to see why he came to believe that these creatures were either endowed with supernatural power or were actual manifestations of gods themselves.

The earliest archeological evidence for the use of animal horns by man comes from a Neanderthal burial site dating from about 60,000 to 70,000 years ago. In this Middle Paleolithic cave of Teshik-tash, located in the mountains of south-western Uzbekistan (Central Asia), the remains of a boy of about nine years of age were discovered. That he was ritually buried seems certain since his head was surrounded

Dancing and fertility magic are closely connected in pagan and primitive societies *Above* 14th century Flemish manuscript showing humans dancing and wearing animal heads, a device often used in early rituals as a means of magically acquiring an animal's peculiar attributes *Below* The Abbots Bromley Horn Dance *(left)*, an ancient British ceremony still performed annually in September, and Tanganyikan dancing *(right)* both employ horns to emphasize the fertility aspect of the rite

by five pairs of ibex horns turned with their points down into the earth. One can only speculate as to the significance of this burial, but when we consider the inverted position of the large, recurved horns of this mountain goat, and the youth of the boy, many questions emerge. Was this the son of a great hunter, perhaps the chief of the group? Were the horns symbolic of how he died, did they wish him good hunting in an afterlife, or did they, even at this remote time and place, indicate a phallus-horn equation?

The Horned Sorcerer

Later, in the Magdalenian era (25,000 to 15,000 years ago), our own ancestors also related themselves to horned animals. In the cave of Les Trois Frères in southern France, there is a painting of a 'Horned Sorcerer' – a depiction of a man wearing large stag or reindeer antlers, skins and a tail. It is generally believed that this figure is a representation of a shaman performing sympathetic magical rituals in connection with animals. Other representations of sorcerers have been found in other caves; some are bull-men, some bison-men, while others are bird-men or stag-men. Other aspects of the horn in the Upper Paleolithic are indicated by the so-called 'Venus of Laussel' incised on the walls of a cave in the Dordogne. This figure is that of a nude woman who holds a curved horn in her upraised right hand.

With the coming of the Neolithic Age, and the change in the relationships of man to

Right **The horned Christian devil may have been derived from the great bull god of Mithraism, or from the goat, sacred animal of the Teutonic god Thor; as late as the 17th century, British witches admitted that the Devil had appeared to them in the guise of a bull; devil bearing off a young woman, by Signorelli; from Orvieto cathedral** ***Far right*** **A Hindu horned demon, fierce, blood-drinking and man-eating, from** ***A Treatise on Astrology and Divination*** **by Mohammed al-Sudi**

the animals he had hunted for his food, the cattle-raising cultures of the south and east spread across the lands where formerly the great herds of bison, reindeer and wild cattle had roamed. In this new culture bulls, while still symbols of strength and power, came to be valued for their fertility and procreative power as well. In the Late Neolithic Age this concept of fertility was utilized in agriculture itself, in the magical securing of a bountiful crop. For centuries following the invention of the plough man continued to give the credit for better crops to the bull and not to the plough itself, which was regarded as merely serving the function of opening the earth to let in the great fertilizing force of the bull. The earliest method of ploughing seems to have been done by attaching lines to the horns of a bull and leading them directly to a plough. Thus the horns themselves were believed to be charged with great fertilizing power and for centuries after the invention of the yoke, ploughing of a ceremonial nature continued to be done in this manner. Not only were the horns symbols of the power of death and destruction but of the power of life as well.

With the rise of historical civilizations examples of the horn as a symbol of supernatural power abound. Gods of antiquity were frequently depicted with horns, and kings and priests were horned to indicate their special powers. Horns became disassociated from the powerful animals they originally represented and were frequently given to animals with which they are not associated in Nature. This is true of the Thracian horned snake Zagreus and a similar horned snake in American Indian legend. The art of Central and North American Indians shows many examples of horned and plumed serpents, dragons and jaguars, in addition to the buffalo bulls' horns which were attributes of many American Indian gods. Likewise the Chinese Dragon of the Infinite was horned.

Status Symbol

There was a strong tradition of horn symbolism among the Teutonic peoples of Northern Europe. Like that of the Celts, the old Norse religion has to be studied mostly from writings made long after the religion had been abandoned. It is thought, however, that the figure of three interlocked horns found on a rune stone in Snoldelev in Denmark was the sign of the god Odin, and that the goat was one of the oldest attributes of Thor (or Donar). A Scandinavian rock carving of the Bronze Age shows a figure with two hammers and a horned head and these symbols of divinity may be older in fact than the belief in Thor. The ancient Teutonic god Heimdall was associated with a ram and an early myth relates that the sound of his horn could be heard throughout the world. The horned head-dresses characteristic of Scandinavian warriors of 2000 BC were still worn as late as 1000 AD by the Viking raiders who ravaged the coasts of Europe. The wearing of horned helmets was probably derived from an earlier custom of wearing a head-dress of the skin of the animal, with horns attached, as a means of securing the power of the animal. In addition, it appears likely that a widespread belief existed that by wearing horns one received supernatural protection. Not only the Scandinavians but the Sardinians, Etruscans, Romans, Greeks, Celts, Anglo-Saxons, Huns and others wore such horned helmets.

In the Indus River civilization of the 3rd millennium BC there is much evidence that the bull was the centre of worship. Many clay seals from this region depict the aurochs (wild ox) or a Brahma bull in what appears to be a ritualistic context. On several seals the god is depicted in a humanized form as bull-horned and three-faced. The origins of the Hindu god Shiva have been traced to this early bull god. The hymns of the later *Rig-Veda* refer to the various Aryan bull gods:

Scala

Bibliothèque Nationale Paris

Indra the bull with a thousand horns, Parjanya the god of thunder and rain, Dyaus the remote overlord, Rudra the god of the lightning flash and lord of the thunderbolt, Agni the horned god of fire.

Nowhere were horned gods more widely and deeply revered than in the ancient lands of the Near East and the Mediterranean world. As early as 3000 BC the supreme god of fertility of the Sumerians was the bull god Enlil. In addition to this high god many of the various city gods of early Sumeria were horned gods, some depicted as bulls, some as men with bull's heads or horns, some as human-headed bulls. Sumerian and Babylonian priests wore horns on their head-dresses and were perhaps themselves manifestations of the gods they served. Kings began to wear bull-horned head-dresses as symbols of their divine appointment and power. There are many seals and stelae (inscribed slabs or pillars) which indicate the relative status of the depicted deities and kings by the number of horns in their mitres. With the rise to eminence of the city of Babylon (c 2000 BC) the sun god of the city, Marduk, became the supreme god of the pantheon. He was also a bull god and virtually fused with Enlil. He is shown on the Stele of the Code of Hammurabi as a man wearing a horned mitre, and on a relief from Nineveh with horns branching from his head. The symbol of the god Anu was a horned cap and these caps, mounted upon shrines, often served as boundary markers in Babylonia. At the ancient cities of Susa and Babylon the chief temple itself was furnished with horns.

The beginning of dynastic Egyptian history is marked by the uniting of the Upper and Lower Kingdoms of the Nile Valley under Narmer-Menes (c 3500 BC). The symbol of this king was a bull and with unification the bull cult of Apis spread throughout Egypt. At a very early date Egyptian bull worship became identical with king worship. The related symbolism of bulls and kings is shown by a tomb of an early king of the 1st Dynasty which is surrounded by a frieze of clay bulls' heads mounted with actual bulls' horns; Egyptian queens were associated with cows. Another cult, that of the bull Mnevis, was instituted during the 2nd Dynasty. Osiris, the god of vegetation and fertility, was fused with the dead Apis to become Serapis and in Graeco-Roman times his cult was spread by the Roman Legions over most of the civilized world. His spouse, Isis, was a horned cow-woman goddess as was Hathor, who was the celestial cow bearing the moon between her horns. The latter sometimes wore ram's horns as the female counterpart of the ram of Mendes. In addition to these major gods there were also the cults of the golden bull of Canopus, the white bull of Min and various other local bulls.

The Bull of Jacob

The gods of the peoples of the ancient Levant reflect the poor soil and unpredictable rainfall of that region. The supreme god was a god who ruled over the rain, lightning and thunderstorm and he was believed to be a wild bull. The bucranium, a bull's head viewed from the front with great, curving horns is a motif commonly occurring on artefacts of the 4th millennium. Later, when the Hittites rose to power, the worship of the bull as weather god was one of the basic features of their religion. It was the only divine animal among the Hittites. The conception in human form of the bull-weather-god is Teshub who wears a horned cap and frequently holds a leashed bull. Closely related to Teshub is a bull god known according to his location as Adad, Hadad, Ramman, Sandas and Baal. The earliest known bull god of the Hebrews was called the 'Bull of Jacob' and the estrangement between Moses and Aaron as described in Exodus was either the result of the clash between two rival bull cults or

The horn was a symbol of fertility and the broken horn with its liberated power was considered to be the horn of plenty, the cornucopia

between two leaders for the control of one cult. Moses himself is described as 'horned' in the Vulgate perhaps having assumed the sign of power of the old horned god. The Hebrew god of the storm, Yahweh, was fused in time with Baal and this Yahweh-Baal fusion continued until the death of Solomon, when Jeroboam urged the northern tribes to return to the worship of their old bull gods. Like the bull, the ram was originally a sacred animal to the Jews so that the ram's horn, the *shofar*, was to represent the voice of the god. The Assyrian horned god Asshur was both a warrior god and god of fertility.

The Minoan civilization of Crete was the location of a great solar bull cult, although to a lesser degree the bull was linked with earthquakes. Minos the king was apparently the incarnation of the island bull god and the focus of cult activities. The stone 'horns of consecration' (formalized horns, indicating sacredness) were used to designate holy places and the horned altar appears in the Theseus legend. These ritual horns probably originated in the shrine of a buried bull which was regarded as a focus of life itself. One important aspect of the bull fertility rites is that of horn grappling. In Crete as in Asia Minor there existed the belief that the great procreative and physical power of the bull was somehow brought to a focus in his horns. The ritual athletes of the Cretan bull cult arena grasped the horns of the sacred animal as it charged them and were somersaulted over its back, thus absorbing the potent strength and fertility of the creature for the benefit of all men (see CRETE). The sacred animal was sacrificed to obtain his blessings for the land and its people.

Bull Cults of Greece

In Greek religion, c 1000 BC, there are two converging strains of bull worship, those of the tribes of Ionians, Achaeans and Dorians from the north and of the Cretan colonizers of the south. One of the oldest and most popular of the Grecian bull cults was devoted to the worship of Dionysus, a god of fertility. Among his many titles are 'Horned Child', 'The Horned Deity', 'Bull-horned' and 'Horn-bearing'. His images were frequently horned. In the Dionysian mysteries there is a fusion of bull-worshipping traditions from all over the ancient world.

Zeus, the father god of Greece, is linked in several rites with bulls. As a bull himself he figures prominently in Greek mythology. Zeus *Olbios*, from northern Greece, was a god of fertility depicted as a bull-horned man. Zeus's wife, Hera, was associated with the cow and at Samos her image was a wooden post with cow horns attached near the top. The satyrs, representatives of the spirits of the woods and mountains, wore goats' horns. And Pan, who was once worshipped as a ram, also was horned.

As in Crete, so in Greece, the horns of the bull were considered to be the seat and focus of his strength. Numerous examples in Greek architecture show where the horned frontal portion of the ox skull was attached to the frieze of a temple. There is some evidence that the volutes or spiral conformations of Ionic architecture are derived from horns. The horn was a symbol of fertility and the broken horn with its liberated power was considered to be the horn of plenty, the cornucopia. A Greek vase painting shows Hercules about to break the horn of the bull-bodied river god Achelous while a nearby horn is shown as the source of a stream of water. In this connection it is interesting to note that the sacred River Ganges is represented in Hindu myth as arising from the head of the bull god Shiva.

Evidence of ancient bull cults, both prehistoric and historic in time, in the form of figures of bulls and bull-horned men has been found throughout Italy and in Sicily and Sardinia as well. These would appear to be gods of strength and fertility. Likewise a river god with the horns of a bull is widely depicted in Etruscan art. The Itali worshipped the bull god Mars, lord of battle, and wore the horns of bulls on their helmets. The Salii, priests of Mars, also wore a horned head-dress. In the middle of the 1st century BC, the Persian cult of Mithras came to Rome and developed into an immensely popular and powerful rival of Christianity. Mithras was early associated with the cult of the bull and as Lord of Fecundity was in part the fertilizing bull he slew in the best known of his myths.

In addition to the horned gods, there are horned demons. For example, in Persian mythology the animal representations of evil powers were often horned. There are horned demons in Hindu and Buddhist mythology. The Devil of the Christians may be the great bull god of Mithraism surviving through the familiar process whereby former gods of eclipsed religions become the demons of the new; a principle known as 'henotheism'. According to the first theological definition of the Devil, reached at the Council of Toledo in 447 AD, he is 'a large black monstrous apparition with horns on his head, cloven hoofs . . . an immense phallus, and a sulphurous smell.' There are other evidences of the survival of this horned figure during the first ten centuries of the Christian era. Indeed, as late as the 16th and 17th centuries in England and Scotland, accused witches admitted that the Devil had appeared to them in the form of a bull. Whether he was derived from the Mithraic bull or, as some folklorists believe, from the goat as the sacred animal of Thor (Donar) the Teutonic god of thunder, one has only to attend the services of certain fundamentalist religious sects in the United States and Europe to realize that the idea of the 'Horned One' as an all powerful and fertile benefactor in Western society has been changed into that of a diabolical and satanic creature.

JACK CONRAD

Celtic Horned Gods and Beasts

The Celts, like many other peoples, venerated horned beasts and used the horns symbolically as insignia of virility and divine power. Many early Celtic helmets were decorated with horns, and a warrior, by wearing such head-gear would not only stress his own martial and male qualities, but ensure for himself the protection of the deity whose particular attribute they were. A god bearing the horns of his cult beast added the strength and powers of the horns to his own magical godhood. The Celts, like their immediate ancestors, the bronze-using people known to archeologists as the Urnfield people, held the symbol of the horn or antler in such superstitious awe that they frequently adorned non-horned beasts and birds with them, or exaggerated those of horned animals by

In early societies the horn was a symbol of supernatural power and protection. The wearing of horned helmets probably stemmed from an earlier custom of wearing a head-dress of the skin of the animal with horns attached as a means of securing the power of the animal: illustration from the *Edda* showing the Norse god Hermod in a horned helmet assailing the gate of the underworld to fetch back the beautiful Balder

The Miraculous Horn

The unicorn was most renowned for the miraculous power against poison supposedly possessed by its horn. The rich had drinking cups made of unicorn horn, the poor had small pieces with which to test their food and drink, for it was firmly believed that even the tiniest fragment would sweat and change colour in the presence of poison, and two famous horns which are still in St Mark's in Venice are worn thin from innumerable scrapings. Alicorn, a unicorn's horn, was an essential item of the apothecaries' stock until the eighteenth century, and at one time powdered horn was valued at ten times its weight in gold, while whole horns were almost beyond price. There were famous horns: one kept in a dark vault in the French Cathedral of St Denis, so potent that even the water in which it had been steeped would cure the sick.

adding knobs to the end of flamboyant bull horns, or giving a horned beast three instead of two horns.

Gods and goddesses alike were given this badge of physical power and sexual force. In some instances the horns or antlers were fashioned from the material used for the whole portrayal, in others, holes were left for the insertion of these – real horn in some cases, and in others no doubt made of some precious metal such as gold or silver. In the case of stone sculptures it was easier to portray horns in vestigial form, on top of the head or flat along the brow, rather than as fully developed and standing free from the crown; and this was frequently done. In the case of the early metalwork they are often used schematically, to blend with the overall pattern, or are grossly exaggerated into great swelling protrusions on either side of the head.

The superstitious veneration which the Celts accorded to horned beasts and to the symbol of the horn, then, was nothing new in Celtic times, and was probably ancient by the time of the Urnfield period, that is between about 1400 and 700 BC. As early as Hallstatt times (c 700 – 650 BC) the composite cult animal so familiar in later Celtic iconography, the ram-horned or ram-headed serpent, has appeared amongst the grave goods of the rich iron-using aristocracy of this early Celtic period. This strange beast was to become the regular companion of the powerful stag god in subsequent Celtic mythology, as well as being a frequent companion of the native war god, whose attributes remained fairly consistent while his name varied from place to place, from tribe to tribe, throughout the Celtic world. The very prominent position occupied by this beast, its large size, and the various ways in which it is depicted suggest that rather than being a mere attribute or cult symbol of these deities, it was divine in itself. However, in the insular literature the sacred beasts are invariably imbued with the powers of human speech and understanding, and there is usually a legend explaining their origin and existence in human shape before they took on animal form, and such may in all probability be the case with the ram-serpent.

The Celts had many basic religious concepts in common with the other barbarian peoples of Europe, but it is what they did with these ideas, and how they developed them and made them distinctively their own, that is so interesting. Just as the Celtic artists borrowed basic designs and motifs from the ancient Northern European world, from the Greeks and Etruscans with whom they had trade contacts, and from the vivid and powerful animal art of the Scythians, and blended the various elements into a whole which is quite unique and original – so they used religious ideas common over a wide geographical area, and wove them into a distinctive mythology.

Many people venerated horns, and used them as some symbol or other in their religious expression, but the Celts not only venerated horns and certain horned animals – they had a complex mythology in which, even in the fragmentary state in which we are now able to view it, horned animals and their relationship with the anthropomorphic deities played a fundamental and systematic role.

Guardian of Peace and War

Two very distinctive, but by no means mutually exclusive, cults of horned deities can be detected throughout the Celtic world. The first cult is that of an antler-bearing god whose appearance in representations is suggestive of a benign deity, concerned with fertility and economic prosperity; but, like all Celtic deities, he was also a god of war and protector of his people. But it is his pacific aspects which predominate in his representational character, and these are reflected in the traces of him which can be detected in the written literatures of the Celtic world. The second cult is that of a ram-horned or bull-horned god, aggressively militant, usually naked – the Celts traditionally went into battle unclad – weapon-bearing, often phallic; he is essentially the god invoked by restless warring tribes, and there is some evidence that he is a god much favoured in pastoralist societies where there was constant internecine strife. But the two cults cannot be completely separated and, like the antlered god, the bull-horned god is often brought into rapport with the Roman Mercury, no doubt in his earlier role of protector of flocks and herds. In the case of the stag god, the Roman deity's concern with economic prosperity would provide a convincing link, while the Celtic god's frequent appearance as 'lord of the animals' would associate him with Mercury in his pastoral role, and also with his cruder counterpart in his milder aspect. As would be expected, in Britain the horned warrior god is found in the restless, pastoralist north, while the stag god is concentrated in the mild, economically prosperous and pacific south-western region.

The stag god seems to be one of the most ancient and widely distributed of the Celtic deities. In one inscription, from Paris, he is called *–ernunnos*; and it has been supposed, very reasonably, that the missing initial letter was C, giving a reading *Cernunnos*, 'the Horned One'. It is convenient to refer to the stag god by this name, but there is no evidence that he was so called throughout the entire Celtic area, although it is possible that this was the case. He appears as early as the 4th century BC on a rock carving in the ancient sanctuary at Val Canonica, in northern Italy, bearing antlers, carrying the sacred torque (neck ornament) that was one of his most regular attributes. There are other early examples of the stag god, but the most impressive dates to the 1st century BC and shows the god in his most typical aspect. He is figured on the famous silver bowl found in a bog at Gundestrup, in Jutland. Exaggerated antlers spring from his head, matched by those of a stag which stands on his right side. A wolf attends him on his left. Other beasts complete the scene, the god sitting in mastery over all.

One of the most impressive verbal accounts of the god – although the deity in question is unspecified – comes from the *Mabinogion* in the story of 'The Lady of the Fountain'. It is prophesied that Cynon, son of Clydno, will encounter a huge black man twice the size of ordinary men, one-footed and with one eye in his forehead, sitting in the middle of a mound in a forest,

Palphot

with wild animals grazing about him. The prophecy is duly fulfilled and Cynon asks the man 'what power he had over the animals'. Grasping his mighty club, the man strikes a stag so that it gives out a great sound, to which wild animals 'as numerous as the stars in the firmament' flock into the clearing, bowing their heads 'even as humble subjects would do to their lord'.

The mention of the single foot and single eye of this character emphasizes his divine nature; the use of one leg, one arm and one eye was a ritual posture among the pagan Celts. He is also described as being dark, and of great size, characteristics of otherworld beings. Although there is no specific reference to horns, it is clear that this figure is a divinity having complete mastery over the animals; and the fact that it is the stag that compels all the other beasts seems to be clear proof that we are in fact concerned here with a deity of the type of the stag god Cernunnos, just as we are on the plate of the Gundestrup cauldron, which portrays such a character surrounded by the beasts of whom he is in complete control. The fact that he figures in medieval manuscripts with his horned serpent attribute in the role of a devil further emphasizes the powerful nature of his cult.

The second type of horned god, the ram-horned or bull-horned deity of a warlike, pastoral people, is also attested by the iconography of Roman Gaul and Britain, and by the early Celtic literatures. A portrayal of this deity from Unterhambach equates the Celtic bull-horned god with Mercury, holding a purse and accompanied by serpents. The other, from Nantes, shows the god with enormous, exaggerated horns. His left hand is raised and his right hand grasps a spherical object in the manner of some of the horned gods of North Britain. Below the god is a ram, and to the left a serpent. In North Britain, the horned god may figure as a war-god, or as a naked, phallic deity with obvious affinities to Silvanus (a Roman god, similar to Pan). Sometimes, in most typically Celtic fashion he appears as a horned head alone.

Warriors and Divine Beings

Over and above these two clearly defined types of horned god there is a selection of horned figures which do not seem to fit closely into either division. For example, an impressive horned bust from Moresby, Lancashire, is clearly of native import, but the pleated garment which covers his shoulders and the general appearance of the work seem to have little connection either with Cernunnos or with the bull-horned god so prevalent in these northern regions. The early literatures contain fascinating references to horn-bearing divine beings and there are allusions to horn-bearing warriors which seem to have puzzled the Christian scribes themselves, and which are sometimes rationalized by them. For example, in one of the early Irish manuscripts, the 'Fitness of Names' *(Coir Anmann)*, a person called Furbaide Ferbend, 'Furbaide the Horned', is mentioned. He is described as having two horns of silver and a horn of gold out of his helmet, but in another version of his story he is said to have been horn-bearing: 'two horns grew on the head of staunch, fair Furbaide.' Another hero, Feradach Fechtnach, 'Feradach the Fortunate', is described as being a magnificent warrior; he is referred to as 'the horned one'.

The early Welsh triads contain references to bull-warriors which seem intended to be understood in two ways: they associate the strength of the hero with the powers of the bull in a purely conventional way while, at the same time, there may well have been an echo from the earlier mythology in the references to 'Three Bull-spectres of the Island of Britain', and 'Three Bull-protectors of the Island of Britain' and 'Three Bull-chieftains of the Island of Britain'.

Horns were venerated amongst the Celts, and horned beasts were hunted and adored as deities and symbols of godhood and martial powers. Perhaps one of the most impressive divinities of the pagan Celtic world was the great brown bull of early Irish mythology, the Donn of Cualnge, round whose deeds a whole epic was centred. Like his rival, the Findbennach, 'White-Horned,' he originally had a human form, taking on bull form after a series of metamorphoses but retaining his human reason and understanding. He is clearly the god of a pastoral, warlike society, having the mighty bull as his tangible form. This great bull god, protector of warriors, averter of evil, conveyor of fertility and maker of

magical music, who is so important in Celtic tradition, seems to epitomize the horned warrior-god we have seen from the early iconography. The cult of horns and horn-bearing and antler-bearing deities may be said to constitute one of the most ancient and deeply rooted of all Celtic cult concepts, to such an extent that the horned god was one of the most repugnant and hostile of pagan divinities in the eyes of early Christianity, and one which strong measures were taken to exorcize.

ANNE ROSS

Fertility Dance of the Horns

EACH YEAR on the Monday after the first Sunday after 4 September, a group of men gather at the door of the church of St Nicholas in Abbots Bromley, Staffordshire. They receive from the vicar the six sets of reindeer horns, the hobby horse, the crossbow and other properties and costumes required for the Horn Dance, which is unique in Great Britain.

The small company of about a dozen men lines up for its first 'run' on the vicarage lawn. This is the start of a 'progress' out of the town and across country. On reaching a farm they form a line, the music strikes up and they begin to run.

Each run follows a regular sequence. There are six deer-men, each carrying on his shoulders a set of reindeer antlers. These six lead a dance in single file. They are followed by four other characters – a hobby horse, a man-woman (called Maid Marian), a fool and a small boy with crossbow and arrow. Two musicians play.

Three of the deer-men have blue antlers, three have white. At first the Blue and the White keep apart, both small columns coiling and twisting in serpentine patterns. When Blue leader meets White, they bend and curtsy with their antlers in greeting. The four extra characters tail along behind impassively except for an occasional clack from the Crossbow, as he takes a shot at the Blue leader.

After a while, the Blue leader gives a signal and the coil opens out into a circle, flattening to a longways set with all ten dancers facing inwards. Three Blue antlers then face three White antlers, while Horse and Maid Marian face Crossbow and Fool.

Meeting and crossing follows in country dance style while antler meets antler in momentary battle. After meeting and crossing, Blue leader swings away from the set into the follow-my-leader single file and serpentine running is resumed.

The Dance that Creates Life

The Horn Dance seems to be a relic of pagan worship which has been, paradoxically, preserved from ancient times by the Church – possibly as the most practical way of controlling the ceremony.

Dancing and fertility magic are closely connected in primitive societies. The rhythm of the dance creates in the dancers, a feeling of increased liveliness and animation. And so the act of dancing is thought to create life in the broader sense of promoting the fertility of men, herds and crops. The interweaving meet-and-cross figures are as symbolic of fertility and the generation of life as the more obvious symbols of phallus and ladle, carried by two of the characters.

In the early accounts of this dance, the Hobby Horse was the chief actor, and it was known as the Hobby Horse Dance. The Horse has a small carved head, with a hinged lower jaw which can be made to snap at a pull of the rein and a wispy tuft of horsehair. The head and hair are fixed at opposite points of a metal hoop, slung from the dancer's shoulders and concealed by his cloak.

Besides the Horse, there is the Maid Marian, a man dressed as a woman, who used to carry the ladle as an emblem of femininity. Her origin is obscure but she may be a faint surviving echo of the great mother goddess of old. The Fool wears the costume of a court jester and carries a phallus, but he represents a much older stock character of mythology, legend and folklore. Crossbow is perhaps the youthful god, the son of the mother goddess, who stands for the rebirth of the crops in spring.

Horoscope

In astrology, a chart or diagram of the heavenly bodies showing the relative positions of the planets at a certain moment in time: given an exact time and place of birth, an astrologer casts an individual's horoscope from which he makes deductions about the person's character and fortunes, and advises on future courses of action.

See ASTROLOGY.

British Museum

To change a horse's name is to alter its luck; a horse hair will turn into an eel if left in water; these and many other beliefs surround an animal which was once considered divine

HORSE

THE MODERN domesticated horse is of Indo-European origin, arriving in Europe and the Near East as part of the vast migration westward of entire peoples. It has been truly said that in the Old World, civilization marched at the pace of the horse for the social development of primitive societies proceeded in direct ratio to the utilization of 'horse power' in its literal sense. South American civilization, in the absence of the horse, relied instead upon the ox and llama as beasts of burden. The triumphant progress of Cortez in Mexico was due as much to the alarm created among the Indians at the sight of the war horses as to the fighting capacity of the invaders.

As a symbol of terrestrial power, the horse was projected into the heavens in the form of the divine horses of the ancient religions, and in this manner became integrated with sky gods. In classical mythology, Poseidon or Neptune is said to have created the horse which became sacred to him, and to have invented horse racing. Among other myths concerning the origins of the horse is that which declared the horse to have been created out of an egg, the symbol of creation.

In Christian art the horse is represented as the symbol of the three saints Anastasius, Hippolytus and Quirinus, who are shown being torn asunder by wild horses. However, to horse-users everywhere, the horse has always symbolized power, speed and pride.

In its role as a divinity the horse has played many parts, of which the divine horses of King Diomedes and the Celtic goddess Epona are prominent examples. Epona, a divinity of the Gauls, was both a goddess and protectress of horses, a tribute to the valour of the Celtic warriors.

Many gods, goddesses and demi-gods

Tate Gallery

The four horsemen of the Apocalypse brought destruction and ruin. The rider of the white horse was armed with a bow, the red with a sword, the black with a balance, and on the pale one rode Death himself: *Death on a Pale Horse* by J. M. W. Turner

were closely associated with the horse in antiquity and Demeter, the Greek fertility goddess, was sometimes represented with the head of a horse. In almost all of the ancient civilizations the sun was believed to have been drawn across the sky in his chariot by celestial horses. It was in this august fashion that Dag, the Norse god of day, was conveyed through the heavens by the white steed 'Shining Mane' which spread its light across the whole living world. According to Norse mythology Mani, the moon goddess, travelled across the sky in a car drawn by Alsvidur, 'the All Swift'. Diana, goddess of the moon, travelled likewise in a horse-drawn chariot. The gods Thor and Helios drove their cosmic chariots through the heavens, while the mighty Odin was borne through the clouds on the back of his eight-footed steed.

Driven Over Precipices

In sacrifice we submit our most precious possessions to the gods, and the horse, the symbol of social power in ancient societies, was accorded this dreadful honour. In Imperial Rome, the October Horse was sacrificed as an offering to Mars. In some of these barbaric rites, horses were driven over precipices as offerings to the sea deities.

Part of the funeral rites of the warlord of old was the obligatory killing of the war horse in order that it might continue to serve its dead master in the afterlife, a custom which continued until as late as the 14th century. The traditional military funeral with its riderless horse, carrying its dead master's boots reversed on either side, is a last surviving relic of this form of sacrifice. The nomadic tribes of the Altai Mountains of Central Asia continued the sacrifice of horses until well into the 20th century, despite attempts to suppress the custom by the Soviet government. In a government poster of the 1920s the skins of flayed horses are displayed on poles above the legend: 'There are no gods. No sacrifices of horses will deliver you from your need.'

In Western Europe horses were burned alive in rural districts as late as the 18th century as a magical device, intended to remove disease from the remainder of the herd, or were burned alive in order to prevent the death or theft of the other animals.

To ancient man the drama of the heavens was performed by demi-gods, animals and men, the gigantic reflections of their pale selves on earth. The hooves of the divine horses pulling the celestial chariots accounted for the thunder; the whip-lash was the lightning that flashed terrifyingly across the sky; and there were the famous Wind Horses among whom were Pegasus and Hofvarpnir, steed of Gna, messenger of the divine Frigg. Sometimes the heavens would be agitated into a fury of terrifying commotion, as if an army was marching through the clouds. Out of this was born the legend of the Wild Huntsman with his diabolical horse and baying hounds, searching for human souls (see WILD HUNT).

Satanic Steed

Allusions to mystical, allegorical and cosmic horses find a place in many religions including Christianity. In both the Old and New Testaments occur supernatural horses. Elijah and Elisha saw visions of fiery horses and in Revelation, St John describes the terrible horses that harry mankind, having 'tails like serpents'.

Fairy horses and horsemen were an integral part of the mystical lore of the past, whether

it was the enchanted horse of the Arabian Nights or the minute mounts of the elves and leprechauns of the West. Fairies were supposed to travel from place to place at fantastic speeds once they had uttered the magical cry, 'Horse and Hattock'. In the demonic beliefs of the past the horse played a central role. There was the colt-pixie, an evil spirit in the guise of a human being which lured horses to their doom. In the annals of witchcraft diabolic colts sometimes become the familiars of witches. Satan himself had been known to manifest himself in the guise of a horse and it was perhaps for this reason that a famous performing horse of the 16th century was burned as a witch in Rouen when taken abroad by its English master.

It was believed that a human being could be transformed by witchcraft into a horse. If the witch approached a sleeping victim and threw a magic halter over his head, he would be immediately transformed into a mount and could be ridden to the witches' sabbath. However, the bewitched human could turn the tables on the hag if he could slip off the bridle and throw it over her head, for she would be transformed into a mare and could be ridden over the countryside until she sank to the ground with exhaustion. Devils and witches were thought to delight in tangling the manes of horses and stealing into the stables and riding them undetected into the night. As a magical defence against such intrusion an amulet in the form of a stone with a hole in it was hung inside the stable door. An example of one of these, recently discovered in Epping Forest, near London, is in the shape of a crudely formed pentacle. Verbal charms both sacred and profane were commonplace in magically-minded Europe. In the

Durham Ritual the aid of Abraham is sought to protect the horse from the powers of darkness, a significant example of the manner in which Christian ideology became permeated by pagan concepts. The ever-popular horse brasses in the shapes of suns, crescent moons, hearts and swastikas, among other symbols, were originally worn as a form of defence against the Evil Eye, to which the horse was thought to be peculiarly susceptible.

The horse played a part in European fertility rites. The character of the Hodening Horse, a man disguised in a white sheet and horse's head who trots around Kent villages at Christmas and All Souls' Day, and the Welsh custom of the Mari Lwyd involving a horse skull (possibly a relic of Roman horse sacrifice), probably survive from fertility rituals. In many May Day festivals the hobby-horse plays a prominent role, the best known of which is the Padstow Horse which dominates the local Spring rites (see HOBBY-HORSE). In primitive communities such as those of the North American Indians, the horse dance was sometimes performed as a rite to emphasize the importance of the horse to the tribe.

Phantom Horses

Over the centuries the sharper outlines of the old divine myths have sometimes become blurred, overlapping into traditional ghost lore. There are innumerable tales of phantom horses which often pull ghostly coaches along lonely country roads. In Devon the ghost of Sir Francis Drake still drives his horrific black hearse pulled by headless horses. At Wyecollar Hall near Colne and at Loughton, Essex, the phantom horsemen gallop down their respective beats; the last being Dick Turpin, the infamous highwayman with the ghost of the woman he murdered clinging to his back. There are also many fascinating legends of phantom horses and riders who sleep through the centuries within caverns buried deep in the hillsides, ready to gallop forth at the clarion call of invasion in defence of their native lands. An interesting example of the fusion of ghost and elemental was the phantom white horse which was once observed at Oxwich, Glamorgan, walking upon its hind legs and then disappearing into the churchyard well. Until about 50

years ago a phantom woman riding through the skies on a white horse could be seen at Mayland in Essex, if one looked through the branches of a certain oak tree.

Horses reputedly possess certain clairvoyant powers of their own which enable them to perceive otherwise invisible intruders from the spirit world. They are notorious for obstinately halting at haunted crossroads, quite unresponsive to the proddings of spur or whip, and there are cases where horses have refused to pass a spot where it afterwards transpired that a funeral was to pass that day. According to the ancient system of divination from horses known as hippomancy, the Celts made their sacred horses walk in procession behind a chariot and ascertained the future from its movements. Germanic priests drew inferences from the carefully observed manner in which their divine horses emerged from the temples; if they advanced right foot first the omen was favourable, while the left was unfavourable. Well into modern times the horse continued to play a modified role in rustic divination. In some places it is still considered lucky to meet a white horse, while in others it is unlucky. A once common ritual was the custom of spitting and making a wish on seeing a white horse and crossing the fingers until a dog was seen. A similar superstition was applied to piebald horses.

Until the early years of the present century, and still surviving in some country places, there was an elite class of horse-handlers known as 'Whisperers', whose members were supposed to exercise an uncanny power over horses. This mysterious art, which was known also in America, enabled the handler not only to tame the most intractable of animals but to paralyse its movements if he so desired – in other words, apparently to bewitch it. According to a recent investigation of this practice by George Ewart Evans, the Whisperers' power was due not to witchcraft, to which it was commonly imputed, but to a shrewd understanding of horse psychology and physiology, certain secret aromatic oils being used to halt or attract the animals.

The magic of the horse has had its influence upon both interior and exterior domestic architecture. Attached to the gable ends of German houses the horse's head served as a defensive charm against evil spirits, while horse skulls were often employed as household amulets.

Many eccentric theories in folklore survive in either direct or indirect examples of the supposed magical power of the horse, such as the belief that horse hairs placed round the neck cure goitre, or inserted in a sandwich will banish worms in children, or again, if left in water the hairs will become transformed into eels. John Wesley, who was interested in folk remedies, recommended as a cure for cancer an infusion of dried and powdered horse spurs (the callosities on the inside of the horse's leg) in warm milk and ale. Pennsylvania Germans attempted to free their children from witchcraft by passing them through a horse-collar.

Many horse superstitions are still religiously observed by horsemen. To change the name of a horse, it is thought, changes its luck. It is still a common practice when entering a horse for a show to mutter 'break a leg' as a prophylactic charm against the hostile intervention of the jealous gods. To dream of a white horse is an omen of death in some places in Britain, but generally the horse that appears in a dream is a good sign and understandably so, since it is the traditional friend and servant of mankind.

HORSESHOE

THE IRON HORSESHOE has a long history as a lucky charm in most countries where horses are used. Various suggestions have been made as to why this should be so. Blacksmiths working with iron, the magic metal, and employing that mysterious substance fire, were traditionally thought to possess supernatural powers (see SMITH). Then again, the iron shoe was enhanced by its close association with the horse, worshipped in early times as a sacred animal (see HORSE). Other authorities have found a relationship between the horseshoe and the crescent moon, which it resembles in shape.

Today, as one of the most popular modern emblems of good luck, it is a familiar sight on greeting cards and wedding-cakes. But to our ancestors it was a powerful protection against the malice of witches and evil spirits: 'Your wife's a witch, man; you should nail a horseshoe on your chamber door,' remarks one of the characters in Sir Walter Scott's novel *Redgauntlet*, and the antiquary John Aubrey, describing contemporary habits of the 17th century, was able to say: 'A Horseshoe nailed on the threshold of the door is yet in fashion: and no where more than in London: it ought to be a Horseshoe that one finds by chance on the Road. The end of it is to prevent the power of Witches, that come into your house.'

A popular greeting of the same period expressed the wish 'That the Horseshoe may never be pul'd from your Threshold.' In 1813, 17 horseshoes were counted outside houses in Monmouth Street, in London's Soho, and there were as many as seven left in 1855. Farmers suspended them above their horses or nailed them to the stable door, to prevent evil spirits from riding the animals at night and tiring them out; this was known as 'hag-riding'. In Silesia three were nailed over the door of the byre before Walpurgis Night, the eve of May Day, when witches traditionally ride to hold their Sahbath. Sailors also nailed them to the masts of ships to avert storms and shipwrecks, and Nelson, who was superstitious, had a horseshoe fastened to the mast of the *Victory*. A correspondent of *The Gentleman's Magazine* (1822) wrote in to say that: 'It (the horseshoe) has been often seen in the ships of war in the royal dockyards.' They were even placed on churches. Aubrey saw a tile with a horseshoe on it under the porch of Stanningfield church in Suffolk.

An 18th century cynic, protesting against the repeal of the Witchcraft Act, observed: 'To secure yourself within doors against the enchantment of witches, especially if you are a person of fashion, and have never been taught the Lord's prayer, the only method I know of is to nail a horseshoe upon the threshold. This I can affirm to be of the greatest efficacy; insomuch that I have taken notice of many a little cottage in the country with a horseshoe at its door, where gaming, extravagance, routs, adultery, Jacobitism, and all the catalogue of witchcrafts have been totally unknown.'

During the last century, a carpenter at Ely, who had fallen ill, became convinced that he had been bewitched. The blacksmith was summoned and told to nail three horseshoes on his bedroom door as a protective measure. The woman supposedly responsible for the carpenter's illness, whose name was Gotobed, was so annoyed that she soon afterwards walked into his bedroom unannounced. Everyone was amazed that the charms had not prevented her from doing this, until it was discovered that the shoes belonged to the wrong animal – a donkey.

Bewitched Churns

In folk tradition, witches were supposed to cast their spells over food in the dairy. If the butter refused to come, it was assumed that the churn was bewitched and the dairymaid would drop in a heated horseshoe to break the spell; in Ireland a horseshoe was actually nailed to the bottom of the churn. In Dunboe, in Londonderry, a woman whose churn had been bewitched called in the local wise man, who shut all the doors and windows and boiled the right fore shoe of an ungelded horse in a new iron pot with other objects made of iron. Soon a man approached the house and asked to be let in. He was refused and, when the pot eventually boiled over, he screamed in agony. The pot was only removed from the fire when he had promised never to interfere with another churn. Not long after, so the story goes, the male witch emigrated to America and was never heard of again.

Such charms were not always so successful. In 1903 the *St James's Gazette* reported the case of a man who, thinking his horses had been bewitched, fed them soup containing horseshoes, nails and iron filings. Shortly afterwards one of the animals died. A similar type of recipe, used for curing impotence in Morocco, involves less personal risk. If a man finds himself impotent, a charm is written on a horseshoe, preferably an old one, which is heated by a blacksmith and dipped in water. If the patient then drinks this every morning for a week on an empty stomach, his virility will return. In Ireland if a child pines for no apparent reason, a charm is prepared from old horseshoe nails, hen manure and salt, but it is hung up and not consumed. Germans used to cure whooping cough by feeding the child from a plate which had been branded with a horseshoe.

Occasionally witches were accused of using horseshoes, traditionally a protection against their activities, to further their own ends. At the time of the witchcraft trials in Scotland, a certain Elizabeth Bathcat was indicted because a horseshoe was nailed to the door of her house and this was 'A devilish means of instruction from the Devil to make her goods and all her other affairs to prosper and succeed.'

Horseshoes were sometimes used in marriage divination. Perhaps this is why, if a girl loses her virginity, the Germans say: 'She has lost a horseshoe.'

The guardian horseshoe, made of iron and shaped like the new moon, has hung on stable doors for centuries to bring good luck and general prosperity

Awarded the sovereignty of Egypt over his rival Seth by a divine tribunal, Horus became the pre-eminent Egyptian god; he is represented in mythology in many different guises and roles

HORUS

Michael Holford/Abbey Museum

The falcon god Horus was identified with the living Pharaoh. Horus the child on the lap of his mother Isis is a common motif in Egyptian art and the early iconography of the Madonna and Child owes something to this pagan tradition: bronze statuette c 600 BC

AS THE ROYAL and national god of ancient Egypt, Horus enjoyed a position of such importance that no rite or festival involving the nation or its king could be celebrated without giving him a prominent place. One of the largest of Egyptian temples, that at Edfu, belonged to him. In form he was a falcon – the peregrine falcon, the most fierce and terrifying of all the birds of prey which scoured the Egyptian sky. His name means 'he who is on high' or 'the distant one' and refers to his domain as a sky god.

Horus was identified with the living Pharaoh, just as Osiris was identified with the Pharaoh in death, and from the 1st Dynasty onwards the Pharaoh called himself Horus (with other names). In the Cairo Museum there is a beautifully impressive seated statue of King Chephren of the 5th Dynasty which shows the Horus-falcon stretching out his wings protectively behind the king's head, recalling somewhat the Old Testament phrase 'in the shadow of Thy wings'.

Horus was the leading god of the confederation of clans or tribes which secured sovereignty over the whole of Egypt when the kingdom of Menes was established. The evidence of totemistic systems reveals the striking fact that the totem is identified with the human leader of the clan. Although totemism is not attested in all its features in early Egypt, this particular religious phenomenon can be recognized in the royal status of Horus.

The Horus-confederation was apparently opposed, in the final predynastic struggle for Egypt, by a league under the aegis of the god Seth (see SETH), a deity of canine aspect whose home was in Upper Egypt. It is tempting to connect the political strife which resulted in the enduring unity of Egypt with the early myth concerning the conflict of Horus and Seth, although other explanations have also been offered. According to the myth, Horus and Seth were two feuding brothers, who inflicted frightful wounds on each other. Seth tore out an eye of Horus and devoured it, while Horus deprived Seth of his testicles. A trial ensued before a divine tribunal, in which Horus was vindicated and awarded the legitimate sovereignty of Egypt.

Horus and Seth Reconciled

There are suggestions that the god Thoth had tried to intervene in the quarrel in a reconciling role, although he sometimes appears as a helper of Horus, especially as the god who restored to him his lost eye, and more rarely as one who sympathized with Seth. An ambivalence, then, is apparent in the position of Thoth; perhaps it is a two-facedness to which mediators inevitably expose themselves. A tradition of reconciliation is certainly reflected in the symbolism of Egypt's dynastic unity, for whereas Horus is the victorious deity who is permanently incorporated in the personality of the Pharaoh, yet the two gods are shown co-operating for the king's benefit in the ceremony of the 'Baptism of Pharaoh'. The king's jubilee festival (called the *Sed*) used to conclude with a processional visit to the chapels of Horus and Seth, and in the purification of 'baptism' of the king the two gods are shown pouring water over the Pharaoh's head.

Similarly, in the ceremony of 'Uniting the Two Lands', the symbolic plants of Upper and Lower Egypt, the reed and the papyrus, were joined by the two deities; Horus being usually associated here with Lower Egypt. Again, the stolen eye of Horus which was healed and restored was symbolic of the crown. In a royal context, therefore, the ceremony of presenting the eye suggested that the sovereign power of the king had been confirmed.

At a quite early stage the myth of Horus was merged with that of Osiris (see OSIRIS), and the main reason for the merger was the double identification of the king. When he died he became Osiris, but as a living Pharaoh he had been Horus. From this divine doubling followed a transfer of the story of the conflict to Osiris. If Seth had been the enemy of Horus, he was now the enemy of Osiris, and the myth maintained that Seth had murdered Osiris. In the early Horus myth the mother of Horus was Hathor, and his father was Geb. Now, in the new Osirian framework, Isis becomes his mother, Osiris his father, and Seth his nephew. In the new framework, similarly, a new Horus is evolved – Horus the child – and the impact of the kingship on this mythic situation is clear: if Horus the king has died and become Osiris, yet the succession in the male line finds a legitimate heir in a young Horus. A further effect of the fusion is that the vendetta against Seth is carried on by the young Horus, who eventually overthrows his father's slayer.

Horus the Child

Horus the child (called Harpocrates by the Greeks) gradually assumed an important place in mythology. Many stories were told about his childhood, when he was nursed by Isis or by a foster-mother in the papyrus swamps of the Delta and defended by his mother's magic against the wicked onslaughts of Seth. It will be recalled that Moses too was a babe hidden in the bulrushes, and the legend of Horus may well have influenced the Biblical episode. Among the misfortunes inflicted on Horus the child was the homosexual attack made on him by Seth; the first version of this appears in a Middle Kingdom papyrus, and it tells of the unavailing efforts of Isis to prevent the assault. Seth also attacks Horus in various unpleasant insect and animal forms; Horus may be bitten and injured, but he is healed by the magic of Isis his mother. A curious feature of the childhood legends is that they also tell of a disagreement between Horus and Isis. One version described Horus and Seth fighting in the form of hippopotami in a river. Isis expresses feelings in favour of Seth, whereupon Horus cuts off his mother's head; one source adds that Thoth restored it as a cow-head. According to Spell 113 of the Book of the Dead the hands of Horus were cut off and thrown into the water through a magical curse uttered by his mother. In a few sources the episode takes a sexual form and Horus violates his mother. Mother-incest has indeed been attributed by some to the Egyptian interpretation of kingship, with the suggestion that Isis is regarded as both the mother and the wife of the Horus-Pharaoh.

Horus the child on the lap of his mother Isis forms a well-known group in Egyptian art, and the early iconography of the Madonna and Child owes something to the pagan tradition. Christian art was also influenced by representations of Horus the fighter on horseback, although this does not occur till Roman times. Certainly the evolution of St George and the Dragon owes something to the way in which Horus was shown attacking the Sethian crocodile. A series of small stelae (tablets) depicted the young Horus dealing triumphantly

Sue Gooders

A sacred bird to the ancient Egyptians, the falcon was particularly associated with Horus, the sky god; as a terrifying bird of prey that dominated the Egyptian skies, it was an apt living form for Horus, also the royal god: Horus on a plinth from the Tomb of the Nobles, at the ancient city of Thebes

with snakes, scorpions and crocodiles. These stelae functioned as magical aids against such threatening creatures, the underlying principle, as so often in magic, being that of analogy. Just as Horus triumphed, so will the possessor of the stele. The principle of analogy extended also, of course, to mythical events described in texts. Many medical texts which rely partly on magic use this technique. A spell in the Papyrus Ebers addresses Isis explicitly as the one who healed Horus and pleads for the same treatment in the case of the patient: 'O Isis, great in magic, release me! Free me from every bad, evil and bloody thing . . . as you released and freed from (every evil) your son Horus.'

Horus as the ancient god of the sky maintained his status only by a process of assimilation to the cult of another god of heaven, the sun god Re. Egyptian religion teems with theological 'take-over-bids' of this kind. The composite name thus evolved was Re-Horakhty (Re-Horus-of-the-horizon), and the amalgam was expressed in art by means of a falcon with a sun-disc on his head.

HOUSE

In symbolism the house has a female character and, because it is a secret enclosure, it is said to be the repository of all wisdom; in the interpretation of dreams it represents security. In fact, the house has been a symbol of safety and comfort ever since prehistoric times when man sheltered in his cave from the dangers of untamed Nature, and as with other children's games, playing with dolls' houses is partly a magical imitation of grown-up life

Previous page **Part of the Currie doll's house, built in 1874, and (*above*) the private chapel on the second floor of this miniature house: in Bethnal Green Museum**

Facing page **The song 'Home, Sweet Home' sums up man's attitude to the place in which he lives: Victorian bookmark in the Victoria & Albert Museum**

Many of the magical practices surrounding the house were aimed at keeping evil spirits, or the elements, at bay; window blind bobbins shaped like acorns are a relic of the belief that the oak, sacred tree of the thunder god, could protect a house from lightning

THE EARLIEST HOUSE was probably erected to shelter the helpless infant from the cold and was designed as an imitation of the lairs and burrows of wild animals. Almost certainly the most primitive forms of architecture were based on Nature, whether in the form of tree branches thatched to provide protection against rain and sun or the chieftain's grave, which was so often a mound that was the replica of the green hills of the countryside.

In the cold North the prehistoric cave was man's first home, usually selected because it faced in a westerly direction to avoid the biting east wind of winter. The cave entrance must have been of immense physical and psychological import from the beginning for it provided not only the means of egress and ingress but was the way of entry for the elemental powers of Nature – light, wind, rain and sun. Within the cave there could he security, warmth and relaxation while outside lurked the dangers of untamed Nature, often in the demonic shapes with which mankind peopled the realms of darkness. It is perhaps understandable that the recesses of the cave should have been dedicated to religious rites and that cave art provided perhaps our earliest experience of abstract form (see CAVE ART; CAVES).

With the development of more sophisticated types of habitation – firstly the stone house on the hillside and later the log hut in the valley – the house must have become ever more important socially, for the more widely one's awareness of the world develops, the more intense are the terrors it excites, and it is only within four walls that man can be completely insulated emotionally against the enervating and destructive power of fear. At a later stage still came the hall, a single-storied, unpartitioned room with the hearth at its centre, the entrance or threshold of which provided a barrier separating the known from the unknown.

In symbolism a house is expressed as an

The house with its storeys doors and windows has been seen as a psychic projection of the human body with its various layers and apertures

enclosed space and also as a receptacle which, like the chest and the womb, is female in character. As a secret enclosure it also symbolizes the repository of all wisdom. There are mystics who have seen in a house, with its storeys, doors and windows, a psychic projection of the human body with its various layers and apertures. It is certain that the sophisticated symbolists of our present age have endowed the house with qualities that would have been inconceivable before the development of psychoanalysis, as for example in the interpretation of dreams in which it is said to represent the different layers of the psyche.

As a further extension of the same theme, the exterior of the house is said to symbolize the human personality, the roof representing the mind and the subconscious being relegated to the basement. The kitchen becomes 'the laboratory of psychic transmutation', echoing Paracelsus's definition of the belly as 'the grand laboratory'.

While such philosophical speculations would have been beyond the comprehension of the ancestral house-owner, it is evident that certain abstract qualities were never far from his mind when he erected his home, since the whole process of building continued to be associated with elaborate magico-religious rites until comparatively modern times. The selection, orientation and layout of the site was determined by augury, for any false alignment in relation to the sun could cast a blight upon the future.

Psychic Household Insurance

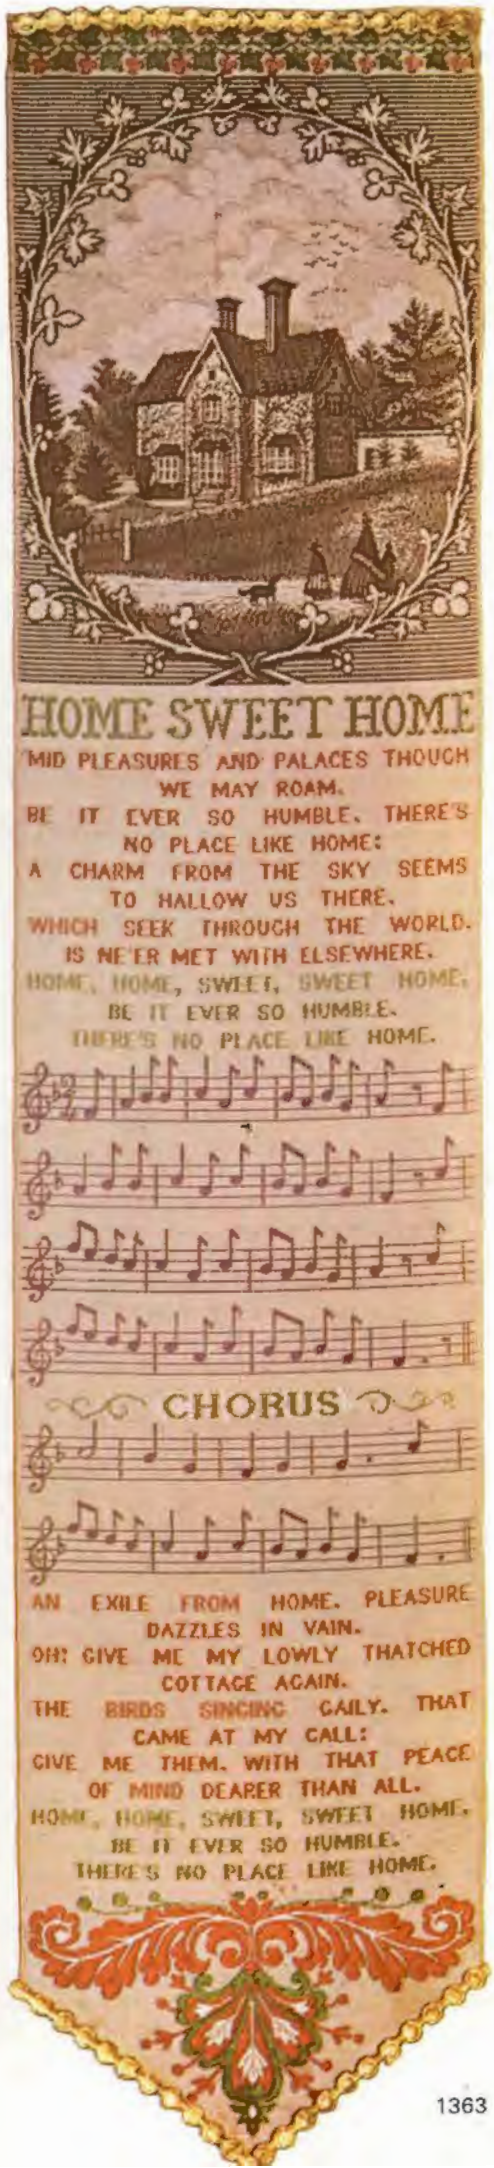
The foundations of households in old-world Europe were customarily 'laid in blood', the sacrificial rite devised to neutralize the enmity of the earth deity and to ensure the stability of the structure in accordance with primitive architectural theory (see BUILDERS' RITES). As a relic of this old practice, the superstition is still common in the North of England that the building or rebuilding of a house or the cutting of a new doorway results in the death of one member of the family. A further reminder of the custom of burying human victims alive beneath a cornerstone is provided by the superstition that corner houses are unlucky places in which to live.

Originally it would have been necessary for any new building to be consecrated by a priest before it could be occupied, to provide ritual protection against demons and ghosts. In the Celebes, in Indonesia, the most elaborate ceremonies were carried out even in modern times to protect those who entered their new homes from the psychic dangers within, and in many lands including Persia and China offerings were always made to the protective spirits before entering a house. A comparable superstitious practice is still observed by those of Anglo-Saxon stock in northern Europe and America who carry bread and salt into a new house to ensure the prosperity of the occupants.

The belief still prevails in many parts of Europe that a newly completed house should be placed under the protection of a lucky tree or bush, and as a further insurance against the attacks of hostile spirits the houseleek, a plant dedicated to Thor, is sometimes grown upon roofs (see HOUSE-LEEK). As an additional insurance with the household deities human and animal skulls were used as magical amulets, and were sometimes embedded in walls, those of the horse being particularly favoured in northern Europe.

The main defence of the house against intruders of all kinds consisted of the wall, which has been described as a 'restrictive force that kept out prying eyes and enemies'. Infinite care had to be observed in its construction. In Ireland it is still considered dangerous to build part of a gravestone into a new wall as this 'builds death into the house'.

The window or 'wind eye', originally a mere hole in the wall protected by branches or a curtain and exposed to the wind, in symbolism represents the idea of penetration; if situated at the summit of a tower it becomes the symbol of consciousness. In addition the window opens the inner darkness to the holy power of light. It is said that some primitive communities worshipped the first ray of the sun when it reached the window. In Ireland a cup of milk is placed on the sill as refreshment for the wandering family ghosts who chance to pass that way at Christmas time. The entry of an alien spirit by way of the window could be prevented by suspending a witch ball, a multi-coloured glass sphere, near the opening, where it distracted the eye of the approaching witch and was thought to absorb the first impact of her venom.



Sweetening the Kitchen God

On the 24th comes the sacrifice to the Tsao Wang or Kitchen God, who is one of the oldest of the household deities . . . In the household he plays a dual role, for he not only looks after the hearth, but has constituted himself the censor of morals of the family. He is the connecting link between God and Man and, seven days before the New Year, he is despatched to make his annual report. Where officials are concerned it is axiomatic in China that every man has got his price, and the Kitchen God is no exception to the rule. The family, whose record is about to be laid before the All Highest, makes every effort to ensure that a favourable report shall be rendered. As a rule, the effigy of the Tsao Wang occupies a small bamboo or wooden shrine, and he is depicted with his horse beside him. On the night of his departure incense is burned, and some straw, or in the North, kao-liang, is ignited by the stove as forage for the steed's journey. A bowl of water is also poured out by the stove. A special sticky sweetmeat, named T'ang Kua, is part of the sacrifice, and a portion is burned with the picture of the god. This is to ensure that he will only say sweet things, but it is not unusual to make certain of his silence by smearing his mouth with opium, or steeping the effigy in wine, to render him drowsy or fuddled when he reaches the end of his journey. He then risks expulsion for drunkenness before he can get a word in with the Jade Emperor and, as the family is free from his surveillance for seven days, they are indifferent as to how he spends his time.

Chinese Creeds and Customs

The threshold of the house has always been an important centre of household rites as it is essentially a barrier against the enemy without, whether human or elemental. In mysticism the doorway, the place of 'comings and goings', represents the free will, while its archway has long been the site of purificatory rites and ritual healing. Specially devised ceremonies, often involving sacrifice, were performed at the threshold of the house to propitiate the household or guardian spirits and to protect the family from evil. There are many who even today believe that it is unlucky to enter a new house for the first time by the back door, which is in effect an unconsecrated aperture, or to leave a house by a different door from the one at which one came in.

In biblical times the threshold or gateway was the scene of mystical ceremonies as in Exodus (chapter 12) where we read that the blood of a lamb, sprinkled on the lintels and doorposts of the Israelites' houses, protected them when God killed the first-born of Egypt. After the erection of the principal entrance to an Indian building the woodwork is even today ritually anointed with the oil of the sandal-tree. The sacrosanct character of the house imposed many prohibitions upon those who entered it, including the need to avoid any contact between the foot and the threshold; in the Orient, for instance, visitors remove their shoes. The sanctity of the doorway is further emphasized by the inscriptions that traditionally appear above it. These may vary from the sacred to the profane, and in the Far East are often obscene. In parts of North Africa the genitalia of animals are set above barn doorways as a warning to the passing demon. An interesting feature of some older English houses is the stone carving of a woman's head that can often be seen placed above the doorway. The grotesquely designed door knockers on old English cottages also served to warn off devils, as did the horseshoes that were nailed to the doorways of barns.

To certain gods and goddesses have been allocated the task of supervising the threshold of the house, and altars were erected near the entrances in their honour. The Roman Janus (see JANUS), god 'of the beginning of things', is perhaps the best known deity of gates and doors and his name is related to our modern 'janitor'.

The symbolism of the door key pervades mythology and religion, for whether it is expressed as the key of heaven or as the key to wisdom, it is the symbol of entrance to the mysteries. For this reason priests and priestesses of the ancient religions carried keys as evidence that they were participants in the rites of the gods. Even in the modern world the key is of great symbolic importance, and to welcome an honoured guest by handing him the keys of the city is in effect to offer him open house.

The keyhole represents a chink in the armour of the household, an aperture by which the devils may enter and it must therefore be rendered secure; however, if the key is left in the lock the home is safe. Many people once believed that stopping the keyhole was extremely important during childbirth to prevent fairies from stealing the baby, and that this action also barred the terrifying evil spirit known as the nightmare from entering the house.

In the past, certain special actions performed with a strict eye to magic were involved in entering or leaving a house, some of which remain part of contemporary folklore. The new bride is still carried over the threshold when she enters her home for the first time, while stumbling at the threshold must be avoided if one is embarking upon a journey. Until recently it was customary in Devon to scrub the bride's footprints from the front doorstep of her parental home after her departure as a sign that she had left her old house and had chosen another.

Ladder to the Gods

The various rooms of a house are said to be symbols of individuality; a closed room without windows is an obvious symbol of virginity. The stairway, leading upwards and downwards to unite the various floors, symbolizes the principle of ascension, graduation and communication between different levels of the personality. This however is little more than a reiteration of the old folk theme that steps and ladders provide a mode of ascension to the land of the gods. For this reason it is considered unlucky to pass someone on the stairs, since he could well be a god in human shape who would resent the presence of a mortal on his sacred territory. There is a pleasant domestic rite still observed in many places in which a baby is carried to the top of the stairs on its first journey, in the belief that it should 'go up in the world before it comes down'. Superstitious flat-dwellers have been known to resort to a step-ladder for the same purpose, so tenacious is this old tradition in our midst. (See also STEPS AND LADDERS.)

The furnishings of the rooms are included in the magical framework; a change in the clock's rhythm being a death omen, especially if it should strike 13. Sleeping has its magic rites, for the bed should face east-west in alignment with the sun, or otherwise the sleeper will suffer from nightmares. New shoes must never be placed on the table as this brings death upon the household, a superstition doubtless arising from the old custom of placing a new pair of shoes on the feet of a corpse. In East Anglia it is considered a sign that a visitor will never enter the house again if he should stand his chair against the wall before leaving the house. A falling picture is an omen that a member of the household will die, especially if it is his portrait, while three knocks on the window, or the presence of crows encircling the roof, is advance intimation to the householder that he would be wise to keep his life insurance up to date.

Death in the Home

Although a house may be protected by magical and religious rites from the assaults of external spirit forces it is, paradoxically, the abode of domestic elementals who have one common feature in that they are capricious, troublesome, hard to please, and even spiteful. The household spirit is known as the boggart, brownie, fairy, goblin or kobold, according to nationality. The kobold was a common feature of English domestic life and as long ago as the 12th century a house-kobold caused a considerable stir at the Suffolk home of Sir Osborn de Bradwelle by discussing learnedly in Latin 'on Scriptural subjects'. A Danish kobold advanced further in this field, ultimately becoming clerk to an archbishop. Promotion from domestic spirit to the higher ecclesiastical ranks was rare, however, and in the main the kobold was restricted to passing the time by playing tricks upon the household; hiding farm equipment and consuming considerable quantities of food. Today the last relics of kobold lore have been reduced to a vague belief in lucky and unlucky houses possessing happy or unhappy atmospheres.

Innumerable are the magical rites

United Press International

Mark Gerson

The key, the instrument which unlocks the door to the house, has always been of great symbolic importance; in ancient religions and mythology it represented entrance to the mysteries, and even today to hand an honoured guest the keys of a city is, in effect, to offer him open house *Above* Tunku Abdul Rahman, Prime Minister of Malaysia, receiving the Freedom of the City of London *Right* A 21st birthday key, symbolically opening the door to adult status and responsibilities

associated with the interior of the house, which were once employed as protection against evil. People with some unusual feature or defect such as red hair, cross-eyes or whose eyebrows met across the nose, were never permitted to cross the threshold as they were either bad luck bringers, witches or involuntary possessors of the Evil Eye. A witch who entered the house immediately acquired power over its occupants; she could be kept from the threshold, however, by secreting a pair of scissors or a knife beneath the doormat, for like all enemies of good she was unable to step over cold iron.

It is in matters connected with death that the magic of the house is most apparent. When one of the family is due to pass over, according to tradition, the family ghosts discreetly return and await the reunion. If the dying are not to suffer a 'hard death' the death-bed must be in alignment with the floorboards and never across them. An older superstition held that if pigeons' feathers were used to stuff the mattress the death agonies might be prolonged indefinitely. Immediately after death all the mirrors in the room were covered lest the soul in its departure (which had previously been facilitated by the opening of every door and window in the house) should snatch at a mourner's reflection and bear it away to keep it company in the afterlife.

The old belief that a house might in some mysterious manner become 'impregnated' by death has often taken strange forms. For example, the Kamchadales of north-east Asia abandoned the cabins in which members of the tribe had died. There are many who fear to live in a house of death believing this to be an open invitation for the spirit of death to embrace the living. In some primitive communities this morbid terror has been responsible for houses being burnt down as a purificatory rite, following a death.

It seems that none of the elaborate precautions undertaken to guard the threshold from evil spirits provides adequate protection against the return of the family ghost. At one time a room would be shut up after a death, often for years on end; the 18th century essayist Addison refers to a house as being 'three quarters locked up as haunted'. There appears to be some connection between the common European belief that an empty

house is an abode of ghosts and the old tradition that after a dwelling has been empty for some time it becomes occupied by devils. In the author's own collection of ghost stories from the North of England is a terrifying legend of a house 'haunted by a pair of eyes'. These had apparently entered the building while it was empty, and finally drove the new tenant insane.

When the family dead choose to return to their old homes they show all the old traits they once possessed as living humans, being either quiet, philosophical and good-tempered, or petulant and vengeful. Sometimes the contest between the dead and the living for the possession of the house becomes so disturbing that an exorcist has to be called in. In Pliny's day houses were 'hallowed' against evil spirits with brimstone. Once the spirit is expelled the house will often remain free of unwelcome intruders of this kind for a considerable time.

Exorcism constitutes possibly the last surviving magico-religious ceremony associated with the house. It appears that there are certain wanton household spirits who do not submit as readily as ghosts to the commands of the exorcist. These are the poltergeists whose activities are closely bound up with the family. The poltergeist has much in common with the old kobold, of whom it is doubtless a direct descendant, being capricious, troublesome and occasionally violent, hurling stones and wrenching bed clothes off people who are sleeping, and occasionally setting a house alight. In the Isle of Man immediately before the Second World War reports of a household elemental in the shape of a talking mongoose created a national sensation. There are few houses as adequately secured against hostile presences from both inside and outside the threshold as Bettiscombe Manor in Dorset, which is protected by a human skull that successfully prevents any evil spirits or ghosts from troubling the tenants.

In dream lore a house is a symbol of security, and to dream of standing outside one indicates a forthcoming change of plans, while to enter the house means a fresh start in life. A house in course of erection symbolizes happiness to come but if it is being pulled down it portends an unhappy love affair. Folk-tales contain a wealth of lore reflecting the importance of the house in childhood fantasies. This is as it should be for the house began as a sanctuary for the helpless child,

Peter Goodlife

only developing into a psychic shrine with the passage of the years.

The garden is in effect part of the precinct, an extension of the house itself; it has been described as a place 'where nature is subdued, ordered, selected and enclosed'. It is here that protective plants and trees were grown for the purpose of providing a first magical barrier against approaching evil. The mountain ash protected the home against witchcraft and the bay withstood the assaults not only of witches but of devils and storms. The plants purslane, pennyroyal and pimpernel were ever potent defenders of the house against devils and misfortune generally.

Certain garden flowers have long been associated with sickness or death and for this reason are rigorously kept from the house. The white lilac is among the most notorious of these flowers, but even the purple and red varieties are said to bring disaster. The lily, perhaps because of its close association with funerals, is considered a death omen, while the white flower of the hawthorn is almost universally excluded from the house since it brings with it tragedy (see HAWTHORN). The glorious daffodil, beloved of the poets, has a more dubious reputation in terms of bad luck and for this reason is banned from the house in some parts of the North of England (see PLANTS AND FLOWERS).

The acorn, on the other hand, the seed of the oak which is the sacred tree of the thunder god, affords protection to both house and home against storms and lightning; it is for this reason that the bobbins on window blind cords are traditionally acorn-shaped. A more positive device for keeping misfortune at bay is to cultivate the visit of bees to the house, since they are not only great luck-bringers but firm friends of domestic harmony. At one time it was the rule to 'tell the bees' of every change in the household or otherwise the whole hive might take umbrage and fly away. The common house spider is also a luck-bringer to any home. 'If you wish to live and thrive, let a spider run alive' is a useful maxim for the superstitious home-lover.

HOUSELEEK

THIS LARGE GROUP of hardy succulent plants, forming rosettes and usually growing in mountainous regions, has the Latin name, *Sempervivum*, meaning 'ever-living'. Although individual rosettes die after flowering, each produces many youngsters around it.

One very variable, widely spread species of houseleek has the name *Sempervivum tectorum* – the houseleek of the roofs. The first reference to this plant is by Theophrastus (4th century BC) who described it as growing 'upon flat shores, on top of earthy walls, and particularly on roof tiles'. Some 300 years later, Dioscorides wrote of how 'it grows in mountainous places, and some plant it on the tiles above their houses.'

The Romans called it *Iovis caulis*, the stalk of Jove or Jupiter, and Diopetes, 'fallen from Zeus'. All over Europe there are equivalent names to houseleek, or variations on 'thunder-beard', derived from Thunor or Thor, who gave thunder its name. 'Jupiter's beard' is another name which, in its Latin form *Jovibarba*, has recently been revived botanically for one group of the species.

All this builds up to a plant of special attributes, a plant of the lightning-hurling Zeus or Jupiter, ever-living and evergreen, thrown down by him to protect man's houses against lightning and fire, and hence planted on roofs as a living insurance policy. Even now it can frequently be seen in the country, and in previous centuries it was very common indeed. Charlemagne ordered it to be planted in this way; Sir Thomas Browne records its uses as 'a defensative against lightning'. There are records of widespread houseleek-planting in the 17th century, especially on inflammable thatch, where it would normally be grown on the clay ridges and corners.

As well as providing protection against lightning and fire, the houseleek was a magical insurance of the wellbeing of the house occupants, keeping away witches and evil spirits. Even today to remove a houseleek from a cottage roof is to bring bad luck; to pick one of its flowers may mean death to an occupant. In some quarters the flowering was considered unlucky and as soon as a flower stalk appeared it would be cut off.

The plant was also considered to be of value in treating burns, scalds or inflammations. Dioscorides quotes its use to cure such ills, and even today 'Singreen ointment' (from Old English *singrene*, 'evergreen') or the juice of the fleshy leaves, sometimes macerated with those of plantain, are used in country districts. Sometimes the leaves would simply be laid and bandaged onto the injury.

The astrologer and pharmacist Nicholas Culpeper (1616-54) had a long list of its curative properties: 'Our ordinary Houseleek is good for all inward health as well as outward, and in the eyes or other parts of the body: a posset made of the juice is singularly good in all hot agues . . . it cooleth and restraineth all hot inflammations . . . scaldings and burnings, the shingles, fretting ulcers, ringworms and the like; and much easeth the pain of the gout . . . it easeth also the headache, and the distempered heat of the brain in frenzies, or through want of sleep . . .'

The 16th century botanist Gerard has a rather peculiar nostrum which includes among its ingredients: 'Juice of the Houseleeke, Garden Nightshade, and the buds of Poplar, boiled in hog's grease.' Albertus Magnus, the 13th century philosopher, suggested that if one rubbed one's hands with houseleek juice one could then handle red-hot iron with impunity. The juice of the houseleek does in fact have soothing qualities and is used today for corns and warts.

Mustograph Agency

Because the houseleek was thought to protect buildings against lightning and fire, it was planted on roofs, especially inflammable thatch, as a living insurance policy

Huguenots

French Protestants of the 16th and 17th centuries who were branded as heretics and subjected to severe persecution by the Catholic authorities: defiantly resisting their oppressors in the wars of religion which ravaged France in the late 16th century, they were rewarded in 1598 with the Edict of Nantes which granted Huguenots freedom of conscience and full civil rights; the Edict was revoked in 1685 by Louis XIV and many Huguenots fled to England and Prussia.

Michael Holford

HUNTING MAGIC

IN CONTEMPORARY Western societies hunting magic persists in the attenuated form of sporting hunters' and fishermen's use of good luck charms and other common 'superstitious' practices. Among primitive peoples, whose understanding and control of the natural world are relatively rudimentary, but who often depend heavily on hunting and fishing for their sustenance, magic may assume great cultural importance.

Hunting (and fishing) magic in such societies may reflect profound cultural concepts of the essential qualities that distinguish men from animals, and of the complex and delicate relationship between human society and the natural world. Less obviously, the beliefs and practices of hunting magic may indirectly reveal much about the tensions and problems of the societies in which they are found. This is because dependence on such inherently uncertain sources of food poses special problems for simple cultures whose fragile yet rigid social structures are threatened in a variety of ways by fluctuations in the luck of the hunters.

Magic is a means of establishing a personal relationship with an otherwise indeterminately related, unknowable and uncontrollable object or situation, which makes possible effective knowledge or control of that situation. It works by symbolically projecting onto such relationships and situations the orderly, predictable or controllable, yet potent properties of familiar social or natural phenomena. The magical act of symbolic projection thus necessarily relies upon a systematic and logically coherent set of ideas about the relations between the magician, the object of his magic, and the symbolic properties of the substances used in his magic. Magic may take the form of positive action directed toward the achievement of a goal; but magical beliefs may be equally important in a passive or negative sense, as explanations for the occurrence of unfortunate or unusual events, or as rules for the avoidance of certain contacts or associations which would have the effect of frustrating the achievement of a purpose, or bringing about actively harmful consequences.

The natural world, and above all the

animate beings, the birds, animals and fish, that inhabit it, constitute the domain of uncontrollable, unpredictable and unknowable events. They form a mysterious realm beyond the ken or control of the laws of human society. The magic of hunting cannot be understood unless it is realized that the hunt is frequently defined in cultural terms as a kind of rite of passage, a venture out of the safe and secure domain of human society into the ritually perilous, alien world of natural beings.

The structure of the hunt itself resembles that of an initiation ritual. The hunter must first prepare and separate himself from society, then encounter and subdue his prey, which requires him to enter into a relationship with an inhabitant of the asocial, natural world, and finally he must return again to human society. The return is often a ritually complex operation, for in many cultures the hunter cannot become fully reintegrated into the society of men without taking the necessary measures to purify himself of his relationship with his prey, which is magically dangerous because of its asocial, inhuman and hostile qualities, and to protect others from its effects. In some societies, this is achieved simply through the social distribution of the meat; in others, by rites of purification for the hunter; in still others, by ritual treatment of the corpse of the victim. The prey itself undergoes its own rite of passage, a transition from its wholly 'natural' existence, through the stage of contact and slaughter by the hunter, to its complete integration into the human cultural world as cooked food.

Lord of the Animals

Magical rites and beliefs may surround every phase of both hunter's and victim's passage between human society and Nature. The hunter's weapons and auxiliary animals (usually dogs or horses) are also frequent objects of magical treatment. There is, of course, enormous variation from culture to culture as to which aspects of these complex phenomena become the objects of magic, what are the explicit and implicit goals of the magical practices, what constitutes the objective content of the magical rites and beliefs themselves, and what basic ideas underlie them.

In some cultures, all hunters share knowledge of the important magical techniques; in others, each man may have his own techniques, either learned from others or discovered by himself. In still others, only specialists, shamans or priests possess the requisite knowledge or are able to perform the necessary rituals or provide the requisite medicines or charms. In certain societies, the ritual of hunting magic is performed by an entire band or community, in others by lone individuals. The techniques employed vary widely: they include the use of spells, amulets, charms, shrines and medicines; offerings or sacrifices to the animals themselves, to the divine guardians of the animals, or to the familiars or gods of the hunters.

Certain cultures concentrate on producing clairvoyant visions and telepathic or dream communication with the animals, to learn their location or secure their co-operation with the hunter. Others stress the establishment of a special relationship between an individual hunter and a particular species of animal, which may consist in an ability to understand its language, a particular skill in tracking or killing it, or occasionally a compact with that species under the terms of which its members allow themselves to be killed and taken by that hunter. A frequently employed technique is the application of medicines or charms to the weapons and body of the hunter or his dogs. The making and manipulation of representations of the quarry, whether in dance, song, or in art, seems also to have been a common device of hunting magic since Paleolithic times.

Much of the magic associated with hunting is directed at the quarry itself, with varying purposes, such as to cause it to multiply as a species, to locate it and perhaps to induce it to come to the hunter, to pacify it or neutralize its strength if it is dangerous. Hunting magic may also be practised to deceive the animal with respect to the hunter's presence or real intentions toward it, to kill it, to make it lighter so that it can be the more easily carried home, to placate or compensate it for being killed and eaten, to forestall the vengeance of the dead animal's spirit or supernatural patrons or protectors, or to counteract the potentially dangerous effects of contact with its physical substance (it is widely believed that the hair, meat and blood of wild animals has a dangerous 'potency').

Another array of magical practices is concerned with preparing the hunter (through fasting, sexual continence, performance of rites, and so on) for the hunt, in ways calculated to sharpen his powers of tracking and finding the game, his strength, skill and endurance in all phases of the hunt, or perhaps to protect him from attack by his quarry or other wild beasts. Still other techniques are employed for making the hunter invisible or otherwise imperceptible to his quarry, for protecting him from the supernatural danger that may result from his having killed, and purifying him after the kill so that he may be reincorporated into human society.

The concept of the man-animal relationship underlying the practice of hunting magic is often extremely sophisticated and complex, and also varies widely from culture to culture. Many primitive peoples base their beliefs and behaviour toward wild animals on a tacit, or occasionally explicit, assumption

Facing page **The hunt has been defined as a '. . . rite of passage, a venture out of the safe and secure domain of human society into the ritually perilous, alien world of natural beings'; before the hunt, it was necessary for the hunter to prepare himself, and separate himself from society: Assyrian relief showing winged divine figures anointing King Assurnasirpal before he leaves on a hunting expedition. The natural world and the animals that inhabit it form a mysterious realm, and the hunters who have to journey through it appeal to various gods or spirits: the Mexican god of hunting, the protector of man, comes to the aid of a hunter

of reciprocity and equilibrium between the wild species and themselves. This is frequently expressed by beliefs that animals at one time possessed culture and language, and bestowed their gifts upon man, thereby losing them for themselves.

In some societies, it is thought to be man's responsibility to perform the rituals necessary to insure the renewal and fertility of the animal species: in this way man, through the ritual increase of game species, counterbalances the reduction caused by hunting. There are widespread beliefs in the necessity to apologize to, or otherwise placate, the game animal for taking it, often associated with beliefs in supernatural 'parents' or protectors of animal species who must be placated by the hunter.

In many cases animals are directly linked to notions about human death. Among the Desana of the Colombia-Brazil border, according to Reichel-Dolmatoff, it is believed that the souls of the dead who have led sinful lives are captured by the 'Lord of the Animals' and taken by him to the caves in the mountains which the Desana believe are the 'wombs of the animals', to be reincarnated in animal form. To kill an animal is therefore to kill a man; animals and men share a common kinship of souls, and, as the Desana put it, of blood. A hunter must propitiate the Lord of the Animals, or distract his attention by inducing him to remain slumbering in one of his caverns, if he is to succeed in his quest.

It is tempting to conjecture that the great painted caves of Paleolithic Europe, which are often chambers buried deep in the cliffs or mountains far from the sites of human habitation, and which seem to have been used solely for ceremonial purposes, may have served as 'wombs' of the animal species found painted so vividly on their walls, somewhat along the lines of the Desana conception. Effigies of animals modelled in clay and pierced by spear-thrusts have been found in the caves, lending some support to the conjecture that hunting rituals may have been practised in the caves, but we shall probably never know with certainty what beliefs and rituals were celebrated by the Stone Age hunters in their subterranean sanctuaries (see CAVE ART).

A more extreme example of the belief in the relation of game animals, hunting and human death is reported by Edward Schieffelin from certain New Guinea tribes, who believe in a dual universe. In this system, every human soul has, as a 'double', an animal soul in the 'parallel' world. The souls of the animals of this world are, in the same way, the doubles of the people of the other world. To kill the animal double causes the death of the human counterpart in the complementary world. Human deaths are thus explained as the results of hunting by the men of the other world, and hunts are occasionally organized by the tribes in question to retaliate against the men of the other world for causing deaths by their hunting.

Such beliefs, however bizarre they may seem, reflect a fundamental belief in the interdependence of human and animal life, expressed in the concept that both form parts of a delicately balanced equilibrium which men only upset at their peril. Hunting magic often serves as the vehicle of these ideas, sometimes by imposing significant restrictions on the behaviour of the hunter (such as sexual abstinence) as preconditions of success, or sometimes by more overtly emphasizing the contractual nature of the hunting relationship between man and animal, for instance by requiring reciprocal rites or gestures by the hunter toward the quarry animal or its species.

It would be misleading, however, to interpret such beliefs as being based solely upon an objective grasp of the principles of the balance between human society and the animal populations of its surrounding territory. In simple societies, the concept that is formed of the balance between man and Nature is often tightly bound up with the character of the social relations between man in his role as hunter and his fellow men.

Hunter's 'Luck'

The Brazilian anthropologist Roberto Da Matta, for example, has shown in a brilliant analysis of the magical beliefs about 'bad luck' in hunting and fishing held by the population of a small Brazilian town on the Amazon, how these beliefs tend to maintain the inflexible social structure of the community. The lowest strata of the town's population, the hunters and fishermen, have no means of raising their status in society other than through some 'lucky' contact or event originating outside the social structure of the community itself. This might take the form of help from a distant relative, a generous employer from the big city, or persistent luck in hunting and fishing. This would provide an opportunity for the successful hunter to expand his network of social relations and raise his social standing by distributing presents of meat to those he might wish to put under an obligation.

The hierarchical social structure of the town is, however, too rigid to tolerate such mobility: it depends on maintaining the amount of hunting at a fairly rigidly fixed level, as well as on strictly regulating the distribution of the proceeds of the hunt. The magical beliefs and taboos surrounding the distribution of meat by the hunter are so defined that any man who hunts with unusual frequency and success would be almost sure to violate one, thus bringing 'bad luck' in hunting upon himself. This system of taboos tends to constrain hunters to limit their activities, at the cost of losing their 'luck'. It also tends to inhibit their losing their place in the social structure of the community.

There is a separate system of beliefs in the same town that animal species, watercourses and other natural resources have 'mothers' who permit modest utilization of the resources under their protection but punish 'over-exploitation' beyond the normal subsistence needs of an individual and his immediate family. This set of beliefs, counterparts of which are found in many primitive and peasant societies, obviously has the same social effect as the system of taboos surrounding the distribution of game.

The main point of Da Matta's analysis is that societies with simple but rigid social organizations, like most primitive and rural or peasant communities, may attempt to restrict their relations with the natural world (above all, hunting) within narrowly prescribed limits of quantity and quality, in order to protect their inflexible social structures from the repercussions that would result from uncontrolled individual variation in hunting productivity.

Those that do not attempt to regulate hunting production frequently surround the distribution of the meat with taboos tending to ensure equitable sharing, in this way minimizing the danger of conflicts arising from discriminatory distribution and inequalities in hunting luck and skill among individual hunters. For a rigidly structured simple society, natural equilibrium (including the equitable distribution of natural produce) is the prerequisite of social equilibrium. Magical beliefs, as Da Matta shows, may fulfil a vital function as regulating mechanisms of this double equilibrium, by establishing direct connections between the hunter's behaviour and relationships within society, on the one hand, and his fortunes as a hunter, on the other.

The hunting magic of the Ndembu of Zambia, although radically different in form and content from that of the Brazilian backwoodsmen analysed by Da Matta, reveals the same intimate link between the social relations of the hunter and his success as a huntsman. The Ndembu, whose society and rituals have been excellently described by Professor Victor Turner, are a simple society of shifting cultivators. Game has become increasingly scarce in their territory, but enjoys a degree of prestige as food that is out of all proportion to its actual quantitative importance as a component of the Ndembu diet. Hunting has become a specialized activity pursued as a vocation by a small number of men, who characteristically scorn to have normal families and settled lives in conformity with the accepted life style of the agricultural villages.

Hunters enjoy great prestige, in large part because they are considered, by the nature of their professions, to be quintessentially masculine, tough, and to some extent above the law of ordinary men. These very qualities, however, make them to some extent a threat to the fabric of conventional social relations. They are, for example, likely to boast of their numerous adulterous affairs. The stereotype of the Ndembu hunter reflects the culturally significant properties of hunting as an economic activity: it is a difficult craft demanding considerable skill, physical endurance and luck, pursued in isolation from settled communities, prestigious but peripheral to the central social and economic life of the people.

Among the Ndembu the craft of the hunter is bound up with two (very similar) cult associations, which exist for the purpose of performing rituals to 'cure' bad luck in hunting. The Ndembu conceive of huntsmanship as analogous in certain respects to a physical substance, that can be lost or spilled and replenished by magical means: the rites of the Ndembu hunting cults are aimed at restoring and increasing the powers of huntsmanship, while attacking the agency responsible for their loss. This is invariably conceived to be

the shade of a recently deceased ancestor who was himself a hunter, and who has become displeased because the unlucky hunter has failed to honour one of a wide variety of social or ritual obligations to his kinsmen, to other hunters, or to the ancestral hunter's shade itself. The hunting rituals simultaneously propitiate the ancestral shade and initiate the novice hunter into the cult of hunters, which doubles as a kind of professional association. Great emphasis is placed on the solidarity of initiated hunters.

However, the presence or assistance of the novice's kinsmen, and the reaffirmation of his social bonds with them is as important for the performance of the rites as the support of his prospective colleagues of the hunter's cult. The magical rites of the hunting cults, which focus upon the erection of a shrine to the shade of the hunter-ancestor who is causing the affliction, serve to confront and reconcile two sets of relations and qualities that are to a large extent opposed and contradictory in normal life. On the one hand, they emphasize the distinctness of the calling of the hunter and the very qualities that serve to set him apart from, and to some extent in conflict with, conventional society; on the other hand, they stress the integration of the hunter into conventional society through the ritual reaffirmation of his ordinary kinship obligations, which form the basis of the Ndembu community.

The hunting ritual of the Ndembu, a primitive African tribe, and the magical beliefs of the backwoodsmen of modern Brazil illustrate a common point: the underlying purpose of hunting magic is frequently as much to integrate the hunter safely into human society as to promote the success of his ventures into the animal world.

Primitive man practised various rituals in an attempt to ensure success at hunting, and cave paintings are generelly thought to be one of the devices he used to gain magical power over his quarry: Bushman paintings in Lesotho, southern Africa

Gerald Cubitt

Mental illness and crime are virtually unknown in the Hutterian communities of the United States and Canada; descendants of the religious dissenters of 16th century Europe, their way of life is determined by principles that have changed little over the last 400 years

HUTTERIAN BRETHREN

RECRUITED FROM the Anabaptists, an amorphous and widespread body of dissenters in early 16th century Europe, the Hutterian Brethren, or Hutterites, came into being as a distinct religious group in the late 1520s.

The Anabaptists were not an organized or coherent sect, and the name, which came from their insistence on the baptism of adults, was applied generally to the many differing and contentious dissenters in Europe at that time. The Hutterians took their name from Jacob Hutter, or Huter, although the group had already become a separate congregation of believers before he took over their leadership in 1529.

Anabaptists of any sort were liable to imprisonment or sentence of death in Switzerland and in the Hapsburg Empire, and many religious refugees made their way to Moravia (in what is now central Czechoslovakia) where the local nobility were prepared to grant them asylum. Among them were the earliest group to become known, later, as Hutterians.

The Anabaptists who settled on the estates of the Liechtensteins at Nikolsburg in Moravia were not a unified body; they differed in particular on the currently important matter of the legitimate means by which they should be prepared to defend themselves, and the nature of a Christian's duty to the state. The extreme party were adventists who rejected resort to arms and who demanded the community of goods. These ideas were expressed by Hans Hut (not to be confused with Jacob Hutter) and a group espousing these principles arose round Jacob Wiedemann. Under him they eventually left Liechtenstein's estates after that aristocrat had sought in vain to persuade the various dissenting groups to adopt common principles; and, such were their pacifist principles, they left because they objected to Liechtenstein's resorting to arms to protect them from King Ferdinand's special commissioner, who had been sent to persecute the Anabaptists at Nikolsburg.

The group fled to the estates of the Kaunitz family near the Moravian town of Austerlitz, and there they were joined by Tyrolean Anabaptists under Jacob Hutter, who quickly established a more rigorous communistic policy for the group than they had had previously. The disruption of the very different wing of Anabaptists at Münster in 1534 (see ENTHUSIASM) provided King Ferdinand with strong arguments for the expulsion of all Anabaptists from Moravia. The Hutterians took to the forest, and soon afterwards Hutter was captured and burned to death at Innsbruck.

A new leader emerged in Peter Riedemann, who travelled over many parts of Germany and Austria visiting scattered sympathizers. While imprisoned by the relatively sympathetic Landgrave Philip of Hesse in 1549, Riedemann wrote his *Rechenschaft* or 'Confession of Faith' which thereafter became, and remains to this day, the authoritative statement of Hutterian belief. The *Account*, as it is known in English, emphasizes the status of believers as children of the Covenant, through whom Christ's spirit works. Disobedience is seen as the source of sin, and the disobedient must be expelled from the Church. This emphasis on the 'ban' is widely found among Anabaptist groups (including the various Mennonite sects) and becomes the symbol for withdrawal from evil and the world. Pacifism and community of goods was reaffirmed by Riedemann, as demonstrations of *Gelassenheit* (surrender) and the elimination of selfishness.

Retirement at 45

Despite intermittent persecution by the authorities the Hutterians prospered: they numbered some tens of thousands in the 1570s, and developed skilled crafts in the service of their aristocratic protectors (although they refused to undertake work that was connected with warfare or work which contributed to sinful pleasures). They were driven from Moravia, Slovakia and Transylvania, when the Catholic Church and the Hungarian monarchy sought to impose infant baptism upon them, to prohibit their communism and to enforce their conversion to the Roman Church.

After successive flights they were eventually offered favourable terms by the government of Catherine the Great to settle and cultivate land in the Ukraine. They prospered there, and later in other parts of Russia, although, under the influence of the Mennonites with whom they became associated to some extent, some of them abandoned for a time their practice of communism. In the early 1870s the Russian government decided to impose obligations of military service on the various groups of foreign sectarians who had helped to settle their frontier regions, and the Hutterians decided, firmly in accordance with their principles, to resort once again to that pattern of response to the world that they had practised over the centuries. They migrated; and the entire population of about 700 Hutterians settled in the territory that was to become South Dakota.

Even in the United States the Hutterians were not safe from persecution. Although they received formal guarantees exempting them from military service and permitting them to establish independent schools, when the United States entered the First World War in 1917, the Hutterians, as German-speaking pacifists, encountered local social and political hostility. A court action was brought against them to enforce the dissolution of their corporations, and in this way to bring their communistic organization to an end. The grounds of the action were that in selling their produce to the wider society (a pattern on which they, like other communitarian sects, were dependent) they contravened the law under which they had corporate status. In the face of these threats the great majority of them migrated to Canada in 1918 and 1919. There, in Manitoba, Alberta and Saskatchewan they have prospered economically and multiplied in number.

Today, the Hutterians consist of three slightly differentiated groups distributed in well over 100 colonies in Canada and about 50 in the United States. The three groups are analogous to closely associated and friendly clans rather than to religious parties. The distinctions between them are marginal differences in customs and life style; their religious beliefs are identical. Each individual colony has about 50 to 150 members, a figure that remains constant as, when a group grows to about 150 it divides and establishes a daughter colony.

The increase in the Hutterian population has given rise to fears in parts of Canada that they will eventually drive other farmers from the land, particularly since the Hutterians have, as communitarians, the advantages of bulk purchase and the means to buy expensive equipment, and advantages in its use. They have been able to farm successfully on marginal land and to operate more efficiently than individual farmers. The Hutterians do in fact incur heavy repeated expense because of their growth in numbers and their needs for capital equipment to establish new colonies. But they live economically because their religious principles do not allow any luxuries, and although they eat well and do not overwork (men retire at about 45) they are self-sufficient in house-building, clothes-making and in the construction of the simple furniture that they use.

Production Not Pleasure

All members work in the colony, and farming is the staple employment, although each group has its craftsmen who do ancillary farming work. Some tasks such as milling flour have now been abandoned. They use modern equipment, electricity, timber, cement and other commodities that they cannot make for themselves. Unlike the Amish of Pennsylvania they have not maintained embargoes on such things as motor vehicles – as long as they are used for productive purposes and not for pleasure. Economic advantage is not pressed, however, where it might endanger community morale. Therefore, although they realize that there are more mechanized methods, they employ their womenfolk to paint their houses by hand, recognizing in labour an intrinsic virtue and also a means of demonstrating commitment to the community.

The Hutterian colony is both a community and a congregation. The two concepts are synonymous for them, and religious principles dominate their way of life, which has changed little in its social ethic since the mid-16th century. Avoidance of the world, surrender, pacifism, adult baptism and communism of goods are the principles that they derive from the Bible. Life is in, and for, the community. Although there are no means by which a colony can enforce a member to remain, few ever leave. Those who do are mainly young men who are lured

into the outside world to work, and most of them return. Those who do not, tend to stand by their Hutterite beliefs, even though these, without community of goods and communal living, can be only a shadow of real Hutterianism.

'Teaching the Young Idea'

Each colony is presided over by a minister, whose duties are those of pastor and supervisor, and who is selected from a number of candidates nominated by the members of the colony. These must be approved by ministers and leading brethren from other groups and the final appointment is made by lot. Each community also elects a steward, who is concerned with the economy and administration, and under him are the elected heads of the various departments of the colony's work activities. Everyone in the community is assigned a task, and willingness to do what one is called to do is a basic assumption of Hutterian life, although the individual is also given some freedom to ask for a charge of work from time to time.

At some periods the Hutterians have separated young children from their parents and brought them up communally, but today families live in their own houses, even though all meals are taken in the community dining hall where men and women sit apart from each other. The colony kindergarten remains important, however, and is attended by all children over the age of about $2\frac{1}{2}$ years. Later the children attend a German school where they learn High German, their language at home being a Tyrolean dialect.

By agreement with the Canadian government they also receive normal school education in English and quite often a school run by the government is established in the colony. This development might yet be the most significant inroad into Hutterian apartness from the world, not only in introducing young Hutterians to the values and attitudes prevalent in the outside society, but in providing them with a good knowledge of English. Learning the langnage of the dominant culture has often reduced the insulation of migrant sects and has facilitated their assimilation into the wider society.

High Birth Rate

The Hutterians keep the education of their children to a legal minimum, and have shown no interest in the world's institutions of higher education. Wisely they recognize that, for life as a Hutterian, worldly education is unnecessary, and might be a cause of discontent and disruption. The sect is not without its own culture, however, and the accumulated religinus writings of earlier leaders, and accounts of sect history, which, since the 1920s, have been printed, are in constant use among them. They read Mennonite newspapers, too, and farming periodicals.

The movement has grown rapidly since settling in North America, and its membership has been estimated at over 12,000 in Canada and more than 5000 in the United States. Growth has been almost entirely due to the extremely high birth rate of the Hutterians. There have, however, been some attempts by outsiders to join the movement, particularly after the Second World War when the Arnoldites, followers of Eberhard Arnold, who had settled in Paraguay and who also called themselves the *Bruderhof*, gained recognition from the Hutterians as fellow religionists. The association did not last, however, principally because the Arnoldites mixed with the wider society in order to evangelize, and tolerated dancing and smoking.

In addition to their remarkable fecundity, the Hutterians' very low incidence of mental ill-health, and the absence of social pathology among them have attracted the attention of psychiatrists and sociologists. Crime, suicide, drug addiction, homosexuality, illegitimacy, alcoholism and divorce are virtually unknown, and they appear less subject to mental disturbance than those living in the wider society. They are freed from much of the stress of life in advanced society, and as far as such judgements are possible, it appears that the Hutterians are more contented and happier than most of their fellow men.

HYENA AND JACKAL

THE NOCTURNAL WANDERINGS of the hyena, its association with death and the uncanny call of the striped species, which is said to resemble demoniacal laughter, have been responsible for the animal's importance in witchcraft. Although it is found mainly in the warmer regions of Asia and Africa, it is also credited with magical properties in European folklore.

Among the Matabele of Rhodesia it was said that wizards dug up corpses which they then turned into hyenas to use as messengers or steeds, while in Africa generally there was a widespread belief that wizards could transform themselves into hyenas. In Abyssinia tales were told of men transforming themselves into the animals while in full view of other people, and in the Sudan it was thought that magicians became hyenas at night in order to roam the countryside howling and gorging themselves. It is said that a soldier who shot a hyena followed the trail of blood to a hut where he found a wizard dying of a fresh wound; the soldier himself died shortly afterwards. In England tales of this kind were told of wounded hares later discovered to be witches. The Wanika of East Africa regarded the hyena as one of their ancestors and it was an offence to imitate its call. Like some South African Bantu they exposed their dead to be eaten by these animals.

In Europe a great variety of magical properties were attributed to the hyena. Greek writers recounted the Arab belief that if one of these animals stepped on a man's shadow it deprived him of the powers of speech and movement. They also reported that if a dog, standing on a roof in the moonlight, cast its shadow where a hyena could step on it the dog would fall to the ground. The statement by the 16th century writer, Bartholomew, that the hyena by circling an animal three times, could charm it into immobility may be a later elaboration of these notions.

Cure for Crocodile Bites

The supposed similarity between the hyena's howls and human cries or laughter, which contributed to African beliefs in humans changing into hyenas, also led to strange European notions. Aristotle stated that the hyena lured dogs by imitating the sound of a man vomiting, and Bartholomew elaborated on this idea in an account of how hyenas approached houses at night, mimicking the human voice and even calling men by name in order to devour them. Sir Kenelm Digby, the 17th century scientist, varied the theme; he wrote that the hyena could imitate the calls of all sorts of animals so that they flocked to him and were captured.

Among Pliny's prescriptions concerning the magical virtues of the hyena's body were the following: if haunted by nocturnal spirits wear a tooth from the beast suspended on a thread round your neck; to foil the charms of wizards smear the blood of a hyena around the doorposts of the house; to cause a woman to fall in love with you touch her lips with a whisker from the muzzle of one of these beasts.

Encouraged by such statements English writers of the 15th to the 17th centuries pleased people who liked to be told of the strange qualities of unfamiliar animals by providing them with far-fetched ideas that owed more to imagination than to tradition. It was said that witches ate the heart and liver of the hyena in order to perform witchcraft. Topsell, whose *History of Four-footed Beasts* was published in 1607, stated that a hyena's skin hung on the gate of an orchard would ward off hail or lightning. He also remarked: 'The dung or filth of an hyena, being mingled with certain other medicines is very excellent to cure the bites and stingings of crocodiles and other venomous beasts.' According to this fanciful writer a man wearing a hyena's skin could pass unscathed through the midst of his enemies and the marrow of the animal's right foot 'is profitable for a woman that loveth not her husband, if it be put into her nostrils'.

Guardian of Cemeteries

Christian hermits living in the Egyptian desert in the 4th century were on familiar terms with hyenas and did not attribute magical properties to them. Stories are told of a hyena who led a hermit far into the desert to the cave where another was living; of another which on finding a hermit lost in the wilderness guided him to safety; and of St Macarius of Alexandria who, when a hyena brought her blind whelp to him, cured it by applying saliva to its eyes.

In a number of biblical contexts the word translated as fox refers to the jackal, an animal that appears in folklore and folktales as crafty and shrewd rather than malicious. As a scavenger and eater of carrion it acquired in some areas an association with death: in ancient Egypt Anubis, the jackal-headed guardian of cemeteries guided the dead to the judgement of Osiris. According to the ancient Indian laws of Manu a faithless wife would be a jackal in her next incarnation. The animal's apparent timidity is the reason why the Bushmen of southern Africa protect their children against becoming timorous by forbidding them to eat the animal's heart.

In Indian folktales the jackal has a role rather similar to that of the cunning fox in Europe. In one story a crocodile seizes a jackal's leg but the jackal talks the reptile into believing he is holding a tree root. In another a Brahmin who compassionately releases a tiger from a trap is about to be eaten when a jackal persuades the tiger to re-enter the trap. In yet another, an elephant swallows a jackal but dies when it is eaten by the animal inside it. The jackal finds himself trapped in the elephant's dried-up skin but calls for rain and escapes when rain falls and softens the hide.

William MacQuitty

The jackal was associated with death in some areas; in Egypt the jackal-headed Anubis was thought to guide the dead to the place of judgement: wall painting showing Anubis with Nefertiti, the wife of Ikhnaten

Hymn

In Christian tradition, a song of praise to God, usually sung to music in public worship: the ancient Greeks composed hymns in honour of their gods and heroes, the most notable being the Homeric Hymns; there are records of early hymns from ancient China, Egypt, Babylonia and India, usually in praise of their gods, but sometimes also sung to enlist aid in averting sickness or disaster.

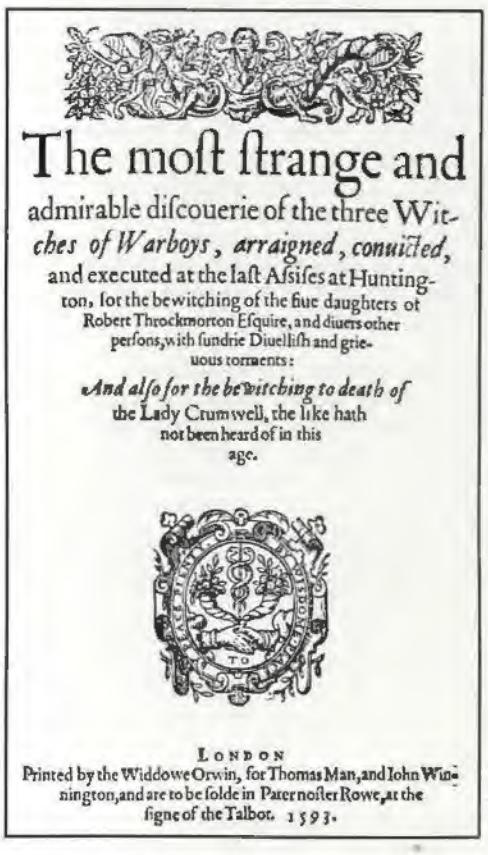
Mary Evans Picture Library

Hypnotism

The inducing of a sleep-like trance by repeated commands and mental concentration in which the subject acts only on the suggestion of the hypnotist: in such a trance state subjects are able to recall long-forgotten experiences: from the Greek *hypnos* meaning 'sleep', it is also termed mesmerism after F. A. Mesmer (1734–1815), an early pioneer of hypnotism, who called it 'animal magnetism', believing it to be an occult force: hypnotism is often used therapeutically to treat nervous disorders. See MESMER.

It now seems certain that many of those who were believed to be bewitched were in fact suffering from forms of mental illness and sexual repression; and that the attitude of society created a climate which fostered exhibitionism and hysterical manifestations

HYSTERICAL POSSESSION AND WITCHCRAFT



The moſt ſtrange and admirable diſcouerie of the three Witches of Warboys, arraigned, conuicted, and executed at the laſt Aſsiſes at Huntington, for the bewitching of the fiue daughters of Robert Throckmorton Eſquire, and diuers other perſons, with ſundrie Diuelliſh and grieuous torments: *And alſo for the bewitching to death of* the Lady Crumwell, the like hath not been heard of in this age.

LONDON
Printed by the Widdowe Orwin, for Thomas Man, and Iohn Winnington, and are to be ſolde in Paternoſter Rowe, at the ſigne of the Talbot. 1593.

John Welsh

After one of the most important witchcraft trials in England, Alice Samuels and her husband and daughter were executed as witches after the five daughters of Robert Throckmorton, a squire of Warboys in Huntingdon, had accused the family of bewitching them; this was the first of a series of similar cases in England: frontispiece to a tract on the 'Witches of Warboys' as the case became known, which was published in 1593

MUCH HAS BEEN WRITTEN in the last 50 years on the psychology of the witch herself. It seems undeniable, on the evidence of trials and personal testimonies, that in every era a number of the people who were accused of witchcraft did believe themselves to be witches. Isabel Gowdie, whose spontaneous confession in 1662 amazed and discomforted her contemporaries is a classic example of this type (see GOWDIE).

On the basis of this and comparable cases there is now a substantial modern literature which treats the witch as a mental case, a person suffering from a classic psychosis, often associated with senility, characterized by delusions as to her own importance and powers. While there is undoubtedly much truth in this view, it seems important to realize that the insanity was by no means one-sided. Frequently as much emotional abnormality, irrationality and sheer ill-will was displayed by the witch-hunters and the witches' 'victims' as by the witches.

Seen in the context of their own time, not all witches were grossly abnormal nor were all the 'bewitched' constitutionally inadequate or hysterical. Nor indeed were all the judges sadistic and neurotic: many were averagely decent, Christian men of their time, doing what they believed to be their duty. Nevertheless it is undeniable that the rigid, tendentious nature of Church law on witchcraft during the centuries of persecution, with the tendency to regard many circumstantial facts as automatic evidence of sorcery and to consider an accused witch guilty unless proved innocent, rather than the other way round, did load the dice consistently against the accused. This provided the opportunity for the abnormally impressionable or paranoid person, to give full rein to his or her imagination.

In every era there are a substantial number of people who are ready, indeed eager, to believe themselves harmed or threatened. The paranoiac who today believes that 'they' (the police, the government, the Jews, the blacks, the Communists, the Arabs) are conspiring against him or his society, is the same man as the suspicious citizen of past centuries who accused witches. The focus of paranoia changes with regimes and fashions in belief, but the type of emotion remains constant. Moreover most paranoiacs display a dreary lack of originality. The repetitive accusations against witches in the past ('they're cursing my pigs – blighting my crops – laming me') are paralleled today by accusations such as 'they're trying to kill me by radar' (or 'by electricity'), which are familiar to every mental health officer.

Unchanging, too, is the paranoid tendency to ascribe the evil not just to one individual's malevolence but to an organized conspiracy of ill-doers; hence the collective prejudice against a mythical 'secret society' – of witches, or Jews, or coloured people. The belief that the scapegoat-group are physically different in some way from ordinary people, and that they are plotting to multiply their number and gain control over society also seems to be constant. The probable explanation for this apparent flaw in the argument is that the accuser, having made a particular group into his collective scapegoat, has to justify his persecution of its individual and apparently defenceless members by making out that there is some widespread organization behind them. The judges who followed the dictates of the *Malleus Maleficarum* (1487) and similar manuals would no doubt have found it difficult to condemn many of the simple old hags dragged before them unless they had fixed in their minds the idea that it was the whole secret society of witchcraft they were attacking, not just this individual.

Self-induced Symptoms

It may be felt that accusations made by individual paranoid schizophrenics can hardly account for the large-scale witch persecutions that took place, especially on the Continent, in the 15th and 16th centuries. In fact, though such clinical paranoia may have been relatively rare, even one isolated case in a town could (and still can) serve to excite the milder, more generalized but equally irrational paranoid tendencies and prejudices found among otherwise sane members of the community. Therefore, although there are probably only a few people in a community at any one time who are convinced that they themselves have been singled out by the scapegoat for evil attentions, there are many more who will concede the possibility of such things happening.

There is also another form of unbalanced behaviour which is in itself less ominous than paranoia but which can be just as

devastating in its social effect if it is not recognized for what it is. This is characterized by the production of hysterical ailments, usually believed by the subject himself to be genuine. The prime reason for them seems to be a desire to attract attention and sympathy, but often an accusation is thrown in to substantiate the hysteric's case. The accusation is therefore not an essential part of the syndrome, but when it is made, and believed, the effect is the same as with the primary accusations of the paranoiac.

In short, while the paranoiac develops a rooted distrust of one particular person or group, and only then invents his injuries, often fantastic ones, the hysteric reverses the process. He – or, perhaps more typically, she – produces symptoms of injury, often in great variety and abundance, and only then casts around for a scapegoat on which the blame can convincingly be laid. Usually this process seems to be unconscious, but it also seems possible that in many cases the hysteric does know, at some level, that her afflictions are self-induced, and therefore finds it particularly necessary to have a good story about their origins. There is no doubt that both types of person, the paranoiac and the hysteric, made a substantial contribution to the history of witch-persecution.

Very little was generally known or accepted about the working of the human mind in the Middle Ages or, indeed, until the 19th century. At various times individual physicians and scholars preached what we should now regard as sound sense: Agrippa (1486–1535) was one and he narrowly escaped being branded as a witch himself for his pains (see AGRIPPA). His pupil the Dutchman Johannes Wier or Weyer was another, and so were the 16th century English squire Sir Reginald Scot and, slightly later, an English doctor named John Cotta. Other writers, such as James I of England in his *Demonologie* (1597) and Joseph Glanvil in his *Saducimus Triumphatus* (1681), while subscribing in the main to popular prejudice on the subject of witchcraft, were sufficiently intelligent to discount certain aspects of it, or to point out rampant abuses. Glanvil, who was in principle a persecutor of witches, admitted that it was 'very improbable that the devil who is a wise and mighty spirit would be at the beck of a poor hag, and have so little to do as to attend to the errands and impotent lusts of a silly old woman.'

But such flashes of reason have to be set against a background of radical ignorance and prejudice. The ancient belief in possession by devils was entrenched in Christian thought; the madman in the New Testament whose 'devil' Christ was supposed to have cast out was the prototype for an interminable series of lunatics in the 16th and 17th centuries whose madness was blamed on the evil attentions of a witch. Inevitably, if society has this basic concept of 'bewitching', the supposed signs of it are taken at their face value without further examination. There was little realization, in the centuries of persecution, that vomiting, pains, disturbance of the menses, impotence, paralysis and indeed 'wasting disease' and fits, could be psychosomatic or hysterical ailments, having their root in the sufferer's own fear or in desire for attention rather than in any organic interference on the part of another.

Hysteria Due to Repression

One of the oldest charges against witches was that they caused impotence, either (in the most ancient accusations) by stealing the male organ, or by 'impeding the conjugal action of men and women' in some less drastic way. This may be taken as simply one manifestation of the general link between witchcraft and sterility, the distortion of the original fertility cults into a 'black' form. It may also be considered as evidence for an important psychological source of witch-fear, the rejection of the mother figure and the buried, infantile fear that the mother is all-powerful and has the power to castrate. The sexual roots both of certain forms of

Above left **Although she was clearly demented, Isobel Gowdie persuaded others that she was a witch: George Cruikshank's illustration of the Devil chastising his followers was inspired by her colourful account of the sabbaths she attended. Mental illness was in fact the cause of many cases of apparent possession** ***Left*** **Engraving of a scene in Bedlam from** ***The Rake's Progress*** **by William Hogarth** ***Right*** **Inmates of an 18th century French asylum are unchained as a result of the humane intervention of Dr Pinel, a pioneer psychiatrist**

witch activity and of witch-phobia are obvious, but as time went by the emphasis within this psycho-sexual area changed.

The male accusing the witch of stealing his masculinity largely disappears, and instead there appear in the records numerous women displaying what to modern eyes seem clear symptoms of hysteria due to sexual repression. These they frequently blamed on male demons and, ultimately, on a specific witch, male or female, who was said either to be wishing the demons onto them or, if a man, 'possessing' them, in two senses, in spirit form. The earliest such recorded case occurred among a group of nuns at Cambrai, in France in 1491, shortly after the *Malleus Maleficarum* and the Bull of Pope Innocent VII had alerted the gullible public to the dangers of witchcraft all round them. The nuns had fits in which they showed superhuman strength, barked like dogs and foretold the future. Eventually the nun who had first begun to have fits and who was therefore the ringleader of the hysteria, was 'unmasked' as a witch herself.

This was by no means the last occasion on which a 'witch's victim' was finally declared to be a witch herself, and this illustrates the confusion that existed on the whole subject of possession. Literally, the root of the word 'possess' implies that the person is actually being inhabited by an alien spirit sitting within it, as distinct from 'obsessed', the linguistic root of which means 'sitting *by*'. Since witches were commonly regarded as being 'possessed by the Devil', in the sense of owned by him, and also as having intercourse either with him or with 'possessing' demons in the forms of incubi and succubi, the assertion that one was 'possessed' could be rather double-edged.

At the same time, since it was also believed that witches could 'shift shape', go forth in spectral form and send their own spirits or those of attendant demons out to inhabit hapless bodies, a plea that one was possessed could also be regarded as a protestation of innocence. 'Involuntary possession' could therefore be a legal defence and a let-out; it was used as such by Johannes Wier when defending accused witches. This doctor of medicine, who has been called 'the founder of modern psychiatry', was a pious man who subscribed

Culver Pictures, New York

to the established belief in devils but at the same time displayed an admirable insight, common sense and frequently courage, in judging particular cases, rejecting hearsay evidence and carefully scrutinizing notions of bewitchment. 'The uninformed and unskilled physicians,' he wrote in his book *De Praestigiis Daemonum*, 'relegate all the incurable diseases, or all the diseases the remedy for which they overlook, to witchcraft . . . In all such cases a good doctor is to be consulted because nothing is more important than to make the clinical situations as clear as daylight, for in no domain of human life are human passions so freely at play as in this one, these passions being superstition, rage, hate and malice.'

Wier's lifetime (1515–1588) was the heyday of possession cases on the Continent, and many of them involved communities of nuns or single young women. Writing at the beginning of the 17th century, Guazzo, an Italian 'authority' on witchcraft, noted that 'those especially afflicted were bound by a vow of virginity', but the only conclusion he drew was that 'it was wonderful with what wiles the Devil surrounded them to deter them from chastity'. Elsewhere in his book *Compendium Maleficarum* his list of the symptoms of possession makes one wonder if some of the possessed were suffering not merely from an excess of enforced chastity but from epileptic fits: he notes rigor of the limbs, contortions, rolling eyes, fainting, the appearance of being strangled, palpitations, panting, vomiting and coma.

Another list of symptoms, drawn up by a priest at Louviers in France, after an outbreak among the nuns there, points more to a purely psycho-sexual hysteria. They included: denial of knowledge of the fits after paroxysm had ended; incessant obscenities and blasphemies; circumstantial descriptions of the sabbat; fear of sacred relics and sacraments; violent cursing at any prayer; lewd exposure and acts of abnormal strength; and finally similar manifestations in others around. A feature of witchcraft outbreaks this last symptom strongly suggests that the desire for attention played an important part in cases of 'possession'.

French nuns, in particular, continued to show signs of being possessed well into the 17th century. A company of them at Lille in 1613 claimed to be leading a life which was one long orgy. A similar outbreak in Madrid, in 1628, petered out when the Inquisition dispersed the nuns involved to different convents. Far more lasting in its effects was the most famous case of all, that of the bewitched nuns of Loudun in the outbreak of 1634; even after the execution of the worldly priest Urbain Grandier, who had been charged with causing their demonic possession, the hysteria spread (see GRANDIER).

In Protestant countries this showy form of mass-possession never seems to have been quite so popular, partly because the Protestant faiths have been wary of too definite a belief in spirits, tending to veer away from them as 'popish fancies', and so have favoured prayer rather than exorcism in cases of possession; a less dramatic and less rewarding treatment from the hysteric's viewpoint. As a modern writer, T. K. Oesterreich has put it, 'possession begins to disappear among civilized races as soon as belief in spirits loses power'. In England possession was never popular among adults, but there are numerous 17th century English cases concerning children and adolescents of both sexes.

Snails and Puppy-Dogs' Tails

The pattern of such cases, however, seems to have been based, like so much in English witchcraft, on Continental prototypes of a generation or so earlier, described by English writers. There was, for instance, Richard Baxter's account of what seems to have been a classic case in Louvain in 1571. A 15-year-old girl, Catherine Gualter, took to vomiting 'great flocks of hair, with filthy water, such as in ulcers, and sometimes like the dung of doves and geese, and in them pieces of wood, and those like new chips lately cut off an old tree, and abundance of skins like parchment shavings . . . After this she vomited innumerable stones, some like walnuts, and like pieces broken out of old walls and with some of the lime on them.' The writer added cautiously, 'that she was cured by the priest's means does not render the story incredible, though there be many deceits.'

Baxter seems to have suspected, as a modern reader may, that the girl herself had been deliberately swallowing a variety of unpalatable objects – a symptom not unknown in present-day hysterical psychopaths. It is also possible that she had not really vomited all the matter produced at all, but simply pretended to have done so. No doubt this is the explanation of many of the recorded instances of people apparently vomiting an extraordinary selection of things, from pins and needles to snails, puppy-tails and live frogs; and also of some of the related cases of 'bewitched' women giving birth to such creatures as leverets or kittens. Other of these unnatural progeny may, in fact, have been deformed, aborted human foetuses which were not recognized as such.

In Vienna, in 1583, after a 16-year-old girl had complained of abdominal cramps, a group of Jesuits spent eight weeks exorcizing her. In the end they claimed to have expelled from her 12,652 living demons which her grandmother had been keeping as flies in glass jars. The grandmother was then tortured into confessing intercourse with the Devil in the shape of a ball of thread, and was burnt to death. If that adolescent's secret motive had been to spite and reject her matriarch, she had succeeded all too well.

The first of a series of such cases in England was the Warboys case, which was also the most discussed witchcraft trial in the land before 1600. In 1589, the ten-year-old daughter of Robert Throckmorton, a squire of Warboys in Huntingdon, began to have fits. These she blamed on the influence of Mrs Alice Samuel, a respectable, elderly neighbour, and presently her four sisters, aged from nine to 15, began to have fits. A local doctor hinted at the possibility of witchcraft, and though the parents were at first inclined to dismiss the whole thing as children's 'wantonness' they reluctantly agreed to confront Mrs Samuel with the girls. Upon this the fits naturally became more dramatic – though presently the girls reversed their ideas and began to have fits in the old woman's absence, so that for a time she was forced to live in the house with them, suffering many indignities in what must by then have been a most unpleasant atmosphere.

When this had been going on for nearly a year and had become the talk of the neighbourhood, a distinguished visitor to the house, Lady Cromwell (grandmother of Oliver Cromwell) attacked Mrs Samuel physically, slashing off part of her hair, which she ordered to be burnt. The significance of this attack, an example of the old custom of 'scratching a witch' to destroy her power, was not lost on poor Mrs Samuel who cried, 'Madam, why do you use me thus? I never did you any harm as yet' – a probably innocent remark which was later made to seem ominous when the 'yet' was emphasized. Lady Cromwell died two years later, when the fits were still going on.

At last, to placate the family, Mrs Samuel ceremonially ordered the girls to stop. They did so, of course, which was taken as proof that she was a witch indeed. She was nagged by the local parson into 'confessing', but next day retracted her statement. She was however brought before the Bishop of Lincoln and held in custody to await the Assizes along with her husband and her daughter Agnes, whom by this time the girls had also implicated. The fits went on, and now the children began saying that the Samuels had magically murdered Lady Cromwell. By this time the neighbourhood was aroused, and there were additional stories of sorcery. The Assize jury found all three suspects guilty, and old Mrs Samuel confessed to intercourse with the Devil. Agnes, however, refused to confess and further declined to save her own life by pleading pregnancy (a recognized escape route) with the fine remark 'Nay, that I will not do: it shall never be said that I was both a witch and a whore.' All three were hanged. The Throckmorton girls appear to have passed on into a normal adult life.

Adolescent Fantasies

The case was an important one because, for the first time in England, the families involved were people of education and influence. It was widely reported and this must have helped to spread and confirm popular superstitions and to give them credence among the law-making classes. A series of comparable cases followed over the next two generations. In 1596 at Burton-on-Trent a boy called Thomas Darling had fits in which he claimed to see green cats. He accused a woman called Alice Goodridge, who was convicted and died in jail. He was allowed to 'scratch' her, at which she said, 'Take blood enough, child. God help thee.' The child answered, 'Pray for thyself, thy prayers can do me no good.'

Another boy, in Pendle in 1634, accused a number of people, among them Janet Device, daughter of a convicted witch, who, as a child, had been responsible for getting her own mother executed (see LANCASHIRE WITCHES). He later retracted his statement,

Credulity, Superstition and Prejudice, **an engraving by William Hogarth, indicates the social climate in which belief in witchcraft was able to flourish**

hut by this time three of the accused (although not the indestructible Janet) had already died in prison. Yet more children's evidence, at Bury in 1644, brought about the execution of two hitherto respected women, after a trial at which the scholar Sir Thomas Browne gave 'expert' evidence for the prosecution. But many English juries were uneasy about such testimony, even at the height of the witch-phobia.

A famous case occurred in 1620, when a boy claimed to be bewitched, to be vomiting oddments and to be voiding blue urine. He was kept under observation and was caught pouring ink into his chamber-pot and also stuffing ink-soaked paper under his foreskin – behaviour not untypical of a neurotic child in any era. His particular devil was supposed to send him into fits on hearing the first verse of the first chapter of St John, but those watching the boy were soon to discover that the devil did not apparently understand it read in Greek. The boy was made to apologize publicly to the witch he had accused, and the case was withdrawn. The contemporary comment that the boy had probably been coached in his symptoms by a Catholic priest, sheds a slightly more sinister light on the issues of principle and belief involved in such cases.

In every era there have always been a substantial number of people who are prepared to believe in a mythical 'secret society' conspiring against them. In the past this delusion resulted in the persecution of witches; in the 20th century Jews were victims of the same kind of prejudice: Dutch poster advertising an anti-semitic film in the 1930s

Probably no case of witchcraft possession is as famous as that of the 'Witches of Salem' which occurred in the New World in 1692, at a time when the idea of witchcraft was being officially relinquished in Europe. In many respects it comes closest to the Warboys case of a century earlier, in that in Salem, as in Warboys, a group of adolescent girls got the bit between their teeth, and rocked a whole community by their malevolent fantasies and exhibitionism. In Warboys only three people died; in Salem, however, over 150 were arrested of whom 31 were tried and sentenced to death. Of these 19 were hanged, two died in jail, one was pressed to death and five others made confessions which secured them reprieves. The remainder escaped death for various reasons.

The only reason the holocaust was not much greater was that within a year, the wave of witch hysteria began to pass; the soberer citizens of the New England township were beginning to come to their senses and doubt was cast on the very principle of 'spectral evidence'. Within a generation the whole affair came to be officially regarded as an unfortunate and backward-looking error of judgement, and some paltry restitution was made to the survivors of the trials. The girls responsible went unpunished and only one ever recorded anything like a confession (see SALEM WITCHES).

Striking contrast is afforded by the case of Jane Wenham in 1712, the last conviction for witchcraft in England, though a witch was burnt in Scotland some years later. Jane's accuser, the servant maid of a minister, claimed to suffer from fits, visions of cat-devils and the vomiting of pins. Jane Wenham, who had long been known as the 'wise woman of Walkerne', was arrested, searched for witch marks, and made a confession. Under her pillow was found 'magic ointment' allegedly made from human fat rendered down, and also cakes of feathers. Clearly Jane thought of herself as a witch, and may have had malevolent intentions. But those concerned with her case had more enlightened ideas. A pamphlet war raged around her in true 18th century style and she was reprieved.

It is the treatment of the maid that is most interesting from a modern point of view. A doctor examined this girl, and ordered that she wash her hands and face twice a day, and that she be confined under observation. Her keeper was to be 'a lusty young fellow'. This was done. The fits and other inconveniences ceased forthwith, and the lusty young fellow later married her. Light, it seems, had at last broken on the true nature of possession and the real needs of many of the possessed.

IBN ARABI

GENERALLY ACKNOWLEDGED as one of the greatest mystics of Islam, Mohammed ibn Ali ibn Arabi, of the Arab tribe of Ta'i, was born in 1165 at Muriac in south-east Spain. He is known as *Muhyi 'd-Din*, 'the Vivifier of the Religion' and *Ash-Shaikh al-Akbar*, 'The Greatest Sheikh'.

When visiting Cordova as a very young man he came into contact with an aged woman saint who was one of his first spiritual guides. He considered himself to be also, and above all, the disciple of Abu Madyan who was looked on as the greatest spiritual master of the age and who is now the patron saint of Algeria. 'My sheikh' he calls him, though he received his teaching through a disciple and never actually met him.

In 1198, at the age of 33, Ibn Arabi had a vision in which he received a Divine Command to go to the East, and he set off in the direction of Egypt, never to return to the lands of his birth and upbringing. From Cairo he went to Jerusalem and from there, in 1201, he made the pilgrimage to Mecca where he spent two years. After visiting Baghdad and Mosul in south-western Asia he lived for a while in what is now eastern Turkey. The Sultan of Konya showered gifts upon him, and later Ibn Arabi went to Aleppo where the king, a son of Saladin, also received him with great honour. He married more than once, and had several children. The last ten years of his life were spent in Damascus, where he died in 1240 at the age of 75. His tomb on the slopes of the hill at the north end of the town has been a much-visited shrine ever since. Two of his sons, both of them Sufis, survived him, and are buried beside him.

Ibn Arabi was the most prolific of all Sufi writers (see SUFIS). His unique combination of quality with quantity is in a sense a vindication of his claim, repeated again and again throughout his works, that everything he wrote was forced upon him by the Divine Spirit. His writing was never motivated, he says, by the desire to compose a book. It was simply, as he puts it, 'a way out' from the fire of inspiration which he sometimes felt would burn him up. This inspiration, he is careful to state, is below

that of a prophet, being such as belongs by right to 'an heir of the prophets'. His largest surviving work, *The Meccan Revelations* which the 'angel of inspiration' ordered him to begin during his first visit to Mecca, consists of 565 chapters (about 3000 printed pages) and was written over a period of 30 years. It contains much about his own life and the lives of earlier Sufis, and is also rich in information about the symbolism of letters and numbers, about astrology, symbolic geometry and other esoteric sciences. His most read work, a book in 27 chapters usually known in translations as *The Wisdom of the Prophets*, was revealed to him in its entirety in a single night when he was was already 65. The prophets (each chapter is devoted to one) range from Adam to Mohammed, and include Jesus and John the Baptist.

But some of Ibn Arabi's shorter treatises, often more concerned with practice than with speculation, best reflect his own life, which was essentially one of invocation, spiritual retreats, contemplation and pilgrimages to saints both living and dead, interspersed with the most remarkable visions. The long prayers which he formulated for his own use and for his disciples are still used in some of the Sufi orders, for although the order which he himself founded never became very widespread, he belongs in a sense to all the orders in virtue of his outstanding authority.

In a list of his writings which he drew up about six years before his death he gives a special section of 'books which the All-Highest Truth commanded me, in my heart, to set down but which He has not yet commanded me to bring forth to mankind'. Of these, 176 in number, only 16 have come down to us. Many of his 'publishable' writings also seem to have been lost.

'Oneness of Being'

In addition to his other gifts, Ibn Arabi is also one of the greatest poets of Islam. Particularly important is his *Interpreter of Longings* (*Tarjuman al-Ashwaq*) a collection of spiritual love poems addressed to the daughter of a Persian sheikh whose acquaintance he made in Mecca, a young woman of great beauty, piety and eloquence who was for him something of what Beatrice was for Dante. After his first visit to Mecca he does not appear to have ever seen her again, but the impression that she made upon him was lasting.

The most exalted and at the same time the most generally known aspect of his writing lies in his formulations of 'Oneness of Being', a doctrine known as 'monism' to Western scholars who have, more often than not, failed to realize that it is in no sense the invention of Ibn Arabi. 'Oneness of Being' is the doctrine that only God *is*, and that the existence of anything else is pure illusion. The created universe is nothing other than the overflowing of God's merciful infinitude, which does not thereby cease to be its one indivisible Self. This has always been the basic doctrine of Islamic mysticism and it stems, as far as Islam is concerned, from the Koran itself and from utterances of the Prophet. What characterizes Ibn Arabi is his extreme and sometimes provocative explicitness, where most of his predecessors had preferred to express themselves by aphorism. 'Men are asleep, and when they die they wake', said Mohammed; Ibn Arabi points out that the world as man sees it is a dream-world and that like a dream it stands in need of interpretation; and he relentlessly strips the dream-mask of illusory plurality from the face of the 'One Reality' on every possible occasion and, it must be admitted, on some occasions where it is pointless to do so.

Ibn Arabi is however criticized far less for his occasional lapses than for the doctrine itself, which is especially associated with him and which is too profound not to be misunderstood.

But if he has had violent critics in every generation since his death, these have always been far outnumbered by his devotees – witness the great number of commentaries that have been written on his works, especially on *The Wisdom of the Prophets*. Moreover eminent authorities have made pronouncements in favour of Ibn Arabi's orthodoxy; and in the 16th century a mosque was built in his honour over the site of his tomb by the Ottoman Sultan Selim II.

IBO

BEFORE THE CIVIL WAR in Nigeria, the Ibo were estimated at some 7 million and lived on both banks of the Niger. Though they occupy a continuous territory and their language is the Ibo branch of the Kwa group of West African languages, they are composed of a number of communities whose membership varies from a few hundreds to many thousands. These often bear the name of a hero, for example the Umundri or descendants of Ndri, and appear to have arisen as a result of the breaking up of large family groups. These speak related dialects, but show marked cultural differences.

A myth of origin exists among the Umundri. The following version was narrated to me by a gathering of priests. 'The name of our founder is Ndri, the son of Eri: Namuku is his wife. Eri and Namuku were sent down by Chuku (a sky god). All the first things happened at Aguleri where the Umundri group started. When Eri came down from the sky he had to stand on a termite mound as all the earth was then a morass. Eri complained to Chuku who sent a metal worker, Awka, with bellows, charcoal and fire to dry up the land. Awka did so.'

While Eri was alive, the priests continued, he and his dependants were fed by Chuku and their food was sky-substance. Those who ate of it never slept. When Eri died, this food supply ceased and Ndri, Eri's son who had founded Aguleri, complained to Chuku that there was no food. Chuku replied that if Ndri were to slay and bury his eldest son and daughter he could obtain food from their graves. Ndri said this was impossible. Chuku then sent Dioka from the sky to Ndri to carve certain patterns (called *ichi* patterns) on the faces of these two children. Thereafter Ndri was to cut their throats and to bury them in separate graves. Ndri did so. Three Ibo weeks later plant shoots appeared from these graves. From the grave of his son Ndri dug up a yam, cooked and ate it and fell asleep. When he woke up his family were astonished and said they thought he had died. He told them what he had done, and they also ate of the cooked yam and fell asleep.

The next day Ndri dug up *koko* yams from his daughter's grave, ate them and likewise slept. For this reason the yam is called the son of Ndri and the koko yam the daughter of Ndri. When a man takes up the post of *eze* Ndri, that is the kingship, he does not have to slay his first-born son and daughter, though both have the ichi pattern carved on their faces.

Chuku told Ndri to distribute this food to all mankind. Ndri demurred, saying it was obtained by the death of his first-born children. Chuku insisted and stated that in return Ndri and his descendants would have the right of cleansing every Ibo town of abominations or breaches of taboo, of crowning the king at Aguleri, of tying the ankle cords whenever a man took the title of *ozo* or immortality; Dioka's descendants would carve the ichi pattern on their faces.

M. D. W. Jeffreys

Ndri and his descendants would also have the right of making the magical yam 'medicine' each year for ensuring a plentiful supply of yams in all surrounding towns. For these and other privileges the surrounding Ibo would pay tribute to Ndri and his descendants. So Ndri distributed the yams and the koko yams and in this way mankind was supplied with food.

Ndri introduced the system of ranking titles. He became the first eze Ndri or divine king while other individuals took and continue to take the title of *eze ozo* after him and in memory of him.

The carving of the ichi pattern on the faces of the son and daughter of the divine king shows clearly the sun cult pattern of Ibo religion. A drawing done by an untutored, illiterate Ibo was explained as representing the moon, the sun and the wings and tail of the hawk. Another design may be compared with, for instance, the Hittite winged solar disc where sun, moon, wings and tail of the hawk are displayed. It is accepted that this design was borrowed from Egypt, where the pharaoh wore on his head a golden diadem known as the winged solar disc. There is no gold available to the Ibo who instead has the same pattern marked on his head and so conforms with the essential requirements of a sun cult. This pattern is restricted to certain Ibos: the divine king, his eldest son and daughter, and those men who take the highest ranking title, namely the ozo title.

The name Chuku or Chiuku can be separated into *uku* 'great' and *chi* or *chu* 'sky being'. Chuku has three aspects or qualities: Chuku, Anyangwu and Agbala. Anyangwu means 'eye of the sun': Agbala splits up into *agba* 'female' and *ala* 'earth' and may mean 'mother earth', 'fertility'. The Umundri declare that there is ouly one Supreme Being and that there is no image or representation for Chuku's aspects whereas there are representations for *alushi* (children of the sun) or patron deities of villages or persons, and no shrine or special priest allotted. These concepts are abstract.

There is, however, a special cult object, the *ofo* (a small wooden image) owned by the Umundri and conferred when the ozo title is conferred upon an individual. This object must be held in the hand and pointed at the sky when prayers are offered. The ofo is thus the outward and visible sign that the holder has the right of audience with the ancestors and through them with the deity.

The ofo is the medium through which the owner obtains spiritual audience with the supernatural and without which no Ibo is entitled to enter the presence of the ancestors. He cannot pray effectively without this liaison between himself, the Supreme Being and the departed. Men not

Far left **Ibo divine king: he wears a crown of light white feathers, and a robe made from special blue cloth** ***Above*** **Ibo temple in eastern Nigeria: stylized figures are painted on the walls and skulls from sacrifices hang from the lintel** ***Left*** **Painted clay sculptures: the female figure in the centre is the Earth Mother, and beside her is an effigy of a white man riding a motor cycle**

entitled to own the ofo suffer the second death, in that after their death they become the forgotten. Through the ofo a man establishes his connection with the immortals and is assured while alive of immortality after death. Hence the striving to take the top ranking title ozo. The titled men dominated and controlled Ibo society. The custody of the ofo remains in the line of descent from the ancestor who acquired it.

The divine Umundri kingship does not go by descent, though the king must come from one of the recognized royal families. Technically, he has no brothers or sisters. The ancestral spirits indicate who is to be the next eze Ndri, often after a long period during which there is no ruler. At the time of his coronation, he must be without parents.

His coronation ceremony contains many elements of a sun cult where the office is immortal. The ceremony opens with a symbolic death, burial and resurrection. The ofo holders assemble under the guidance of the Okpala Okaka, or head of the Adama lineage, who is the custodian of the royal regalia and master of ceremonies.

The divine king-to-be is stripped, washed, rubbed over with red camwood, wrapped in burial clothes and laid out in a shallow grave in his own house. The grave is lined with *iroko* planks while the Okpala Okaka, holding an ofo, prays: 'You who are about to enter the grave, rise up again with a white and shining body. May no harm befall you. Rise as previous divine kings have arisen.' A plank is placed over the grave and earth is thrown on its top. The candidate's family now go into mourning, his wives donning the garb of widows. At the foot of his tree of life a goat and a fowl are sacrificed; the tree is then cut down and burnt. This destruction of the tree of life is the recognized sign that its owner is dead. When eventually the man does die there is no mourning ceremony. He is entombed in a special tomb and is said to have gone back to the sun.

The man is left in the grave till sunset when men from the Adama lineage exhume him. A banana stem replaces the body in the grave, which is filled in. The man has now left his family home for ever. Standing on a bull-hide, he is stripped of his grave-clothes and is washed with water from a sacred lake. Then his body including the hair of his head is smothered in a coating of white clay. He thus fulfils the prayer that he should rise with a white and shining body.

Re-creating the World

Henceforth he must wear only special white or blue cloth. Copper greaves are placed on his ankles but, strangely, he remains barefooted. He is now regarded as a sky-being or god, and his body is sacred. Only members of the Adama lineage may touch him or his belongings. All his servants must now come from this lineage. His food is prepared by a pre-adolescent boy of this group who, as he approaches puberty, is replaced by a younger lad.

The new king, whitened, now proceeds on his circumambulation which, beginning and ending at the sacred town of Aguku, takes several months. Mounting a special termite mound to pray to Chuku and ancestors is the first step. He eats food alone, in silence in a palm-leaf booth. Gods do not need terrestrial food, so no one sees him eat.

On reaching Aguleri he sits on a heap of stones and publicly consumes white clay presented to him in the form of rays. It is significant that he eats that which caused his body to be white and shining. Writing of the Egyptian dead, A. E. W. Budge stated: 'Those who chose the Boat of Ra sailed with him over the skies, they fed upon light and were arrayed in light; . . .' One recalls that in the origin myth of the Umundri, Eri was fed by Chuku on sky-substance or light.

At Aguleri, as the new divine king, he must prove his divinity by re-creating the world, by raising a lump of white clay from the waters of the Anambra creek. A sacrifice is made on the river bank. The new king points his ofo over the water and prays that all dangers be removed. Whereupon a man plunges in to the water to bring up a lump of white clay. In this way the new king re-creates the world and therefore the world is his. This lump of clay, retrieved from the waters, has its counterpart in the orb of other coronation ceremonies.

On his return to Aguku, which he will never leave again, he lives a year in a palm booth while a new palace and temple are built. An Ibo week after his return he demonstrates his control over the food supply: sacrifices are made, holding his ofo the king prays, an oil palm obligingly flowers, fruits and ripens in one day, and the oil is distributed for sacrifices for fertility.

Carry Bevington

Head-dress worn at an annual ceremony to propitiate the Earth Mother; the custom was abandoned at the end of the 19th century

The king's enthronement in the temple upon a stool on an earth dais covered with cow-hides and containing the skull of his predecessor is preceded by a ritual combat against youth and age. Then follows the presentation of the regalia, brass face mask, sacred spear, the ofo and the lump of clay or orb. The Okpala Okaka, ofo uplifted, invokes long life and prosperity, and invokes ancestors to abide with and guide the king, who is exhorted to conduct himself as his predecessors have done. After this comes the crowning of the king by the Okpala Okaka who places on his head a cow-hide diadem adorned with eight white plumes from the fish eagle. This crown is buried with him. The king now mounts the throne and announces his new name. He is, however, saluted by the term Igwe or Sky.

As soon as he has been crowned a wide road is made from the temple to the main road of the town. The entrance to the temple is through an arch of triumph where today the sacrifice of a cow replaces that of a human. The rest of the day is spent in feasting and games. The king now occupies his throne daily all day for 12 days during which time delegates from surrounding areas come to make obeisance to him.

The next step is the ceremonial establishment of the markets. Four sacred stakes are driven into four cylindrical mounds about six feet apart in the courtyard of the palace. Each stake is tied to the next with palm-leaf fibre. A fowl is sacrificed at each stake, each of which receives a name from each day of the four-day Ibo week. The king has now completed the ritual by which a human man is converted into an immortal god.

There is another cult object among the Ibo traceable to the sun cult of Egypt, a ram head image called Ihenga. In 1878 A. Burdo, describing the cult objects of the Ibo chief of Oputa on the Niger wrote: 'At the end of the room there was a ledge, near which were placed three wooden idols, curiously painted; a sort of *lares* (household deities), called Tshi, Ikenga and Ofo' (*The Niger and the Benue*, 1880).

P. A. Talbot in 1926 wrote that 'another protective spirit, worshipped by most of the Iho suh-trihes is Ikenga . . . It is the genius of a man's strength and of his fortune' (*The Peoples of Southern Nigeria*, 1926). Margaret Murray in *The God of the Witches* (1933) remarked: 'The chief of the horned gods of Egypt was Amon . . . He is usually represented in human form wearing the curved horns of the Thehan ram.' These parallels between the Umundri religion and that of ancient Egypt are sufficient to establish the Umundri religion as a sun cult that has been diffused from Egypt.

It is said that this ancient Chinese source of wisdom, which has been used for divination for thousands of years, yields astonishingly apt counsel to the serious inquirer but gives a random or even a rude reply to the frivolous

I CHING

PROBABLY THE OLDEST extant book in the world, the I Ching or Book of Change is certainly one of the most extraordinary. This abstruse Chinese classic is known to English readers by several names. I Ching (pronounced Ee Jing) is the official romanized Mandarin spelling, while Yee King, Yik King and so on are spellings representing certain Chinese dialects. Often called the Book of Changes, it is better rendered in the singular form; either would suit the Chinese characters, but its authors were concerned with the principle of everlasting change which governs the exquisitely balanced universal harmony; the transient individual changes that result are of secondary importance. Though this ancient work has long been used primarily for divination, it is revered also as a source of wisdom and as containing in cryptic form the quintessence of an incredibly ancient philosophy.

For well over 2000 years, philosophers have been debating the purpose and meaning of the I Ching. The discrepancies in the various English versions are an indication of the profundity of the Chinese text.

By a complicated manipulation of yarrow stalks, one of 64 possible hexagrams is obtained; the inquirer then consults the appropriate section of the I Ching for the answer to the question in his mind

Its hoary antiquity, its extreme terseness and the mystical nature of its contents all combine to make it highly enigmatic. Chinese scholars who have devoted whole decades to its study disagree on many points; and the scores of Chinese commentaries, both ancient and modern, are similarly at variance with one another. It is indeed quite possible that the enigmas are intentional, that the I Ching, like many other mystical works, was written in a secret language whose significance was revealed only to initiates.

Deserving 50 Years' Study

That it was immensely important in ancient times is apparent from what Confucius has to say about it. He tells us that the leathern thongs binding the tablets on which his copy was inscribed 'thrice wore out' from constant use and that, could his life have been prolonged, he would have given 50 years to studying it, thereby perhaps becoming a man 'without grave fault'. What use he made of it is not recorded. While he may have loved it wholly for its deep insight into the mysterious workings of the universe, he may also have esteemed it as a practical book of divination. What is certain is that it came to be included among the 'Four Books' and 'Five Classics' which, for nearly 2000 years, were required study for Chinese candidates taking part in the all-important Imperial Civil Service Examinations.

There have been stern scholars who believed that so lofty a classic was shockingly besmirched by being put to use by soothsayers. For all that, it is certain that it has been used for divination since before the days of Confucius (550–480 BC). Certainly it owes much of its reputation – now swiftly extending to the West – to the surprising accuracy claimed for its predictions. Today in China, Japan, Korea and Vietnam – the four countries where scholars readily understand the Chinese script – there are countless people, ranging from pious mystics to street fortune tellers, who peer into a future revealed by means of its curious diagrams. The present Chinese government, in its campaign against 'ancient superstitions', is likely to have banned its use but it would not be surprising to learn that Communist generals and administrators still seek its advice in secret. They must know, for example, that in 17th century Japan, Yamaga built up the Samurai into the finest fighting force in Asia by teaching them a type of strategy that accorded with a special interpretation of the I Ching. Though it is not a military book, it teaches how all activities benefit from being made to harmonize with the universal cycles of everlasting but orderly change, involving advance and retreat, progress and retrogression, each in due season.

System of Diagrams

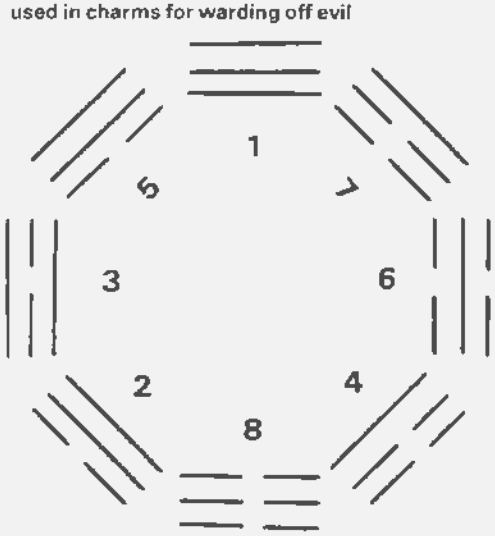
The I Ching is the product of a religion that antedates both Confucianism and Taoism (see CHINA; TAOISM) and goes back to the very beginning of Chinese civilization. According to its teaching, the womb of the universe is a limitless, imperceptible void – T'ai Chi, the Absolute. In it all objects have their being and each owes its transient individuality to a particular combination of Yin (negative) and Yang (positive).

A system of diagrams illustrating this concept is attributed to Fu Hsi, who is said to have lived 30,000 years ago (see box opposite page). Even assuming that he never existed or that so vast a stretch of time is a fanciful exaggeration, the fact remains that the diagrams are perhaps more ancient than any others in the world. Probably these diagrams had already existed for thousands of years when, if the traditional belief is accepted, King Wen (c 1150 BC) and his son Duke Chou provided each of them with an explanatory text. Modern scholars believe the text to have been produced at a later period, but it cannot have been much later as Confucius regarded it as belonging to high antiquity. This text, coupled with a commentary written either by Confucius or by some of his immediate disciples, forms the work as it now stands. Since Confucius lived some 2500 years ago, the main text must be somewhere between 2500 and 3100 years old and the commentary, just about 2500.

The main body of the book consists of 64 sections, each headed by a different diagram in the form of a hexagram (figure made up of six broken or unbroken lines). The hexagram is followed by a short explanatory text attributed to King Wen. Here is an example: 'Integrity. Sublime success. Righteous persistence brings rewards. Those opposed to righteousness meet with harm. It is not favourable to have any goal (or destination) at this time.' Next follows a terse Confucian commentary which amplifies the meaning of the text and usually explains how it came to be derived from the hexagram. Then comes a brief note on the symbolism and its implications: 'This hexagram symbolizes thunder rolling across the whole earth; from it all things receive their integrity. The ancient rulers gave abundant and timely nourishment to all.' So much for the hexagram as a whole. Next come notes on each of its separate lines, attributed to Duke Chou: 'Line 1. Moving onward with integrity brings good fortune.' Each note is followed by a Confucian commentary on the line text: 'What is willed comes to pass.'

Obviously a book containing so many sections, each composed of terse, disjointed aphorisms, does not make for smooth reading. There are readers who, believing that an inner significance relates the parts to one another, read and re-read the book from cover to cover as regularly as devout Christians read the Bible. But mostly it is read a section at a time in connection with the act of divination. The soothsayer (who may be anyone at all) burns incense, prostrates himself thrice before the silk-wrapped book and, by a complicated manipulation of yarrow stalks (a plant also used for divination in the West) or by tossing three coins six times, receives in answer to the question in his mind one hexagram or, in many cases, two of them, usually with the emphasis directed to one particular line. As there are 64 hexagrams, each capable of giving seven answers (either with reference to one of the six lines or without emphasis on any of them), the total number of basic answers is 448. As two hexagrams are often drawn and more than one line may be stressed, the number of possible answers is much larger. They are considered sufficient to take care of any eventuality, though in one sense all of them are variations on four themes – proceed energetically, proceed with caution, stop, or go back.

Circular arrangement of the eight trigrams used in charms for warding off evil



High Moral Tone

In another sense this is a gross oversimplification, for almost every word in the text, the commentary, the note on symbolism and the individual line or lines particularly stressed is carefully weighed for its bearing on the question and on the circumstances governing both question and inquirer. Because of the seemingly mechanical means of obtaining an answering hexagram, this method could be dismissed as fortune telling of the most arbitrary sort were it not for at least two special characteristics. First and foremost, the I Ching does not regard the future as fixed, so that ordinary fortune telling is out of the question. The answers tell the inquirer, not what will happen, but how he should act. Secondly, the book's high moral tone makes it quite useless to people who intend to act from selfish motives. The answer 'cautious progress' does not mean that the inquirer will act in that way, which is what a fortune teller would be likely to imply, nor does it mean that to progress cautiously would be to the inquirer's immediate material advantage. What it does mean is that, under the circumstances, it would be morally right to do so and therefore it would redound to his ultimate good and perhaps to his immediate advantage, but in the higher sense.

However, where impersonal objects, events or forces are involved, there is indeed a powerful element of prediction, for it is assumed that normally all things, unless disturbed by deluded man, progress in accordance with the cycle of events to which each belongs. Yet even where such predictions do suggest fortune telling, the moral tone of the book still sets it quite apart from what is usually understood by divination. Again and again there are references to 'the Superior Man', the paragon of virtue whom the inquirers are expected to take as their model.

The one seemingly crude aspect of the whole process is that, mathematically speaking, the manipulation of the yarrow stalks or of the three coins produces results apparently just as random as those achieved by the ordinary tossing of a coin. However, Western sceptics who on that account feel inclined to dismiss such divination contemptuously are sometimes deterred by C. G. Jung's preface to Richard Wilhelm's German translation of the I Ching, in which it is apparent that the eminent Swiss psychologist was convinced of the value of its predictions. Unfortunately his explanation of 'how it works' is less satisfactory than his description

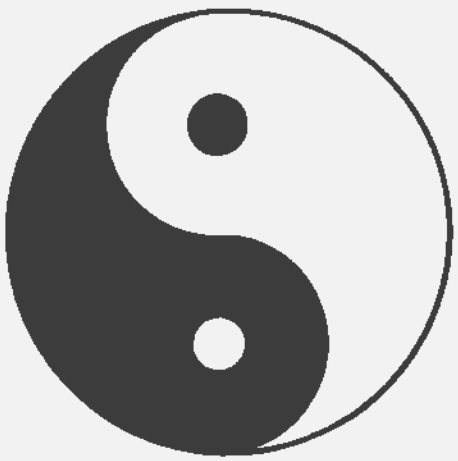
of 'what it does'. One gathers he had faith in the I Ching's ability to foretell many of our actions quite accurately, and attributed this ability to the fact that the images it employs relate to the collective unconscious and make a powerful though perhaps imperceptible appeal to us to act or expect things to happen in a certain way. His attempt to explain the mechanics of working the oracle is by no means clear. The traditional explanation is that what happens to the yarrow sticks or coins while held in or falling from the inquirer's hands is not at all accidental but bears a hidden relationship to the cycle of events to which the answer belongs.

As it is impossible to demonstrate such a relationship, there will always be scoffers – Chinese as well as Western. However, doubters open-minded enough to persist for a while in using the I Ching are, it is said, often astounded by the accuracy of the answers and by their sometimes extraordinary appositeness both to the question and to the surrounding circumstances. According to a commonly accepted belief, it does not take long to discover that the responses are random or even discourteous when the act of divination is performed for fun; whereas they are most likely to be strikingly correct when the 'diviner' acts in all seriousness and when, while putting questions and interpreting the answers, he allows his mind to enter a state similar to that reached in the early stages of Buddhist or yogic meditation. From this one may infer that Jung was perhaps right in supposing that the symbols and words which constitute the oracle convey messages directly to the mind, at a level beyond everyday consciousness.

It is apparent that the Book of Change is wholly concerned with the attainment of inner serenity and of harmony with man's surroundings and not at all with material success, except to the extent that, in a universe governed by moral law, material success may well be the ultimate result of righteousness. There are Chinese philosophers and mystics who read it for its spiritual counsel, using it less often (if at all) for divination, and they appear to be untroubled by the disjointed nature of the aphorisms. Perhaps they really are able to discern a sublime pattern hidden from ordinary readers. Chinese tradition claims that the book reveals the secret workings of the universe; also, that its careful study would lead a man to live a blameless life largely free from frustration, because all his thoughts and actions would be in serene accord with the mystical order of being that governs the activities of the ants and the bees, the smooth progress of the seasons and the majestic movements of the stars.

The Diagrams of Fu Hsi

In the centre of Fu Hsi's pattern is a circle representing the Absolute, but divided into overlapping positive and negative sections, each containing the seed of its own opposite, thus



Around this is a circle of eight trigrams and beyond that a larger circle of 64 hexagrams (figures made up of six lines), all of them built up of positive (unbroken) and negative (broken) lines.

Each of the hexagrams in the outer circle is a different combination of two trigrams, for instance ䷇ or ䷬. These also have names and attributes and represent further subdivisions of creation

The eight trigrams or symbols of the primary subdivisions of creation are named below:

Adapted from John Blofeld, *The Book of Change* (Allen & Unwin 1968)

Ch'ien	Heaven	sky	cold		creative active strong firm light
Tui	Lake	marsh	rain	autumn	joyful pleasurable
Li	Fire	lightning	sun	summer	beautiful depending clinging
Chên	Thunder		thunder	spring	active moving arousing
Sun	Wind	wood			gentle penetrating
K'an	Water	cloud a pit	moon	winter	enveloping dangerous
Kên	Mountain		thunder		stubborn immovable perverse
K'un	Earth		heat		receptive responsive yielding passive weak dark

All Versions Satisfactory

Of the three available translations in English, Legge's was produced about a century ago, under the inevitable handicaps of those days – lack of dictionaries and reference books and of learned teachers fluent enough in English to check what he wrote. It is an extremely literal translation and thereby doubly puzzling. Richard Wilhelm's, rendered into English from his German version, is on the whole excellent; it is marred by a few sentences of which the sense is far from clear, but that is perhaps to be expected in a book designed for use as an oracle. His notes and explanatory chapters are most valuable. Blofeld's rendering is less scholarly and has much less detailed explanatory material; it is a popular version with introductory chapters specially written to make the book's use as an oracle as straightforward as possible. A comparison of all three translations reveals discrepancies on every page and there are research scholars, both Chinese and Western, whose interpretations agree with none of those published. Fortunately, faultless accuracy matters somewhat less than in most other books; there is often so little connection between the terse sentences that a mistake made in one is not likely to perpetuate itself in those that follow.

A remarkable observation frequently heard is that all three versions produce satisfactory results when used for divination. This is further evidence in support of Jung's theory that the symbols make a direct communication to the unconscious mind. If this is so, it would seem that errors in the translation (and some small errors or divergencies in the various Chinese editions) are, as it were, by-passed.

ICONOGRAPHY

The urge to make pictures and sculptures of the gods is a human need which has found expression in most religions, although some, notably Judaism, have prohibited it. As Christianity developed, images of Christ, the Virgin and the saints became objects of reverence, sometimes credited with the power to perform miracles

THE HUMAN MIND is so constructed that for most people comprehension of anything implies the ability to picture or visualize it. This is why the understanding of abstract ideas is difficult for the ordinary man. Popular expositors of such subjects as philosophy or physics are successful only when they can find vivid images to serve as analogies to the abstract ideas that they want to explain. In a similar way the idea of deity, or of a particular god, can only be comprehended by most people when they can see a linear or plastic representation of it.

That such a need was felt by man as soon as he became capable of conceptual thinking may be accepted as certain. And the earliest evidence that we have of human culture offers apparent confirmation. For Paleolithic archeology provides two possible examples of the way in which the Old Stone Age peoples (c 15,000 BC) tried to express ideas of supernatural beings whom they conceived of as existent and powerful.

The first example is carved on a slab of rock, found at Laussel, in the Dordogne area of southwest France. It shows the figure of a faceless woman. She is nude, with her maternal features grossly emphasized, and holds a bison's horn in her right hand. The failure to delineate the face must have been deliberate, for such facelessness also characterizes the many female figurines found on other Paleolithic sites (see FACELESS GODDESSES). The makers of such images clearly had the skill to carve facial features but for some reason they refrained. For them the maternal features appear to have been all-engrossing. The Venus of Laussel (to give the figure its customary name) was so positioned, when found, that it had obviously been the centrepiece of a rock sanctuary, probably used for fertility rites. The carving may justly be regarded as the earliest known representation of the mother goddess. We can only guess at the idea that inspired its making. Its emphasis on maternity or fertility doubtless expresses a conception of a creative power, productive of new life, of which the mother was the physical embodiment.

The motive behind the transformation of such an idea into a figure carved from stone represents a problem basic to all religious iconography. In the Venus of Laussel it poses itself for the first time. The idea of a creative power, the source of all life, was presumably a communal idea. But who thought of representing it as a faceless woman? The phenomenon of birth doubtless suggested the figure of the mother. But how came the carved stone figure to be accepted in such a way that it became the cult object of a sanctuary?

We have not the knowledge to answer these questions. But it is important at least to define them, for they represent problems raised by the first images of deity in every religion. The one certain factor in primitive art is the magical aspect of creativity, the fact that to draw a figure or carve one out of stone gives new and significant form to what has previously been formless. Marseilt Collection

thousands of years later, was to think of himself as freeing a spirit imprisoned within stone when he carved his superb figures. The Paleolithic sculptor must surely also have wondered at the strange power that enabled him to bring such a form out of a rock. For once it was carved it was no longer a rock; it was endowed with a new form of being.

The Dancing Sorcerer

That the Venus of Laussel is the earliest known image of a deity there can be little doubt. Its cultic purpose is obvious. But not so obvious is the purpose of another notable product of Paleolithic art, sometimes known as the Dancing Sorcerer. This is a strange figure, partly painted and partly engraved, on the wall of one of the innermost recesses of the so-called cave of the 'Trois Frères' at Ariège, in the Tarn department of south-west France. The figure is roughly human in shape, and its posture seems to depict the action of dancing. It has the antlers of a stag, the eyes of an owl and a long tongue or beard. It has also the hairy pelt, tail and genitals of an animal and is placed high on the wall of the cavern, above drawings of other animals (see HORNS).

There has been much expert discussion about the significance of this curious figure. The name Dancing Sorcerer represents one interpretation. Some scholars have maintained that the figure is that of a sorcerer, disguised as an animal, performing a magical dance. Other prehistorians have suggested that the depiction represents a god, a kind of 'Lord of the Beasts'. They argue that these Paleolithic peoples, who lived by hunting, conceived of a great being which combined the attributes of various animals. It was thought to own all the animals, and so had to be propitiated by the hunters. If this theory could be proved, the so-called Dancing Sorcerer would be the earliest known image of a god, as the Venus of Laussel is the earliest image of a goddess.

The next known examples of divine images date from the seventh millennium BC. They were discovered in the Neolithic settlement at Catal Hüyük, in Anatolia. They represent the mother goddess, with the same emphasis upon the maternal attributes as the Paleolithic prototypes. The sanctuaries in which they were found indicate that the goddess was associated with both life and death. The exact purpose of the images is not clear. One, having the form of a mural bas-relief, seems to have been a cultic object. Much of the adornment of sanctuaries – the mural depiction of a bull and mounted bulls' horns, drawings of human hands, skulls of foxes and vultures, models of female breasts – appears to have had a symbolic meaning.

The religious iconography of the earliest civilized states of the Near East can be traced back to the fourth millennium BC. In Egypt it already shows its characteristic mixture of animal and human forms. The slate palette of the Pharaoh Narmer (c 3200 BC) provides both the earliest and most significant evidence of the fluidity of the Egyptian imagination in portraying deity. On one side of the carved palette the figure of Narmer dominates the scene, as he smites a kneeling enemy. To the right of the king a hawk is depicted, perched on six papyrus plants which grow out of a curious human-headed rectangular object. The hawk has a human right arm, which holds a cable hooked into the nose of the head below. This complex symbolism obviously relates to the Egyptian belief in a royal god, Horus, who took the form of a hawk. The pharaoh was regarded as the incarnation of this divine hawk. The depiction, therefore, may either show Horus as helping Narmer to overcome his enemies, or represent the king as the incarnation of Horus in victorious action. At the top of the palette two cows' heads symbolize the goddess Hathor. On the other side, the pharaoh is shown as a bull breaking up a fortified town and trampling on a foe.

The strange imagery of this famous palette of Narmer provides a clue to understanding the iconography of the Egyptian gods. The fact that on the same object the king can be depicted both in human form and as a bull, and possibly also as the Horus-hawk, reveals that reality for the Egyptians did not reside in the outer form or appearance of a thing.

Another significant but more aesthetic example, dating from about seven centuries later, is provided by a sculptured group of King Men-kau-re and two goddesses. All three figures are realistically human. The goddesses wear contemporary Egyptian costume, and might well represent two Egyptian women. Their divine status is denoted by symbols on their heads. Hathor has the horns of a cow, between which is the disc of the sun. The other goddess is a local deity and wears the standard of her district.

Statues Treated as Living

With a few exceptions, most ancient Egyptian deities were portrayed in one of three ways: in human form, with an appropriate symbol on the head; in animal form, usually with a symbol; with human body and animal's head, surmounted by a symbol. Their cult statues, after being made, were endowed with life by a special ritual known as the 'Opening of the Mouth'; the same ceremony was performed on a mummy to reanimate it. In the temples the cult image was regarded as the focus of the divine presence and treated as a living being. It was housed in a special shrine in the innermost sanctuary. Each day it was awakened and fed, and a toilet ceremony was performed. At the great festivals it was carried out of the temple, set on a ceremonial boat borne by priests. In some instances it was taken to visit a neighbouring deity to whom it was considered to be related.

The ancient Egyptians were an intelligent people, and it is difficult to believe that they thought the cult image was really the god. Moreover, images of the gods abounded in Egypt; in the same temple there might be many representations of the chief god besides the cult image. The cult image was the focus of their attention and worship; they treated it as the visible presence of the deity. It was the concrete expression, though symbolically presented, of those qualities which they imagined to be invested in a particular god or goddess.

The religious iconography of the Sumerians, which equals that of Egypt in antiquity, was wholly anthropomorphic; the Sumerians, and the neighbouring Akkadians also, thought of their gods as being of majestic human form. The typical Sumerian god was represented seated, wearing a long robe and a horned head-dress; the number of the pairs of horns which he wore seems to have been the chief index to his status. Usually an appropriate symbol was shown: a crescent moon, for instance, denoted Sin, the moon god. There are, however, two notable exceptions to this Mesopotamian representation of deity. In what has come to be known as the Eye

Temple of Brak the deity concerned, possibly the fertility goddess Ninhursag, was symbolized by two eyes. This strange symbol for a goddess seems to have had a wide currency later, becoming a characteristic symbol of Megalithic culture (see EYE). The other exception is provided by two bronze figures found at Ishchali, representing a pair of four-faced deities. Such monstrous features, of which there are parallels in some other religions, may indicate an attempt to show that the god was all-seeing. It is significant that in the *Enuma elish*, the Babylonian creation epic, Marduk, the god of Babylon, is described as having four eyes and four ears.

The gods and goddesses of the other peoples of the ancient Near East were invariably portrayed in human form. Sometimes they were given an appropriate attribute. Weather gods such as Baal, Adad or Reshef, brandish a weapon symbolizing lightning. Fertility goddesses of the Ishtar-Astarte type offer their breasts. An interesting example of religious syncretism or 'borrowing' in art is found on an Assyrian cylinder seal, now in the British Museum. The god Assur is depicted set in a winged sun disc, which was a characteristic Egyptian symbol for the sun god. A similar instance of borrowing occurs in Iranian representations, dating from the 5th century BC, of the supreme deity Ahura Mazdah. The Egyptian winged sun disc had evidently established itself as an attribute or symbol of the supreme deity.

Anthropomorphism also characterizes the religious iconography of ancient Crete. The Great Goddess was depicted in human form, wearing the typical flounced dress of contemporary Cretan women. Some statuettes show her wearing a high tiara, which appears to have been an exceptional ornament that probably indicated her divinity.

That the Greeks conceived of their deities as 'human beings writ large' is common knowledge. Homer's descriptions of the Olympic gods inspired an essentially anthropomorphic conception of them, and his authority sanctioned its realistic presentation. The peculiar Greek sensibility for perfection of form and a restrained harmony, however, soon transformed the archaic images into the assured products of classical

Reproof from an Image

Hard by under a portico there is a statue of St Peter, repentant, and over him there is a cock still crowing . . . This cock is said to have been the chief instrument in a miracle not less noteworthy than any recorded in connection with the Sacro Monte. It seems that on the 3rd of July 1653 a certain Lorenzo Togni from Buccioleto, who had been a martyr to intemperance for many years, came to the Sacro Monte in that state in which martyrs to intemperance must be expected generally to be. It was very early in the morning, but nevertheless the man was drunk, though still just able to go the round of the chapels. Nothing noticeable occurred till he got to the Caiaphas chapel, but here all on a sudden, to the amazement of the man himself, and of others who were standing near, a noise was heard to come from up aloft in the St Peter chapel, and it was seen that the cock had turned round and was flapping his wings with an expression of great severity. Before they had recovered from their surprise, the bird exclaimed in a loud voice, and with the utmost distinctness, "Ciocc' anch' anc'uei." . . . These words I am told mean, "Drunk again today also?" . . . The bird repeated these words three or four times over, and then turned round on its perch, to all appearance terra cotta again. The effect produced upon the drunkard was such that he could never again be prevailed upon to touch wine . . .

art. And we may assume that the Greek conception of deity found satisfaction in the contemplation of such superbly beautiful human forms. This certainly seems to have been so with the famous gold and ivory statue of Zeus at Olympia. It was ranked as one of the Seven Wonders of the World, and created a profound impression on all who saw it. A tradition records the answer of its sculptor Pheidias, when asked how he intended to portray Zeus, the supreme god of the Greek pantheon. He said that he desired to convey in sculpture what Homer had expressed in words: 'The son of Cronus (Zeus) spake, and nodded assent with swarthy brows; the king's ambrosial locks flowed downwards from his immortal head, and he shook great Olympus.' Another celebrated cult image was that of Pallas Athene, in the Parthenon at Athens. The work of Pheidias, this gold and ivory statue was 40 feet in height. It showed the goddess armed with helmet, shield and spear. Her right hand held an image of Nike (Victory), and on her breast was the famous *aegis*, with the Gorgon's head in the centre.

Representations Forbidden

This brief survey of the religious iconography of the ancient world must include a note about the curious Jewish prohibition of images. Its classic statement is in the Second Commandment: 'You shall not make for yourself a graven image, or any likeness of anything that is in heaven above, or that is in the earth beneath, or that is in the water under the earth; you shall not bow down to them or serve them; for I the Lord your God am a jealous God. . .' (Exodus 20.4–5). The prohibition is curious because it ran counter to contemporary religious practice. It was also a departure from the practice of the Israelites themselves, for the Golden Calf described in Exodus, chapter 32, was obviously a cult image of Yahweh. Moreover, it is not consistent with the instructions given for the making of the Ark of Yahweh, since these directed that two golden images of cherubim be made (Exodus 25.18–20). However, the prohibition was gradually established as a basic tenet of Judaism, which became the supreme example of a religion which forbade the representation of the deity in human or animal form; a prohibition followed later by Islam.

With a few rare exceptions, the religious iconography of the ancient Near Eastern peoples and of Graeco-Roman society was restrained in its use of symbolism. Such restraint has not characterized the iconography of Hinduism and the religions of the ancient Central American peoples. Indian art has traditionally sought to represent the diversity of divine power by endowing the divine image with many arms. Thus in the statues of Shiva Nataraja, representing the great god as the manifestation of divine energy, the figure has four arms. Each hand holds an object that symbolizes some essential attribute or makes a significant gesture. The whole figure does in fact constitute a complex exposition of the divine nature. Even stranger and more repulsive are the images of the goddess Kali. She is black and a chaplet of severed heads hangs round her neck; her teeth are hideous fangs and her tongue lolls out. The hands of her four arms hold objects symbolizing both her creative and destructive power, for Kali personifies the ambivalence of deity, which manifests itself, according to Indian tradition, in the unceasing cycle of life and death, creation and destruction.

To the non-specialist in ancient American art the representations of Maya and Aztec gods appear even more mystifying than those of the Hindu gods and equally repulsive. The idiom of the art has clearly first to be learned, before its religious iconography can be understood. But even when the imagery becomes familiar, the concept of deity still remains essentially horrific. It is not surprising that gods of such a nature should have required the myriads of human victims that the Aztecs zealously provided.

Buddhist iconography provides interesting evidence of a change of thought about the propriety of representing the Buddha in bodily form. The fundamental tenet of the Buddha's doctrine was that of the necessity of detachment from physical existence in the material world. In the earliest forms of Buddhist art the presence of the Buddha was, accordingly, denoted only by his footprints, or an empty throne, the wheel of the law, or a riderless horse. However, some five centuries after his death images of the Buddha began to appear in northwest India. The change probably reflects the steady transformation of Buddhism into a popular religion. The Buddha became increasingly regarded as a divine saviour incarnated in perfect human form. An iconographic tradition was established concerning the posture of the Buddha's body and the positions of his hands and fingers; each posture or gesture had its own particular significance. The supernatural status of the Buddha figure was also indicated by the nimbus that encircled the head – a symbol that occurs in Hindu, Iranian and Christian iconography. National characteristics have made themselves manifest in the way in which the Buddha is represented: there are distinctive Indian, Tibetan, Southeast Asian, Chinese and Japanese types.

Christian Iconography

The first Christians preserved no record of the physical appearance of Jesus of Nazareth. Such an undertaking, if the idea of it had ever occurred to them, would doubtless have been dismissed as useless. For they were concerned with the future, not the past. They looked forward to the imminent return of Jesus with supernatural power and glory as the promised Messiah of Israel. And when that hope waned after the destruction of Jerusalem in 70 AD, Christians had become more interested in Christ as a divine being than as a man. They did indeed stress the reality of his human nature but this was a doctrinal issue, not the result of interest in 'the historical Jesus'. It is significant that the earliest known description of the physical appearance of Jesus, the so-called *Letter of Lentulus*, is a 13th century forgery. The true situation was frankly stated by the great scholar and theologian, St Augustine of Hippo, writing about 400 AD: 'We do not know his face, any more than that of his mother'.

But if the original disciples of Jesus, who had seen him, had not been interested in preserving the memory of his physical appearance, later generations certainly felt the urge to portray him in either linear or plastic art. Their purpose, however, was a doctrinal one. It first finds expression chiefly in two forms: in mural paintings in catacombs and in sculptured sarcophagi. The catacomb paintings do in fact provide the earliest

British Museum/Michael Holford

specimens of Christian iconography, beginning about 200 AD.

Because the catacombs at Rome were burial-places, the Christians chose subjects for depiction there that symbolized divine salvation. The subjects were taken from both the Old and New Testaments. Among the former the story of Jonah was most frequently used: Jonah's being thrown to the sea monster and his subsequent deliverance provided a graphic analogy of salvation, which had been sanctioned by Christ's use of the incident as an allegory of his Resurrection. The New Testament subjects chosen were relatively few: the baptism of Christ, the miracle at Cana, the multiplication of the loaves, the healing of the paralytic man and the resurrection of Lazarus are the chief. In the scenes no attempt was made to represent Jesus as a 1st century Palestinian Jew. He is generally portrayed as a young beardless man, wearing a long robe of the toga type. The Crucifixion is never depicted in the catacombs, and there is only one problematic scene of the Passion, namely, the Crowning with Thorns and Mocking of Christ. The accent in the catacombs is clearly on salvation and new life. The Good Shepherd figure appears often, but it is doubtful whether it always represents Christ (see GOOD SHEPHERD).

Resemblance to Jupiter

The catacombs offer few examples of what might be specifically called a portrait of Christ. One occurs in the catacomb of Commodilla, dating from the 4th or 5th century; it shows a majestic bearded face, with luxuriant hair, and is reminiscent of contemporary statues of Jupiter. The head is encircled by a nimbus, and the Greek letters alpha and omega indicate that it represents the eternal omnipotent world-ruler. Another example of the adaptation of pagan iconography was found in the excavations beneath St Peter's, Rome. It appears to be a mosaic depiction of Christ as Helios (the sun), together with the sun chariot; it probably dates from about the 4th century.

The sculptured sarcophagi, used for the burial of the dead and dating from the 3rd to the 5th centuries, constitute a rich treasury of early Christian iconography. On them Christ is invariably depicted beardless and in Roman costume. Among the scenes additional to those portrayed in the catacombs are the triumphant entry into Jerusalem, the arrest and trial of Christ. One of these sarcophagi is particularly notable for its representation of the Resurrection. The subject is treated with an interesting mixture of reality and symbolism. The trial before Pilate and the carrying of the cross by Simon of Cyrene are shown realistically but the centre panel presents a large cross, surmounted by a laurel crown of victory, inset with the Chi Rho symbol, a sacred monogram representing the first two letters of the Greek word for Christ; beneath the cross two sleeping Roman soldiers recall the miracle of the empty tomb.

A sarcophagus, now in the Lateran Museum, deserves special attention for its attempt to portray the creation of Adam and Eve as the combined operation of the Trinity. The triune Godhead is represented as three identical bearded persons. This early essay in the iconography of the Trinity, essentially a difficult subject for pictorial representation, was rarely repeated in later times.

The Crucifixion of Jesus, which had been avoided earlier as a pictorial subject, began

St Godric claimed that he once saw a little boy come out of the mouth of the figure of Christ on a crucifix and sit in the lap of the nearby image of the Virgin

to figure in Christian art from the 5th century; but it remained for many centuries a comparatively rarely treated topic. The Church was still primarily concerned with Christ as the divine Saviour, whose transcendental significance far outweighed that of the few years of his earthly life. But the depiction of the events of that life becomes more frequent, doubtless because they provided graphic themes for the teacher and the artist. Indeed the purpose of their representation was didactic. But with the development of the use of mosaic for mural decoration, scenes from the life of Christ provided suitable subjects both for the ornamentation of church walls and the instruction of the laity. The fine series of such scenes in the nave of San Apollinare Nuovo, Ravenna, executed in the 6th century, are notable examples.

Cult of the Icon

Although the idea of a cult image of Christ similar in purpose to that in pagan temples would have been repudiated as idolatry, the development of the basilica church during this period provided an opportunity for depicting such images, which was fully exploited. The domed ceiling at the eastern end of such churches afforded a large concave area which suggested the vault of heaven, and soon these areas glowed with mosaic representations of Christ. Such majestic figures as those in Santi Cosma e Damiano, Rome, and San Vitale, Ravenna, must have focused the attention of the worshippers so compellingly as to become the object of their devotion.

The popular appeal of holy images steadily grew, especially in the Eastern Church. The need was met by the production of icons, small portable depictions of Christ, the Virgin Mary or various saints. Usually painted on flat boards, they could be used for private as well as for public devotion. They were treated as intrinsically holy, being kissed, bowed to and censed. Many icons acquired a reputation for curing disease or warding off misfortune. Some, such as the icon of Christ of Edessa, were regarded as *ocheiropoietos*, 'made without hands'. The cult of the icon provoked a powerful reaction in the Greek Church from c 725 to 842, known as the Iconoclastic Controversy. It started with an edict of the Emperor Leo III, condemning all images as idols and ordering their destruction. After much bitter persecution, the orthodox Christians eventually won and the icons were restored. The first Sunday of Lent is still kept in the Greek Church as the Feast of Orthodoxy, commemorating the defeat of the iconoclastic party.

In the Western Church the use and veneration of images was not seriously challenged until the Reformation in the 16th century. Although officially the nature of the veneration to be paid to images was carefully defined, popular piety often accorded to them a devotion that was indistinguishable from worship. What intensity of devotion could achieve is vividly seen in the case of St Francis of Assisi. He believed that the ancient crucifix in the little church of San Damiano spoke to him, charging him with his fateful mission: 'Go and restore my falling Church'. It may be noted also that from the 9th century the image of Christ on the cross became more realistic, and attention was given to representing the body as tormented to death.

Stories of miracle-working images abound in medieval literature. St Godric, a 12th century English saint, claimed that he once saw a little boy come out of the mouth of the figure of Christ on a crucifix and sit in the lap of the nearby image of the Virgin, who fondled him for three hours. At Château-en-Brie it was reported that a man cursed the image of the Virgin and broke its arm. Blood immediately poured from it, and the miscreant was seized by a demon. That the clergy were not above making wonder-working images was publicly demonstrated by the famous 'Rood of Grace' outside St Paul's, London. Brought up from Kent by Henry VIII's agents, its mechanism for moving the eyes and lips was exposed as evidence of priestly duplicity.

The 'Bible of the Poor'

But in spite of such abuses and popular superstition, iconography played an important educative and cultural role in medieval Christendom. In an age when the mass of the people were illiterate, knowledge about their religion was acquired by verbal instruction and visual illustration. The cathedral and parish church, through their images and paintings, constituted the 'Bible of the poor'. Ordinary folk saw the Trinity represented as a venerable man in papal attire holding the crucifix while the Holy Spirit, as a dove radiating light, emanated from his breast. They were shown how Christ had risen from the tomb after harrowing hell, how he had crowned his mother Mary as Queen of Heaven; and they knew how he would appear at the Last Judgement.

In great churches such as cathedrals the arrangement of the sacred scenes portrayed was carefully planned. At Chartres the main themes depicted were: Christ; Mary; the Church as the Bride of Christ; as Christ's body; and as the community of the saints – with the Eucharist as the divinely ordained link uniting the Church with Christ. Indeed, the medieval cathedral in its layout, sculpture, painted glass and murals, and with the drama of the Mass performed at its high altar, epitomized the universality of Christianity; it seemed to extend from this temporal world to the eternal world of Christ and his saints.

The destruction of images was in the forefront of the programmes of most religious reformers of the 16th century. Although their iconoclasm ended certain abuses, the damage done to the artistic heritage of many countries was irreparable. In Catholic countries the Counter-Reformation exploited the emotive potential of sacred iconography as a stimulus to piety and loyal devotion; El Greco's *Burial of Count Orgoz* and Bernini's *Ecstasy of St Teresa* are notable examples. The cult of images still flourishes vigorously among Catholic peasant populations in both the Old and the New World, involving many strange practices and curious beliefs.

The influence of the traditional image of Christ remains powerful for both Catholics and Protestants, and indeed even for secularists. The bearded, long-haired portrait which became established by the early Middle Ages has so dominated the imagination that puzzlement, if not shock, is felt when the artist departs from this convention. But it is chastening to reflect that the early Christians visualized Christ as beardless and with a close-cropped head.

William MacDuffy

Idol

An image or object representing a divine being; the more sophisticated worshipper may take it as a symbol of the thing reverenced, but at more popular levels of belief the image is thought to possess power in itself and is treated as if it was the god himself, or the abode of the god.

Ignis Fatuus

'Foolish Fire', the pale flickering light sometimes seen hovering over marshy ground or graveyards; it is thought to be caused by the spontaneous combustion of gases from decaying matter; also called will-o-the-wisp, jack-o-lantern, fox-fire, corpse light, friar's lantern, fairy fire; in folk belief it is ascribed to a mischievous spirit which misleads night travellers, or to fairies or witches; in Germany it is said to be a wandering soul, in Russia the soul of an unbaptized child; sometimes taken as an evil omen.

See WILL-O-THE-WISP.

After his death the name of Ikhnaten, the heretic pharaoh, was obliterated from the king lists. He had challenged the power of the priests of Thebes by attempting to abandon Egyptian polytheism for the worship of a single divinity, symbolized by the disc of the sun

IKHNATEN

PHARAOH AMENOPHIS IV of the 18th Dynasty of Egypt, who adopted the name of Ikhnaten (or Ikhnaton, or Akhenaten), is the most remarkable individual figure in the history of Egyptian religion. After a period of sometimes excessive admiration, later scholars have sought to reduce his stature. It has been claimed that the introduction of new art forms, as well as the monotheistic religious teaching for which he is famous, had already begun before he ascended the throne – indeed the monotheism itself has been questioned. It has been said that the more permissive, peace-loving and internationalist values with which he has been credited are altogether illusory.

Though the new interpretations are partly justified, the greatness of Ikhnaten remains. Whether the force that drove him is called fanaticism, megalomania, or will and imagination, there can be no question that this pharaoh by his own genius succeeded in changing the overwhelmingly conservative traditions of ancient Egypt. Looked at from the point of view of the future history of man, it can be seen that his changes were enlightened. The fact that his endeavour plainly contained the seeds of its own destruction turns drama into tragedy. No wonder that modern man has been stirred by his story – even to the point of intensifying and recolouring it.

Amenophis IV was the son of Amenophis III and Queen Tiye. His boyhood was probably divided between their great Malkata palace at Thebes, and Memphis, the old capital which kept its importance as a royal city. During his father's long reign of some 38 years, the New Kingdom attained its greatest height of cosmopolitan opulence.

The problem which profoundly affects the historical interpretation of the reign of Ikhnaten and his immediate successors is that of his possible co-regency with his father. A minority of Egyptologists are convinced that Ikhnaten was crowned as early as the 28th year of Amenophis III and therefore ruled beside him for about 11 years. While there is a considerable amount of inconclusive evidence on both sides, it is very difficult in human terms to believe that Ikhnaten was carrying out his revolutionary policies while his powerful father was still on his throne and still orthodox.

Ikhnaten's reign lasted 17 years. Those who hold that it began only after the death of Amenophis III assign it to c 1367–1350 BC, while those who favour the co-regency must date it to c 1378–1362 BC.

The parentage of his beautiful queen, Nefertiti, is uncertain. She was closely associated with him in his religious ideals, and appears to have enjoyed love and domestic happiness with him until near the end of his reign. She then either died or was estranged. She bore him six daughters. The eldest of these was married to Smenkhare, who ruled beside Ikhnaten for a short time but died before him; the third daughter became the queen of Ikhnaten's successor, the Pharaoh Tutankhamen.

On the other hand, the pharaoh was no longer idealized in art, but portrayed realistically** ***Right*** **Egyptian stele showing Ikhnaten and Queen Nefertiti making offerings to the Aten, the solar disc, from which emanate long rays each ending in a beneficent hand**

Roger Wood

Radiance of the Aten

The Thebes of Ikhnaten's youth was dominated by the city god, Amun. Linked with the royal sun god, Re, he stood for the unseen, creative solar force, and the wealth and power of his priesthood was very great. Probably under the theological leadership of the learned prieste of Re at Heliopolis, there had long been a tendency to merge the divinities of Egypt's bewildering pantheon with the sun god. He was seen most often in the form of Re-Herakhty, compounded of Re and the falcon sky god Horus – who was Pharaoh (see HORUS). In one early text Re is the 'sole god who has made himself for eternity', and other deities appear as his 'bodies'.

It has been supposed that the development of solar religion during the 18th Dynasty may have been in part an attempt to return to the conditions of the Old Kingdom, when the solar cult of Heliopolis gave Pharaoh unique power – a move by the crown and the northern priesthood to counter the hegemony of Amun. It is also suggested that the emergence of a new form of the solar cult, that of the visible sun disc or Aten (in which the spirit of Re was manifest) represented a compromise that could win new adherents.

There is no doubt that this growth took place. At their deaths several kings of the 18th Dynasty were said to have been reunited with the Aten; under Tuthmosis IV the Disc appears as a distinct divinity associated with the power of Pharaoh. In his father's reign Ikhnaten would certainly have witnessed a mounting concern with the Aten. By now the god had a cult centre in Thebes, and the title 'Radiance of the Aten' was applied to the state barge, the Malkata palace and probably even to Amenophis III himself.

Although these developments may have anticipated Ikhnaten's teaching, yet they were a slender growth in the forest of Egyptian polytheism – and at Thebes were quite overshadowed by the great tree of Amun. Amenophis III built several temples to Amun and to others of the old gods. The break which Ikhnaten had to make to achieve an uncompromising monotheism was therefore more revolutionary than evolutionary.

Already in the second year of his reign he was planning a huge temple of the Aten at Thebes. At this time the deity was still shown as a falcon or falcon-headed man crowned with the sun disc. Now the first great innovation was made. The human and bird forms were swept away, and instead the divine power was expressed by a disc bearing the uraeus of kingship and long rays each ending in a beneficent hand. These rays stretched out to all and sundry, giving a new unity to every scene, yet they offered the ankh, symbol of life, only to Ikhnaten and Nefertiti. At the same time the king seems to have demanded a deeper obeisance from those approaching him. This intensified reverence, so contrary to other trends in the royal life, can be explained in both theological and personal terms. The living Pharaoh had been one among the gods, the divine Horus. Now with one god alone, Pharaoh, too, became the sole divinity. The young king must also have felt complete identification with the godhead that had been revealed to him personally. On a boundary stone at Akhetaten he declares that it was his father the Aten, and he alone, who had shown him the site for this new city, and at the end of his famous sun hymn he says, 'there is none other who knows thee save thy son Ikhnaten. Thou hast made him wise in thy plans and power.' The same concentration on the divinity of Pharaoh is shown in the private tombs at Akhetaten. Where in the past the tomb owner himself would have appeared before Re-Herakhty, now there was only the Disc shining upon the royal family.

Temples Open to the Sun

After the adoption of the rayed disc, the next revolutionary step was the move to Akhetaten (now El Amarna) halfway between Thebes and Memphis. Thebes was heavy with the old gods and their priesthoods. The Aten needed his own residence in his own city. The site was probably first established in the fourth year of Ikhnaten's reign, and was ready for occupation two years later. It was in this sixth year that Ikhnaten changed his name from Amenophis.

The temples of the new city imitated that of the sun god at Heliopolis. In place of the dark sanctuaries of most Egyptian temples their courts were wide open to the rays of the Aten. The royal family must often have worshipped in them. As for the litany, it must have followed the lines of the marvellous hymn to the sun (see EGYPT).

The composition of this great poem is always credited to Ikhnaten himself. It celebrates the eternal return of the Aten, his creation of all lands, peoples and living things – and his care for them. Nature is shown rejoicing in its creator: vegetation burgeons, beasts gambol, fish leap and birds raise their wings in his praise. The monotheism of the hymn is absolute.

Ikhnaten's teaching on the life after death is imperfectly understood. He had, of course, banished Osiris and his judgement of the dead. The sun hymn was inscribed in tombs, and its equation of night with death is suggestive. Pharaoh probably taught that through him the dead shared in the solar resurrection.

The New Naturalism

Ikhnaten's ideas transformed not only religion but also art and the habits of court life. Egyptian art had always shown movement arrested, now it became an art of movement. Where before Pharaoh had been idealized to the verge of impersonality, Ikhnaten had his peculiarities provocatively exaggerated. The formal public scenes gave way to the liveliest portrayals of the royal pair embracing, eating and driving out together, dandling their babies. Traditional scenes glorifying Pharaoh as hunter, warrior, trampler of subject races were rare, at Akhetaten almost absent. The palaces at Akhetaten were bright with realistic paintings of the plante and creatures of the Nile. It would be foolish to judge these facts in the light of modern liberalism, but it is legitimate to see behind them a consistent mind and personality.

The inevitable negative side of the Atenist revolution is represented by the ruin of old temples and priesthoods, and the economic dislocation that resulted. Some authorities consider that it was only in his last years that Ikhnaten gave the command for all names of other gods, all words implying a plurality of gods, to be struck from the monuments.

The closing events of the reign are much disputed. Certainly Ikhnaten's boy successor quit Akhetaten, changed his name from Tutankhaten to Tutankhamen and devoted himself to restoring the supremacy of Amun and the temples and statues of the old gods. It was not, however, until the coming of the 19th Dynasty that Ikhnaten's name was obliterated and removed from the king lists.

JACQUETTA HAWKES

ILLUMINATI

THE ORDER OF THE ILLUMINATI, which was founded in 1776, took its name from the Latin, meaning 'the enlightened ones', and the aims of this society were to combat ignorance, superstition, religious restraint and tyranny in various forms. Although it has frequently been described as a prototype subversive secret society and has been accused, for example, of conspiratorially paving the way for the French Revolution, and of planning to achieve the political domination of Europe by unknown secret chiefs, nothing could be further from the truth. Initially its membership was confined to Bavaria and it never recruited adherents outside Germany and Austria. If we ignore its rather childish policy of secrecy and mystification, it represented little more than a society which attracted men of progressive rather than conservative views. The Order began as a protest against the old-fashioned, Jesuit-influenced system of Bavarian university education and if its founder, Adam Weishaupt, had not been an eccentric monomaniac, might have achieved more than was actually the case.

Adam Weishaupt (1748–1830), a product of the Jesuit educational system, who was appointed Professor of Law at the Bavarian University of Ingolstadt when still a very young man, conceived the plan of using Jesuit methods to found a secret school of wisdom. His idea was that young men of intellectual promise should have the opportunity to acquaint themselves with areas of knowledge which the priests had successfully banned from the southern German universities, typically Voltaire's writings and the works of the French Encyclopedists. Secrecy was essential in order to avoid attacks from the Bavarian Jesuits, who in any case mistrusted their former pupil.

Weishaupt now studied the history of the secret societies of antiquity, such as the Pythagoreans and Essenes, but without obtaining any very useful information. In 1774 he happened to meet a Protestant Freemason from Hanover who told him a little about the Craft, about which he had hitherto known very little. He briefly considered a union with Masonry but this was rejected

Left His anti-clerical views led Adam Weishaupt, a Bavarian Professor of Law, to found the Order of Illuminati in 1776; as a secret school of wisdom it set out to encourage the study of areas of knowledge which had been banned by the ecclesiastical authorities in southern Germany *Below* Baron Adolph Knigge reorganized the Order on more or less Masonic lines but quarrelled with Weishaupt on matters of policy and finally left the Order

because the latter did not have the character of an Order, in the Jesuit sense. Although fanatically anti-Jesuit he proposed to fight them with their own supposed methods.

Spartacus the Secret Chief

The Order of Illuminati was accordingly founded on 1 May 1776 with five members, all of whom received fanciful pseudonyms. Weishaupt became known for Order purposes as Spartacus. He was under the impression that once recruits were won the German Freemasons would flock to join his Order. Nothing of the sort happened and after two years the total number of Illuminati did not amount to more than a score. The hoped-for expansion nltimately came in Municb where a few prominent citizens joined, upon learning that they wonld be granted the mysterious title of Areopagite.

No activity worthy of the name was evident until 1779 when Weishaupt finally produced a scheme of organization and a 'curriculum'. The Order was now to consist of three grades: in ascending order of seniority those of Novice, Minerval and Illuminated Minerval. A candidate for the Novitiate, who had to be introduced and vouched for by a member in good standing, had to swear an oath binding him to complete secrecy and unconditional obedience to his superiors.

An extraordinary system of mutual espionage was introduced. At the end of every month the Novice had to deliver to his proposer a sealed letter. This contained a detailed report on every aspect of his relationship with his mentor, who sent it unopened and unread to Weishaupt through an appropriate channel. The proposer, in his turn, had to furnish similar information about the Novice. Weishaupt devised printed forms for these 'intelligence reports'. An incredible volume of information had to be supplied. For example, he wanted complete details about a man's character, intellectual interests, family, friends, financial standing and so on. This mutual espionage was a feature of all the Illuminati grades.

Every Novice had to undertake a course of prescribed reading, based on the works of classical and modern authors, including those of the French Encyclopedists, and write regular essays. He was only allowed to know his proposer. The situation changed when he was considered worthy of promotion to the Minerval grade. For this there was a solemn initiation ceremony. The candidate was taken at night to a dimly lit room where he was received by an unknown individual who asked him certain questions. Provided that satisfactory answers were given, a password and certain secret signs were communicated.

As a Minerval a member was allowed to know others of his grade, but the identities of those in the higher Illuminated Minerval degree were not disclosed. The Minerval meetings were not unlike those of a learned society. Those present reported upon the books they had recently read, and discussed the latest scientific discoveries.

The degree of Illuminated Minerval could be taken without much ceremony. The member merely undertook further obligations, such as to instruct the younger bretbren and strengthen their devotion to the Order's somewhat vague principles.

By the end of 1779 the Order had achieved very little and certainly had no political significance. Indeed, Weishaupt received one complaint after another from Munich about his dictatorial rule and the time-wasting correspondence. At this point he realized that far from the Order capturing the Freemasons, members were leaving it to join Masonic Lodges.

Infiltrating the Masons

However, a solution presented itself: the Illuminati must infiltrate Freemasonry and conquer it from within. A charter for a new Masonic Lodge at Munich was obtained from the Berlin Grand Lodge Royal York. The Munich Lodge, which quickly recruited members, including a number who were already Freemasons, immediately declared itself independent. Initially, at least, most of those concerned had no precise idea of what Weishaupt was contriving.

The most influential of those who then became Masonic Illuminati was Baron Adolph Knigge (1752-96), who was soon to be the most important man in the Order. Knigge, who had assumed the pseudonym Philo, quickly put an end to the quarrels between Weishaupt and the senior members at Munich. Since he travelled far and wide in Germany, he immediately brought in new recruits. Much to his dismay, however, he speedily discovered that Weishaupt's plans for the Order were still very vague. Knigge, who was a first-class organizer, gave it a new

structure on more or less Masonic lines and there was a very rapid expansion. Among those who now joined were Duke Ferdinand of Brunswick, Duke Ernest of Gotha, and even the illustrious Goethe.

Hitherto the Order had been so obscure that it had attracted little attention. Now, however, it had a number of enemies, not least among the Freemasons, who realized that they had been duped. To add to the complications, Knigge quarrelled with Weishaupt. The Baron was in favour of a more democratic organization and wished to restrain his colleague's anti-clerical and, above all, anti-Jesuit policies on the grounds that they were politically and tactically unwise. Weishaupt was stubborn and Knigge left the Order.

Politically Suspect

So far the Order had not experienced any trouble with the Bavarian authorities. But its expansion coincided with a period when conservative and clerical forces were gaining ground in Bavaria. All manner of rumours, mostly untrue, about Weishaupt and the Order were now circulated. The Order became politically suspect, although there were few grounds for considering it as a dangerous revolutionary organization. Without naming the Order, the Elector of Bavaria sanctioned a decree forbidding all secret societies, including the Freemasons, on 22 June 1784.

Yet another decree, dated 2 March 1785, named both the Illuminati and the Freemasons and confirmed the ban on all further activity. There were many arrests and Weishaupt was obliged to leave Bavarian territory. The Order collapsed in southern Germany and was soon moribund elsewhere.

The Order of the Illuminati was revived in Berlin in 1906 by Leopold Engel at the behest of Theodor Reuss, who had a hand in every conceivable variety of pseudo-Masonic activity. It then came under the spacious umbrella of Reuss's Order of Oriental Templars. Yet another revival of the Order has been attempted very recently at Frankfurt am Main.

The Step-Pyramid at Sakkara, tomb of the Pharaoh Zoser and first of the great Egyptian pyramids, bears witness to the technological genius of its architect, Imhotep, Zoser's vizier and 'chief of all the works of the king'; he was also renowned as a great healer

The man who designed the great Step-Pyramid at Sakkara was transformed into a god some 2000 years later, and became the Egyptian god of healing

IMHOTEP

THE ANCIENT EGYPTIAN SAGE Imhotep has two claims to unique distinction. He provides the best documented instance of the deification of a man and he is the first individual of genius known to us. His reputation, moreover, was due to his wisdom and technological ability, not to success in war, too often the qualification for fame.

Imhotep was the vizier of the Pharaoh Zoser of the 3rd Dynasty (c 2778–2723 BC). Among his titles were 'overseer of the king's records', 'chief of all the works of the king' and 'supervisor of that which heaven brings, the earth creates and the Nile brings'. His personal name Imhotep meant 'he who comes in peace'. His father was Kanofer, 'chief of the works of the south and of the north-land'; his mother's name was Khreduank. These facts are significant; for they show that Imhotep's human origins were well known and recorded.

One famous monument created by his genius still survives – the Step-Pyramid at Sakkara. This is the first-known stone building, and it was planned by Imhotep as a tomb for Zoser. Interesting evidence of the connection between king and architect has been provided by the finding, within the mortuary-temple complex of the Step-Pyramid, of a statue of Zoser bearing both his and Imhotep's names. The scientific and technological knowledge involved in the erection of the pyramid and its adjacent buildings at this early period impressively attests to the genius of Imhotep. But such an achievement does not explain how Imhotep came to be regarded as a god some 2000 years later, in about 525 BC, according to the

British Museum/Chris Barker

Imhotep, 'he who comes in peace': his wisdom became a legend in Egypt. This bronze statuette shows Imhotep wearing a skull cap, without any of the attributes of divinity which he later acquired

earliest available evidence of his deification.

From Egyptian sources, however, we learn that Imhotep had a reputation for other abilities than his skill as an architect. An inscription of the Ptolemaic period (330–30 BC), on the island of Sekel near Aswan, preserves an ancient legend about Imhotep. Egypt, during the reign of Zoser, was afflicted by a terrible famine owing to the failure of the Nile for seven successive years to reach the flood level necessary for the irrigation of the land. Zoser appealed to Imhotep to find the cause. After withdrawing to consult the sacred books, Imhotep revealed to the king 'the hidden wonders, the way to which had been shown to no king for unimaginable ages'. In the inscription Imhotep is described as 'the chief *Kheri-heb* priest ... the son of Ptah'. The description, in this context, is significant. The office of Kheri-heb involved the reading of magical texts during the performance of rituals believed to achieve supernatural results. Hence the holder of the office was associated with magical knowledge and ability. The legend indicates that Imhotep had a pre-eminent reputation in this connection. It also shows that he was regarded as the son of the great god of Memphis, Ptah (see EGYPT), although the name of his earthly father was also known.

An interesting reference to Imhotep occurs in the curious sceptical poem known as the *Song of the Harper*, which dates from the Middle Kingdom (c 2060–1788 BC), and was sometimes inscribed on the walls of tombs. It reads: 'I have heard the discourses of Imhotep and Hardedef, with whose words men speak everywhere – what are their habitations (now)?' The 'Harper' seems to imply that the wisdom of the great sages of old had not saved them from the ravages of time – Hardedef, incidentally, was the son of the Pharaoh Khufu (Cheops), builder of the Great Pyramid; but he never attained the posthumous fame enjoyed by Imhotep.

Healed in a Dream

In some way Imhotep also acquired great renown as a physician or healer of disease. A Greek papyrus found at Oxyrhynchus, an ancient city of the Nile valley, dating from the 2nd century AD but claiming to preserve an older Egyptian record, suggests that Imhotep's medical reputation was already well established by the reign of the Pharaoh Menkaure (c 2600 BC). The papyrus, which was written by a certain Nechautis, who sought appointment as priest in a temple of Imhotep, contains interesting evidence of the Egyptian practice of incubation – sleeping in a temple in the hope of divine healing. It relates how the mother of Nechautis, suffering from quartan ague, slept in the temple of Imhotep and was cured after dreaming that the god had visited and healed her by 'simple remedies'. After this miracle, Nechautis also became ill. He too slept in the temple, accompanied by his mother who remained awake. She suddenly saw 'someone whose height was more than human, clothed in shining raiment and carrying in his left hand a book.' The presence intently regarded the sleeping Nechautis from head to foot and then vanished. Recovering herself, the mother found her son bathed in perspiration, but free of his fever. On awaking, he described a similar vision, and was conscious that Imhotep had cured him. When mother and son duly offered sacrifices of thanksgiving to Imhotep, they learned that the god wished Nechautis to fulfil a long-standing promise. This was to translate into Greek the ancient Egyptian book which the papyrus claims to embody, so that 'Every Greek tongue will tell thy story and every man will worship the son of Ptah, Imouthes (the Greek form of Imhotep).'

The story graphically illustrates the manner in which the ancient architect of the Step-Pyramid had been transformed, some 2000 years later, into a healing god. The Greeks identified Imhotep with their own divine physician, Asclepios.

The gradual deification of Imhotep seems to have been completed about 525 BC. It was paralleled by a change in his iconography. Previously he had been represented, in small bronze statuettes, as a man, generally seated, wearing a short waist-cloth and skull cap, and without any symbol of deity; he held an opened papyrus scroll on his lap. Later, particularly in mural representations, he was shown with all the customary attributes of divinity: the Puntite beard, a long narrow artificial beard worn after the fashion of the men of Punt (Abyssinia), the uas-sceptre (see EMERALD) and the ankh, symbol of life. His divinity is clearly attested in the following inscription, adjacent to his picture in the small Ptolemaic temple at Kasr el-Agouz, near Luxor: 'Son of Ptah, beneficent god, begotten by the god of the south wall (Ptah), giver of life, who bestows gifts on those he loves, who listens (to those who call upon him), who provides remedies for all diseases.'

Imhotep's deification led, in turn, to the deification of his mother and his wife Renpetnefert. His father did not share in this exaltation, for already Ptah had been credited with the siring of the divine physician. At Memphis Imhotep came to form a divine triad with Ptah and the goddess Sekhmet.

Three temples are known to have been dedicated to Imhotep in Egypt, the chief being at Memphis, which became a famous medical centre, and on the sacred island of Philae in Upper Egypt. Many temples contained special shrines for his worship; on the upper terrace of the temple of Hatshepsut at Deir-el-Bahari there was a sanatorium for those who sought his help. The centre of his cult was probably at his tomb at Sakkara, near the Step-Pyramid. Excavations are now in progress at Sakkara and there are hopes that the tomb of the man who became the Egyptian god of medicine will eventually be discovered.

Imitative Magic

The use of a doll, made of wax, clay, lead or other material, to kill, injure or seduce the person the doll represents, is known from all over the world, ancient and modern

The quickest way to murder someone by witchcraft is to 'make a Picture of clay, like unto the shape of the person . . . then take a Thorn or a Pin, and prick it in that part of the Picture you would so have to be ill'

MIMICRY for magical purposes is deeply embedded in human nature. One of the common reactions to danger, for instance, is to keep absolutely still and shut your eyes. What you are doing is to pretend you are not there, so that the danger cannot strike you. We all know that this is not a sensible way to avoid a car which is out of control, or the anger of someone who is offended, but we do it automatically.

At racetracks and athletics meetings you may find yourself tensing and straining, to imitate a surge of energy in a runner, in the magical hope of spurring him on. Another simple example is observable at bowling greens where, after releasing the bowl, a player gestures with his arms and curves his body to persuade the bowl to curve in the way he wishes. Another is the simple device employed by doctors to make an embarrassed patient urinate when a sample is needed. The doctor turns on a tap and very quickly the sound of trickling water produces the desired result. This is an interesting parallel to primitive rain-making magic in which water is poured out to make the gods urinate from on high.

A familiar piece of imitative magic is to look at yourself confidently in a mirror and say, 'Every day in every way I am getting better and better.' This depends on mimicking what your inner feelings and outward behaviour would be if you improved each day, with such conviction that you do improve. Though much mocked, it is often effective, and this type of playacting to yourself is an ingredient in most ways of trying to change your character. In his book on *Magical Ritual Methods*, which contains many examples of imitative magic, W. G. Gray describes a method of banishing a bugbear by mentally imitating it looming up in the mind and then mentally shrinking it away to nothing.

Image Magic

The use of a doll, made of wax, clay, lead or other material, to kill, injure or seduce the person the doll represents, is known from Egypt and Mesopotamia, from India, Greece and Rome, and from all over the world, ancient and modern. The quickest way to murder someone by witchcraft, according to old Mother Demdike at the trial of the Lancashire witches in 1612 (see LANCASHIRE WITCHES), is to 'make a Picture of clay, like unto the shape of the person whom they mean to kill, and dry it thoroughly: and when they would have them to be ill in any one place more than another; then take a Thorn or a Pin, and prick it in that part of the Picture you would so have to be ill: and when you would have any part of the body to consume away, then take that part of the Picture, and burn it. And when they would have the whole body to consume away, then take the remnant of the said Picture and burn it: and so thereupon by that means, the body shall die.'

The principle is not extinct in the modern West. In 1964 the figure of a naked woman, six inches long and made of modelling clay, with a sliver of hawthorn piercing its heart,

was found near Sandringham in Norfolk. It may have been meant to kill its victim or to seduce her by piercing her heart with love. In 1939 it was reported from Cairo, Illinois, that 'a sure way to kill a man is to place his picture under the eaves at the corner of your house during rainy weather and let the water pour upon it.' Modern technology has allowed sorcerers and witches to use a photograph of the victim, pinned on to the doll to make identification certain, and the reluctance of some primitives to be photographed, because it puts them in the photographer's power, is well known.

In 1900 a figure of President McKinley, riddled with pins, was burned on the steps of the American Embassy in London. According to Lady Charlotte Campbell in her diary for 1814, Caroline of Brunswick, the unhappy wife of the Prince Regent (afterwards George IV), frequently made wax images of her husband with fell intent. One evening after dinner, she made one of these dolls and 'gave it an amiable addition of large horns; then took three pins out of her garment and stuck them through and through, and put the figure to roast and melt at the fire.'

The Killing Doll

In England in 1324 a magician named John of Nottingham was said to have made seven images of wax and canvas to represent King Edward II and other notables, in order to murder them. The seventh figure represented a courtier named Richard de Sowe who, as C. L'Estrange Ewen dryly remarked, 'somewhat inconsiderately was included for experimental purposes'. To test the procedure, a 'curious pin wrought of sharp lead' was driven into the forehead of de Sowe's image, two inches deep. The next day one of the magician's accomplices went to Richard de Sowe's house and found him raving and shrieking. They left him in this condition for a month or so. Then they pulled out the pin and stuck it into the image's heart, and Richard de Sowe died.

Image magic was also used by medieval Jews, frequently to force a thief to restore stolen goods. A picture of the suspected thief would be drawn on a wall and nails would be driven into it, usually into the eyes. This would cause the thief such pain that he would give himself up. A man's name could also be used against him (see NAMES).

In 1649 John Palmer and Elizabeth Knott were executed at St Albans. They were said to have made a clay figure of a woman which they put on a fire. As the figure was slowly roasted, their victim writhed in agony and when it was completely consumed, she died. Not only human beings but inanimate objects could be harmed in this way. Margaret Barclay, an Ayrshire witch executed in 1618, had quarrelled with her brother-in-law, who afterwards went on a sea voyage. She was accused of making wax models of the ship and captain, with which she caused the ship to sink and her brother-in-law to be drowned.

The British tradition crossed the Atlantic. In the walls of the cellar of the house of Bridget Bishop, one of the witches of Salem (see SALEM), 'poppets' were discovered, made of rags and hog's bristles into which headless pins were stuck. In Goody Glover's house were found small dolls made of rags and stuffed with goat's hair. She was prevailed on to admit that she tormented a victim by wetting her finger with spit and stroking one of the dolls.

Images have been used to provoke love, as well as to injure. A magical textbook called Picatrix (see PICATRIX) provides a method of making a girl fall in love with a man. Make an image of each of them, from pulverized stone mixed with gum, and put the two images, facing each other, into a vase with seven twigs. Bury the vase in the hearth, then light a fire in the hearth and put a piece of ice in the fire. When the ice has melted, dig up the vase and the spell is complete. The fire melting the ice, of course, is love melting the hearts of the man and the girl.

A Black Vitality

As an alternative to sticking an image with pins or burning it, it can be sunk in a running stream to be gradually worn away. Or it can be broken, twisted, mangled, buried, hanged on a tree, plunged in boiling water or suspended in a chimney.

It is significant that the images are so often called dolls, 'child's babies', poppets, puppets or mommets – names which point to the roots of image magic in the experience of

Axel Poignant

Above **Australian aborigines performing a dance round a shark totem: they mime the taking of young sharks from the belly of the totem as a way of magically ensuring an ample supply of sharks**

childhood. A child accepts that a doll is alive, is a person, and can be cosseted or hurt. For many sorcerers of the past, the fact that the doll represented the victim, and the mimic torments inflicted on it, would be enough by themselves to cause the victim harm.

In more sophisticated magical theory what harms the victim is the concentrated malice of the sorcerer, for which the image acts as a focus. In the making of the doll, in the gleeful torture of it, the magician arouses his own inner hatred, concentrates it and projects it at his enemy. If the image is accidentally damaged, the victim is not harmed. Only when the image is 'charged' with hatred and deliberately maltreated does the victim feel the effects. The rites of 'charging' are ways of concentrating the sorcerer's fury but, even so, the image takes on an evil vitality of its own. Bernard Bromage says (in *The Occult Arts of Ancient Egypt*): 'An image can be charged in a number of ways: inverted "prayer"; the burning of incense; actual blood sacrifice in its vicinity; the sheer impact of petrifying venom – all these can play their part in causing an image – especially one already associated with destruction – to spring into a black, abounding vitality which can burn itself into the conscious and subconscious, especially during sleep...'

It is essential that the image be linked with the victim, so that the magician's hatred hits the right target. 'It is not enough to pretend that your wax image is the person you want to bewitch,' says a character in Aleister Crowley's novel *Moonchild*, 'you must make a real connexion. That is the whole art of magic, to be able to do that.' The image should look as much like the victim as possible, and it may be given his name. The witches of North Berwick (see NORTH BERWICK WITCHES) made a wax image of James VI (afterwards James I of England) which they intended to roast on a fire. But first ten of them met the Devil, their master, near Prestonpans and passed the doll from hand to hand, saying formally, 'This is King James the Sixth. . .' Other ways of linking the victim with the image are to mould into it his nail parings, a lock of his hair, a piece of his clothing, or anything else that has been in close touch with him.

That it is the venomous hatred focused on the image, and through it on the victim, which does the damage is not a new theory. In the 14th century Antonius de Monte Ulmi said that image magic may work in practice, especially if the maker of the image exerts 'strong volition, so as to affect his own body and multiply emanations from its pores'. He goes on to say that some people of strong personality can cure diseases by incantations, though the words themselves are idle.

In cases where image magic works, as it sometimes does, the simplest explanation is that if you believe in a magician's powers and you know that he is projecting a violent current of hate at you with a determined resolution, this knowledge itself may bring about the harm which the magician intends. A curse or any other form of hostile magic can equally be damaging and even lethal when directed at a victim who believes in it. Cursing procedures themselves frequently involve imitative magic – the twisting of a piece of cord in the Azande ritual of blood-brotherhood, for example, which imitates the grip the blood will take on the vitals of a man who breaks the oath, or the tying of a piece of wire round a lead cursing tablet to make the spell 'binding' (see CURSE).

Leaping for Increase

In *The Golden Bough* Frazer regarded the principle of mimicry, 'that like produces like, or that an effect resembles its cause', as one of the two basic principles of magical thought. The other he called 'the law of contact or contagion', which is 'that things which have once been in contact with each other continue to act on each other at a distance after the physical contact has been severed.' In practice, as he noted, the two are often combined (as in the case of adding the victim's nail parings to a wax image) and he gave the two principles together the label of Sympathetic Magic, the belief 'that things act on each other at a distance through a secret sympathy.'

Certainly, the principle of imitation is fundamental to magic and to many religious rituals as well. Ritual gesture, for instance, often involves mimicry. Fingers are crossed for luck, to bar the path of evil influences, or in a gesture of blessing two fingers are closed

Banishing a Bugbear

A good way to begin is to take some problem or other which is a matter of personal worry, annoyance, or to which there is a definite and constant reaction. Evoke and conjure it up in the consciousness until reaction sets in, then deliberately banish and neutralise it into Nil, the principle being that what is called up on purpose can also be dismissed on purpose. The diminishing effort is but a continued and inversed energy-flow of the original invocation. The purpose of all this is to bring the power of consciousness under control of the will and intention.

To ritualise all this is quite simple. It needs associating with appropriate circuits of consciousness through components of adaptation such as gestures, words of command, visual vehicles, and so forth. Suppose we try putting this in practice.

First the Time-Space-Event field is rapidly built up. Then a simple invocatory gesture and command is made while the subject of invocation is brought to mind as strongly as possible. Elaborate pentagrams and wordy pieces of prose are a complete waste of time and effort. A neat and effective gesture is opening a double door, which is that of bringing both hands forward together, then back towards the body and out to both sides. At the same time the plain command; 'Come in' is given either aloud or mentally, while the concept invoked is considered as advancing through the open doors upon the invocant. A positive reaction must be made appropriately. If the concept is enjoyable, then pleasure must be felt, or if otherwise, then whatever is called for in the way of aversion. We have now 'called up' or 'raised' a definite formation of consciousness and recognised it reactively, which gives it reality in mental dimensions.

Now we must expel the concept from our world. This is done by mentally pushing it through the open portal, making the closing gesture of bringing the hands together and forward again as if pressing the door shut, and saying clearly; 'Go out'.

W. G. Gray *Magical Ritual Methods*

so that the open thumb and two fingers are left to represent the Trinity (see GESTURE). In magic a symbol does not merely stand for something else, it *is* the something else, hence the Egyptian reluctance to put a complete hieroglyph of an animal inside a tomb in case the animal came alive (see ALPHABET), or the simple belief that an image of the victim is the victim. In religious ceremonies, especially at the popular level of belief, there is always a tendency to confuse the mimicry or the symbol with what is imitated or symbolized, hence the widespread belief in the magical powers of the consecrated host, and the theological debate over whether the elements of the Eucharist are really the body and blood of Christ or only represent them, whether the ceremony, in imitating the Last Supper, re-enacts it or only commemorates it.

Striking modern examples of imitative magic are found in the cargo cults of the Pacific (see CARGO CULTS), where air strips are built and model planes set up in shrines in the hope that real planes will arrive, full of desirable goods. At the other end of human history, it has long been thought that some prehistoric cave paintings are examples of imitative hunting magic – an animal is shown wounded so that the hunters will wound it in reality (see CAVE ART).

Games in which children ceremoniously jump up and down have been connected with imitative magic, in the form of leaping to make the crops grow tall, as in the old hymn of the Curetes: 'To us also leap for full jars, and leap for fleecy flocks, and leap for fields of fruit. . .' European customs in which girls rise high into the air on swings or people are lifted up in the air seem to have had the same magical purpose, and became connected with Easter through another imitative link, that of rising in the air with Christ rising from the grave (see CHILDREN'S GAMES; EASTER).

The Horse Sacrifice

Imitative magic ranges all the way from minor spells and superstitions, like the use of words which shrink away to nothing to reduce fever (see ABRACADABRA) or the belief that if a dying man's bed is set across the floorboards, instead of parallel with them, he will 'die hard' (see HOUSE), to major magico-religious rituals like the mock death and burial of an Ibo king, which is followed by his restoration to life on a new, divine plane (see IBO).

Other examples are those rituals which depend on the principle that sexual intercourse magically promotes the growth of crops and the fertility of cattle. One of these, described by Benjamin Walker in *Hindu World*, is the *asvamedha* or horse sacrifice offered by kings centuries ago in India. A young male horse, preferably white, was chosen and sacrificed, after elaborate preliminary rites. Once the animal was dead, the king's four wives walked nine times round its corpse, fanning it with their robes. The horse was identified with the god Prajapati and it was necessary for the chief queen to be 'impregnated' by him. The sacrificial pit was covered with a sheet, under which the queen went through a mimic copulation with the dead horse. After this the chief queen, the other queens and the four officiating priests exchanged obscene remarks, and it is possible that the queens had intercourse with the priests. 'The whole ceremony is believed to be part of a long-forgotten fertility rite for bringing prosperity to the realm.' An asvamedha was offered by a ruler of Jaipur as late as the mid-18th century.

Dance and drama are largely rooted in imitative magic, in the principle that by mimicking an animal, a person or a supernatural being you can be carried out of yourself and become that being, momentarily at least, share in its innermost nature and sanctity and control its actions (see DRAMA). In ceremonial magic, the 'assumption of god-forms' depends on the same principle, the imitation of a supernatural

In magic, to imitate or act out an event with sufficient vividness and concentration is to make the event occur in reality, a principle also found at the roots of dance, drama and many religious rituals *Below left* A doll may be pierced and mangled to inflict the same injuries on the real victim *Below centre* Two 'bones' strung with human hair, used by Australian aborigines for 'pointing the bone', in which the medicine-man jabs the bone in the direction of his victim with fierce thrusts and twists, acting out the harm he means to inflict *Below right* Sheep's heart riddled with pins and nails to neutralize a spell put on sheep and cattle *Right* The Inca offers a libation to the sun and since he is an incarnation of the sun god, he acts out the drinking of the offering himself: from a 17th century Peruvian manuscript

Chinese illustration of the curious child-birth custom of couvade, known in many parts of the world. The father takes to his bed and behaves as if he, not his wife, is having the child. Sometimes he roars and rocks about in agony, evidently with the intention of magically transferring the birth pangs from his wife to himself by imitating them. The origin and underlying significance of the custom is uncertain. It may have kept the father quiet so that no evil influences could harm the baby through him

being or force, through which the magician attempts to become it and control it.

A love of playacting is another human characteristic which comes out strongly and spontaneously in children, but the point of it is not a mere liking for dressing up and strutting the boards but a longing to escape from yourself and, by imitation, to become someone or something else. We require a willing 'suspension of disbelief' by both actors and audience, a temporary agreement to accept that an actor *is* what he impersonates. Long ago, and in societies less affected by Western rationalism, 'suspending disbelief' was more easily achieved. In the totem-lodges of Australian aborigines, for example, where the actors imitate the actions of the hero-ancestors of the Dreamtime: 'the chanting goes on and on; the decorated actors appear; but they are no longer the men of a few hours earlier. They are now the heroes of the Dreaming' (see AUSTRALIA).

Immaculate Conception

Virgin birth; in theology, the Roman Catholic dogma asserting the sinlessness of the Virgin Mary who, alone among humanity, was conceived free from sin and preserved from all taint throughout her life; this long-held Catholic belief was made an article of faith by a papal bull in 1854; the Feast of the Immaculate Conception is celebrated on 8 December.

See MARY: VIRGIN BIRTHS.

Sonia Halliday

Immanent

Indwelling, inherent; term applied in theology to God, to express the idea that God pervades the universe, existing within and throughout the created world; the opposite of 'transcendent', which suggests God's existence above and apart from his creation, and not subject to its limitations.

If man survives in some form into the future, may he not also have had an existence in the past? Plato's proposition, one of the greatest puzzles concerning immortality, was echoed by the poet Wordsworth, who said that 'the soul that rises with us . . . cometh from afar'

IMMORTALITY

THE BURIAL CUSTOMS of primitive man cannot be cited in proof of his belief in human survival of death and continuance into endless life. The fact that many of the skeletons found at Mount Carmel and other prehistoric sites had the legs tucked up behind the pelvis could be taken to mean that the living were afraid that the dead might 'walk' and were seeking to immobilize them. It could just as well mean that they thought of death as a return to the womb from which life came and that they were preparing the dead body accordingly, in the posture of an unborn child; or it might mean that they thought that the dead body had to be bundled up small so as to gain access to a new world, to which the sun retired each day through a tiny hole in the western sky. Finally, given the limitations of primitive tools, the real reason might be that the living did not want to have to make a very large hole to serve as a grave. Not until written records became available along with burials (see BOOK OF THE DEAD) is it possible to infer anything about the beliefs of the people concerned.

The great value of Herodotus, that observant Greek historian of the 5th century BC, is that he went about taking notes in the manner of the modern anthropologist. His reports of the burial customs of the Scythians in South Russia agree remarkably with what has been found there in modern times; royal *kurgan* graves have yielded up skeletons of horses (as many as 50 at a time), cup-bearers, attendants and concubines, just as Herodotus describes. These practices, which ensured that the dead prince would be provided with a retinue, point to a belief in immortality of a sort, even though it might have been a selective immortality that was to be enjoyed by princes only.

Mesopotamian literature tells of the descent of the goddess Ishtar (or Inanna) to the underworld through its seven gates; there she is sprinkled with the water of life and then ascends through the seven gates to rejoin the world of men. The *Epic of Gilgamesh* includes an episode where the hero brings up a wonderful plant from the sea bed, the virtue of which is to restore life and youth. Where such tales were told, the belief in survival cannot have been weak.

An Egyptian papyrus dated as early as 2000 BC contains a sophisticated dialogue between a man and his own soul. At the end his soul advises: 'Desire to reach the West (the abode of the dead) when thy body goes into the earth, that I may alight after thou hast grown weary.' The papyrus describes 'those who are yonder'. They are shown as 'men of knowledge; they punish sinners and 'stand in the barque of the sun, giving choice gifts to the temples'. This is a remarkable description, far removed from what Hebrew thought had achieved by the same epoch.

The sojourn of the Jews in Egypt did not affect their beliefs about the fate of the dead. Jacob grieved for his lost son, Joseph, saying: 'I shall go down to Sheol to my son, mourning' (Genesis, 37.35). Sheol was the darkling abode of the dead, where personal survival was at a very low ebb. Those in Sheol could not praise God but were condemned to a state of weakness and dullness. Saul might visit the witch of Endor and call up the spirit of Samuel from Sheol, but the rest of the dead had to bear an existence that was a pale shadow of life upon earth.

Escape from Sheol

Gradually, towards the end of the Hebrew Scriptures, there appears the idea of a general rising from the dead, an escape from Sheol to a life that is once more enriched with bodily sensation. The just, in the words of the Wisdom of Solomon (in the Apocrypha), are to receive the kingdom of glory and the diadem of beauty from the hand of God. They will confront their persecutors, who will then become objects of ignominy suffering remorse. A similar picture is given by the prophet Daniel.

The Greek philosophers, according to their habit, looked at the problem in rational fashion. A distinction between body and soul, and the destiny of each, was current in Greece in the time of Herodotus, for the war memorial to the Athenians killed at the siege of Potidaea (in Macedonia) speaks of their bodies committed to the ground and their souls flying upward. Over a generation later Plato (in the dialogue *Phaedo*) draws a portrait of Socrates discoursing on immortality during the last hours that his disciples were allowed to spend with him in the condemned cell. The setting of the dialogue implies that it was in the main a true report of what was said. The argument runs from the existence of eternal objects of knowledge which are not liable to change (such as the idea of beauty) to the eternity of the knowing subject. The whole Greek theory of knowledge rested on the proposition that like is known by like. Plato was at pains to show Socrates refuting the Pythagorean idea that the human soul was a harmony, for a harmony could be dissolved. Since death and life are contraries, the onset of death forces the soul either to withdraw or be annihilated; it cannot be annihilated, and so it withdraws from the function of animating the body.

Existence Before Birth

In an earlier dialogue, the *Gorgias*, Socrates is shown by Plato propounding a purified version of the Greek myth that there was a judgement after death and that souls passed either to the Islands of the Blest or else to prison and torture. In the *Meno* he presents the case for the pre-existence of the soul, based on the phenomena of memory and of the spontaneous understanding of mathematical problems by the young; this can be made to look like a memory of what was understood in a previous phase of existence. With this conclusion Plato formulated what has proved to be one of the great puzzles about immortality: if it is good for the future, why not for the past also? If the soul is to exist in the future, may it not also have existed in the past?

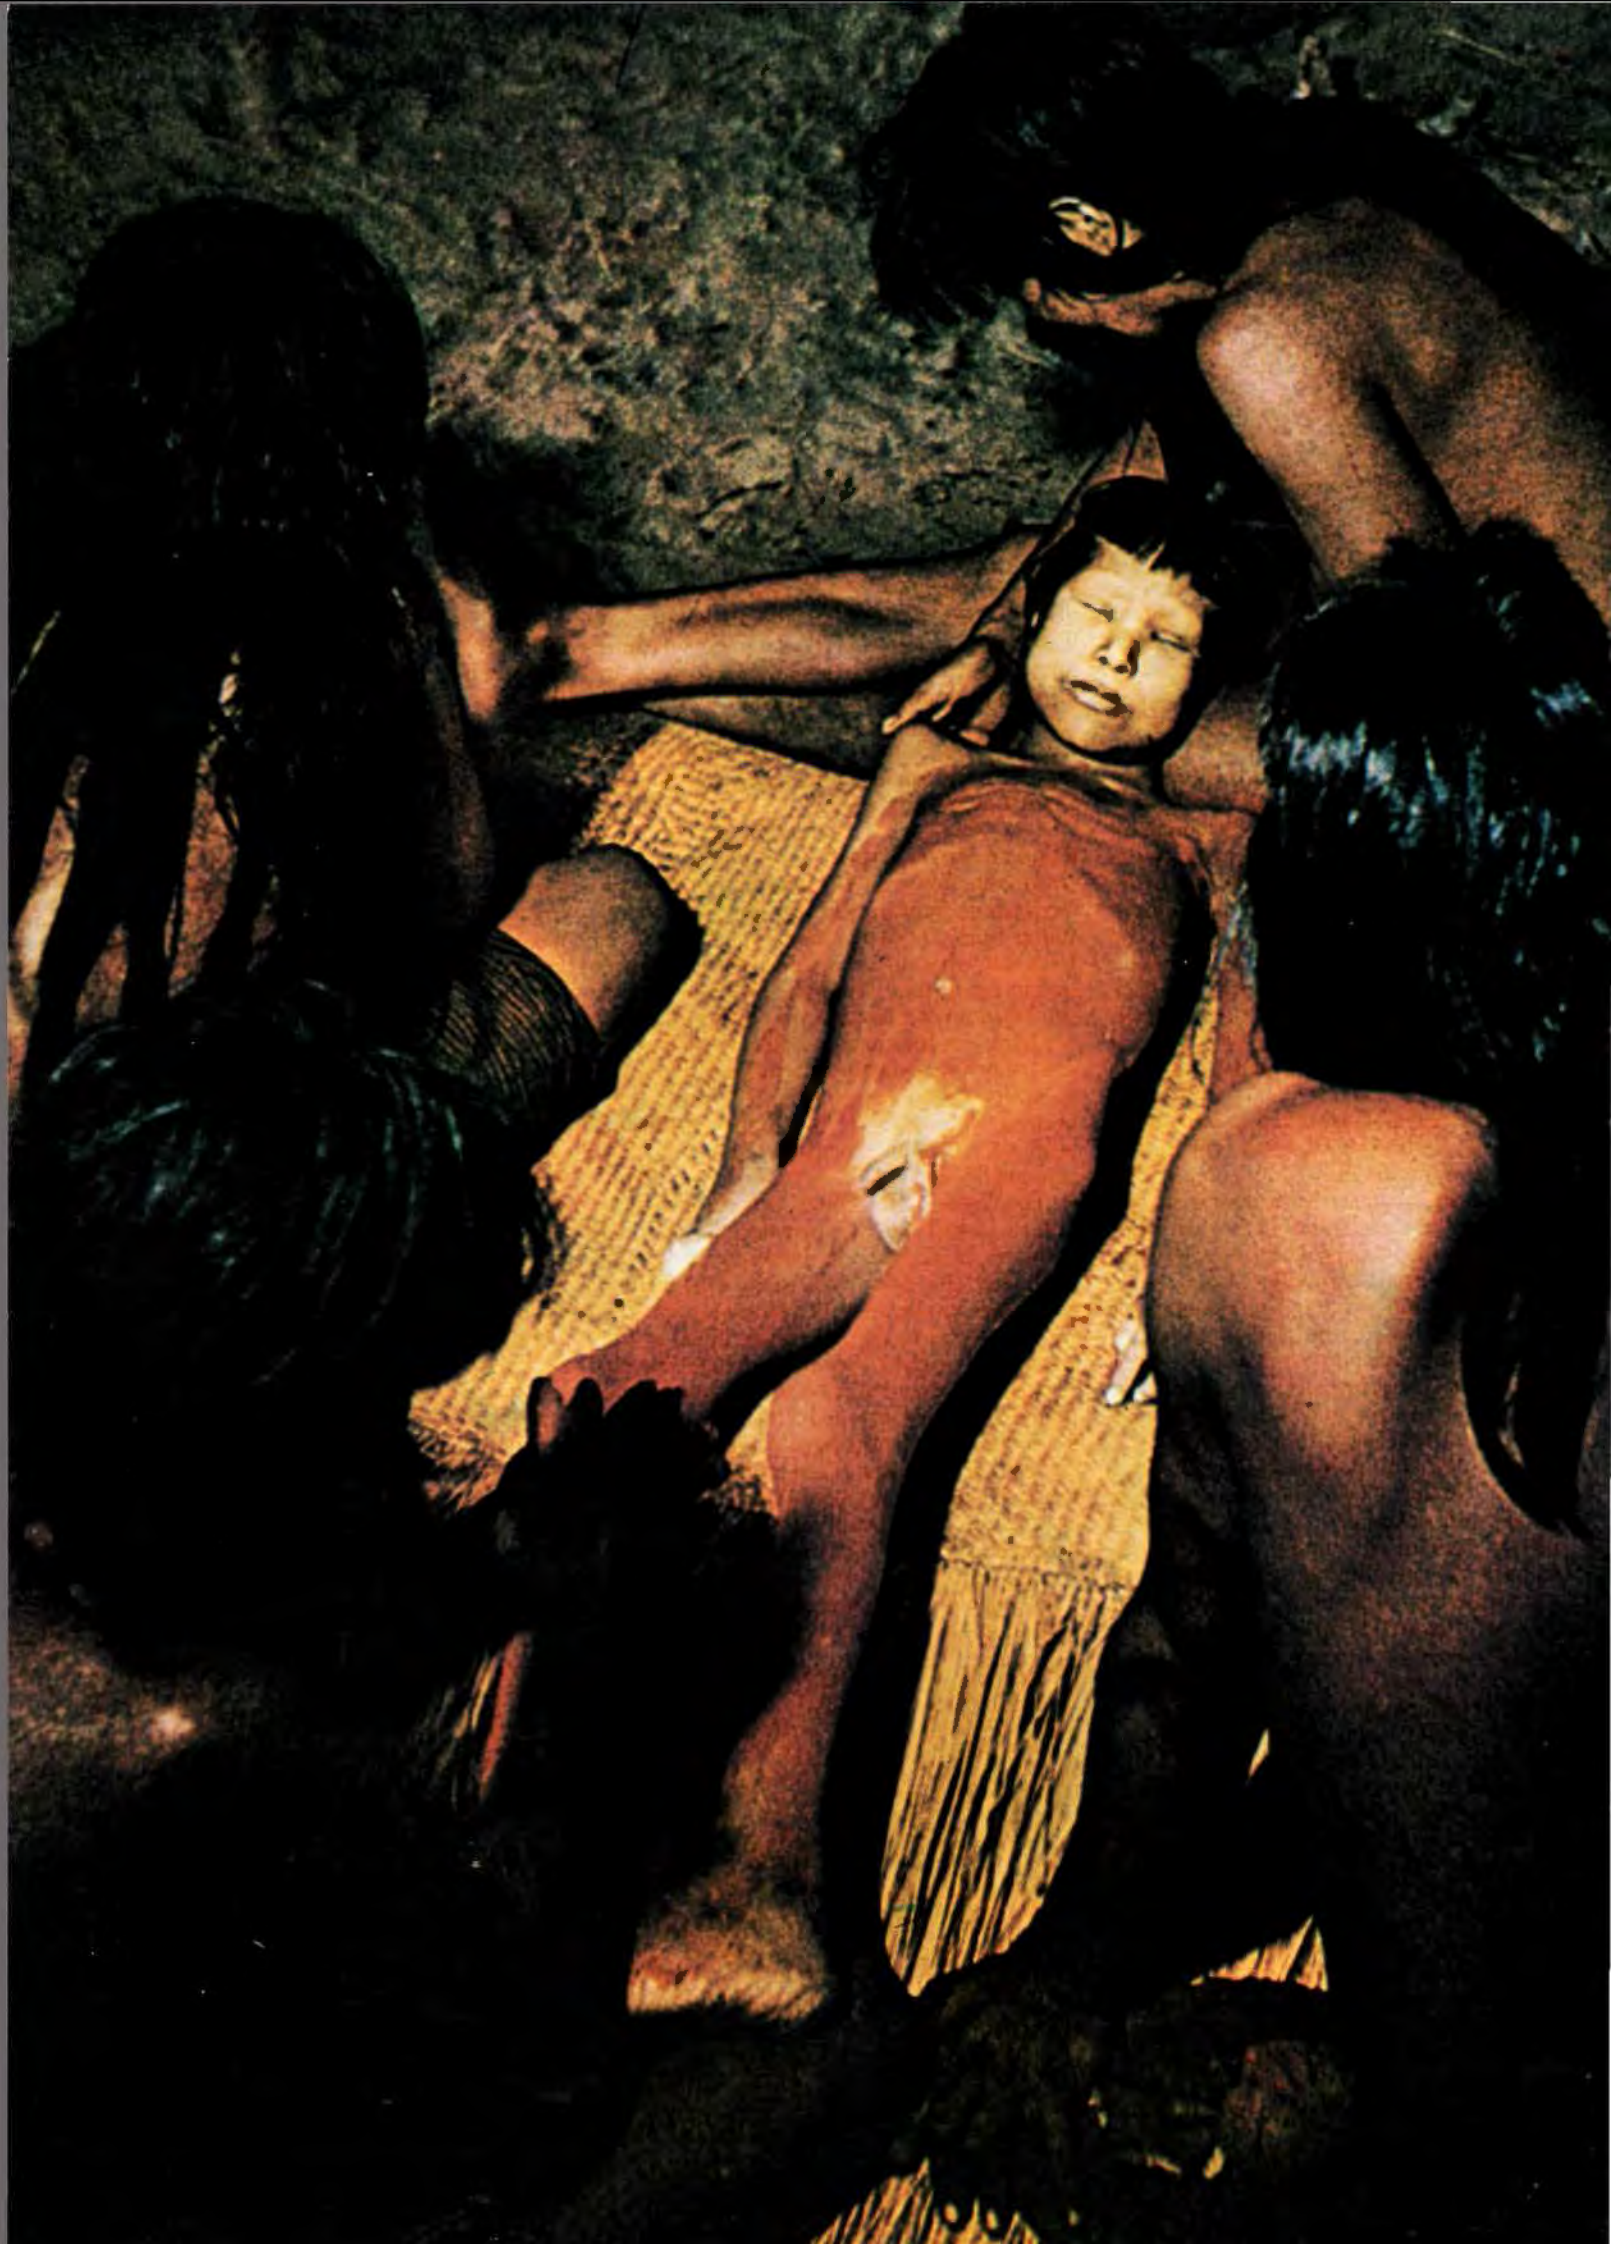
Plato never quite made up his mind about the individuality of the human soul. If it was strictly of the same nature as the eternal objects of knowledge (from which its existence was deduced) it ought to be looked on as a universal idea. Aristotle accepted this conclusion readily; for him there was a world-intellect which performed in each man the higher functions of understanding and which withdrew from man at death. In life a man should 'play the immortal as far as he can', but there would be no future for him when he had done.

Transmigration of a human soul from one body to another lent it a bogus universality, and it was to this solution that Plato himself inclined. The charm of his work won for Plato many Christian admirers. In 380 Gregory, the Bishop of Nyssa, wrote a dialogue *On the Soul and the Resurrection* after the death of his brother, Basil, and his sister, Macrina; it is a close imitation of the *Phaedo* in style but its argument reaches out beyond Plato.

Christian thinkers from the 2nd century

Bildarchiv Foto Marburg

The Egyptians believed that the dead might be brought to life, provided the funerary rites were correctly carried out. The process was often illustrated by a god holding an ankh, symbol of life, to the nostrils of the corpse to restore the breath of life. In this relief from the temple of Abydos in Upper Egypt the Pharaoh Seti I holds to his nose the sa ankh, a symbol which combined life-giving properties with those of protection



onwards speak of themselves as a third race, neither Jew nor Greek, and thus one may look for some attempt by them to combine the Jewish idea of a risen and restored body in the hereafter with the Greek idea of immortality for the soul alone. It is not surprising that some of the early Christian thinkers found it difficult to combine Jewish ideas from the Old Testament with the Greek philosophy they had learned as young men. Thus in the writings of Theophilus of Antioch in the 2nd century AD, one finds a notion that God did not make man mortal or immortal by nature, but indifferent; if he lived a good life, he would be immortal but otherwise he would be condemned to mortality. St Paul had left no doubt about his own beliefs; he spoke of the resurrection of the body for the just and unjust alike, as he acknowledged to the Roman governor Felix (Acts 24.15). The Athenians to whom St Paul was preaching, seem to have thought that he was advocating the worship of two gods, Jesus and Resurrection, so much had he to say about the latter (Acts, chapter 17).

Purpose of the Soul

Athenagoras, a Christian Platonist of the late 2nd century, wrote a lengthy treatise on the resurrection of the body, since it was this feature in Christian teaching which most scandalized the Greeks. Why say that the body would be reconstituted, when Plato and so many others had argued that immortality came through getting rid of the body? The Christians claimed that their ideas about the future life had come to them from Christ but the human mind could grasp them, when once they were set out, and could find reasons to make them plausible. It was these reasons that Athenagoras undertook to give. He dropped the threefold view of human nature, which divided it into body, soul and spirit, though Plato, the Stoics and the Jews all accepted it; instead, Athenagoras used a twofold division, body and soul, and this afterwards became generally accepted. His main argument for immortality was based on the purpose of the creation of the soul. God did not make the soul idly, nor yet for any need of his own, nor again for the service of any other creature, since no creature with reason and judgement has been created for any other's sake. The only purpose that will answer is that man was created for society with God who is eternal.

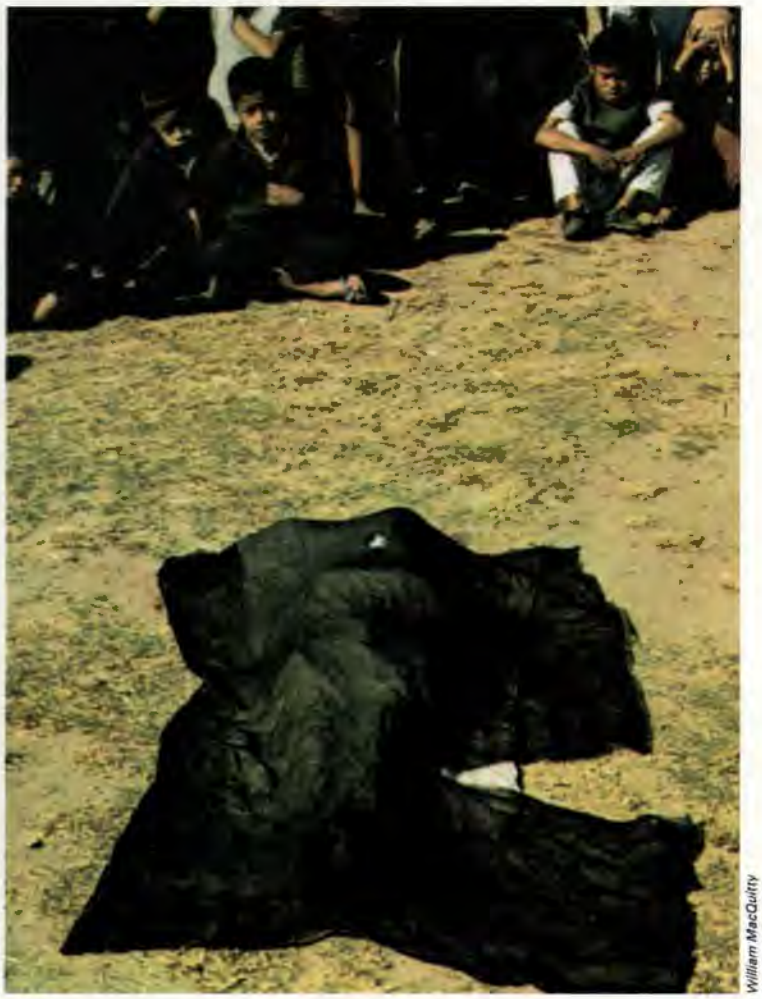
The theologian Origen (c 185–254 AD) was so taken with this argument that he developed from it the conclusion that, since society with God was the goal for man, there would be a general amnesty for all men at the end of the world, whatever their sins might have been. The Church rejected this on the evidence of the New Testament but also on the rational ground that human free will, if once it becomes immobilized in enmity to God, is enough to exclude a man from society with God for ever. The other line of thought developed by Origen was a renewal of the Platonic theory of the pre-existence of the human soul. He held that the fact of some men being born with active minds and others with minds wholly obtuse and incapable of instruction pointed to their having existed in another world, where some had sinned and drawn upon themselves a punishment in the next round of life. Other Christian Platonists, such as Gregory of Nyssa, brushed aside the transmigration theory: a soul at death was left incomplete, but this did not mean that it must seek another body and another life. It would be completed by the resurrection.

Immortality before and after life on earth was still a difficulty for St Jerome (340–420 AD), who in a famous letter sets out the possibilities of the case. He rejected the idea of the emanation of the soul from God, and envisaged three alternatives: all human souls could have been created at one time and then kept in reserve until wanted for life in the world; or they could be created each time there was a human conception; or else they might be passed on from the parents. Jerome himself adhered to the second alternative.

Love Eternal

St Thomas Aquinas (c 1225–74), theologian and philosopher, held that the eternal truths which the human mind can contemplate must be anchored in a supreme truth, and that this is the goal desired by the human mind as it

Eric Cross



William MacQuitty

William MacQuitty

contemplates. He also held strongly that it was good and natural for the soul to be in a body; if all souls had been created at one time, then most of them would have suffered violence and been under restraint until they received their bodies, and of this there was no sign. In 1513 the fifth Lateran Council defined that it was heretical to say that the soul was mortal, but it did not elaborate the grounds for immortality. Luther accepted this definition.

Gradually in modern times interest in proving immortality has centred upon the value of the person and of that most personal of relationships, love. The unique quality of love lends more force than ever to the traditional argument that man is meant for society with God, once it can be entertained that love of God is a possibility. The British philosopher McTaggart (1866–1925), who was professedly an atheist, held a firm conviction of human immortality which was based upon the unique and timeless quality of love.

One of McTaggart's difficulties about immortality was that 'even the best men, when they die, are not in such a condition of intellectual and moral perfection as would fit them to enter heaven immediately.' As if in answer to this, Karl Rahner has recently been advocating the idea that death is not simply a passive condition of being snuffed out but a personal deed, a final affirmation of what one's life has been, since death must be considered to affect both body and soul. A certain amount of experimental evidence has been gathered from those who have come very close to death through some accident and then been restored to life; the trend of this evidence is to support the idea that at the moment when death was nearest they passed in review the events of their whole life. Thomas de Quincey (1785–1859) noticed this fact, a kinswoman of his having reported that she had seen the whole of her life arrayed before her when she had fallen into a river, not successively but simultaneously, 'and she had a faculty developed as suddenly for comprehending the whole and every part.'

The Ascension of Christ; the gospel account of how the resurrected Christ was taken up from the sight of the disciples and ascended into heaven, as pictured by a 15th century Italian miniaturist. St Paul took the resurrection of Christ, 'the first fruits of those who have fallen asleep', as proof of a general resurrection; generations of theologians after him hotly debated the questions raised by the Christian doctrine of the immortality of the soul

G. Tomsich, Rome

The Attainment of 'Being'

Investigation into the phenomena of telepathy and other branches of psychical research in the present century have greatly increased the interest in the problems of immortality. The French philosopher Gabriel Marcel, in the Myers Memorial lecture of 1955, recounts that it was these factors that quickened his own interest. He has elaborated a distinction between 'being' and 'having': fears and desires belong to the realm of 'having', while a loving collaboration with the liberty of another helps both to attain 'being'. Thus a basis is provided for justifying the unique and timeless quality of love. Thought transference without any physical link, where it can be verified, offers the prospect of an activity of the human mind that does not depend upon the body. The phenomena of Spiritualism are of more doubtful quality, for whatever their causation they do require a physical basis.

The value of the human person may thus be seen as the main prop of all arguments for immortality. Stunted or split personalities, or other psychological wreckage, make no difference to the argument, which takes 'person' in the metaphysical sense of an intelligent being who is an end in himself. When Aristotle said that slaves were animated tools, cogs in the social machine, he was repudiating the notion of person as he had repudiated immortality.

IMP

AN IMP is a small demon, usually malignant, though at least one magician in London will provide an invisible but allegedly helpful imp that lives in an empty wine bottle. The bottle is corked and sealed with red sealing-wax. Around it is a piece of paper bearing magical signs and numbers in pencil and green crayon. The imp's chief duty is to prevent papers from going astray.

Paracelsus was supposed to keep a small demon shut up in the crystal pommel of his sword but the most indefatigable demon-bottler of history was a Frenchman named Alexis Vincent Charles Berbiguier, who died in 1851. For the first nine years of his life he was crippled and he early decided that demons were persecuting him. His room was full of ox-hearts stuck with pins and the aroma of anti-demonic soups, and his clothes and bed were riddled with pins, each of which transfixed the body of a wriggling imp. He stupefied the imps with tobacco and shut them up in bottles, 'where they would later awaken to grin and gibber at their conqueror.'

An 18th century French grimoire, *Secret des Secrets*, has a formula for conjuring a demon into a bottle. It is summoned by God, by Jesus, by the Holy Trinity, by the virginity of the Holy Virgin, by the four sacred words spoken to Moses by God (Io, Zati, Zata, Abata) and by the nine heavens, to appear 'visibly and without delay in a fair human form, not terrifying, without or within this phial, which holds water prepared to receive thee.'

The small familiar spirits of British witches were commonly called imps. In Suffolk in 1645, for example, Mary Scrutten of Framlingham confessed that she had three familiar imps which she suckled at night. She told her husband they were mice but he was not convinced.

Language is one of the great weapons of sorcery, and the magical use of words can be seen not only in the incantations of the grimoires but in many prayers

INCANTATION

WORDS ARE WEAPONS of power in magic because they are weapons of power in ordinary life. We use them to influence each other. Gestures and facial expressions help, and are also used in magic, but to state your wishes with commanding clarity or persuasive charm you usually resort to speech. The magical theory is that just as someone of powerful personality can use forceful words to dominate other people, so the magician armed with the lightning of concentrated will-power and the thunder of overwhelming language can dominate anything in the universe, natural or supernatural. 'In magic,' according to the French magician Eliphas Levi, 'to have said is to have done', and again, 'to affirm and will what ought to be is to create; to affirm and will what ought not to be is to destroy.'

In other words, to assert that something is so makes it so – at least under certain conditions. One condition is that the assertion must be made with sufficient strength of will. Another is that the words used must be the right words. They may be 'right' because they are tested by experiment and found effective by the magician who uses them or because they are hallowed by time and tradition, which means that they have seemed effective in the past. The Lord's Prayer, for example, has often been turned to magical uses. In the 13th century Arnald of Villanova said that a priest cured him of over 100 warts in 10 days. The priest touched each wart, made the sign of the cross and repeated the Lord's Prayer, but substituting for 'deliver us from evil' the words 'deliver Master Arnald from the wens and warts on his hands'. Then he took three stalks from a plant and put them in the ground in a damp and secluded place. When the stalks began to wither, the warts began to go.

Evidently the priest believed that the words of the prayer contained power which could be used for wart-charming, and Arnald believed it too and it worked. In some societies, among the Maori in New Zealand, for instance, or some of the Pueblo tribes in North America, the words of an incantation or a prayer must never be changed. In others, as in Europe, the magician may experiment with words and phrases until he hits on those which seem to work best for him, though considerable respect is still paid to traditional formulas. This respect is not confined to magicians. In 1963 the Ecumenical Council voted to authorize the saying of Mass in languages other than Latin, provided that Latin was retained for 'the precise verbal formula which is essential to the sacrament', the words spoken by the priest, assuming the person of Christ and using the same ceremonies used by Christ at the Last Supper, which transform the bread and wine into the Body and Blood.

Perhaps long ago, as language developed, the use of words had natural elements of awe and magic in it, a feeling that words gave man a grasp of reality which he had previously lacked. This is suggested by the old and persistent belief that everything has a 'real' name, a name which enshrines the essence of the thing, which *is* the thing. To know and pronounce the real name of a god, a man or an animal is to exercise power over it.

Lord of the Gods

For magicians in Europe the great example of the magical use of language was the creation of the world as described in Genesis. 'God said, Let there be light; and there was light.' It was assumed that God brought his creations into existence by pronouncing their names.

Besides knowing the name, knowing and reciting the qualities of a thing gives a man magical power over it. The Semang people of Malaya have a song about a particular species of monkey, which describes its behaviour. It tells how the monkey stamps his feet, drags along, climbs up and away, swarms up the bamboo, hangs down, seizes fruit, bends the bough for a leap, lets the bough fly upwards. This song is not just an expression of delight in Nature (though it is that in part) but a hunting spell. The vivid description of the animal, the clear picture of it in the hunter's mind, gives him power over it, and the moment at the end of the song, when the monkey is about to jump, is the moment when the hunter means to kill it. Similarly, early Greek hymns to a god begin with a recital of the god's names and attributes, which was probably intended to catch the god in the net of his own nature, and to concentrate the worshipper's mind on him, so as to give some measure of control over the god.

In the same way, in a magical ritual devised by Aleister Crowley and called *Liber Samekh*, the magician recites the names and characteristics of a supremely powerful 'spirit', who created the heavens and the earth, night and day, darkness and light. 'This is the Lord of the Gods: this is the Lord of the Universe: this is He whom the winds fear.' He commands this

William MacQuitty

In the same way as the poet or orator depends on the power of words to convey impressive ideas and to sway his audience, so the magician with his incantations and sometimes the suppliant with his prayers, although fulfilling different needs, make deliberate use of compelling language, both engaging in sound and clear in meaning ***Left*** **Wall painting on the tomb of Senedjem at Luxor near the ancient Egyptian city of Thebes, showing Senedjem and his wife chanting prayers to the sun** ***Right*** **Imaginative picture from** ***The Astrologer of the 19th Century*****: by means of magical incantations the sorcerer commands a spirit to appear and orders it to do his bidding** ***Far right*** **This Buddhist pilgrim to a temple in Katmandu, Nepal, although silent, makes pious avowals of faith by repeatedly turning a prayer wheel**

spirit, 'Come thou forth and follow me: and make all spirits subject unto Me so that every Spirit of the Firmament, and of the Ether, upon the Earth or under the Earth: on dry Land, or in the Water: of Whirling Air or of rushing Fire, and every Spell and Scourge of God, may be obedient unto me.'

The spirit is the divine being who is the magician's own inner self, and he announces his identity with it at the climax of the ritual by repeatedly proclaiming, 'I am He'. By describing the spirit, by vividly imagining it, the magician summons it up and controls it. He commands it to come forth and with every ounce of energy in his being he asserts that he and it are one. Finally the command 'Come thou forth', is repeated again but as if by the spirit itself, which has now taken possession of the magician.

Sound and Fury

This ritual was adapted from a Graeco-Egyptian magical text, itself descended from ancient Egyptian spells and incantations, like those in the Book of the Dead which identify the dead man as Osiris, or protect him from dangers in the afterlife, or give him power over his enemies. Here again, the belief that saying a thing is so makes it so is fundamental. The dead man's identification with Osiris depends heavily on the solemn assertion that he is, as in the spell identifying the dead Pharaoh Unas with Osiris (see BOOK OF THE DEAD).

Crowley's *Liber Samekh* also illustrates another essential principle of incantation, the use of sonorous, rhythmical, rhetorical language which is not spoken flatly but chanted, with steadily rising intensity as the ritual proceeds. This contributes to a rising state of intense excitement and self-intoxication, in which the magician convinces himself that the words he utters are charged with invincible power and are actually taking effect.

Because the chanting is an aid to self-intoxication, a magical operation of high importance and difficulty is likely to involve repeating several incantations several times over. A short spell or charm is usually applied only to comparatively minor and simple acts of magic. This is not always the case: a grimoire called *The Black Pullet* says that you can open any lock at a touch by reciting the words Saritap Pernisox Ottarim, but you can equally call up all the powers of heaven and hell by chanting the magic words Siras Etar Besanar. But it is doubtful whether many magicians would take this seriously.

The words 'incantation' and 'enchant' are both derived from Latin *cantare*, 'to sing' (and 'charm' is from Latin *carmen*, 'song'). The element of singing or chanting is magically important because it means that the words are put together deliberately – not in the slapdash hurry of most everyday speech – and are rhythmical. Not only do they build up the magician's own excitement but their impressive sound and beat influence the supernatural forces which he attempts to control. These forces are believed to be swayed by compelling sound in the same way that human beings are moved by poetry, oratory, preaching or honeyed words of love – all of which depend for their effectiveness on their combination of meaning and sound.

In *The Anatomy of Puck*, Katharine Briggs quotes an incantation in which the magician appeals to the judge of hell to discipline an obstinate demon. Part of it runs:

> O thou most puissant prince Rhadamanthus, which dost punish in thy prison of perpetual perplexity the disobedient devils of hell, and also the grisly ghosts of men dying in dreadful despair, I conjure, bind and charge thee by Lucifer, Belsabub, Sathanas, Jauconill and by their power, and by the homage thou owest unto them, and also I charge thee by the triple crown of Cerberus his head, by Stix and Phlegiton, hy your fellow and private devil Baranter, that you do torment and punish this disobedient N. (naming him) until you make him come corporally to my sight and obey my will and commandments in whatsoever I shall charge or command him to do. Fiat, fiat, fiat. Amen.

This incantation uses language which is impressive in sound, evocative and atmospheric, and clear in meaning, a combination which, with all his own inner powers concentrated on his object, the magician believes will exert an irresistible force on the lords of hell.

There is an obvious basic difference between a magical incantation and a prayer.

John Webb

William MacQuitty

The essence of incantation is command and the magician orders supernatural forces to do his bidding. A prayer is not a command but a request: the worshipper begs for help (though prayer can be turned to many other purposes, including thanksgiving, praise, confession of sin, and repentance). The prayer of Jesus in the garden of Gethsemane, in horror of his approaching torment, makes the difference clear: 'Abba, Father, all things are possible to thee: remove this cup from me; yet not what I will, but what thou wilt' (Mark 14.36).

Apology to an Elephant

But though this distinction is clear in theory, and often in practice, human beings do not always keep their attitudes to the supernatural in separate compartments. Many of the incantations in the European grimoires mingle prayers, perfectly sincere petitions that God will come to the magician's aid, with monomaniac declarations of supreme power. On the other hand, prayers are not always free of a magical use of language, an underlying belief that the right form of words, the right tone and delivery, will themselves compel the desired effect. The prayers of primitive peoples tend to run the gamut from respectful petition to reproaches, orders and even threats. Among the Pueblo tribes, a farmer puts down prayer-feathers in his field and says commandingly, 'My field, you will be good all the time.' Part of a song found among the Pygmies, apologizing to a slaughtered elephant, nicely blends orders and cajolery.

> Do not make us feel your wrath.
> Henceforward your life will be better,
> You go to the country of spirits.
> Our fathers go with you to renew the alliance.
> Henceforward your life will be better,
> You go to the country of spirits.

This verse, with two significant lines repeated, may also be intended magically to send the elephant to the spirit country and make him happy there.

In the account of Elijah's great contest with the prophets of Baal (1 Kings, chapter 18) there seems no essential difference in the methods used by both sides, and Elijah's address to the Almighty is distinctly peremptory in tone. There is an inextricable mixture of the magical and religious frames of mind in the vengeful prayer of the priest Chryses to Apollo in the *Iliad* (book 1): 'Hear me, god of the Silver Bow, Protector of Chryse and holy Cilla, and Lord Supreme of Tenedos. Smintheus, if ever I built you a shrine that delighted you, if ever I burnt you the fat thighs of a bull or a goat, grant me this wish. Let the Danaans pay with your arrows for my tears.'

Some prayers employ a magical 'as . . . so' formula, based on the underlying belief that if an appropriate past event is cited, a parallel future event will occur. St Hildegard of Bingen (12th century) mentions a cure for bewitchment. You take a wheaten loaf and cut a cross on it. Draw a jacinth through one arm of the cross and say, 'May God who cast away all the preciousness of gems from the Devil when he transgressed his precept (the reference is to Ezekiel, chapter 28), remove from you, so-and-so, all phantoms and magic words and free you from the ill of this madness.' Then draw the jacinth through the other arm of the cross, saying, 'As the splendour which the Devil once possessed departed from him because of his transgression, so may this madness which harasses so-and-so by varied fantasies and magic arts be removed from you and depart from you.' Then the patient should eat the bread around the cross.

When prayers have fixed formulas, or are accompanied by prescribed postures and gestures, or are associated with sacrifice, an element of magic, if not always present, may at least be in the offing. Humanity's sense of the magic of language is so strong that its use creeps even into sincerely religious prayers and ceremonies.

INCARNATION

A FUNDAMENTAL TENET of Christianity is the incarnation of the Second Person of the Trinity as the historical Jesus of Nazareth. The term devised to express this derives from the Latin: *in carne*, meaning 'in flesh'; *incarnore*, 'to make flesh'. In this context flesh is understood to mean the physical being of a human person, including the mental and psychical constituents of personality. Although it has only been strictly defined and formulated as a doctrine in Christianity, the idea is both ancient and widespread.

The ancient Egyptians believed that the pharaoh was the incarnate son of the sun god Re, the chief state deity. How the acts of divine generation and birth were accomplished is graphically depicted in a series of sculptured scenes in the temple of Amun at Luxor. The scenes portray the divine birth of the Pharaoh Amunhotep III (1402–1364 BC): at this period Amun was identified with Re. Amun is shown with Queen Mutemuya as she conceives the future king. The goddesses Selqet and Neith, beneath the bridal couch, assist the conception. Another scene represents the consequence of the divine act of generation. The god Khnum fashions on a potter's wheel the infant king and his *ka* or soul, while the goddess Hathor animates them with the *ankh*, the symbol of life. In other scenes the actual birth, and the presentation of the infant Amunhotep to Amun-Re, his divine father, are depicted. According to Egyptian belief, the pharaoh acted on earth as the viceregent of his heaveuly father, and at death he was reunited with him. The idea of the pharaoh as an incarnate deity was long-established and effective in Egypt (see EGYPT); but its metaphysical implications were never discussed.

Belief in divine incarnation *(avatara)* is a basic tenet also of Hinduism. It finds its most notable expression in the cult of the great popular deity Vishnu, who, as Narayana, is conceived as the Supreme God and upholder of the cosmic and moral order of the universe. In the *Bhagavad Gita*, Vishnu declares: 'For the rescue of the pious and for the destruction of the evil-doers, for the establishment of the Law I am born in every age.' Ten incarnations of Vishnu are popularly recognized. Some are of an obviously mythical kind, for instance, as Fish, Tortoise and Boar; some have an apparent historical character; such as in the form of the heroes Rama and Krishna, and as the Buddha.

In Buddhist thought the Bodhisattva is really thought of as a divine saviour who becomes incarnate periodically to save mankind. Buddhist metaphysics, however, made the idea of incarnation by way of sexual intercourse unacceptable, and other modes of entry into the world were devised: Maya, the mother of Gautama, conceived the future Buddha through a vision of a white elephant (see GAUTAMA BUDDHA).

The story of the Virgin Birth of Jesus served a similar purpose in Christian theology. The deification of Jesus of Nazareth, which the apostle Paul initiated, inevitably entailed a number of theological and metaphysical problems, among them that of the nature and mode of the Incarnation. For Christian thinkers had to explain and reconcile two obviously incompatible beliefs: that Jesus was essentially God, and that he had become truly a man. After much bitter controversy about metaphysical niceties concerning human nature and divine nature, the orthodox position was authoritatively established at the Council of Chalcedon in 451 AD. The declaration was there made that Jesus Christ was 'the same perfect in Godhead, the same perfect in manhood, very God and very man, the same consisting of a reasonable soul and a body, of one substance with the Father as touching the Godhead, the same of one substance with us as touching the manhood, like us in all things, sin except . . . born of the Virgin Mary, the Mother of God . . .' But the definition of the orthodox view of the Incarnation did not justify it intellectually, and it remains an abiding problem of Christian theology. In one respect, the idea of Christ's Incarnation differs from other conceptions: it is regarded as a permanent state of being, and not a temporary aspect. Christ is believed to have ascended into heaven in his human state.

INCAS

CHILDREN OF THE SUN

The Incas were invincible in their faith that the ruler of their powerful empire was a direct descendant of the sun; but when the throne was usurped the theocracy with its glittering temples of gold fell to the invading Spaniards

WITHIN FOUR CENTURIES the Inca family expanded from rulers of part of a small town to a semi-divine tribe of which the head, the Sapa Inca, ruled an immense empire which they termed *Tahuantinsuyu*, the Four Quarters, to imply that their father the sun god destined them to rule the entire known earth. In the mid-11th century, about the time of the Norman Conquest of Britain, a family of American Indians came from the East and ascended the mountains into a civilized country which had broken up into warring tribal troups. Their legend tells us that they were commanded to find the very centre, the navel or *Cuzco*, of the earth. To ascertain this they carried a wedge of gold, symbol of a sun ray, and at each stopping place they placed the wedge upon the ground to see if it would sink into the earth and disappear. This at last happened when Inca Manco and his sister Mama Occlo, who were the only survivors of the family, came to a little mountain town near the headwaters of the Apurimac river. They were allowed to rule half of the town which they now named The Cuzco, and although they were respected because of the mystery of their origin, it was not until the reign of their great-grandson that the Incas ruled the whole of the town. This must have been in the first half of the 12th century of our era.

At the time of the Inca arrival Peru was divided. The mountain peoples were heirs to three previous empires. The earliest originated around Chavin de Huantar well before 1000 BC and its characteristic art styles enable archeologists to show how it dominated much of the northern part of the Peruvian Andes. It has a close artistic relationship with the peoples of the more southerly part of the Peruvian Coast around the Paracas Peninsula, where there was a typically Peruvian cult of the dead, important people being sun dried after death, and then wrapped in great quantities of elaborately embroidered cloths. The strange art of these peoples was obsessed by the forms of serpents, pumas and condors, sacred animals representing earth, mountains and sky. A slightly later development of this religious art centred around Nasca on the southern half of the Peruvian Coast and was expressed in the creation of beautifully painted pottery, which in the early centuries AD included the first near realist figures of human beings in Peru.

Further to the north, again in the early centuries AD, another culture had arisen. These Mochica people lived in city states, were apparently often at war with each other, and built temples on great pyramidal mounds of brick. Their pottery is well modelled and painted simply with terracotta colours on cream, and here also arose true portrait modelling. Presumably this was part of the cult of the dead for the best vases are all found in the pits in the coastal sands where the mummified bodies of people were buried with their household treasures bundled in fine tapestries and woven cloths.

The people of the highlands seem to have developed separately and by the 6th century AD formed into two rather similar groups around the northern city of Huari and the

Left **Lost city of the Incas; the remains of the city of Machu Pichu, first discovered by explorers in 1911, is sited on an almost inaccessible ridge of the Andes. The advanced culture of the Inca sun kingdom declined rapidly with the arrival of the Spaniards in the early 16th century** ***Right*** **Modern Peruvian witch-doctors, like their earlier Inca counterparts, are thought to be able 'to converse with the spirits of the air, and the creatures of the earth'**

Right Many Christian festivals among the Sierra Indians of Peru contain practices which are relics of forgotten Inca beliefs. At the feast of Corpus Christi, dancers wear masks bearing both the cross and the ancient Inca symbol of the sun *Centre* Headhunting was prevalent in Peru before the advent of the Spanish; it was believed that the possession of another man's head increased the new owner's spiritual powers: llama wool fabric depicting warriors grasping shrunken heads *Far right* In honour of their great father the sun, the Incas celebrated elaborate festivals of feasting and rejoicing: wooden beaker showing a ceremonial procession

Camera Press London

famous southern one of Tiahuanaco near Lake Titicaca. In the 8th century or perhaps a little later, the Tiahuanaco people defeated the tribes around Nasca and imposed their culture upon them. But the conquest did not last, and eventually Tiahuanaco itself fell in some catastrophe beyond our knowledge. Similarly the Huari power broke up. In the 10th and 11th centuries central and southern Peru and all the highland regions fell into a chaos of small conflicting tribal states. Only on the northern half of the coast was there much development. The Mochica towns were taken over by a warrior group who came on balsa rafts from the north, led by a great king known as the Great Chimu.

Chimu culture prospered exceedingly and from the 12th to the 15th centuries the kingdom was centred around the great city of Chan Chan. On that rainless coast it was built of mud brick covered with brilliantly painted plaster. The artisans worked in gold, silver, turquoise and crystal. Women created beauty in workshops, weaving quantities of clothing for the townspeople. Irrigation of the narrow river valleys passing through the arid coastlands made the plantations of maize, beans, pumpkins, melons and chilli peppers fruitful and rich. These people worshipped the stars and forces of Nature, but above all they adored the moon god, Si, who spared them from the fierce heat of the sun and guided their fishing boats over the calm seas on moonlit nights. From all the evidence they were a rich comfortable people, loving colour and jewellery. Their fertility festivals were gay and often enough thoroughly and happily pornographic, to the shocked indignation of their highland neighbours, the Incas, who were becoming a powerful force to be reckoned with by the late 14th century.

Merciful Masters

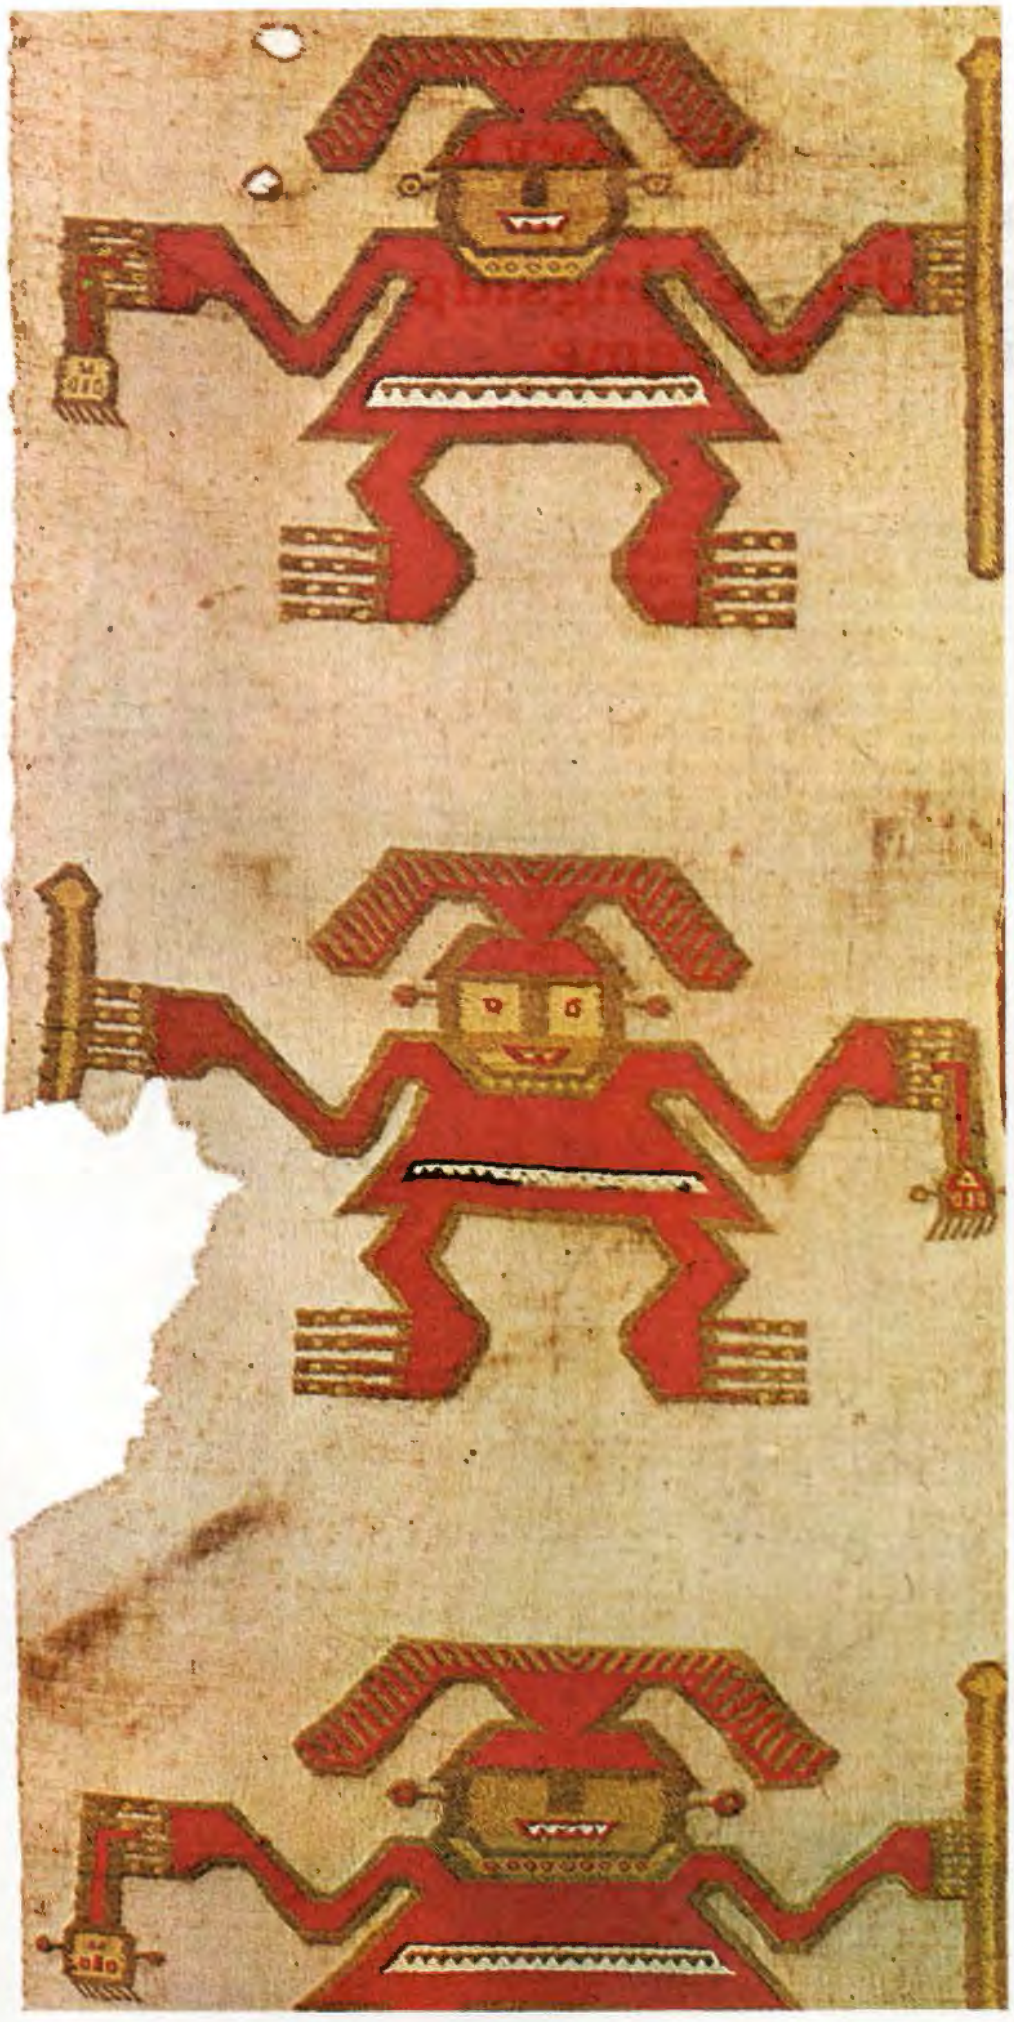
The Inca city of Cuzco had been slowly growing in importance, and the Inca family claiming descent from the sun god actively worked to spread their rule. The Inca was so holy that he could not be born from normal human parents. He was always the firstborn son of the divine marriage of the previous Sapa Inca with his sister (some say first cousin) the Ccoya, who was of equally pure lineage from the sun. In the male line there was only one breakdown – the Prince Yahuarhuaccac, He Who Weeps Blood. It seems that the growth of Inca power in the Cuzco Valley roused the jealousy of a group of Highland tribes known as the Chanca confederation. The young Inca was terrified of the power of the confederated armies and he lost a battle. His own family had him killed and appointed his brother to rule. The new ruler dared first to state the gravity of their plight by taking the name of Viracocha, the Creator. Only under that protection could they hope to win. In a series of outflanking raids and unexpected attacks the Inca forces destroyed the Chanca confederacy and Inca Viracocha found himself in command of all the mountain tribes around Cuzco. In another generation the Incas spread their rule over the whole Peruvian part of the Andes, including the sacred though ruined ancient city of Tiahuanaco.

Eventually the clash with the Chimu kingdom developed. The ruling Inca was becoming elderly but he sent his son Prince Tupac to conduct the campaign. After some fighting the Chimu capitulated. The Inca made their burden light, taking all the gold in the country for the glory of the sun god, but allowing the Chimu to retain silver ornaments. The Chimu were permitted to worship their own gods, but every temple had to support an oratory to the sun which made it quite clear that his children, the Incas, were the real rulers of the country. The Chimu crown prince was taken to Cuzco to learn Inca ways. He was treated well and married to an Inca Princess, which made sure that his children would also be of proper Inca descent.

The capture of the Chimu kingdom made the Incas masters of all the civilized areas of Peru. Under the great Tupac Yupanqui when he became Sapa Inca, the Inca armies faced a movement of tribes from Argentina, so he decided to spread the Empire down to Chile. His son Huayna Ccapac turned northwards and captured the Cara kingdom of southern Ecuador and took the Cara princess as one of his hundreds of junior wives. He was so in love with her that he decreed that on his death Huascar, his son by his sister, should be Supreme Inca in Peru, but that his son by the princess, Atahuallpa, should rule the northern section of the Empire. As things turned out, on the death of Huayna Ccapac, the two princes engaged in a terrible civil war. The true heir, Huascar, was taken prisoner and shut up in a cell in Cuzco and the false Atahuallpa called himself the Supreme Inca. Peru was paralysed because the people realized that this was no true child of the sun. Just at this time the Spaniards arrived. In a short campaign they captured Atahuallpa, and murdered him; but not before he had had Huascar, the true heir, killed. Thus in 1533 fell the divine sun kingdom of the Incas.

Golden Temple of the Sun

In their years of power the Incas achieved a great deal. Believing themselves to be directly descended from the sun god they felt it to be their duty to spread the benefits of divine rule throughout the lands which they controlled. They improved the road systems and arranged for storehouses of food and clothing in all parts of Peru so that in times of catastrophe there was always a reserve for the people. They greatly extended the



Michael Holford

use of the coloured knotted cords by which they transmitted messages instead of writing. Most important of all from their point of view was the establishment of a sun temple in every town of their dominions.

In Cuzco the great sun temple was surrounded by smaller buildings which held the lesser gods of all the peoples of the empire, as if they were servants waiting to obey their master. There was only One more powerful than the sun. Inside the sun temple was a wall covered with gold. Upon it there were figures of the sun, moon, thunder, and rainbow. The first humans were there and the first Inca. Then there were the constellations of stars and in their midst an open blank space, which astronomers now know as the 'coal sack' because of its comparative blackness in the Milky Way. This centrepiece of the golden wall was always empty. It represented the mystery of the Creator, Viracocha, the Breath of Life who was everywhere unseen but eternally giving life, even to father sun. The temple was so placed that once a year the rays of the rising sun shone through the doorway and lit up the golden wall with living burning light. On that occasion the Sapa Inca was alone in the temple. He was without his crown and barefoot, having meditated all night and prayed that the sun, which was now at its furthest point away from his kingdom, should return to spread light and life again. Outside, the people of the city had spent a night of penitence without fire and food, weeping for their past evil-doings. The priests had worked magic over a black llama so that it would take the sins of the peoples on its back before being driven away into the mountains.

Then when the returning sun had shone upon the golden wall the Inca put on his diadem and his golden sandals. After he had sacrificed a pure white llama the people burst into songs of rejoicing and the city was filled with processions, singing and dancing. On that occasion strangers kept outside the city for fear. From the royal storehouses food was distributed and every individual was given a vase holding about half a gallon of maize beer. After the day of rejoicing was over the streets of the city were lined with people in a quiet, happy stupor, for the drunken Peruvian preferred sleeping to fighting. They were happy that once again the sun was returning through

There is nothing else in history to compare truly with Inca Peru; it is an example of divine kingship taken to the ultimate extreme

the skies, every day shining higher and higher, until the day came when he sat on his stone throne in every town and cast no shadow because he was right overhead, showering blessings on the four quarters of the earth ruled so wisely by his son, the Sapa Inca.

In addition to the great powers of Nature the Peruvians found magic in all manner of things which they thought were lucky charms. They collected strangely-shaped stones, reverenced unusual animals, and found an aura of power in the dried bodies of the dead. Wise men knew how to interpret the language of animals and predict the future from the flight of birds. On occasions of great disasters they might offer a few human sacrifices, but normally they made little presents of food and small animals and birds to their gods. They well understood that sometimes the powers of Nature were terrible, but they accepted that the Nature gods took their own human victims as they pleased. Famine might be sent by the gods but the storehouses of the sun and the Inca existed to return the divine bounty to help the afflicted people.

Society and Custom

Under the Incas social organization was thorough. Every event in a village was recorded on the knotted string *quipus*, or cords, and sent to the town for the archives. Abstracts of these reports were knotted up and sent to the supreme administration in Cuzco. The Inca was in his massive stone palace for all great festivals, but he also travelled widely inspecting towns, ordering the construction of roads, bridges and storehouses, and impressing his people that all were interdependent in the kingdom of the sun. The taxes for the Inca and the sun god, each taking a third of the harvest of every field, were largely returned in the paternalistic welfare service. Only his direct servants, the High Priest and his closest relatives might look closely on his face. Others threw themselves down and turned their faces to the earth as the divine king passed close to them.

It appears that people discussed the Inca as an individual, and on a very few occasions protested against new regulations, but on the whole they regarded him as a natural phenomenon, a divine sun child sent to guide them in the pleasanter paths of life.

In such a society marriage was important because good family organization was the basis of the state. Once a year in every district there was a great ceremony in which young couples were married. They had only a very small choice of partners, but there seems to be little record of domestic unhappiness. They accepted the chosen partner whom they had almost certainly known from childhood, reared their families, looked after the flocks, cultivated the fields, and made pots and wove cloth for the home. For the family of the Inca himself, however, arrangements were different. Each Sapa Inca was married to his sister who was the sacred queen, the Ccoya. In addition he was expected to take many more wives. The daughters of defeated chiefs were often

Gold funerary mask of the Chimu people, who were conquered by the Incas: they worshipped the stars and the forces of Nature, but especially the moon god who guided their fishing boats 'over the calm seas on moonlit nights'

Infant Sacrifice

The children destined for the sacrifice were brought by their own mothers who were proud that the gods should accept such a gift. So that their children should appear beautiful to Viracocha, they were dressed in all their finery and more wreaths of flowers. Then the little ones were given a sleeping draught; in the case of babies, the mothers suckled them shortly before the sacrifice took place. Then with great ceremony the Tarpuntary took the children from their mothers, led them round the altar and laid them on the sacrificial stone with their faces to the sun. At the next moment they were killed in the particular manner prescribed by the ritual – strangled, garotted or their breasts torn open with a sharp obsidian knife. With their blood the ceremony of 'Vilacha' or 'Pipano' was performed; this consisted in the smearing of the sacrificer or certain privileged persons with red stripes from ear to ear. The same blood was allowed to dye sacrificial utensils and finally these and the children were lowered into a common grave.'

Siegfried Huber *The Realm of the Incas* trans M. Savill.

taken into the harem of the Inca, an honour which bound their family in allegiance. Important tribal areas were kept happy within the empire if their noblest young ladies bore children of Inca descent.

In the general field of religion there were the functioning priests from the High Priest of the sun right down to the cleaners in the temples. A third of the wealth of the country secured their welfare and was used to keep the store rooms full in readiness for times of shortage. In Cuzco there was a college for young ladies who were chosen from all the kingdom for their intelligence and beauty. They were known as the Virgins of the sun. They wove beautiful clothing for the Inca and for the priests and temples. Some of them remained dedicated to the service of religion all their lives; but most were married off to nobles and visiting rulers. They became the gifts of the Inca to those whom he delighted to honour.

The position of women in Inca Peru was of equality with men, but within the sphere of women's work. They were not warriors and roadmakers, but no men made pottery or wove cloth. Everywhere in the empire the woman and mother was treated with respect and honour, and the Ccoya was queen of women's employment just as the Inca was king over the male side of life. Some women became professional healers. They had a deep and scientific knowledge of herbal medicine, and knew the value of massage and of bone-setting. There were also many women as well as some men who were inspired by spirits and who gave advice when in a state of trance. They were supposed to be able to converse with the spirits of the air, and the creatures of earth.

There is nothing else in history to compare truly with Inca Peru. It is an example of a divine kingship taken to the ultimate extreme. By good fortune the individual Incas seem to have been men of very high character with a real care for the welfare of their kingdom. They used the thousands of cousins in the Inca family as a disciplined and closely knit civil service. The organization of every facet of life made administration easy, but it was also scientific. There was not much freedom, yet very few revolts. Progress was not great because there was enough food, clothing and entertainment for everybody and no one wished to introduce innovations into a contented, divinely-inspired civilization. On the whole the gods and mankind had found a *modus vivendi*, a way of living that was mutually acceptable, for a few generations. But at the beginning of the 16th century came the strange end, with the Divine Inca deposed and murdered by his more earthly brother; and then a total change when the bronze age theocracy was taken over by the feudal iron-using Spanish invaders from over the great oceans.

INCENSE

THE BURNING of sweet-smelling substances in religious ceremonies, both public and private, is of great antiquity and common to many peoples. Pleasing odours have been thought to delight the gods and to be offensive to evil spirits. Smoke from glowing aromatic substances has been taken to symbolize the ascent of prayer to heaven, and in death rooms and at funerals it is believed to bear the souls of the departed to their eternal rest. Sweet fragrances have been used to ameliorate the stench of blood and burnt offerings and as purifications to clear the air of nasty material smells and, by implication and extension, of foul immaterial presences.

Many different combustibles have been used for ritual purposes, particularly aromatic woods, barks, resins and herbs. North American Indians offered the smoke of tobacco to their gods and the Aztecs and Mayas that of copal, a kind of resin. Some substances used in pre-Columbian Mexico gave off narcotic fumes that drugged the senses of human sacrificial victims. The ancient Egyptians worshipped the sun god Re with the burning of resin as he rose in the morning, of myrrh as he stood at the zenith at noon and of *kuphi* as he sank westwards in the evening. Kuphi, an elaborate compound of 16 ingredients including honey, wine and bitumen, was mixed by the priests according to a secret ritual, to the accompaniment of the chanting of sacred texts. It had a mystical significance of order and harmony, since the number of ingredients, four times four, represented the squaring of a square and brought calm and quiet to those who breathed it.

Such burnt aromas are commonly spoken of as 'incense' but true incense is what is properly called frankincense, the gum resin of trees of the *Boswellia* family growing chiefly in the hinterland of the Somali coast of East Africa. Frankincense was one of the 16 ingredients of kuphi and the Egyptians valued it highly. They organized expeditions to the 'land of Punt', as this area was known to them, to acquire it. The Greek traveller and historian Herodotus mentions this trade in the 5th century BC and says that the trees were guarded by winged serpents. The more prosaic historian Pliny (c 23–79 AD) records that the trees were tended by 3000 families which had a hereditary right to them. When the trees were being pruned or tapped, the men were forbidden intercourse with their women or the sight of a corpse.

The use of incense seems to have spread south-east and west from the Semitic lands. From early beginnings in Egypt and Babylonia, it was taken up by the Greeks (probably in the 8th century BC) and later by the Romans. It was often included in the aromatic substances with which burnt offerings were stuffed and was much used in processions and ceremonials. Grains of incense were customarily burned privately by the Romans before the images of the *lares*, the household gods, and publicly before those of the emperor. Incense has never been used in Moslem religious rites, as such, but may be burned at the shrines of holy men and during funerals. It was also used for magical purposes in Islamic countries, to ward off the Evil Eye and in a curious ritual of incantation. Different perfumes were associated with letters of the alphabet and the initial letter of the name of the person on whose behalf the incantation was made determined the choice of the aromatic used.

Frequent references to incense in the Old Testament have given rise to the mistaken view that its use goes back to very early times among the Jews. In fact, the Authorized Version often uses the word to refer to the aroma of burnt offerings and the ancient Hebrews may indeed have regarded the use of incense, so popular with the Babylonians, as a mere trapping of idolatry. Scholars are now agreed that the burning of incense was not introduced into Judaic ritual until the 7th century BC but that, once adopted, it became more and more important in the acts of worship. The incense used was compounded of few ingredients – stacte, onycha, galbanum and pure frankincense – and its mixture by the priests was regarded with much the same reverence as was given to the making of kuphi by the Egyptians. It was burned with meat offerings and with the first fruits and, on its own, at morning or evening on a special altar; and also once a year on the Day of Atonement, in the inner sanctum of the temples.

Christianity was also slow to adopt incense into its rites. The services of the early Church were very simple, and incense, save as a practical purification, was eschewed as something Jewish or pagan. Indeed, during the Roman persecutions the burning of grains of incense before the statue of the emperor was a test of an individual's loyalty to the state, and hence to the state religion, and also a symbolic act of apostasy. From the 5th century onwards, however, incense was gradually but increasingly used in church services. By the 14th century it had become part of the established ritual of High Mass and other services such as Vespers, at the consecration of churches and in processions and funerals. Although usage varied from place to place, incense, along with other external rituals, was driven from the churches by the Reformation. In the second half of the 19th century its use by the High Anglican movement to enrich church ceremonial became a highly controversial issue.

The passions aroused by the 'incense question' in the English church may now strike many people as somewhat ridiculous. But incense is curious stuff and may be if not physiologically at least psychologically addictive. It is a matter of personal temperament but, for many people, the sweet smell and the swirling patterns of the smoke, in a candle-lit church filled with solemn music, have a strange power.

INCEST

AN ESKIMO MYTH relates that the sun and the moon were once sister and brother. They lay down together and made love in a house where there was no light. When the sister discovered that her lover was her own brother, she tore off her breasts in her shame, and threw them to her brother with the cry, 'Since my body pleases thee, taste these too!' Then the sister took a torch and fled, pursued by her brother, who was also carrying a torch. As the sister rose in the sky, her torch burned bright, and she became the sun. The brother's torch spluttered out, as he ascended after his sister, and he became the moon.

Freud suggested that 'the beginnings of religion, ethics, society and art, meet in the Oedipus complex'; scene from Pasolini's film *Oedipus Rex*

Almost all human societies prohibit marriage and punish or disapprove strongly of even casual sexual intercourse between persons of certain specified degrees of relatedness. Modern investigators set themselves the task of distinguishing clearly the problem of incest, which has to do with sexual relations, from the institution of exogamy, the rule which forbids marriage within a group. This distinction is not always made however, in the older anthropological literature, and it is by no means certain that it is absolute in the minds of all the

John Webb

16th century woodcut by Gerard de Jode of an incestuous relationship; incest myths of great antiquity often make a brother and sister the first pair of all mankind

members of the societies which have been most intensively studied in this respect. An important point is that the group on which the exogamy rule is based need not be a family in the sense that the word would normally be understood in contemporary civilized society. In many societies, the group is identified with a specific plant or animal which constitutes its totem (see TOTEM), and though totemism is found without exogamy and exogamy without totemism, the two are so frequently associated that some writers have treated them as inseparable.

The complex of incest – exogamy – totemism crop up in unrelated societies all over the world, and the near universality of taboos on incest does invite the formation of an all-embracing theory. In the Eskimo myth already quoted there are several features which have striking parallels in incest myths from other parts of the world, and other periods in history. Thus the offending pair act in ignorance, accounted for here by the naïve device of their lying together in darkness. The sister's reaction on discovering her sin is to mutilate herself out of horror and shame.

The Story of Oedipus

Several of these details find an echo in the most famous incest myth of all, the story of the Greek king Oedipus. Oedipus obeyed the inexorable rule of his own destiny in murdering his father Laius and marrying his mother Jocasta. The Greek myth incorporates an imaginative episode to explain how both these crimes were committed in complete ignorance. Oedipus's reaction on the discovery of his true relationship to Jocasta is also one of extreme horror and shame, and he, too, punishes himself through mutilation, putting out his eyes (the source of light in ancient Greek belief).

Freud was not the first to sense the universality of the Oedipus myth. As early as 1855, Burckhardt wrote that there was 'an Oedipus chord in every Greek that longed to be directly touched and to vibrate after its own fashion.' For every Greek, Freud substituted every man, and made the Oedipus complex, as he called it, the pivot of his psychoanalytical theory. In the book he devoted to the twin problem of incest and totemism, Freud wrote: 'the beginnings of religion, ethics, society and art meet in the Oedipus complex. This is in entire accord with the findings of psychoanalysis, namely that the nucleus of all neuroses as far as our present knowledge of them goes is the Oedipus complex.'

According to Claude Lévi-Strauss, however, social constraints such as incest taboos, cannot be explained as the effects of emotions which crop up again and again in different parts of the world at different periods in time. It is, rather, the taboos and rituals which give rise to the emotions. But both Freud and Lévi-Strauss would agree in putting the incest taboo at the very basis of the human condition. For Freud, the incest prohibition blocks the iufantile longing for the mother, and forces the libido along the path of life's biological purpose. For Lévi-Strauss, the 'universal presence of the incest taboo means that in human society a man must obtain a woman from another man, who gives him a daughter or a sister.'

Awareness of incest as a practice to be hedged about with prohibitions goes back to a very early stage in man's development. The earliest known incest myths agree in imputing the practice to the first-born among gods and men: in Greek mythology, Rhea is the sister-spouse of Cronus, and Hera of Zeus. In Hawaii, Kii (or Tiki) is the ancestor of all men by incestuous union with his mother, and myths which make a brother and sister the first pair of all mankind are found over the face of the earth. The myths also show that incest has an ambivalent power of attraction and repulsion to the majority of mankind. It is not without reason that the *Oedipus Tyrannus* of Sophocles is the one surviving ancient Greek tragedy that retains an undiminished hold over modern audiences.

INCUBUS
& SUCCUBUS

The theme of the demon lover occurs repeatedly in Romantic poetry. The antecedents of this nocturnal visitor are far older, however, and reach back to the incubus, one of Satan's legions sent to torment mankind in terms of sex

THE INCUBUS was a devil who was thought to visit his lust upon women, while the demonic succubus attended to men. Most Christian demonologists of the Middle Ages, and later, agreed that unbridled sexuality (which they apparently defined as anything this side of joyless procreation) offered one of the most slippery paths to hell. And if human seducers did not present threat enough to the potentially virginal, these lecherous demons – and in rare cases even the Devil himself – would happily perform the same function.

Usually the incubus or succubus was believed to assume human form for its purposes and, naturally, a sexually attractive form. The theologians insisted, however, that demons were spirits: hence the human form they put on had to be an animated corpse, or a fleshly fabrication endowed with movement and artificial life; the notion that devils can create life was and is a heresy. Frequently the demon lovers appeared to their partners, or victims, in the semblance of a human husband, wife or lover. Sometimes, too, they appeared in equally familiar but less welcome shapes – as in the case of a medieval nun who claimed to have been sexually attacked by one Bishop Silvanus, though the Bishop insisted that it was an incubus who had assumed his form.

But certain signs could reveal the true demonic nature of the incubus in human form. When a woman willingly admitted it to her bed, it had the ability to put others in the house into a deep sleep – and could even render a husband so soundly asleep that it could enjoy his wife in the bed beside him. At times, the demons gave away their evil origins by the unpleasurable sensations they caused. But this aspect of their love-making did not gain wide credence until the time of the great witch persecutions. The witch-hunters believed on the one hand that initiate witches had to have sexual relations with their Satanic master, and on the other hand that they never enjoyed it. Victimized witches claimed at their trials (or rather, were made to claim, usually by torture) that Satan's sexual organ was cold as ice, or painfully large, or made of iron, or all of these. Some even described it as two-pronged. Occasionally, too, men would confirm the unpleasurable nature of this supernatural intercourse.

Demon Lovers

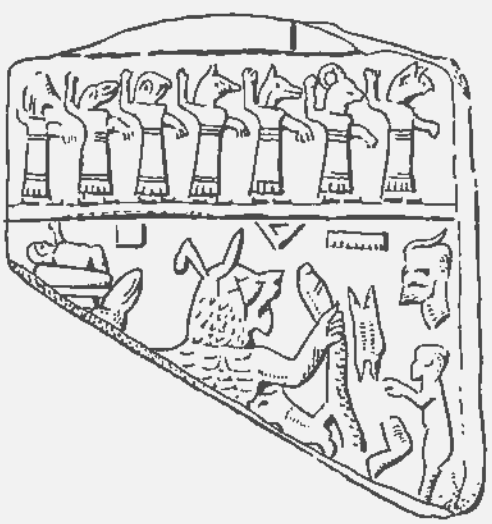
It was a common belief in the Middle Ages that the Devil himself could easily assume female form, to tempt some male saint such as the beleagnered St Anthony. It was a short step, therefore, for the incubus and succubus to be seen as the same devil, putting on a male body one night to visit a woman, a woman's body the next night to tempt a man. Out of this idea came the belief that devils, spirits or not, could impregnate humans. Some demonologists said that they saved up the semen of corpses; but most theorists preferred to assert that the incubus ejaculated semen which it had gathered, earlier, when in the guise of a succubus. In spite of the fact that this demonic form of artificial insemination used human sperm, the children of such unions were generally expected to be monstrous – physically deformed, or more subtly odd. Even twins were viewed with suspicion, as likely products of an incubus's attentions. The magician Merlin was in some tales reputed to have had one demonic parent. Because devils were not humans, sexual intercourse with incubi or succubi was considered to be bestiality – and some writers threw in sodomy as well – so any humans suspected of willingly taking a demon to bed would be punished not only for diabolism but also for sexual perversion.

And of course the demonologists and their hysteric inheritors the witch-hunters were by nature suspicious people; their victims were guilty until proved innocent. These people believed that witches were given incubi as lovers and familiars in return for entering the service of Satan. Necromancers, black magicians and the like also received demonic mistresses from their master, rather in the way that Mephistopheles conjured up Helen of Troy and other delights for Faust. Such people, when caught, and when 'confessions' had been wrung from them by torture, were invariably punished for their general heresy – of which sexual relations with devils played only a minor part. But ordinary people who were accused of sleeping with devils, were tried entirely for sexual sins. They might defend themselves by saying that they were seduced – even raped, for the incubus took by force what it could not get by blandishment and temptation. And then the line of innocence or guilt had to be drawn too finely for the judges in the days of the witch-hunting frenzy. Seduction by an incubus was as punishable as succumbing to temptation in other sinful directions; besides, the witch-hunters said, a girl who 'falls' sexually (to a devil or not) is more easily drawn into total corruption.

Nevertheless, many young women (including, during the Middle Ages, quite a few nuns) claimed rape by an incubus when the loss of their virginity became evident. So the belief became a convenient excuse for unmarried mothers, adulterous wives, women ashamed of a deformed child, and so on. Men found it a handy escape from accusations of paternity of an illegitimate child, and also an easy road out of marriage; evidence, however spurious, that their wives were sleeping with devils usually brought a quick annulment. In a famous 17th century case a noblewoman gave birth to a child in spite of the fact that her husband had been away from home for four years; she claimed that her husband had come to her in a dream, and had impregnated her. Learned theologians wrangled over whether the dream lover had really been the husband (in which case the child would be an heir to the estate) or an incubus in her husband's semblance. No one seems to have doubted for a moment the lady's honour – not, at any rate, in public. The husband's opinion is not recorded.

This extreme of credulity on the part of demonologists, whose gullibility reached astonishing proportions and complexity, indicates some crucial thinking about the incubus and its origins. In the legend of this demon it appears in one instance as a night visitor in the flesh (whatever flesh), but in another as a spirit visitor arriving in the form of an erotic dream. Naturally, it was assumed that any lewd thoughts entering the sleeping mind of a devout and celibate churchman, or a maritally devoted churchgoer, must have been sent by a devil. No one conceived of the idea that such dreams might erupt because the lid was clamped too firmly on a normal sexual drive. So the devil as incubus or succubus came to be seen as interchangeable with the nightmare, a word then in use both for horrifying dreams and for the devils who were thought to give rise to them.

The Latin word for nightmare, *incubo*, comes from *incubare*, meaning 'to lie upon'; the nightmare's content was described as uniquely terrifying, usually erotic, and conveying a feeling of a great weight pressing on the chest. Clearly, to the celibate clergy and other 'pure' minds, any erotic dream was horrifying; but of course the erotic content might often have been symbolic rather than explicit. Havelock Ellis, in company with other modern sexologists, sees erotic dreams and fantasies as the main impulse behind 'those conceptions of *incubi* and *succubi* which played so important a part in the demonology of the Middle Ages.' He adds the comment: 'Such erotic dreams of the hysterical are by no means always, or even usually, of a pleasurable character.' So the chaste and devout medieval Christian, fearing and abhorring his or her own



Previous page Nightmares with their sensation of horror and eroticism, were long considered the work of incubi and succubi, demons who could assume either male or female form: in Fuseli's *Nightmare,* the young girl is tormented by an incubus *Left* The Hebrew demon Lilith, queen and mother of succubi, was the successor of sexually insatiable Babylonian demonesses: amulet of the lion-headed Lemashtu and her seven demons *Right* Female devils assailed St Anthony, to tempt him from the path of righteousness

Firma Schmoz and Huth

sexuality, was denied any enjoyment even in the dreams that the unconscious mind put up to try to correct the dangerous imbalance.

Bachelors' Invisible Wives

The belief in incubi and succubi did not spring entirely from the murky depths of medieval hysteria and repression. It had its antecedents in more permissive times and places. Many ancient civilizations had their forms of the nightmare or incubus demon and also saw it as operating either in the flesh or in dreams. The early Assyrian *lili* was a sexually insatiable female demon who roamed the night looking for a mortal men to lie with; and she became, in ancient Hebrew myth, the monster Lilith (referred to in the book of Isaiah as the 'night hag'), the very queen and mother of succubi (see LILITH). The Graeco-Roman world had its equally sexually rapacious wood nymphs and the like, who led men to their doom. Their male counterparts, the satyrs and fauns, are pre-Christian incubi; just as the woodland god Pan, with his horns and cloven hooves, antedates Satan and influenced early Christian conceptions of the Lord of Evil.

The Teutonic Lorelei and the Greek Sirens were succubus figures, leading men to disaster through sexual desire. The Arab *jinn* were spirits who tended to kill their human lovers by means of excessive sexual demands – in exactly the way that an early Christian hermit, seduced by a succubus, was said to have died within a month trying to satisfy her. Such relations were not always fatal, however: in Arab tales of the jinn the female version was believed to serve as the invisible wife of any unmarried man – and many men who in legend had such wives were exceedingly unwilling to exchange them for mortal women.

The Celtic *dusii* and the Hindu *bhut* are further examples of the demon lover. A great many of the fairies, elves and other creatures of British legend operated sexually in this way until their stories were prettified and bowdlerized for children's consumption. Along with these slightly more distant relatives of the incubus can be included the vampire, who visits its victims at night while they sleep; the werewolf belongs here too, with its definite overtones of perverted sexuality, as do those shaggy and virile wild men of the woods of folk legend, variations on the satyr. The gorillas in the 'penny dreadfuls' of the 19th century, who spent most of their time carrying off beautiful white women, may also be numbered among this company.

So it seems that to some extent man's mistrust of his own sexuality has at all times caused him to depict it as a demonic figure. Medieval Christian man, however, took this depiction to new and obsessive extremes. He even saw the incubus as powerful enough, in its obtrusion into our most rational or spiritual lives, to resist exorcism: many stories exist of the sexual devil ignoring the exorcist, laughing at him, even attacking him personally. Demonologists ascribed the ability of the incubus to withstand exorcism to the fact that it was of the lowest order of demons, and so more thick-skinned and stupid. Similarly, remarkably few magical cures exist in folklore for people plagued by incubi. One or two writers allude to certain herbs that can protect innocent beds, including St John's wort, vervain, dill, and garlic, which is also reputed to hold off vampires. Otherwise, the early Christian fathers apparently relied solely on the hope that their usual prescription of prayer, mortification of the flesh and so on would keep their chastity intact.

If these tactics failed, the medieval Church and the later witch-hunters resorted inevitably to driving out the incubus through punishment of the victim. The revolting tortures that followed were obviously aimed, by the vicious hysterical minds that devised them, at the normal sexual urges of men and women. It is clear that the Church believed that no innocence could escape tainting, once exposed to the devil of lust in dream or otherwise. That belief, and the cruelties perpetrated in its name, reveals the scale of the sexual repression that existed in those centuries of the Church's dominance. The myth of the incubus remains one of the most ugly manifestations in all history of man's frequent attempts to cripple and pervert his own sexuality in the name of religion.

DOUGLAS HILL

Unlike the lords of Olympus, the deities of prehistoric India cannot be arranged in a neat family tree; brought together from a variety of sources, they imparted a breadth and tolerance to later Hindu thought

INDIA

THE HISTORY OF INDIA, in any modern sense of the term, begins to take a personal and coherent shape in the 6th century BC. Then great moral philosophies, which still between them influence millions of people in the East, combined with a spreading literacy and a complex but increasingly codified religion to introduce historical elements into the Indian record. There remained large gaps and uncertainties in that record, but the year 500 BC may be taken as the approximate divide between prehistoric and historic India.

The prehistoric period is not an entirely uncharted landscape. India was a land where oral tradition flourished with an astonishing persistence and exactitude. Thus when we speak of the hymns of the *Rig-Veda* as the oldest literature, not merely in India but in any Aryan language, and ascribe them to the second millennium BC, we are thinking of hymns transmitted then by word of mouth and not written down (as the word literature implies) until unknown centuries later. Nevertheless those ancient hymns convey to us with something of the precision of literature the ideas and belief of the Aryan invaders who entered north-western India perhaps between 1700 and 1200 BC and helped to shape the cultures of the northern half of the subcontinent down to modern times.

These Aryan invaders were a rough, mobile folk with no cities and few material possessions of a durable kind but with a close-knit tribal organization eventually systematized in four classes: priests *(Brahmins)*, warriors *(ksatriyas)*, peasants *(vaisyas)* and serfs *(sudras)*. The tribal chieftain was the *raja* who led his tribe into battle but did not interfere with religious ritual, though he and his peers were partial to an inebriating drink, *soma*, sanctified and used at sacrifices. This *soma* or nectar, has been identified tentatively as a drug derived from hemp or, in a more recent theory, from the fungus fly agaric (see DRUGS).

The most accomplished products of the prehistoric Indus civilization to survive are steatite seals: pectoral from Mohenjo-daro of an ox-like beast shown with a single horn, nicknamed a 'unicorn'

Josephine Powell

The Aryan religion was based upon sky worship, and the early gods were *devas* or 'the shining ones', the father god being known as Dyaus, equivalent to the Greek Zeus and the Latin Jupiter. But when the Aryans reached India this remote Almighty had faded into the background and survived principally as the parent of a more real and active brood. Of these the most prominent was Indra, god of war and the weather, who destroyed his foes with a thunderbolt, drank soma immoderately and bragged freely of his prowess. Typically, in one of the hymns of the *Rig-Veda* he proclaims, 'Like wild winds the draughts have raised me up. Have I been drinking soma? As a carpenter bends the seat of a chariot I bend this frenzy round my heart. In my glory I have passed beyond the sky and the great earth. Have I been drinking soma?' Across the sky with him rode into battle the charioted spirits of the storm, singing wild and warlike songs as they sped. Amongst his achievements was that of dragon-slayer. In one way and another he links up with religious ideas of Mesopotamia and as far afield as Germanic Europe. He was pre-eminently the warriors' god, violent and jovial in an age of heroic barbarism.

But though foremost, Indra was not the only Aryan god whose special zone was the sky. There was, for example, Surya or the sun god who drove across the heavens in a flaming chariot, like the Greek Helios or Apollo. The twin husbands of Surya's daughter, the Asvins, also used the sky and are comparable with the twin Dioscuri of the Greeks, but were specially concerned with shipwrecked mariners and generally with warding off the ills that beset mankind. Vishnu, who was later to become one of the two great gods of the Hindu world, was another frequenter of the Vedic skies. So too was Pusan, though, like the Asvins, occupied with peaceful missions such as protector of herds and herdsmen.

Next in esteem to the boisterous Indra was the somewhat mysterious and complex god or presence, Varuna, who reigned as a heavenly king in a celestial palace and was surrounded by a godly court. Upon Varuna rested responsibility for the order of the universe, for ensuring that day and night and the seasons followed one another in proper succession. Varuna's great quality was that of knowledge. He was present at all human interchange, and he abhorred sin, including the drinking and gambling which characterized Aryan society. He punished wrong-doing and was approached with awe and penitential humility.

In this he was quite unlike Rudra who had no moral sense but was a stormy archer god whose arrows brought disease; grim, though like so many of the ancient gods, capable of occasional beneficence.

Ritual Slaughter

A significant feature of the Indo-Aryan system, in distinction from that of the classical theocracy of the West, was its lack of close corporate inter-relationship. The Olympian complex can be expressed genetically in the form of a family tree. Not so that of the Vedic Aryans. These were content with a loose assemblage of divine skills and characters, brought together no doubt from a great variety of sources and confronted on arrival in India with a further multitude of regional deities and powers, which they lacked at first the political cohesion to co-ordinate into any very closely knit unity. In large measure this heterogeneous quality remained a characteristic of the developing religions of the subcontinent.

The ritual focus of the Aryan cult was animal sacrifice. In the *Rig-Veda* mention is made of great sacrifices in which numbers of animals were slaughtered for the pleasure of the gods and doubtless also for that of the worshippers, with whom the gods shared the sacrificial feast. The more mystical and elevating aspects of the occasion were no doubt encouraged by the soma which accompanied the banquet. Later records speak of smaller sacrifices at the domestic hearth, and the basic principle of the cult, on whatever scale, would appear to be the widespread reverence for the hearth as a centre of life and comfort, of dreaming and of utterance, which the *Rig-Veda* combines in the mystical word *Brahman*. The possessor of this supernatural quality was *Brahmana*, the priestly magician of the Vedic tribe (see BRAHMAN). In a special sense the Brahmana was the priest of the fire god Agni (equivalent to the Latin *ignis*) who was the spirit of hearth and home and dwelt in the timbers of the sacrificial fire itself as a sort of intermediary between gods and men. The sacrificial priest alone had full knowledge of the divine mystery and of the exact meaning of the words and formulae which themselves had a magic value and so were preserved with an astonishing fidelity.

Sacred Horse of the Sun

Of individual sacrifices the greatest fame attaches to the *ashvamedha* or horse sacrifice, which was the prerogative of kings. It is not known to the *Rig-Veda* but appears in the later Vedic period, approximately 1000–500 BC, when the centres of Aryan dominance had moved from the north-west frontier to the jungles and rivers of the northern plains. In this region and period the old tribal assemblies were being replaced by a defined monarchical system, comprising the king with his relatives and court officials; a system which, in however shadowy a form, continued in many parts of India until modern times. An obvious weakness of this regime arose when a ruler's advancing age and decreasing powers encouraged the ever-ready intrigues of an entourage chosen perhaps on grounds other than ability. It was important therefore to preserve or increase the king's vitality, from middle age onwards, by every heavenly device. The most potent medium was that of the horse sacrifice. The procedure was to release a specially consecrated horse so that it ran wild for a year. It was followed by a band of selected warriors, who saw that the rules were strictly observed: namely, that any king on whose territory the horse chose to wander must either do homage or fight. The thinking behind this strange ceremony is, as usual in such cases, hard to discern. It may be observed, however, that the horse had specific associations with the nomadic and warlike Aryans; that it was associated with the sun, one of the major powers of life; and that the ceremony included a quasi-coupling with the queen, thus representing the fecundity of nature. In other words, it symbolized an Aryan life-source (see also IMITATIVE MAGIC).

In one way and another, the act of sacrifice, however difficult of interpretation and probably in part because of its incomprehensibility, became the central mystery of the Brahman doctrine. This meant that by the late Vedic period (middle and latter part of the first millennium BC) – that of the *Upanishads* – the individual characters and qualities of many of the gods of the *Rig-Veda* had become obscured, or had merged into new complexes: a process which may be ascribed partly to the fusion of Aryan with non-Aryan elements and partly to inevitable changes wrought by time and changing environment. A notable example of this was the gradual exaltation of the fierce Rudra of the *Rig-Veda* into the mighty Shiva of classical Hinduism. *Shiva* meant 'propitious', and was in origin the placatory epithet of Rudra but eventually assumed a separate and independent status as one of

Seals from Mohenjo-daro showing cult scenes *Top to Bottom* A 'unicorn' seal: the animal is by an incense burner. A horned ithyphallic god squats in a yoga position, bangles along his arms: possibly an early form of Shiva. The three-headed animal on the next seal may be Shiva in the character of Pasupati, Lord of Beasts. Seal depicting a rhinoceros. Horned goddess in a fig tree with priestesses or sacred dancers. Horned animal

the two great cosmic deities of the Hindu world, the other being Vishnu. In character, Shiva was an irreconcilable mingling of the hopes and fears and questionings of his worshippers. He is the destroyer; he haunts battlefields and burning-grounds; he is himself both time and death; he wears a garland of skulls and is surrounded by demons. At the same time he is the creator and is ithyphallic (represented with an erect phallus). Again, on Mount Kailasa in the Himalayas he sits upon a tiger skin in deep meditation. But also he is Lord of the Dance. He wields the trident, and is constantly accompanied by his gracious wife Parvati and his 'vehicle', the Nandi bull. He rules menacingly over his adherents, with whom he nevertheless shares the Hindu urge towards reflection and yogi. He brings together in one stern but ineluctible Being many of the principal strands of Indian religious thought and sensation.

Antecedents of a God

Archeology suggests that, in spite of links with the Aryan Rudra, Shiva owes much in his complicated character to native Indian, non-Aryan, prototypes. Although difficulties, often insurmountable, obstruct the interpretation of undocumented material relics in terms of religious or metaphysical thought, it is permissible to recognize elements of a worship approximating to that of Shiva in the great prehistoric Indus civilization of north-western India. This civilization extended from the foot of the Himalayas at Rupar to the Arabian Sea west of Karachi at an approximate period of 2500 to 1700 BC, and there can be little doubt that its walled citadels such as those of Mohenjo-daro, Harappa and Kulibangan, represent the fortified sites proclaimed in the *Rig-Veda* to have been destroyed by the invading Aryans sometime within that millennium. At least there are no known rival claimants. Now amongst the steatite (soapstone) seals which are the most accomplished products of that civilization are three from Mohenjo-daro in Sind bearing the figure of a Shiva-like deity squatting on the ground or a low stool. One of these is particularly notable: it shows a somewhat sinister three-faced and horned god squatting in an attitude of yoga on a low throne; he is apparently ithyphallic, and his arms are covered with bangles. On either side of the god are four animals – elephant, tiger, rhinoceros and buffalo – and beneath the throne are two deer. It is generally accepted that the representation is that of Shiva, or a proto-Shiva, in the character of Pasupati, Lord of Beasts. And, since it is equally accepted that the Indus civilization is rooted in pre-Aryan India, it would appear necessary in this instance to reconcile this pre-Aryan 'Shiva' with the Aryan Rudra. The answer may well lie in the probability that the so-called 'Aryan invasion' was a fairly protracted penetration and that there was some sharing of ideas and beliefs.

Other seals from Mohenjo-daro show cult scenes, including suggestions of some sort of tree worship such as has survived into modern Hinduism. One seal shows a horned goddess sitting in a peepul, or sacred fig tree.

Stone bust of a priest-king or deity from Mohenjo-daro: the many gods of the Vedic Aryans bequeathed to later Hinduism a liberalness and tolerance which tend to be lacking from more sternly monotheistic faiths

Another seal shows a god or hero grappling with two tigers, a scene recalling the familiar representation of the Sumerian hero Gilgamesh between two lions.

In one way and another it is evident that the main outlines of Hindu belief took shape in the second millennium BC, and represent a fusion of Aryan, non-Aryan and perhaps Sumerian sources, with an appreciable admixture of more local elements. As time went by, and more settled social and economic conditions supervened, there was an increasing trend towards meditation and introspection, culminating in the great moral philosophies of Buddhism and Jainism during and after the 5th century BC (see BUDDHISM; JAINS). But alongside these philosophies, and rarely in active opposition to them, the traditional religious beliefs and practices continued as they continue today to provide the religious beliefs and usages which still form the broad basis of Indian life. INITIATION

The youth in a primitive society who submits to being severely stung by hornets, and the Western apprentice who accepts the bullying and ragging of his workmates are both activated by the same principle: the acceptance of an ordeal which must be undergone and surmounted before initiation into a new status

IN EVERY INITIATION ceremony there is some idea of a new birth as part of the process of assuming full status in the group. 'Except a man be born again' is the Christian phrasing for a process which in many ceremonies involves acting out a return to a symbolic womb. Part of the ritual of the Kunapipi, an Australian aboriginal group, involves the initiates being brought into the sacred ground 'to enter the Mother; they go into her uterus, the ring place, as happened in the beginning.' In acting out the ritual they are covered over with bark and hung from a pole. 'They are', as Mircea Eliade shows, 'in the womb, and they will emerge reborn – "their spirit comes out new".'

The theme of rebirth is paralleled by the equally important recurring theme of death. Both are closely linked structurally in the whole process of initiation. The new life cannot start until the old has been disposed of. Ritual death to the old life, the former sinful, corrupt condition, is expressed in the elaborate mythology surrounding most puberty rites. In the Congo on the Loango coast boys between ten and twelve years old have a ritual death in the village when they are given a potion to make them unconscious as a prelude. Now 'dead', they are taken into the jungle, circumcised, buried in the fetish house and painted white, a sign that they are ghosts of their former existence.

Rebirth may be similarly expressed by the infantile behaviour of the initiates when they return. They may appear helpless, like babies. The stay in the bush serves the important function of signifying the death of the previous relationship between a son and his mother. Initiation ceremonies serve several functions in relation to the social

structure but they also emphasize the deeper belief system. The newly initiated have a special status because they have learned the mysteries, survived the ordeals, having escaped the belly of whale or serpent or whatever other experience may be central to the creation myth of the group.

Initiation into secret societies, shamanic or other groups of priests, witches or warriors, follows a similar patteru but with a more elaborate and distinctive indoctrination of the individual. In these ceremonies the demonstration of some magical, divine or shamanic power by the initiate is looked for as a sign that he has attained the appropriate characteristics of a god, animal or spirit. A transcendent existence, and the powers that go with it, replace the mere human condition. In most hero legends the young warrior characteristically undergoes an experience of a sacred, mystical kind which gives him superhuman powers or magical elements which he can use in his ordeal. The tasks which are set to those who hope to win the hand of the beautiful princess in the classical fairy tales depend on more than normal attributes in the performer. The hero becomes seized with power, he becomes heated, baptized with fire. Eliade describes how in Germanic secret societies the young man became a berserker in a frenzy of fury. 'He became "heated" to an extreme degree, flooded by a mysterious, non-human and irresistible force.' The initiation of the Kwakiutl Indian warrior in British Columbia involves a similar frenzy of possession and heating and the same thing is recorded in the Irish hero legends of Cu Chulainn or the Greek and Indo-European initiations of cultural hero figures.

Rebirth Through Pain

Trials of strength and endurance, as tests of fitness to share the sacred membership with the ancestors or folk heroes, are common to all initiations. Formal learning and preparation for the new status in the

During the recent initiation of a new garage hand, he allowed himself to be tied up and petrol was sprinkled round him and set alight

'initiation school' is only part of the experience which is bound up with a complex of fear, awe and dread in face of the mysteries. The adult must be brave in the face of danger and must be steadfast in the face of pain. Consequently the novice is subjected to the fearful noise of the Melanesian bull-roarer – a wooden instrument which makes a booming sound – or to the beating with stinging nettles and the dropping of hornets on to their backs which the Naudi adolescents in East Africa experience.

The common experience of fear and pain provides an important social bond between the novices who have survived the experience. They are incorporated into a group distinguished sharply from outsiders who have not shared in the ordeal. By having passed through the sacred experience they have attained a new status prescribed by tradition. Their circumcision, the decoration of their skin by cuts, their ordeals in the initiation school, their skill as warriors, show that they are boys nn longer but men ready to take a full part in the life of the community.

One Melanesian experience described by R. M. Berndt includes a progressive series of nose bleedings caused by slivers of bamboo which are covered with salt and then twirled in the nostrils. The tongue is also cut and the penis rubbed with rough, abrasive leaves. By the time he is 18 or 20 years old the young man is introduced to penis bleeding caused by progressively larger objects pushed into the urethra and twirled. Some of the puberty rites for girls include similar insertions into the vagina to cause bleeding. These rites demonstrate strength (if a man's penis is strong his arrows will be also) while blood has importance hoth as a symbolic representation of menstruation and of the religious and magical qualities associated with sexual elements.

Ritual Rapes and Panty Raids

The ritual rapes of Kikuyu warrior bands following circumcision have attracted a certain amount of notoriety, particularly when English women living in the Kenya highlands were the victims. The explanation for the ceremonial rape lies in the need of the young men to purify themselves after the initiation rites. This could be achieved by passing on the 'contagion' to a woman through intercourse before they could return to the group to claim a wife of their own. Often a band of young men wandered the countryside far away from their homes until they found a woman who was of married status and a stranger to them.

Something very similar is to be found in some of the ceremonies and 'dares' demanded of newcomers to the armed forces and in particular those aspiring to membership of male fraternities in American colleges and universities. These may range from the 'panty raid' on the women students' residence (ritual rapes) to tasks requiring the initiates to collect some prized possession which signify their mauliness and daring – bringing back G-strings from night clubs or placing chamber pots on Oxford spires. Various forms of the 'chicken' game, especially when played with cars or motor-cycles, are of the same order. Such activities may he part of the official conditions of membership of the group but often they represent an unofficial response by the existing members to the newcomer. Apart from tests of skill and daring, initiates are often subjected to debasing ceremonies of an equivalent kind. Initiates of one fraternity must wear an iron ball and chain padlocked to their ankles for a week, others must wear women's or children's clothing or have their hair cut in a special way. Another quite common practice involved an initiate being taken to a deserted spot often at a considerable distance and there left without clothing or money (or with a minimum of each) to see if he could get back.

Similar, less formal initiation rites are conducted in most social groupings to emphasize the common and shared trials through which members have passed and on which their solidarity is based. A typical newspaper report (*Daily Telegraph*), from the 1970s, describes the bullying of a 16-year-old garage hand on his first day at work. After a certain amount of general ragging of the 'new boy' he was tied up and petrol was sprinkled round him and set alight. In this case he was badly burned but it was noted in the court hearing that he had submitted willingly – recognizing that this kind of initiation ritual was a condition of his acceptance by his workmates.

Tests of endurance, strength, ridicule and fear are used in the more elaborate initiation 'schools' as a means of emphasizing and disciplining the novice as he learns the cultic knowledge and mysteries of the group. An important feature of many initiation ceremonies, especially in the secret preparation period or 'school', involves the use of figurines symbolizing traditional magical or religious characters, ancestors, or elements in the total knowledge and moral structure of the society. These figurines are often carefully guarded by the members of a particular group and are not allowed to be seen by those who have not been initiated. They have spiritual significance and consequently are carefully guarded from enemies. The special rituals appropriate to each are similarly reserved for fear that the sacred objects might be angered or polluted by those who had no right to see them, or did not know 'how to behave' in their presence. The sacraments are similarly reserved in the Christian Church for those who have become full members.

Lessons in Sex

Initiation figurines are either kept as part of a store of sacred objects or are fashioned anew for each group of novices. Examples from East Africa include instructive, cautionary and punitive figures. They are all associated with songs, proverbs or riddles which the novice must learn. One example of a simple and obvious kind is the model of a hare used by the Sambaa as part of the rites for boys. The teaching that is depicted is that it is foolish to be quarrelsome and the associated words state that the hare is cleverer than most animals but he is never anxious to start a fight. A large majority of the figurines are used to convey lessons about sexual behaviour or morality and here again proverbs are taught to the initiates to define correct hehaviour. A good example of such a riddle is shown in the female figurine used by the Zigua with a riddle which runs: 'There is only one person who laughs when she should mourn and who rejoices in her loss', to which the answer is 'A girl on her wedding night'. As well as being used in puberty ceremonies, these figurines are used in the entry rites to secret societies and associations. Clay or wooden figures are handled ritually and associated with a fixed form of words sung or recited. Again the objects depict familiar social roles, or common objects as well as highly stylized art with a very complex symbolism. The figures and the form of words are treated as sacred and are kept

secret from those who are not initiated.

The initiation schools and the lengthy process of disciplined teaching of the lessons associated with the puberty rituals in tribal societies have inevitably been affected by social change. Often lack of time and the constraints of formal education or occupation have meant that both the ceremonies and the training period of the initiation must be curtailed. Where figurines are used the number may be limited or the verses only will be learned. These effects of social change only serve to emphasize the important and complex function served by the initiation of adolescents in tribal society. They ensured that each individual was fully educated in the central belief system, moral codes and normative standards of the society and was intellectually as well as emotionally prepared for an adult role in the community.

One particular set of initiation ceremonies involves the installation of new incumbents into various offices. Kings, chiefs, presidents, professors are all expected to observe formal ritual procedures and take part in ceremonies connected with their assumption of the prerogatives of office. Coronation ceremonies are an elaborate example of the combination of rituals designed to acknowledge formally and acclaim publicly and anoint the one chosen for the office. Part of the ceremony usually involves admission to a ritually appointed place or locus of office. The professor has no actual 'chair' but a bishop has a cathedral throne and knights of orders of chivalry are ceremonially led to their stalls in the chapel of their orders. Similarly with a mayor or president the office holder is sanctified with the symbolic elements of authority: orb and sceptre, crown and sword, seal or gavel. These objects signify that the incumbent has been properly chosen, indoctrinated and acquainted with the mysteries that surround the office. The laying on of hands, the anointment, represents the conferring of divine or magical power which alone sets the initiated incumbent of office 'apart'. Where the succession to office is hereditary, or where the successor is selected in childhood (as in the case of the Dalai Lama before the Chinese invasion of Tibet), the whole process of growing up forms an overall initiation which points toward the eventual attainment of office.

Jorgen Bitsch

The common experience of fear and pain promotes a social bond, distinguishing the initiated from the outsiders: in Chad, cicatrization or the decoration of the skin by painful cuts, indicates the fully fledged member of the community

Humiliation and Abuse

Much of the ritual surrounding the initiation of new holders of office shares the characteristics that have been noted in the rites surrounding puberty. The symbolic death of the old and rebirth to the new condition and status is represented in the divesting of original clothing, and the profane objects of life. The new ruler, as in the coronation ceremony of the British monarch, assumes a new royal robe as well as other symbols of office: orb or sceptre, crown and sword.

Some of the ceremonies are dignified and formal, enshrined with pomp and circumstance, but it is significant that even the most solemn occasions also have a festive and irreverent side in which 'the gods are mocked'. The chancellors of Scottish universities, elected by the students, however honoured and dignified, endure a bombardment of flour, missiles and abuse as part of their inaugural ceremony, and it is customary for the professors at some American universities to be subjected to similar horseplay. These examples show clearly the conflicting and complementary elements of debasement and honouring that characterize the initiation process. Just as we have seen with puberty rites, the candidate must be 'cut down to size' and divested of his former status before he can assume the new. The experience of the army recruit is no different once he joins up. The admonition 'Get your hair cut – you're in the Army now' demonstrates the removal of the civilian status and the assumption of the new status of 'soldier' with uniform, dress, style, regulations and equipment just as clearly.

Modern examples of initiation rituals abound and demonstrate many of the features already noted. In some cases the ceremonies are merely vestigial remnants of earlier, more elaborate and public rituals, involving the whole community. Infant baptism 'casts out the devil' and 'makes new' and the baptismal water is an

All religious groups, cults and societies develop a conscious boundary between those who have membership and those who do not

indication of the washing away of sin. Adult initiations in some churches often involve baptisms by total immersion and 'speaking in tongues', spiritual trance and 'possession' in the new member. The transcendental religious or magical recognition of the new member both fortifies the faith of the group and signifies that the initiation procedure was correctly performed.

The organization of fraternities and sororities probably has been most fully elaborated in the Western world in bodies such as the Masonic Order, Guilds, Knights, and more recently formed bodies, most of which claim ancient lineage such as the Orange Lodges, the Lions, Elks and many others. Freemasonry is defined in the ritual of symbolism associated with great religious orders and categories of progressive initiations in Ancient Egyptian, Hindu and Buddhist traditions. Similarities have been pointed out between the Eighteenth Degree of the Freemasons, 'Knight of the Pelican and Eagle and Sovereign Prince Rose Croix of Heredom' to which any Master Mason of one year's standing is eligible and the initiation rites of the Australian Bora aborigines. The symbolic teaching of this degree describes the passage of man through the valley of the shadow of death, accompanied by the Masonic virtues of Faith, Hope and Charity and his final acceptance into the abode of light, life and immortality.

Symbolic Social Statement

Just as in the initiation ceremonies of secret societies, in simpler societies membership represents a distinct and far-reaching social statement about the individual. Being adult or being a Mason or being a Baptist or a witch represent far more than the mere labels. They are involved statements about the whole society and the place and significance of different groups within the society; statements which have significance in all those aspects of the social structure in which particular kinds of belonging can be a means of articulating social relations. The questions of whom you may marry, where you can live or whom may you work with are not idle when belonging to the Roman Catholic Church or the Loyal Orange Order become the prime defining characteristics of life in Northern Ireland; or being a Jew or an Arab define sharply the possible relationships in a situation of conflict in the Middle East. Where 'belonging' in this sense is open to the individual the significance of the transition from one condition to another is very apparent. Those who have 'passed' from Negro culture to white in the United States or those who have succeeded in the world of espionage, are acutely conscious of the dimensions and social significance of the new roles they have chosen to adopt. But even in these rather mundane examples the questions are not simply social in the sense of setting out rules of behaviour. They are symbolic, as all social statements are inevitably symbolic, because they are statements about man, the world, the cosmos and the possibilities of human existence, as well as statements about life and death. It is precisely in those areas where the maintenance of distinct boundaries is most important to the people in a particular society that one finds a particular emphasis on their maintenance and on the proper observation of the boundary-crossing rituals of initiation.

In some societies age distinctions may be pivotal, in most societies sex differences, and in many societies differences of race or ethnic origin or language may serve to demarcate structurally the bounds of social relationships. In many societies the division between male and female is sharply observed in territorial definitions of space in the settlement or living quarters. Male and female areas for eating, washing and defecation are reserved and this latter distinction can be seen also in contemporary Western societies. A good example is the division by sex of public lavatories and the recognition that for very small children the rigid differences generally observed are considered unimportant. In the Southern United States the problem was multiplied in some areas by the belief that it is necessary to provide facilities for white and coloured as well as for male and female: four separate spaces to fulfil one natural function. The point of importance is that these particular divisions are pivotal for the world view of these particular societies. It is not surprising that one finds fraternities of men or sororities of woman's groups of one kind or another which as distinct sex groups serve the important function of emphasizing and symbolizing these distinctions which their own initiation into the particular group both recognizes and supports.

In her interesting book *Purity and Danger* Mary Douglas shows how important is the act of separation between sacred things, places and persons from the profane or polluting world. All religious groups, cults and societies develop a conscious boundary between those who have membership and those who do not. Fear of malevolent or benevolent spirits or beings often characterizes the concern with which it is felt necessary to observe the proper 'passage' ceremonies which connect these two states. Quite apart from the examples of initiation that we have already discussed, birth and death are surrounded by similar ritual observations designed to placate various forces which may have an influence on the destiny of the child or the dead person. Even in tribal societies no necessary claim will be made for these rites as essential and empirical measures which will bring the desired result. But man is not only a practical being and even in contemporary societies initiation ceremonies convey the mixture of beliefs at a variety of levels – mystical, magical, metaphysical and religious, as well as scientific – which can co-exist without difficulty in the same individual and group.

Initiation rituals surrounding death are often elaborate, both at the level of preparation and in the way in which the dead are treated. There are numerous examples in the rites of burial of the placing of money in the hand or mouth to secure the passage of the dead across the Styx which illustrate that the characteristics of initiation are found here as well. Burial in the foetal position also symbolizes the recognition of rebirth following death.

Death and rebirth indeed characterize the features of all initiation rites. We have seen this illustrated in boys' puberty initiation schools and it is found equally in the often less developed puberty rites for girls. Girls' ceremonies tend to involve a less intentional process than those of boys which represent a more deliberate introduction to a world of spirit and culture. For girls, as Eliade points out 'initiation involves a series of revelations concerning the secret meaning of a phenomenon that is apparently natural – the visible sign of their sexual maturity.'

This does not preclude considerable emphasis being given to some female puberty rites in certain societies. The Dyaks

Journeys through the Dark

The soul (at the point of death) has the same experience as those who are being initiated into great mysteries . . . At first one wanders and wearily hurries to and fro, and journeys with suspicion through the dark as one uninitiated: then come all the terrors before the final initiation, shuddering, trembling, sweating, amazement: then one is struck with a marvellous light, one is received into pure regions and meadows, with voices and dances and the majesty of holy sounds and shapes: among these he who has fulfilled initiation wanders free, and released and bearing his crown joins in the divine communion, and consorts with pure and holy men, beholding those who live here uninitiated, an uncleansed horde, trodden under foot of him and huddled together in mud and fog, abiding their miseries through fear of death and mistrust of the blessings there.

Attributed to Plutarch
(trans George E. Mylonas)

Initiation into the mysteries of Isis:
. . . I will record as much as I may lawfully record for the uninitiated, but only on condition that you believe it. I approached the very gates of death and set one foot on Proserpine's threshold, yet was permitted to return, rapt through all the elements. At midnight I saw the sun shining as if it were noon: I entered the presence of the gods of the underworld and the gods of the upper-world, stood near and worshipped them.

Well, now you have heard what happened but I fear you are still none the wiser.

Apuleius *The Golden Ass*
(trans Robert Graves)

exemplify this in the separation and isolation of girls for a whole year in a white cabin, dressed in white and only eating white foods. This separation – the wilderness experience – recognizes the fact that during this period the initiate is 'nothing', neither man nor woman, asexual. Together with other separations – Christ's 'forty days in the wilderness' – it is a condition of the attainment of spirituality. The emerging initiate is reborn in a symbolic and spiritual way. The return announces that the mystery of rehirth has been accomplished. Eliade gives the example of the Kavirondo Bantu to illustrate a characteristic imagery found also in Brahmanic initiation in India and the recognition of the double character of birth in the egg from which the chick emerges when the shell is broken. It is said of the Kavirondo initiates when they complete their ritual: 'The white chick is now creeping out of the egg, we are like newly fired pots.'

One final example will serve to illustrate something of the elaborate character of initiation mythology. An ascetic period of isolation is characteristic of many North American Indian initiations. The novice leaves the community in order to obtain those dreams and visions which will identify for him a particular spirit with which he will then continue to be associated. He will fast and exhaust himself until the spirit appears to him, usually in animal form. Once he has achieved this personal sacred experience he can return to the tribe, having died to be rehorn with his guiding spirit.

The Dancing Societies of the Kwakiutl Indians studied by F. Boas show a more elaborate version of the same isolating and sacralizing experience. The ritual commences with the initiate falling into a trance to signify his death to the profane world. He is then carried off to be initiated by the spirits. He may be taken to a cave or to a special hut in which the spirit lives. An extreme example is that of the Cannibal Society where as part of the initiation the candidate is served by a woman while he is secluded in the forest. He is identified with the god and demonstrates this by swallowing strips of a corpse which she prepares for him. His cannibalism is a reversal of the horror of the Kwakiutl for human flesh. To overcome this revulsion he must indeed be divine and the similar acts of frenzy in which he engages on his return serve also to demonstrate this possession by the god.

In the final ceremony he acts like a beast of prey attacking all he can reach, biting their arms. He is almost impossible to restrain but finally is subdued after the woman who served him in the wilderness dances naked before him with a corpse in her arms. His frenzy is finally subdued by repeated immersions in salt water and his new personality and identity is achieved.

MAN, MYTH & MAGIC

VOLUME 6

Inse – Mani

INSECTS

Until the 17th century it was generally believed that insects were spontaneously generated, and beetles were said to arise from putrefying flesh and from dung. In some parts of the world butterflies were believed to be the wandering souls of men, and they have also been regarded as disease spirits; fire-flies are said to be the eyes of gods slain in battle

INSECTS

THE INSECT WORLD comprises an enormous group of organisms, many with very different characteristics. There are, for example, over 250,000 species of beetle, some of which are microscopic, while others are larger than the smallest birds; their coloration varying from dull and inconspicuous to brilliant iridescence. The characteristics of insects have become associated with mythology and folklore giving rise to remarkable beliefs and superstitions.

Man has been interested in insects not only out of curiosity but because some have forced their attentions unpleasantly upon him as parasites, pests and destroyers of his crops. The locust, the tsetse fly, the plague-disseminating flea and the mosquito have profoundly affected human history and economy. Only the bee and the silkworm have been effectively 'domesticated'. The mythology and folklore of insects has been mainly concerned with their origins, transmigrations, oracular significance, the explanation of their characteristics, devices for the expulsion of noxious species and the use of insects in magic and medicine.

From ancient times ants have been mentioned in proverbs and fables as paragons of industry. In Thessaly their digging activities caused them to be associated with agriculture through the myth of the nymph Myrmex who falsely claimed to have invented the plough. Athene, who had actually done so, transformed her into an ant. There was a 16th century fancy that the ants of Ethiopia and India dug for and treasured gold. An ancient German belief was that they could be driven away by ringing bells. In England it was said to be a sign of rain when ants were seen carrying their pupae but in Germany this was interpreted as indicating fine weather. In ancient and more recent times treatment in various ways with ants was believed to have medicinal value, especially for people suffering from fever.

Thunder Chrysalis

It was a common belief, mentioned by Aristotle and persisting into the 17th century, that insects were spontaneously generated. Beetles were said to arise from putrefying flesh and from dung, where they were often seen to gather. The ancient Egyptian belief in the scarab (see SCARAB) as a symbol of life beyond the grave appears to have arisen from observations of beetles emerging from the ball of dung in which some beetles place their eggs. The ladybird is called by names which associate the insect with Our Lady, such as *Marienkäfer* (Mary beetle) in Germany. It is still the custom in Britain for children to place a ladybird on a finger and say to it:

> Ladybird, ladybird, fly away home,
> Your house is on fire and your children
> are gone.

In some areas it was thought that the direction in which it flew indicated from whence a girl's 'true love' could be expected and in Sussex when a ladybird alighted on someone its spots were counted to ascertain how many happy months to expect. In the Hebrides its five spots are said to represent the wounds of Christ; the number of spots vary with different species.

Beliefs concerning the cockchafer have

some similarities to ladybird beliefs and there may have been transference from one to the other. The cockchafer is regarded with favour in France and Germany; in Bavaria it was considered a good omen if this beetle settled on the hand and in France it was carried in processions. Like the ladybird it appears to have been anciently associated with spring and fertility.

The stag-beetle was connected with thunder and in Germany was called *Donnerpuppe* (thunder chrysalis) perhaps through its association with the oak tree, the tree most often struck in a thunderstorm. In Scotland blindfolded boys struck at it, probably on the assumption that a black, horned creature must be devilish. According to a Hebridean legend the burying-beetle betrayed Christ during the flight into Egypt by telling his pursuers that he had passed by the previous evening, but the dung-beetle contradicted it, saying that he went by a year ago. Therefore, boys kill the burying-beetle but turn the dung-beetle on its back because although it lied it was in a good cause.

Irish folk say that the devil's coach-horse beetle is putting a curse on you when it raises its tail and there are still folk in Britain who are disquieted when they hear the tapping of the death-watch beetle. In Africa, Baronga women threw noxious beetles into a lake, screeching obscenities characteristic of rain-making ceremonies. Arabs used to employ sympathetic magic to recall a runaway slave, tethering a beetle of the sex of the fugitive by a thread to a nail, in the belief that as it crawled in diminishing circles the slave would be drawn back. In East Anglia at the end of the 19th century a beetle was suspended by a thread round a child's neck to cure whooping cough, on the assumption that as it decayed the ailment would disappear.

It has been widely believed that butterflies, being ethereal creatures, were the souls of people. A myth of the Pima Indians of North America relates that the Creator flew around as a butterfly to find a place for man. On Greek vases the soul was represented as a tiny winged human being and later artists depicted it as a butterfly. Among the tribesmen of northern Asia it was thought that the soul-substance could leave the body during life, so causing illness or unconsciousness. A grey butterfly or moth was tied in a cloth round the patient's neck in order to restore it to him.

There was a Gaelic tradition that a butterfly flitting over a corpse was the soul and in Ireland such an event indicated its everlasting bliss. In 1810 an Irish girl was reprimanded for chasing a butterfly because it might be the spirit of her grandmother. According to a Gaelic folktale a soul in the guise of a butterfly went wandering and was about to enter a sleeping man when it was killed. In Calabria, Italy, a white butterfly fluttering around a cradle was called the baby's spirit and in East Anglia to see a white butterfly signified that a baby had died.

According to an Australian tale an aborigine who left his starving son in a shelter of bark and branches while he hunted for food was reassured on finding the larva of a case moth (a species which surrounds itself with a case of bark) clinging to a tree. The boy had evidently been changed into this insect. In the Solomon islands a man could choose the creature of his reincarnation and often selected a butterfly. In China and Japan this insect has propitious symbolism. One Japanese *Noh* play is based on the theme of a human soul transformed into a butterfly.

Perhaps the widespread association of butterflies with the soul vacating the body in some areas and in particular circumstances has given them a sinister reputation. From Scotland to the Balkans they were sometimes thought of as witches or the souls of witches. Rumanians said that naughty children became butterflies and that these should therefore be killed. They have also been believed to be disease spirits. In some English counties it was the custom to kill the first butterfly seen and in Westphalia children knocked at doors on St Peter's Day, 22 February, bidding the butterflies go away. The householders themselves might go through the rooms to expel the insects by this ritual which, if omitted, could entail misfortune such as the multiplication of vermin or outbreaks of cattle disease.

According to the number seen or their hue butterflies could have different significance. In Cambridgeshire to see three was lucky while in other counties this portended misfortune. In the North of England red butterflies were killed. A dark butterfly forecast illness in Bulgaria, a white

George E. Hyde

Bruce Colman/Des Bartlett

As pests, parasites and destroyers of crops, insects were identified with destruction and evil in some parts of the world: ancient Peruvian painting depicting a demon in the form of an insect, capturing a bird

one in Ruthenia in the Russian Ukraine. The death's-head hawk moth, because of the similarity of its thorax markings to a skull and its ability to squeak, was also regarded as sinister.

The wormlike appearance of the caterpillar, the larva of the butterfly or moth, is probably the reason for the widespread superstition that it was made by the Devil, or by witches with the help of the Devil. In Switzerland there is a belief that tree spirits are responsible for caterpillars, and that they send them to creep into a man's brain and drive him mad. In Rumania they are said to have originated in the Devil's tears, and the Bantu of South Africa believe that the souls of the dead take the form of caterpillars.

The insect has some virtues in folk medicine; according to English lore carrying a caterpillar around will ward off fevers, and in ancient times the bite of a poisonous snake was rubbed with a mixture made from a cabbage caterpillar and oil.

The Devil's Darning Needle

Cicadas and crickets early attracted special attention because of their chirping or stridulating calls. Alike in ancient Greece and in Shantung in China they were believed to live on wind and dew. According to Plato's account of the story told by Socrates the Muses live again in these insect songsters. Early Chinese authors wrote enthusiastically about them and the Chinese still keep them in small cages. Aesop's fable of the Ant and the Cicada (or Grasshopper) is very ancient. In Japan the cricket is regarded as giving warning of the approach of winter.

In Europe if crickets forsake a house it may be regarded as an evil omen but occasionally one of these insects chirping in a house where they have not been heard before is considered to be an omen of death. These are instances of the tendency for some unusual occurrence to be considered to foretell a calamity.

Magical ceremonies were widely conducted with the aim of destroying or expelling locusts and grasshoppers. An Arab writer mentions a golden locust set up to guard a town from infestation and it is reported that Naples was rid of grasshoppers by means of bronze or copper images of them. In Japan straw images of larvae of a certain species of insect which was damaging the rice fields were paraded around the infested area by villagers bearing torches, ringing bells and beating drums. The images were then thrown into the river or burned. In the Argentine tin cans were beaten to frighten away grasshoppers, as in Europe beekeepers made a similar din to encourage swarming bees to settle.

When locusts or beetles were destroying the crops in Albania the women would go in funeral procession to a stream and drown a few in the hope of eliminating them all. In Mirzapur, India, an insect was caught, its head marked with a red spot and dismissed with a *salaam* on the assumption that it would lead its fellows away. Among the Wajagga in Africa a locust's legs were tied together and it was let fly in the belief that the horde would accompany it beyond the boundaries of the tribe. In 1590 a plague of locusts in Ethiopia was excommunicated and confidence in the effectiveness of the procedure was reinforced by the outbreak of a storm which destroyed them.

The long, slender bodies of dragon-flies have given rise to their being called 'Devil's darning needles'. They have been viewed with suspicion partly because their claspers at the end of the abdomen have been supposed to be stings. It was said that they would sew up the mouths of scolding women and cursing men. In Cambridgeshire an elderly man said recently that it was lucky to see a dragon-fly skimming over a pool. He would then cross his fingers and wish, as he had been told to do during his boyhood. In Japan, where the dragon-fly is an emblem of summer it is regarded as a lucky talisman. It symbolizes courage and the return of the dead to their homes on earth. On the South China coast when dragon-flies appear in numbers they are believed to presage a typhoon.

Fleas were said to be generated from dust, filth or horse urine, whereas lice were believed to appear spontaneously from greasy cloth or 'from the very flesh of man'. In East Anglia infestations of lice were attributed to the malevolence of witches. The remedy was to stick pins into a piece of flannel which had been next to the patient's skin and then burn it at midnight. In Ireland it was thought that strewing foxgloves around would cause fleas to leave and in England until the end of the last century a housewife would rise early on 1 March to brush around the lintel and hinges of the door; it was assumed that the fleas would know better than to enter or to remain where the lady of the house was so diligent.
